H. N. Starnes, Jr., has been appointed general sales agent of the Tune Coal Co., mines at Carbon Hill, and the John Henry Coal Co. mines at Jasper, and has opened an office in the American Trust Building, Birmingham, Alabama.

Thomas H. Shaw recently closed down Mine No. 1 on the Smedley lease near Midland, Ark. This mine was in a dangerous condition with poor air supply, and several practices being pursued which were in open violation of the state laws.

George Best for 12 years president of the Best Manufacturing Co. has severed his connection with that concern, and with his son, George H. Best, has organized the Best Pipe Engineering & Supply Co. The office of the new firm will be at No. 3026 Liberty Ave. Pittsburgh, Penn.

CONSTRUCTION NEWS

Hynes, Iowa—The Smoky Hollow Coal Co. is sinking a new shaft at Chisholm, Iowa. This will be Mine No. 9.

Peoria, Ill.—It is announced that the Big Creek coal mine plant, recently destroyed by fire, will be rebuilt at once.

Sharon, Penn.—The Shenango Furnace Co., operating three blast furnaces at Sharpsville, has acquired recently considerably more land near its property. This is taken as further proof that a big coking plant is to be erected soon.

Bluefield, W. Va.—The new all-steel coal tipple which the Jewell Ridge Coal Corporation, of Richlands, is erecting at the head of Big Creek, is expected to be complete about Sept. 1. This is one of the most modern and uptodate coal mine equipments in the Clinch Valley district.

Stone, Ky.—Colonel L. E. Tierney, of the Tierney Mining Co. at Stone, Ky., has awarded to the Link Belt Co. of Philadelphia, the contract for a complete tipple equipment and retarding conveyor. This equipment is especially complete in all respects and practically every combination of the various coals as well as the separate sizes can be produced.

Cordova, Ala.—The Oak Leaf Coal Co., began grading on Aug. 18 a three-quarter mile extension of track preparatory to making two new openings into the main body of its coal. The two openings will be on either side of the valley, and connected by a twin tipple. It is believed that this work can be sufficiently completed to run coal from both openings by the first of the coming year.

Weyanoke, W. Va.—The Weyanoke Coal & Coke Co. is putting in the concrete foundation for a new tipple. This tipple, which is to have a capacity of 1500 tons per day, is to take the place of the present structure, which is no longer able to handle the increasing tonnage. This coal company has 1150 acres of land in Mercer County on the famous Pocahontas No. 3 seam, which so far as developed in this property averages 4½ ft. in thickness.

NEW INCORPORATIONS

Pittsburgh, Penn.—The Pennsy Coal Co. and the Buckingham Coal Mining Co., of Franklin, Penn., have been consolidated into one organization, known as the Pennsy Coal Co.

Chicago, Ill.—The Illinois Commercial & Mining Co. has been recently organized to deal in coal, coke and other products. The incorporators are Geo. J. Clare, Edward Corlet, and others.

Chicago, Ill.—The Middle States Coal & Coke Co. has been organized with a capital stock of $10,000 to engage in the mining and sale of coal. The incorporators are Geo. N. Beek, Wm. G. Beek, and F. D. Brenner.

Indianapolis, Ind.—The Otter Valley Coal Co. has been organized with a capital stock of $100,000 to mine and sell coal, and other minerals. The directors are Wm. B. Smith, Wm. E. Lenton, and Lauren A. Hilligoss.

INDUSTRIAL NEWS

Hobson, Ohio—The Calvin-Essex Coal Co. has just closed a contract with the Roberts & Schaefer Co. for equipment for a 200-ton per day modern tipple, which will be immediately built at Hobson.

Philadelphia, Penn.—The Lehigh Coal & Navigation Co., which operates canals in eastern Pennsylvania in connection with its coal properties, anticipates the purchase of 21 steel canal boats. These will be about 90 ft. long and will weigh 70 to 75 tons each.

Kempton, W. Va.—The Davis Coal & Coke Co. plans to open a new mine at Kempton and equip it for a daily capacity of 1500 tons. The development will include the construction of a mining town and a ¾-mile branch railroad from the Western Maryland, from Henry to Kempton.

Uniontown, Penn.—George F. Titlow, of this place made a profit of $50,000 on a coal deal recently consummated. A tract of land, which consists of 261 acres on Roberts Run in Wayne Township lying in Greene County was purchased by Titlow eleven years ago for $13,500 and sold for $65,000.

Connellsville, Penn.—Fire on the night of Aug. 20 did some slight damage to the coal tipple in the Baltimore & Ohio yards. It first started about nine o'clock and was supposedly extinguished, but revived again about eleven, when the city department was called out. The damage done was not great.

Camden, Ark.—Dr. George W. Kimball, of Chicago, who discovered the vast lignite and clay deposits in this county, is erecting a factory in the suburbs of this city for the manufacture of byproducts from the lignite. Among these byproducts are a fireproofing fluid, a strong creosote oil, a high grade of carbon, and a number of medicinal chemicals.

Patton, Penn.—Interest surrounds the activity of the Manor Real Estate and Trust Co., which has taken an option on a 400 acre tract of coal extending from Patton to Frugality. The tract is situated in the Beaver Run field which has been the bone of contention for a long time between the New York Central and Pennsylvania R.R. Both roads have easy access to this district by the construction of short spurs of track.

Washington, Penn.—A miner charged with changing coal checks in the Marianna mine of the Pittsburgh-Buffalo Co., recently had the unusual experience of having the presiding judge in his trial act as his attorney. The foreigner had no counsel. No attorneys were present in the court room and the judge stated he would act not only as judge but counsel for the miner. The Court cross-examined witnesses, and after hearing the evidence the jury acquitted the defendent but placed half the costs upon him.

Connellsville, Penn.—The Interstate Commerce Commission has issued a second supplemental order in connection with the decision of May 29, in the case of the Connellsville Coke Producers Association against the Baltimore and Ohio and other roads. The decision is modified to the extent that it relieves the Baltimore and Ohio and the Erie from maintaining a rate of $2.30 a ton on coke from the Connellsville region to Newark, by way of Mount Jewett, and leaves in effect the old rate of $2.35 a ton.

Morgantown, W. Va.—The Morgantown & Kingwood R.R. has closed a deal by which it has leased from the Central Iron & Steel Co. 40 big steel hoppers for use in transporting both coal and coke. These cars have been delivered at the company's Sabreton shop and are now being restenciled with the railroad name. The cars are of extra large size, and will be a material addition to the road's rolling stock. The leasing of extra cars was made necessary by the increase in output of the Elkins mine, the company shipping a considerable amount of coal to the East.

Bremerton, Wash.—Tests of Alaska coal are to be conducted abroad the armored cruiser "Maryland." If the results prove that the Alaskan coal is of a steaming quality sufficient for the needs of the navy it will result in the saving of hundreds of thousands of dollars every year. At the present time, coal used in the boats on Pacific waters is shipped around Cape Horn from Norfolk, Va. The supply for the tests has been obtained, and the coal is available at Controller Bay. This coal, which is now being tested, was mined in the Bering River coalfield, brought on sleds over snow and ice to Bering River, where it was transported to the coast on light barges. The mining was done under the direction of experts from the Bureau of Mines.

COAL TRADE REVIEWS

GENERAL REVIEW

Hard coal uniformly dull except for water shipment out of New York Harbor. Some storing and no immediate improvement anticipated. Bituminous quiet but showing no weakness. Heavy production being well absorbed. Increased pressure for coal from the Northwest. Prices firm.

The demand for water shipments of hard coal out of New York harbor is the only active branch of the anthracite trade. Down East points, particularly those where navigation closes, are taking all the possible coal they can get. Otherwise the trade is dormant and orders are difficult to obtain. Some of the smaller sizes are going into storage, including pea, although indications are that there will be a severe shortage of this latter grade within sixty days.

The abnormal tension in the bituminous market has been materially relieved, although no important weakness has developed except possibly on occasional odd tonnages of the off qualities. The export business is falling off, but coastwise shipments are heavy and the West Virginia coals are moving forward in a good volume. Most of these tonnages are applied on contracts, but some companies are actively seeking an outlet for odd lots of prompt coal and as a result the demand has slacked off. Vessel tonnage is scarce, due to the continued heavy movement of anthracite. Prices are holding up well, particularly on the better grades, which are showing a stiffening tendency, but there is rather less inquiry than has prevailed.

Increased pressure for coal, due to the heavy demand from the lakes, has been the feature of the Pittsburgh market. Prompt tonnages can be obtained only at a substantial premium, and there appears to be little available even then. The car and labor shortage are steadily becoming more severe, and as a result the market is maintaining its full strength without any difficulty. Loading at the Ohio docks is up to full capacity, and both the steam and domestic grades are strong. Quotations have stiffened up still further on reports of a further tightening in the car situation, the inadequate supply of which is also interferring with the lake shipping to some extent.

The movement of coal through Hampton Roads has been heavy, but prices continue firm at the previous level with some agencies still short. There has been a large demand from the foreign trade and also in the New England markets. The railroads in the South are storing heavily in anticipation of an acute car shortage, the situation already being so tight that production is seriously curtailed. The demand for both steam and domestic fuels is excellent, and prices as a whole are entirely satisfactory. Business in the Middle Western markets is improving generally, and prices are better maintained. The car shortage, which had a noticeably stimulating effect upon the market is materially improved, but still rather severe. The September circular will probably show some further advances.

BOSTON, MASS.

Hampton Roads coals easy at the season price, but no prospects of any concessions. Consumers are taking tonnage liberally and will continue doing so until stocks reach the maximum. Little interest in spot coal. Pennsylvania grades less firm and Georges Creek in better supply. Anthracite market in good shape; another "advance" rumored.

Bituminous—Aside from small local labor troubles in the New River district the situation is generally easy with regard to supplies for September. The West Virginia coals are coming forward in such volume that the demand for other grades is beginning to slacken. Several shippers are actively seeking business for spot coal but buyers are rather slow responding. With the market so quiet it is hard, in late August, to get up much enthusiasm and when the $2.85 figure is considered over against the $2.70 of a year ago the operating and selling interests have much to be thankful for in the course of the season's business thus far.

There are few weak places in the price situation; while now and then are heard rumors of 5c. less than the contract price for Pocahontas and New River, they are usually traced to the less favorably known operations, and sales have been made within a week at $2.90 f.o.b. Receipts at this end continue heavy but with not as much effect on car prices as was looked for. So far most of the tonnage has been applied to contracts and no doubt will continue so until stocks are well beyond what New England manufacturers have come to regard the safe point, which means the utmost they can store. That keeps the larger agencies well supplied with orders for some weeks to come and close observers will be much surprised if they are not enabled to go through the next two months with $2.85 a reasonably firm price.

Georges Creek shipments to tide have been heavier the past week than at any time this year and the sales offices are quietly looking over the market to see where it shall go. One of the factors in placing this grade as well as those from Pennsylvania is the unexpected dearth of barges for Philadelphia loading. The demand for anthracite keeps up so well that almost no water transportation is being released to the bituminous trade, and that acts as a setback to shipments of those coals to this market.

Prices on the Pennsylvania varieties continue firm but with rather less inquiry than a week ago. Quotations on all grades are somewhat off but operators still profess to be apprehensive over labor and car shortage during late fall and winter. All-rail the trade is brisking up a little and the outlook for September is favorable.

Anthracite—The companies appear to have ample business in hand for current output and the Eastern ports that close to navigation in late November are showing a renewed interest in getting supplies forward. The steam sizes are also in good request and the trade as a whole seems in excellent shape. There are rumors once more of an advance in the company barge rate from New York to Boston points. For 15 years or more this has been fixed at 50@55c., depending on the loading port, and if this charge is increased it will be still another of the many "lifts" the New England trade has had to meet the last few years. It will be interesting to see how this phase develops.

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River

NEW YORK

Soft coal dull but not weak. Some large railroad contracts pending. Production heavy. Demand for water shipments out of New York Harbor the only active branch in hard coal.

Bituminous—The softening tendency noted in our last report still continues, although without having developed any direct weakness. Consumption continues large, the demand heavy and operators generally are pushed to meet their contract obligations. The market is temporarily dull but not weak. Several important railroad contracts involving large tonnages are still pending and continue to be one of the principal features in maintaining the market; indications point to the railroads being important buyers in the spot market, as has been the case during the past few years.

There is not much coal at tide and business there is also slow. In the line trade orders are coming in more freely. Car supply as a rule is fairly good, only occasional shortages being reported at some sections on the Pennsylvania R.R. The insufficiency of miners is one of the greatest uncertainties in the market at the present time. Not only are men scarce and difficult to obtain, but production has been further restricted by a seemingly unprecedented succession of holidays, such as "Old Home Week," Labor Day and religious holidays, not to mention countless picnics, county fairs, etc.

Production is up to full rated capacity with the exception of some small tonnages which the producers have refused to place in the contract market, keeping these free for use in the spot market during the winter activity; such tonnages are necessarily difficult to move at present and require a certain restriction in production. We now quote the New York soft-coal market on the following basis:

West Virginia steam, $2.60@2.65, fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85;

best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—The trade locally is dormant, there being little activity in anything except stove, the demand for which is only moderately good. Mines are only working four to five days a week and it is a question at the present moment when the situation will improve, but certainly not before there is some evidence of cold weather. The consumption is not sufficient to absorb the production and orders are difficult to obtain, particularly by those agencies who are charging the new Pennsylvania State tax on hard coal. Pea and buckwheat are going into stock, but it is expected that the winter will see pea one of the short, if not the shortest sizes.

One of the most encouraging conditions in the local hard-coal market is the heavy demand for all grades from down East points. Shipments in that direction are running well ahead of last year, for this same period, but this does not give a consistent comparison for the reason that shipments were light last year, due to the strike. However it is indicitative of a heavy shipment into that section. In anticipation of the suspension the first part of next week, due to Labor Day, the mines will probably be pushed for a little larger production, than has been the case for several weeks past, when it was found necessary to restrict the output.

We quote the New York market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken..............	$4.90	$4.90	$4.85	$4.85
Egg.................	5.15	4.95@5.15	5.10	4.90@5.10

Rice................	2.25	2.25	1.95@2.20	1.70@2.20
Barley..............	1.75	1.75	1.70	1.30@1.70

BALTIMORE, MD.

Export business has fallen off, but coastwise charters are numerous. Slack and coke both show advances, and the rest of market is holding firm. Car shortage becoming more acute. New mines to begin shipping soon.

That August will show a decline in the amount of export business seems undoubted, as the past two weeks has seen a considerable let up in the number of charters announced for foreign delivery. On the other hand, the domestic coastwise trade is in excellent shape and all the piers here have been busy with loadings both north and south. Charters announced the past week for the coast trade include a number to Boston and other points Northeast while Southern charters are principally to Savannah, Galveston and Port Tampa. There has been some talk that the drop in export figures is attributed largely to the unsettled state of affairs in Mexico, which may have curtailed the coal movement in that direction.

The principal features of the local market for the week have been slack and coke, both of which have strengthened. Slack was selling at the mines easily at from 80 to 85c. West Virginia coke, under an increasing demand, has risen to from $2.20 to $2.50, and Connellsville grades are quoted at from $2.40 to $2.65. The balance of the coal market has held firm, and, indeed, some of the better grades are scarcer than ever. A growing car scarcity has not been conducive to an easy supply. While there have been days when cars were fairly plentiful, there were also periods when few, if any, were delivered.

That the producing end is satisfied that good times are ahead is shown by the rapid opening of new properties. Following the announcement that Hite and Rafette will open a new mine in West Virginia on the line of the Western Maryland R.R., comes the statement that the Elkhorn Fuel Co. leases will begin first shipments from the Kentucky properties of that corporation within the coming month.

Anthracite business is slowly showing increased signs of activity. There is plenty on hand of all grades, however, and the main business just now is in rounding out affairs for the fall trade.

PITTSBURGH, PENN.

Mines working at full capacity, with fair supply of labor and cars but fears of car shortage later. Hardly any free coal available, and then only at premiums. Slack output well absorbed. Slight flurry in Connellsville coke quotations, market righting itself later. Production and shipments slightly increased.

Bituminous—The pressure upon the mines has slightly increased, the Northwest apparently being ready to take all the coal that can possibly be shipped. Car shortage has also increased, and while no serious difficulty is expected it is recognized that the capacity of the railroads will be tested throughout the next two months. Labor supply is fairly good, and Pittsburgh district mines are working practically at capacity, and turning out very close to the maximum tonnages ever reached.

Free coal can be secured only in exceptional cases, and on a few divisions, commanding substantial premiums in such cases, while contracts cannot be closed at regular prices except for shipment beginning not earlier than Nov. 15 or Dec. 1. Slack is usually bringing the full season price, concessions being light and obtainable only on a few divisions. We continue to quote regular prices as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55 per ton at mine, Pittsburgh district.

Connellsville Coke—A little flurry was caused early in the week by a prominent merchant firm offering furnace coke for spot shipment at various prices from $2.40 down to $2.25, presumably with a difference in quality. This was in a market of no absorbing power, and it appears that none was sold. Later demand appeared and the best that could be done was $2.50, which was paid on about 2000 tons for shipment over the balance of the month, so that the market is regarded as well established as at any time.

The next demand of importance will be for September, from a few furnaces not already covered, and there seems to be little question that this will be covered at the full price. In view of the further declining tendency of prices in the steel industry, making improbable any important advance in pig iron, a fresh question is raised as to whether the $2.50 price on Connellsville furnace coke can be indefinitely maintained. We quote: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $3; contract foundry, $3, per ton at ovens.

Production in the Connellsville and lower Connellsville region in the week ended Aug. 16, as reported by the "Courier," was 398,617 tons, an increase of 3792 tons. Figures for recent weeks have shown a slight progressive increase, though blast furnace operations have been on the decline. The coke rate is now only some 25,000 tons below the average rate in the earlier months of the year.

BUFFALO, N. Y.

The unusual strength in bituminous continues unabated. Car and labor shortage the two worst features of the market. Prices firm with occasional premiums offered. Heavy shipments of hard coal up the Lakes.

Bituminous—The market shows undiminished strength with many sales being made at a premium which is an unusual condition at this time of year and is accounted for mostly by the heavy lake business. Were it not for the scarcity of miners the operators would have little to complain of, but coupled with the large demand there is also a curtailment of output. Advertising for men and solicitation in the labor markets, generally meets with little success. More is being heard right along of a scarcity of cars, especially gondolas. The railroads are cautioning their patrons to keep cars moving and not to use them for storage purposes. The outlook is for a tie-up of motive power and equipment this winter and a consequent difficulty in moving coal. From now until the arrival of cold weather an increasing car shortage is looked for. From the extent of contracting during the summer, it is apparent that buyers wish to be sure of coal this fall and winter.

Bituminous prices remain strong and sometimes reach a premium, the quotations being as follows: Pittsburgh lump, $2.90; three-quarter, $2.80; mine-run, $2.65; slack, $2.15; with Allegheny Valley about 15c. lower.

Coke—The coke market is firm, with a somewhat better demand on account of the starting up of furnaces. Nevertheless, the trade cannot be called active in this territory. Quotations remain on the basis of $2.65 for best Connellsville foundry.

Anthracite—There is only the usual quiet midsummer trade in hard coal. Retailers apparently will not buy in any quantity until the weather becomes colder. Their supplies continue fair, but with the approach of chilly weather there will no doubt be the sharp demand that is almost always present. The main outlet for coal is up the lakes and that trade is continuing on a large scale. August is likely to run almost equal to the unprecedented figures of July, and may possibly exceed them. For the past week the shipments dropped off as compared with the previous week, but at the same time the total was large, amounting to 158,000 tons.

TOLEDO, OHIO

Loading docks for Lake coal being worked up to full capacity. Car supply fair so far. Domestic trade good. Prices strong and will probably increase as the season advances.

The coal trade continues active in Toledo especially at the docks where machinery and men are having difficulty in taking care of cargoes. During the week just past 154,590 tons of coal passed through. Thus far in the month of August more than 700,000 tons of coal were sent to the uplake ports from Toledo. The demand for steam coal continues undiminished and Pocahontas is also very strong and is improving steadily.

The traffic situation here is the best and no complaints of car shortages have been heard although railroads are occasionally asking dealers to take hopper cars. This is only in occasional instances, however, and has not by any means become general. Toledo dealers are somewhat opposed to the hopper cars as they are not equipped for unloading this class of cars and find themselves at a disadvantage. Rumors of car shortages are heard now and then from the north but have not as yet reached an acute stage even there. Toledo is exceptionally well equipped for taking care of traffic which will in a measure off-set the difficulties attendant upon a Michigan car shortage.

Work is being pushed on the new Hocking docks and it is confidently expected that this mammoth piece of construction will be finished by the opening of navigation next season, to the great advantage of Toledo. The domestic trade here is good for this season of the year. There are still occasional cars of coal being sold here at concessions from the list but this is invariably coal on track being moved to avoid demurrage and left on dealers' hands through some unforeseen mishap. Prices are being well maintained and dealers are all confident that coal will be even stronger later in the season, than now.

Prices as quoted on this market follow:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.60	$2.50	$1.75	$2.50	$1.35	$1.
Egg	2.25	1.20	2.50	1.50	2.50	....	....
Nut	1.80	1.20	2.25	1.50	2.50	....	....
$\frac{7}{8}$ lump	....	1.35	....	....	....	1.20	1.20
Mine-run	1.50	1.10	....	....	....	1.10	1.10
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

The car shortage has appeared and production is restricted. Prices well maintained and the tendency is upward. A new circular effective Sept. 1 shows advances in all grades.

The coal trade in Ohio during the past week has been at the mercy of the car supply to a large degree. As a result of a worse condition in that respect, strong quotations prevailed in every grade. The demand ruled good and taking it all in all the tone of the market was excellent.

The lack of cars was most noticeable in the Eastern Ohio field where the B. & O. and other roads have had trouble to keep mines in operation. It is estimated that the output in that district was 65% of normal. In the Pomeroy Bend district the car shortage was also bad and the production was considerably curtailed. In the Hocking Valley the output was about 75% of the average and the same percentage prevailed in the domestic fields.

The Lake trade is still active, although somewhat hampered by the car shortage. The demand for tonnage from the Northwest continues good and activity is expected to prevail right up to the close of navigation. Boats are still being chartered for September and October.

Domestic business is increasing in volume although the weather has not been the most favorable. Dealers are trying to accumulate stocks to guard against a car shortage. Consumers are ordering steadily and retailers are busy making deliveries. Operators are not inclined to book orders for domestic grades to be delivered in the future and the result is that all dealers are buying a great deal in the open market. Retail prices are strong and at a level higher than last year at this time.

Steam trade is also active and manufacturing establishments are consuming a large tonnage; in fact there appears to be an increase in their requisitions. Iron and steel concerns especially are good purchasers of steam tonnage while railroads are using a great deal of fuel to move the freight of the country. Steam contracts, when they expire, are being renewed at a higher figure than last year.

A new circular, effective Sept. 1, will advance domestic lump to $1.75 and three-quarter inch to $1.60. Mine-run in the Hocking Valley and Pomeroy Bend will be $1.40.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburg	Pomeroy	Kanawha
Domestic lump	$1.70 @ 1.65	....	$1.70 @ 1.65	$1.70 @ 1.65
3-4 inch	1.55 @ 1.50	$1.30 @ 1.25	1.45 @ 1.40	1.50 @ 1.40
Nut	1.30 @ 1.20	....	1.35 @ 1.30	....
Mine-run	1.35 @ 1.25	1.20 @ 1.15	1.30 @ 1.25	1.20 @ 1.25
Nut, pea and slack	0.70 @ 0.65	....	0.70 @ 0.65	0.65 @ 0.70
Coarse slack	0.60 @ 0.55	0.75 @ 0.70	0.60 @ 0.55	0.55 @ 0.50

HAMPTON ROADS, VA.

Coastwise and foreign shipments fair. Prices firm with a normal accumulation of coal at Tidewater.

Shipments from Hampton Roads during the past week have been fairly heavy. Some large cargoes have moved to the New England market as well as to foreign ports. Prices for New England and foreign shipments have ranged from $2.85 to $2.95 and even $3 has been asked by some of the suppliers, but so far as can be ascertained there have been no sales at this latter figure. Quite a number of the agencies are still short of coal and are only taking care of contract business.

There has been a fair demand from inland buyers for Pocahontas and New River coals, but little inquiry for gas splint, etc. In addition to coastwise and foreign cargoes loaded from Hampton Roads the U. S. Collier "Brutus" took a cargo of 4000 tons from Sewalls Point for use on the various vessels of the Atlantic Fleet.

LOUISVILLE, KY.

Almost a typical fall market already. Car shortage becoming more pronounced daily. Operators conservative on future business. Strike rumors also influencing the situation.

With the demand for coal steadily increasing and the supplies as consistently decreasing, the local market resembles conditions in December rather than the last of August. Normally at this time of the year the car supply is plentiful and the operators experience no difficulty in producing more than sufficient coal to meet all requirements, but now the car shortage is reaching serious proportions which, together with other difficulties, is making it difficult for the producers to meet the demand, with the result that the situation is already moderately tight.

The shortage of equipment is becoming more pronounced almost daily. There are already rumors of embargos being declared against Chicago and other Northern points, due to the difficulty in getting cars returned. There has been a heavy movement in that direction this summer and there is already a noticeable shortage of rolling stock. The situation is being further aggravated by the absolute refusal of many consignees to accept the new hopper bottom cars of the L. & N. R.R.; the tipple equipment at many of the mines is also not adapted to loading these cars. It is estimated that there are 2000 more local cars in the Northwest than last year, and that this, together with the general dissatisfaction with the new hopper-bottom equipment, accounts for the tight situation, and indications are that it will become steadily worse as the season advances.

Persistent rumors regarding the possibility of a strike in the eastern Kentucky field are also having an important bearing on the situation. Operators in that section are inclined to take a conservative attitude toward future commitments and are generally refusing to accept orders for the September delivery. The difficulty may reach a climax at any time or may drag on until winter, when the situation would be even more acute than at present. Organization among the miners there has heretofore met with prompt action by the operators, but it is understood that the unions are bringing more than ordinary pressure to bear in this instance.

Steam coal is probably the strongest branch in the local market while prices generally are at about the same level, 90c. being the prevailing quotation on Straight Creek, nut and slack, which is rather scarce; in western Kentucky nut and slack sells easily at from 50 to 55 cents.

DETROIT, MICH.

Market strong in every particular. Car shortage having a sharply stimulating effect on the situation. September circular will probably show some advances.

Bituminous—Both domestic and steam business have been active during the past week and the outlook for the future continues as encouraging as ever. The principal difficulty facing the producers at the moment is the impending car shortage which is, however, being anticipated in every way possible.

The steam consumption continues heavy, railroads requiring a large tonnage in order to take care of the excessive freight movement and manufacturing establishments are showing no disposition to decrease their demand. The steam trade is undoubtedly the strong feature in the local situation and the indications are that it will continue so indefinitely. The domestic business is also good, the large retail dealers ordering heavily in order to replenish their stocks; because of the heavy demand from their customers these are seriously depleted in many instances and in addition to this the dealers are anxious to anticipate the probable car shortage as much as possible. Prices for September delivery have not yet been arranged and there is some uncertainty over business for that month. It is believed that a slight advance on the domestic grades will become effective Sept. 1. The Lake business continues as active as ever.

The local soft-coal market is quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	$1.75	....	....	$2.75	$2.50
Egg...........	1.65	....	1.75	....	....	2.75	2.50
Steam lump....	1.50	....	....	....	....	....	....
-in. lump......	1.25	$1.25	1.25	$1.25	$1.25	....	....
Mine-run.......	1.15	1.15	1.15	1.15	1.15	1.50	....
Slack..........	0.90	0.90	0.65	0.70	0.70	....	....

Anthracite—While apparently dull and featureless on the surface there are many indications of strong latent possibilities in the hard-coal market. Quotations on all grades are holding firmly at the circular with premiums of 25c. being demanded on some sizes. The indications are that the market will be firm throughout the season with the possible exception of a few isolated cases where some independent coal has accumulated.

BIRMINGHAM, ALA.

Demand good for all grades. Prices holding up well. Car shortage still handicapping operators, with no prospects of improvement. Pig iron firm with slightly better sales.

The operators in this district report that the demand for both steam and lump coal is exceptionally good, and that the prices are entirely satisfactory for this season of the year. As is generally the case, the higher grade coals, both steam and domestic, feel a depression less than the lower grades, but due to the fact that several of the railroads are storing a large quantity of fuel in anticipation of a serious car shortage this fall and winter, even the lower grade coals are moving as rapidly as cars can be obtained. The Louisville & Nashville R.R. is supplying their mines with cars exceptionally well, but the 'Frisco, Illinois Central, Queen & Crescent and Southern Railway are seriously affected, mines on their lines running only about one-half time. The railroads are holding out no hopes for a better car supply, and are sending out letters of warning to all shippers and consumers asking that they coöperate in loading and unloading all cars as fast as possible.

There is practically no change in the coke market over last week, either furnace or foundry. Sales of pig iron are slightly larger this week, with prices about the same, or possibly a shade better.

ST. LOUIS, MO.

Market advancing and coal moving freely with a good demand. Shortage of cars will have a steadying influence from this time on. Standard coals weak. No demand for anthracite, smokeless or coke.

Conditions are continuing to get better locally, and business in the country is exceptionally good. Prices on all coals, excepting Standard, are advancing and things are looking better for the operator. The Standard market, however, is dragging because of the overproduction. The future does not look exceptionally good for the Standard field, but other than that everything indicates high prices and a good demand.

The car shortage is not as pronounced this week as last, the mines getting not less than three days and in many instances four days. As usual, the coals with a trade name are bringing a premium of from 10 to 15c. a ton. There is absolutely no demand for smokeless, and very little coming in. The falling off is accounted for largely by the cheapness of anthracite, of which there is an abundance. The same applies to coke.,

PORTLAND, ORE.

Some notes on the appearance of Coos Bay coal in the Pacific Coast markets.

The Southern Pacific interests announce that, their main source of immediate revenue from freight hauled over the railroad being built from Eugene to Coos Bay will be from coal. It is stated that the railroad company will put in large bunkers at the principal cities and towns in Oregon to be supplied with Coos Bay. Coal for Eugene, Salem, Roseburg, Medford and other Oregon towns is supplied from Wyoming and Utah mines and as a result it retails at from $10 to $14 a ton. Coos Bay coal can be sold for much less.

PRODUCTION AND TRANSPORTATION STATISTICS

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for July and first seven months of this year and last year in short tons:

	July 1913	July 1912	Seven Months 1913	Seven Months 1912
Anthracite................	719,944	952,741	6,138,175	5,525,010

FOREIGN MARKETS

GERMANY

The following is a comparative statement of production for June and the first half of this year and last year:

	June		Half-year	
	1912	1913	1912	1913
Coal	13,888,848	15,929,858	84,706,380	93,577,987
Lignite	6,217,498	6,858,699	39,480,142	41,900,158
Coke	2,315,126	2,610,818	13,454,682	15,944,237
Coal briquettes	426,025	490,067	2,488,763	2,878,665
Lignite ditto	1,508,075	1,727,160	9,123,691	10,303,617

Production, Consumption, Imports and Exports for the half year were as follows:

	Coal		Lignite	
	1912	1913	1912	1913
Output	84,706,380	93,577,987	39,480,142	41,800,158
Imports*	4,553,826	5,364,127	3,685,486	3, 601 407
Exports*	19,176,907	21,836,212	584,553	998,034
Consumption	70,083,299	77,105,902	42,531,075	44,503,531

* Including coal the equivalent of coke and briquettes.

BELGIUM

The following is a comparative statement of the Belgium production for the first six months of the last two years:

Hainaut:	1913	1912
Couchant de Mons	2,147,000	1,782,820
Centre	1,691,030	1,648,730
Charleroi	4,001,800	4,227,270
Liege:		
Liege-Seraing	2,396,420	2,471,510
Plateau de Herve	582,500	602,780
Namur	402,800	402,180
Totals	11,221,550	11,135,290

GREAT BRITAIN

Aug. 15—Work has not yet been fully resumed in the coalfields and supplies are limited for prompt loading. In consequence prices are firm. There is a fair enquiry for forward loading. Quotations are approximately as follows:

Best Welsh steam	$4.98@5.04	Best Monmouthshires	$4.20@4.26
Best seconds	4.74@4.86	Seconds	4.02@4.08
Seconds	4.62@4.74	Best Cardiff smalls	2.70@2.82
Best dry coals	4.32@4.56	Seconds	2.46@2.58

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending Aug. 23:

No Important Dividends were announced during the week.

COAL FREIGHT DECISIONS

Suspension Docket No. 181—Rates from West Virginia and Kentucky to points in Wisconsin.

Soft coal originating on the lines of certain of the defendant carriers and destined to points beyond Milwaukee, Manitowoc and Kewaunee, Wis., has, for 10 or more years, moved over the across-lake routes to those points at the Chicago rates. By the tariffs under suspension the carriers undertook to close certain of the routes and cancel the rates applicable to them because of a failure to arrive at agreements following a demand on the part of the delivering carrier for an increase in its division; **Held**, That the suspended tariffs must be withdrawn and the present routes kept open. An advance of 10 cents per ton in the rates is permitted. **Opinion No. 2335.**

I. C. C. No. 4773—Montana Railroad Commissioners vs. Denver & Rio Grande R.R.

Rate of $5 per ton charged by defendants prior to Dec. 27, 1911, for transportation of coal in carloads from Sunnyside, Utah, to Helena, Mont., not shown to have been unreasonable. Increase of 10c. per ton in the rate as of the date mentioned found not justified by defendants and therefore unreasonable. **Opinion No. 4377.**

I. C. C. No. 3811—Consolidated Fuel Co. (Utah) vs. Atchison, Topeka & Santa Fe Ry.

1. The Denver & Rio Grande Ry. Co. in competing commercially in interstate coal markets, through the operations of a coal company owned by it, not only violates the commodities clause of the act, but is guilty of an unjust rate discrimination against the complainants, in that the group rates apply only from its junction with the industrial lines of the complainants, while they are applicable directly from its own mines on its own branch lines, the latter being operated under general conditions substantially similar to those surrounding the operation of the industrial lines of the complainants.
2. Without entering an order, several forms of relief which the complainants may have under the circumstances of the case are indicated on the report, and the tariffs in question are required promptly to be adjusted in one form or the other, the rate situation as readjusted to be maintained so long as the Denver & Rio Grande competes commercially in interstate markets with the complainants.

400 H. P. Westinghouse Motor for Driving Mine Hoist.

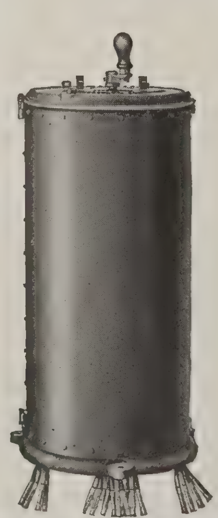
Westinghouse Motors for Mine Hoists

are made to withstand, without injury, the heaviest overloads encountered in normal service. They have been designed with the knowledge that any accident to the hoisting equipment will not only halt production until service is re-established but may also cause damage of the most serious nature.

Special attention has been paid to protecting these motors against the racking vibration of gears. The brackets are heavy and massive, the bearings large in area, and the shafts are extra large in diameter, and made of axle steel, the best material to withstand severe stresses.

Westinghouse Electric & Mfg. Company

East Pittsburgh, Pa.



Westinghouse Controllers for mine hoist motors can be furnished in several types to meet various requirements. Selection of the most suitable type for a given installation will be made upon request.

VOLUME 4 SEPTEMBER 6, 1913 NUMBER 10

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 331

Presents a rather new idea in the matter of producing a clean grade of coal. The suggestion is made that it is better to have competent mining men make a careful examination of the seam and then determine what the approximate saving would be if the miners were to produce clean coal. Then divide this saving by two and increase the digging price per ton, by that amount. COAL AGE, Vol. 4.

IDEAS AND SUGGESTIONS: *Pages* 332-333

Facts about Gas Poisoning. By L. K. Hirshberg—Holding Men.

*THE ATLAS CO.'S PLANT AT BURGETTSTOWN, PENN.: *Pages* 334-337

The first of two articles on this interesting plant. It is one of the newest operations in Pennsylvania and the equipment is modern in every respect. This installment takes up the general conditions prevailing in the field and outlines the schemes of operation. Lee Llewellyn. COAL AGE, Vol. 4.

WASTE HEAT LOSSES IN THE CONNELLSVILLE REGION: *Page* 337

*COAL SHIPPING ON THE GREAT LAKES: *Pages* 338-342

This installment takes up the situation at the head of the Lakes. The "Twin Harbors" last year handled some 40 million tons of freight, or more than the total foreign commerce cleared from the six leading Atlantic ports. Coal shipments for the current year will approximate 10 million tons. The docks are equipped with the most elaborate unloading machinery in the world, in addition to which there are large cleaning, screening and briquetting plants. I. C. Cuvellier. COAL AGE, Vol. 4.

POWER DEPARTMENT: *Pages* 345-346

*A MODERN COMPRESSOR PLANT:
Where the underground conditions preclude the employment of electricity, compressed air is the next best medium of power transmission. The plant here described is a representative of a good type of compressor installation. Frank H. Kneeland. COAL AGE, Vol. 4.

EDITORIALS: *Pages* 347-348

Asepsis in the Mine—Summer Boiler Complaints—First-Aid Demerits—Building Activity in Coalfields.

LEGAL DEPARTMENT: *Page* 349

VALIDITY OF COAL-TRADE NAMES:
A name which describes the character of coal or the district in which it is produced cannot be regarded as a private designation applicable only to the coal produced by the firm using that name. A. L. H. Street. COAL AGE, Vol. 4.

How Advertising Has Become A Necessity

The Weekly Ad-Talk Page

A very curious case came to our attention the other day. It was so unusual that we believe you, too, will be greatly interested in it.

A few years ago *Rubifoam* was a national tooth wash. Our sisters, our cousins and our aunts used it. It was sold practically all over the country. And the girl with the *Rubifoam* smile was as well known as—well, say as well known as a Vice-Presidential nominee before his election.

But suddenly this girl disappeared. Her dazzling smile no longer lighted up magazine pages, glorified billboards, burst forth from newspapers. Rubifoam was no longer advertised.

A coterie of advertising men got together and decided to go after the manufacturer of Rubifoam and find out the why and wherefore of Miss Rubifoam's retirement.

This manufacturer lived up in New England.

"What's the matter—lost your nerve; didn't the advertising pay you?" asked the advertising men when at last they confronted the manufacturer.

He shook his head, smiled. "Yes, it paid me. I believe in it—thoroughly."

Naturally his questioners were dumbfounded. "Well, what—"

"You see, gentlemen, it's this way." I've built up this business entirely by myself. I have no one to whom to leave it. I have no idea how it would be managed after my death—no idea as to whether the standard of the product would be kept up. I want to guard against its deterioration. So I've simply let the advertising drop and the business is slowly dying. I figure by the time I'm ready to pass in my checks the business will be about finished, too."

The advertising men, when they had sufficiently recovered from their astonishment, told him it was his duty to the community to continue advertising, that he was throwing his employees out of work and tried a host of similar arguments. But the manufacturer refused to give up his peculier views regarding the matter.

It would cause an earthquake like a hundred panics combined if all advertisers should suddenly make a decision similar to this which the manufacturer of Rubifoam made.

Imagine the quandry you'd be in. Where would you buy the things that are absolutely essential to you?

There was a time when man was almost entirely independent of other men.

He tilled his own ground (or rather his wife did), raised the vegetables and fruits he needed and killed the meat and clothed himself with the skins of the animals he killed.

But year after year, century after century, that kind of independence has slowly gone. Modern man is dependent upon his fellow men.

Like a huge net this dependence of ours upon each other stretches through the fabric of life.

Today we look to others for the bed we lie in, the house we live in, the clothes we wear, even the food we eat. Others look to us for that one small thing which is our product.

New York City, shut off from its food supplies, would have a starving population within 48 hours.

Advertising is the means by which men offer their product to as many other men as possible—hundreds of men, thousands of men where before they could only reach individuals.

Advertising enables men who manufacture the machinery you use to come direct to you with their product no matter where you are.

The advertisers, of course, depend upon you but you also depend upon the advertisers.

Think about it as you read over the Selling Section this week.

COAL AGE

ol. 4 NEW YORK, SEPTEMBER 6, 1913 No. 10

Everyone must admit that the miner at e working face, in most mines, can load ean coal if he wants to. It is true that in any seams, this would require great care on e part of the miner, and would reduce his ssible tonnage earnings considerably, but e fact still remains that he *could* load clean al, if he so desired.

Now, that being the case, why shouldn't e see to it that he does load clean coal?

"We try to do that very thing;" says one perintendent, "but we have about decided give it up as a bad job." When you hear man talk that way, you may depend upon that he has centered all of his activities on dockage system, and in the end he has nd that the tighter he draws the deduction les, the dirtier his coal becomes.

In contrast to that man's method, let us amine another operator's system: When s manager found that his markets were dually slipping away from him, because of ty coal, he began to install various menical devices. His product began to prove somewhat, but his working capital ldenly threatened to disappear altogether, l he realized that if the mechanical pickers uired further nursing, it would soon be up his creditors to furnish the nurse.

Then the thought suddenly came to him, t he had begun his experiment at the ng end. He immediately employed several scientious inspectors, and with them he de a careful study of conditions inside the e.

hey found that with very little extra rt the miners could load clean coal. Then they calculated the loss, due to the fact that the coal was not being properly loaded. They considered: (1) interest on special equipment (pickers, separators, etc.); (2) wages of picker boys; (3) reduced price of the coal due to the excess dirt that it contained, in spite of all the mechanical equipment; (4) losses due to coal absolutely rejected after shipment. They divided this total loss by two, and made the miners a proposition to increase their digging price per ton by that amount, if they would agree to clean the coal. The miners jumped at it, *and they loaded clean coal.*

We realize that this is a broad question. In many seams, it might be cheaper to load dirty coal, and depend upon mechanical devices or washers to clean the product, rather than pay the increased mining rate that would be required. But even under such conditions, proper supervision at the working face will work wonders.

Investigations as to what constitutes reasonably clean coal in any seam are only successfully handled by practical men, and herein probably lies the explanation for the scarcity of such investigations.

Managers whose experience had its beginning in the engineering department, are easily interested in mechanical devices of all descriptions (the improvements in coal washers, screens, picking tables, etc., worked out by these men during the past few years, are truly remarkable), but the possibilities for improving conditions by instructing men, are often unappreciated by them—"More's the pity."

IDEAS AND SUGGESTIONS

Facts about Gas Poisoning

By L. K. Hirshberg*

Dr. Morris Fishbein, of Chicago, recently, while testing the blood of a man fatally poisoned by the inhalation of illuminating gas, studied the effect of formaldehyde on the carbon monoxide. By the use of chemical examinations, as well as the spectroscope, he investigated the blood of individuals poisoned and afterward embalmed in formalin, normal blood, normal blood in which formalin was present, and normal blood through which gas was passed, and the blood of tissues suspected to have been killed by carbon-monoxide poisoning.

By boiling blood with CO, it is known that a brick-red mass is formed. Healthy blood becomes brown-black. Formaldehyde in the usual amounts does not interfere with this test. Blood with formaldehyde or carbon monoxide does not clot as readily as normal blood.

Doctor Fishbein found that old spots of suspected blood must be diluted with lots of water to make a fair examination.

Dilution of the blood is advisable in order that a clear spectrum may be observed. Whenever carbon monoxide is present, the spectrum may be observed after a little practice, the presence of small amounts of formaldehyde having no effect. Formaldehyde in larger quantities acts as a reducing substance, and when the quantity of carbon monoxide present is not large, the spectrum of reduced hemoglobin may be found. In the case of normal blood, various quantities of formaldehyde produce the various spectrums of oxyhemoglobin, some of which are distinguishable only with great difficulty from the spectrum of carbon-monoxide blood, until sufficient formaldehyde is added, when the spectrum of reduced hemoglobin is produced.

In view of the fact that formaldehyde was found to modify more or less completely all the chemical tests, and to act as a reducing agent when present in large amounts, so as to interfere also with spectroscopic examinations, it was thought best to make a brief report of these examinations. From Doctor Fishbein's experience with the various tests under these conditions, it would seem that the test, namely, dilution of the blood one part to four parts with water and shaking with three times the volume of 1 per cent. tannic acid, whereby normal blood becomes gray and carbon-monoxide blood remains red, is most reliable and trustworthy in the presence of formaldehyde. In case no formaldehyde is present, the addition of four volumes of lead acetate will be found to yield satisfactory results. Spectroscopic observations are of little value unless preceded by many observations on the various forms of hemoglobin.

Dr. Fishbein records the conditions in the following instances of gas poisoning:

The patient, subjected for several hours after exposure to the action of the pulmotor, which has seemed to be of great efficiency in many cases, remained comatose. (admission to the Cook County Hospital, 12 oz. of blo were withdrawn and intravenous transfusion of saline s lution was made. During a period of four days, norm saline solution by the drop method was given practi ally continuously. The patient remained unconscio throughout. The condition gradually grew worse and died, nearly five days after the exposure to the gas.

Carbon monoxide was demonstrable in the blood the various tests, chemical and spectroscopic. This of special interest in view of the fact that many autho ties hold that carbon-monoxide blood loses its charact istics when exposed to the air, whereas, in this case, it w found even though the person lived five days after moval from the gas. Ordinarily, if the patient lives, t carbon monoxide is eliminated within a few hours, though carbon monoxide in the blood seven days after t exposure to the gas has been mentioned. Few such reported; probably a further study would show many stances of this nature.

⁂

Holding Men

By West Virginia Superintendent

The principal of a preparatory school was receiving his office a call from the father of two boys who had b suspended from school for a short time on account some violation of school discipline. The old gentlem had been a miner for many years, had saved his mon leased a small tract of coal, opened a country ba hired a miner to help him dig, and, from this beginn had hired more men, built shanties, houses and n buildings, installed equipment and prospered.

As is usually the case, having little school traini himself, he was anxious that his boys should become e cated in the shortest possible time, and was much out that there was to be any interruption. He wan the boys cowhided, put on short rations, denied p ileges—any of the list of school punishments save s pension. The principal was firm, or perhaps stubbo and after much argument the father gave up, sayi "Professor, maybe you are right. I don't know nothi about teaching, but in my business I have always made a rule never to give the men nothing they ask for.

"Sometimes they may be reasonable, and then ag they may be unreasonable, but it's all the same, I ne give in to nothing. Sometimes they say the rent is high. Then I say, 'When I built them houses I lef hole in the side to come in by and to go out by, and wh you think the rent ain't right, you can just go out that hole,' and," he concluded, justifying his poli "they all love me like a brother."

This latter statement was more nearly the truth th one might suppose from the outline of his policy, a thereby hangs the reason for this lengthy introducti By loving him like a brother, the old man meant th he had no trouble keeping men, that they were satisf and felt that they were getting a square deal, in other words, having dug coal himself, he anticipated the needs of his employees and was a keen judge of the merits of a "kick." His men undoubtedly liked him, and he held them in his employ.

---

*Baltimore, Md.

Another Type of Manager

There is another type of mine manager who, imagining that all men are "kickers" and that all complaints are alike, attempts to follow the policy of refusing all requests, and does not succeed in getting himself loved like a brother, but loses his men and gets such a reputation for himself that no new men apply.

The next superintendent, hearing him cussed and discussed, sets about correcting the mistake by being so easy that his concessions beget inequalities and make his refusals seem arbitrary and partial. He is beset daily with trivial complaints and ends by losing control of discipline, and is literally "run off the job."

Then comes the "liar." He promises with no intention of fulfilling his word. Possibly he intends to look into complaints and requests, but his intentions are not serious enough to make him remember. Of all types he is the most exasperating. Possibly he makes good a sufficient number of his promises to keep men thinking that perhaps their particular requests may fall under the one sometimes granted, and they hang on for a while.

Some managers of men even advocate the "promise system." They say, "Why, hell, yes, always promise. What is the use of arguing? Agree to everything and then do as you please." Strange to say, once in a long while you will find a man of the Ananias type who is wonderfully successful. He has been so consistent in the failure to fulfill his promises that his men do not expect anything, and take his jovial assurances much as the refusals of the old man whose men loved him like a brother. The secret of his success is the same as in the former case. He is a good judge of a "kick," and knows when a man is working at a disadvantage.

The New Superintendent

Then there is the new superintendent, who imagines he has come to correct the faults of his mine foreman. He begins by granting requests that the mine foreman has refused, and soon he is beseiged with, "My place no cut"; "water in my place"; "no gotta turn"; "driver no good"; "too much push for car"; "all time slate come down"; "no car to clean up my place"; "lika new buddie my place"; "no catch nothing for clay vein"; "short six cars this time"; "right away finish."

If the superintendent is really going to arbitrate these cases, he must have the same means of judging them as has his mine foreman. Possibly the complaints are genuine, and the foreman may, or may not be in touch with the various situations. Anyway, it is taking a long chance for a superintendent to attempt to judge independently. But, if he is a good inside man, he may be invaluable in helping keep a check on the cause of dissatisfaction, and by assuming certain responsibilities, take much worry off of his foreman.

In these days of machine coal, when a miner's kit consists of a pick and shovel, and his family is in the old country, it takes only a shade of difference in management to send him on his way to another mine, and it is not so much the granting of requests and privileges that holds men as it is the maintaining of a condition that does not admit of privilege. The best-paid man on the job quits, not because he is not paid enough, but because someone else has an advantage over him. It may be easier to keep a mine full of diggers where there is a uniformly unfavorable condition than where some of it is good and some bad; nor need this principle be confined to miners alone.

Overcoming Difficulties with Machinery

An agent for a hoist for cars on steep room pushes recently made the statement that the steep push was the greatest hindrance to holding men in the low-vein coal, arguing that his hoist would overcome this difficulty. But there is a question whether the inequality of working conditions brought about by installing a limited number of hoists in steep rooms would not leave the situation the same as before. Of course, we are not talking about the impossible grades. A room with a hoist, if it presented an advantage, would present also an inequality, and the inequality is what makes men refuse to work. We have all had the experience of having a butt of steep rooms worked up until some rooms show a lighter grade, and then it is all off. It is difficult to get the two grades worked side by side.

Some student of economics might say, "Yes, but why not pay a better price for the steeper rooms?" The miner himself knows that it would be harder for him to set a price on a room grade that would make it equal to some other grade than it would be to change the dip of the coal. He might just as well advocate rain for the just and drought for the unjust, or guess at the conditions the next cut will reveal. Probably the best way to make the conditions equal is to drive rooms off along the strike from another room.

Roller-bearing wheels might lighten the push for everyone and would be a distinct advantage for the whole, but it would not adjust the inequality. I am not sure but that if each superintendent and manager knew exactly what salary the other was getting, there might be as great a dearth of material for these positions as exists at the mines presenting unequal working conditions. Men do things because "everybody's doing it." A mine with one rate and equal working conditions would be too good to be true, but to hold men at any given mine, seems to be a question of approaching such an ideal rather than giving fancy prices for bad stuff, wet rates where ditching could be done, and yardage where good service to the miner might make his working condition better.

The old fellow whose miners loved him like a brother may have met this problem in his own crude way, but he held men without handing out a lot of "sugar."

⁂

The points to be considered when laying out a haulage system are: (1) nature of the roof; (2) output per day; (3) grade; (4) number of branch roads and their distance from the shaft; (5) initial expense. Where the roof is good, double tracks are practical, and the endless-rope system gives good results, as there is a constant supply of loaded cars at the shaft bottom and empties in the chambers, which means a large output. This system permits the working of any number of branches together or separately. It can be used where the grade is steep as well as on the level. While the initial cost is high, the long life of the rope, the use of small engines, the low per cent. of accidents, and the increased ventilation tend to render this system efficient, durable and cheap.

The Atlas Co.'s Plant at Burgettstown, Penn

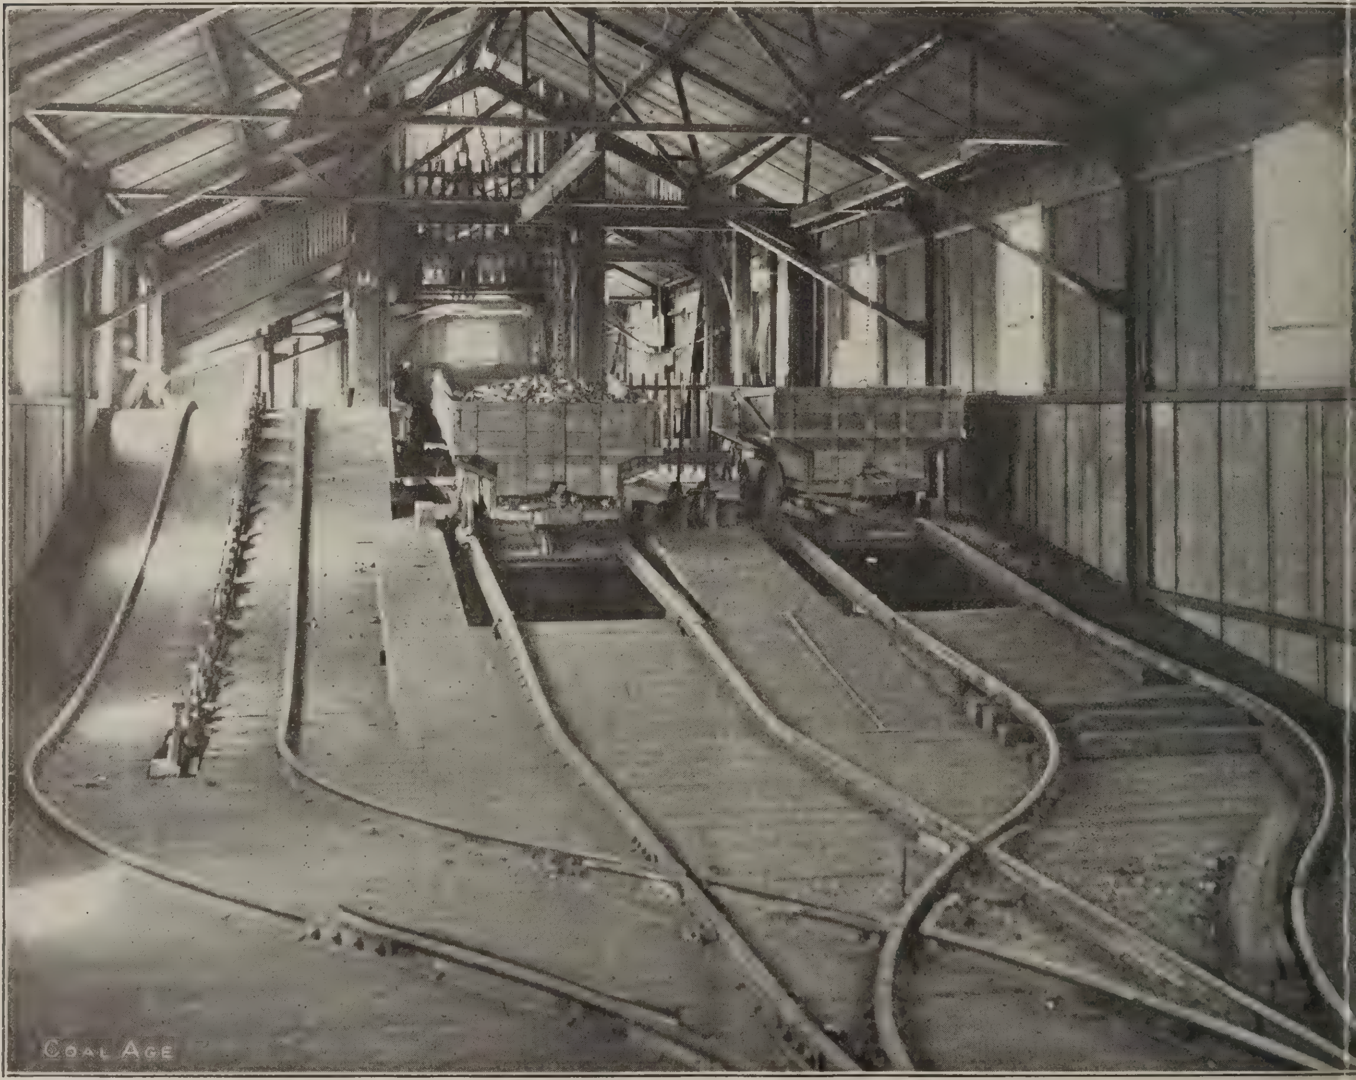
By Lee Llewelyn*

SYNOPSIS—The first of two articles on this interesting plant. It is one of the newest operations in Pennsylvania and the equipment is modern in every respect. This installment takes up the general conditions prevailing in the field and outlines the scheme of operation.

⁂

This operation is located on Raccoon Creek, about four miles from Burgettstown, and has connections with the Pan Handle railroad. The officers are: George Z. Hosack, president; James B. Haines, Jr., vice-president; John A. Bell, Jr., secretary-treasurer; and W. A. McBride, superintendent. The engineers for the company are Smith and Lewis, Oliver Building, Pittsburgh, Penn., who were engineers in charge of the construction of the entire plant.

The company owns 1700 acres of coal and 300 acres of surface, upon which the plant and town are built. The name adopted for the town is Atlasburg. There are two seams of coal. One is the famous Pittsburgh seam, which is from 5 to 6 ft. thick and 270 ft. belo the surface. The other is what is known as a "Rooster seam and is peculiar to that particular field; it is abou 4 ft. thick and lies immediately above the Pittsburg seam, some 4 to 5 ft. of strata intervening. It is th company's intention to work both seams.



View of Dumps and Chain Haul for Returning the Empties

The arrangement is such that one man and a helper can handle the full capacity of 3000 tons per day.

Shafts and Surface Equipment

Both shafts are 12x24 ft., the air shaft being locate 1000 ft. distant from the main shaft. Tracks are pro vided at the main shaft bottom for 200 loads and 20 empties. The cars operate by gravity at this point an require but two men.

The main hoisting engines are two 26x36 in. Vulcan direct connected to 7x9-ft. conical drums. The air-shaf engine is a double 15x24 Vulcan, direct connected to 7-ft. cylindrical drum. The cage operating in the ai shaft is counterweighted and is used for hoisting me and supplies, but coal was hoisted during the constructio of the main tipple.

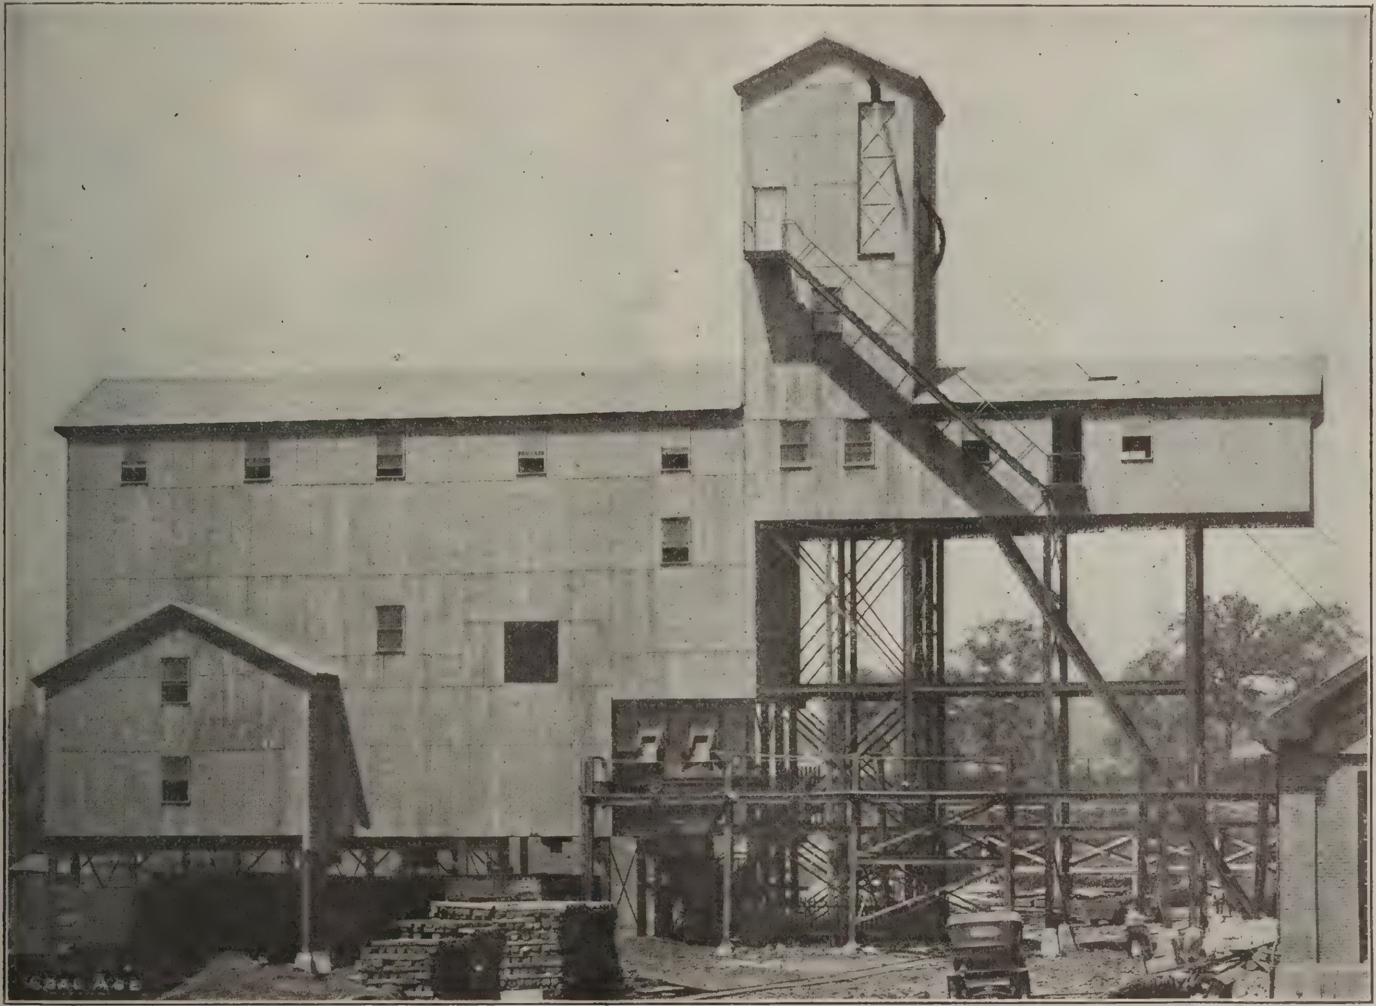
The building housing the power plant is 45x120 ft.

---

*Chief engineer, Pittsburgh Coal Washer Co., Pittsburgh, Penn.

with a partition separating the boiler room from the engine room. It is of brick construction, with concrete floors. The boiler room contains four 300-hp. Erie City watertube boilers, equipped with Jones underfeed stokers, two Epping-Carpenter boiler-feed pumps, and a Hopper's feed-water heater of 2000-hp. capacity. The boilers operate under 150-lb. steam pressure. The engine room contains two 250-275 compound-wound generators of the General Electric make, driven by two 17x24-in. four-valve, Erie City engines.

The shop building is 45x75 ft., of brick construction, and is equipped with forges, hammers, pipe machine, drill presses, etc., for making the necessary repairs.



View of Tipple, Showing Boiler-Coal Bin with Trestle and Electric Larry

Vertical doors in the headframe are to admit the sheaves and large opening in the side of the tipple is for the rock trestle now being constructed.

The mine fan is of the Jeffrey type, 16x5 ft., and driven by two 17x21-in. four-valve Erie City engines, and will have an ultimate capacity of 300,000 cu.ft. of air against a 6-in. water gage when operating at 160 r.p.m.; it is inclosed in a steel, concrete and brick building of pleasing design.

The motors are the General Electric type, equipped with cable and crab reels. Cutting machines are of the chain type and were manufactured by the Goodman Electric Company.

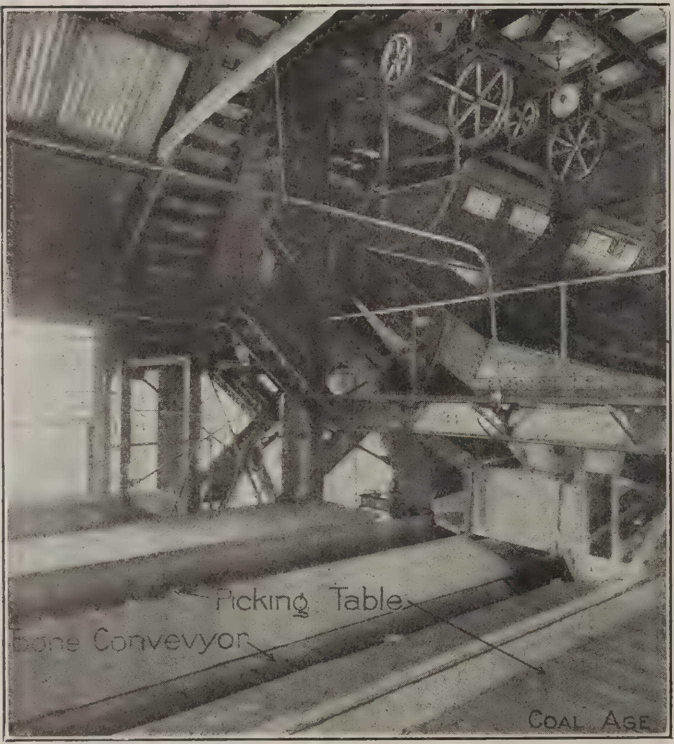
Owing to the advantageous location, and also the great care and expense gone to by the company, the town is one of the most excellent mining towns in the Pittsburgh district. No expense was spared in providing the employees with comfortable homes. The houses are single and of different designs and are located on lots 60x150 ft., with 60 ft. streets. The store building, which is a handsome brick structure, is 45x100 ft. and two stories high. This building also contains the post office and superintendent's offices.

Scheme of Operation

Mine cars of three-ton capacity are hoisted from the coal seam to the tipple floor on platform cages, operating in a two-compartment shaft. The cages are provided with hinged bottoms, which are level while hoisting, but a separate set of landers are provided so that when the cages come to rest the hinged bottom is tilted to such an angle as will allow the loaded car to run off by gravity. The loaded cars gravitate to a Phillips crossover dump, of which there are two placed side by side, and are dumped into one of two sets of gravity-screen rigs. The empty cars pass on over dumps to a kickback and return by gravity, on one side of the tipple, to a chain haul, which elevates them sufficiently to run them to a second kickback behind the hoistways. From this kickback the cars gravitate to spring horns located behind each cageway. When ready to admit the car to the cage the operator presses a foot treadle which releases the horns and the car runs onto the cage for return to the mine.

There are two dumps, two screen rigs, two feeders, and two picking tables, with the dumps setting opposite to each other. The run-of-mine coal is dumped into a chute equipped with a set of standard screen bars having 1¼-in. spaces. The screened coal passes to weigh baskets, where it is weighed and then deposited in a chute common to both weigh baskets, terminating in two hoppers fitted on the bottom with plate feeders for feeding the coal to the two picking tables running parallel to the railroad tracks.

The bone is picked from the coal by pickers walking on the tables, and thrown onto a pan conveyor, located between and running parallel to the two tables, conveyed to the back end of the picking house, and discharged onto a similar conveyor running at right angles, which in turn conveys the material to a roll crusher. The crushed bone is then elevated to a storage bin, from which it is taken by an electric car to the boiler house for use in boilers. The picked coal passes from the picking tables to cars over the special loading chute arranged for loading cars 8 ft., 10 ft. and 11 ft. 6 in. high.



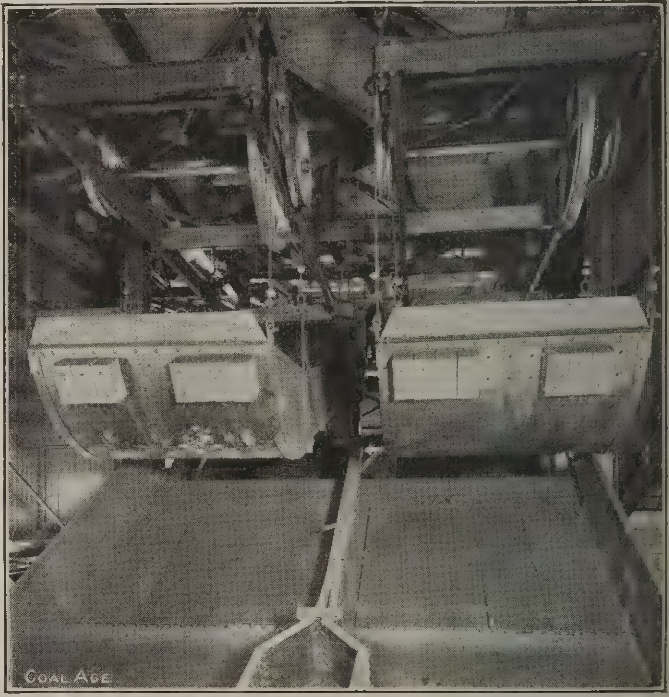
Showing Weigh Baskets, Feeder Hopper, Picking Table and Bone Conveyor

The 1¼-in. screenings from each rig, drop onto a set of nut-bar screens having ¾-in. spaces, where separation into nut and slack takes place. Each product is collected in chutes, common to both screen rigs, and loaded in railroad cars on their respective tracks, the chutes being fitted with proper gates for stopping the flow of coal when shifting cars.

Provision is made for two egg screens in the hopper under the weigh baskets, so 3-in. egg coal may be made on both rigs and loaded on the nut track, separate, or mixed with the nut, or with the nut and slack. The upper end of each slack chute is a short section of perforated screen for taking the real fine dust out of the slack coal. This dust is collected in a chute and passes to a cross-bone conveyor, thence to an elevator leading to the storage bin for boiler-house use.

When desired, the nut coal, or the nut and slack mixed, from either screen rig, may be put on their respective picking tables, producing either ¾-in. lump or run-of-mine, the fine coal being loaded on the tables underneath the lump to facilitate picking. With these screen rigs it is possible to make the following loading combinations:

1 ¾-in. lump on either lump track.
2 1¼-in. lump on either lump track.
3 Run-of-mine on either lump track.
4 Nut on nut track.
5 Nut and slack mixed on nut track.
6 1¼-in. lump on nut track.
7 ¾-in. lump on nut track.
8 Run-of-mine on nut track.
9 Egg on nut track.
10 Special run-of-mine (consisting of egg, nut and slack) on nut track.
11 Nut and egg mixed on nut track.
12 ¾-in. or 1¼-in. slack on slack track.



The Weigh Baskets (with the Egg Screens below) and Chutes to the Feeder Hopper

Of the above combinations, Nos. 6, 7, 8, and 12 may be loaded without operating the picking tables. Provision is made in the upper end of the screen rigs for bypassing room cleanings to the bone conveyor, and rock to the rock bin under the dump, from where it passes to the rock car.

Principal Parts

The principal parts entering into the construction of the tipple and air hoist are as follows:

Two special cages for main tipple.
One counterweighted cage for air hoist.
Four sets of landers for main tipple.
Two sets of landers for air hoist.
Two head sheaves for main tipple.
Two head sheaves for air hoist.
One empty car haul.
One system of tipple tracks.
Two Phillips cross-over dumps.
Two gravity screen rigs.
Two plate feeders.
Two picking tables.
Two bone conveyors.
One bone crusher.
One bone elevator.
One storage bin.
One main headframe and tipple.
One air hoist headframe.
One 3-ton electric traveling car and runway.
Two car-releasing mechanisms for shaft bottom.

The cages are of the platform type and provided with hinged bottoms. They are built to conform to the new mining laws of Pennsylvania and equipped with Lepley's patented steel-wedge safety device with double springs. They have forged-steel rope sockets 16-in. long, forged-steel safety clamps, 1-in. bridle chains, ¾-in. safety chains, and horns to secure the car when hoisting and receive the empty car when caging it. These horns remain in position until released by the operator to allow the loaded car to run off the cage, and then return automatically to their initial position for receiving the empty car. Steel side plates, ¼ in. thick by 4 ft. high, run the full length of the cage. Hand rails are provided on either side and safety chains across both ends. A steel canopy top is provided, with one side hinged to turn up for accommodating long material.

Cages were built by the Connellsville Manufacturing & Mine Supply Co. from plans furnished by the Pittsburgh Coal Washer Co. This same company also furnished the head sheaves, which are 10 ft. in diameter and heavy pattern, bicycle-spoke type, mounted on an 8-in. hammered-steel shaft, supported in heavy cast-iron, babbitted pillow-blocks equipped with adjustable sole plates.

The tipple tracks are constructed of 30-lb. American standard rails and are secured to the 3-in. oak floor by standard railroad spikes. Back of the hoistways a special automatic switch is provided for diverting the empty car to the proper hoist. The empty car going onto the cage sets the switch for the next car.

The dumps are of the Phillips extra heavy crossover type. Special dumping rings are provided for operating the car doors, which are of the lifting type. The rings are operated automatically by the in-going loaded car, thus relieving the dump operator of the extra work of handling them. The car haul is on about 40-ft. centers and consists of a 12-in. pitch steel-link chain, which has cast-steel pivoted dogs inserted in it every 2 ft. for engaging attachments on the bottom of the car.

(To be continued.)

⁂

Waste-Heat Losses in the Connellsville Region

E. W. Parker, statistician of the U. S. Geolo. Survey, has compiled the following* interesting memorandum concerning waste-heat losses in the Connellsville region:

The production of coke in the Connellsville and Lower Connellsville districts of Pennsylvania in 1911 amounted to 16,919,749 short tons, to produce which in retort ovens would require about 9300 such ovens. These operated as "waste-heat" ovens would produce approximately 180,000 boiler horsepower per hour.

Through the courtesy of the late R. N. Durborow, general superintendent of motive power of the Pennsylvania R.R. Co., the writer has received estimates of the quantity of drawbar horsepower developed by some of the locomotives of that company during 1910. Mr. Durborow states that it required about 32,358 drawbar horsepower as the average during the month of March, 1911, to haul the freight trains over the portion of the Pennsylvania system between Pittsburgh and Harrisburg. For the passenger trains 9762 drawbar horsepower is required, the total drawbar horsepower developed per day being 42,120. The efficiency of transmission from the power house to substations on the line would be about 82 per cent. for the distance between Pittsburgh and Harrisburg, and for 42,000 drawbar horsepower. The efficiency of the distributing system between the substations and the locomotives would be about 85 per cent., and the efficiency of the locomotive itself would be about 75 per cent. The power that would reach the drawbar of the locomotive and thus be available for a train would, therefore, be about 52.3 per cent., this being the product of 82 by 85 by 75 per cent. Assuming, therefore, that 42,000 drawbar horsepower is 52.3 per cent. of the power-plant horsepower, sufficient to move the traffic, 80,000 hp. would be required at the power house.

HORSEPOWER DEVELOPED BY DIFFERENT CLASSES OF LOCOMOTIVES

Mr. Durborow was kind enough to submit the following tables, giving the estimates of the horsepower developed by the different classes of locomotives, hauling freight and passenger trains, during the month of March, 1911, from which the foregoing estimates have been deduced:

FREIGHT TRAINS, MONTH OF MARCH, 1911

No. of trains per month	Average running time (hours)	Locomotive class	Average horsepower.	Total horsepower hours per month of 31 days
Altoona and Harrisburg, eastbound:				
686, slow	10.80	H-8	650	4,815,720
439, preferred	8.85	H-6	600	2,331,090
Altoona and Harrisburg, westbound:				
608, slow	11.36	H-8	650	4,489,472
393, preferred	8.35	H-6	600	1,968,930
Altoona and Pittsburgh, west and eastbound—all freight trains:				
1851	8.76	H-6	600	9,728,856
130	8.76	H-8	650	740,220
Total trains 4107	....	....	...	24,074,288

744 hours in 31 days; $\frac{24,074,288}{744}$ = 32,358 horsepower required any instant.

PASSENGER TRAINS, MONTH OF MARCH, 1911

Altoona and Harrisburg, east and westbound:				
1777		3.03	E	2,423,828
	533		3.03	K
533	3.03	K	630	1,066,000
Altoona and Pittsburgh, east and westbound:				
1247	3.30	K	660	2,715,966
712	3.30	E	450	1,057,320
Total trains, 4269	....	....	...	7,263,114

$\frac{7,263,114}{744}$ = 9762 horsepower required at any instant.

From the foregoing it appears that the quantity of power which might be obtained from the coking operations in the Connellsville and Lower Connellsville districts by substituting nonrecovery retort ovens for the beehive ovens would be more than twice the quantity of power necessary to move every train on the Pennsylvania R.R. between Pittsburgh and Harrisburgh.

This estimate is, of course, roughly calculated as the efficiency of a power plant will range from one-half horsepower per boiler horsepower in a small simple noncondensing engine to three horsepower in the best compound-condensing engines. The power used on the railroad is not uniform, the rate of fuel consumption varying during all hours of the day and from day to day. Moreover, the conversion of boiler horsepower per oven into dynamometer (drawbar) horsepower may differ considerably in practice, but, allowing for all possible errors and variations, the enormous waste of energy now obtaining in the coking districts of Pennsylvania is glaringly apparent.

Coal Shipping on the Great Lakes

By I. C. Cuvellier*

SYNOPSIS—This installment takes up the situation at the Head of the Lakes. The "Twin Harbors" last year handled some 40 million tons of freight, or more than the total foreign commerce cleared from the six leading Atlantic ports. Coal shipments for the current year will approximate 10 million tons. The docks are equipped with the most elaborate unloading machinery in the world, in addition to which there are large cleaning, screening and briquetting plants.

⁂

Duluth is a city crowding the 100,000 mark and stretching for twenty-five miles along the rugged, rock-bound coast of the Head of the Lakes. Shipping during the season of 1912 aggregated 41,474,776 tons of freight, 8,585,039 tons being coal, enough to fill an order of 161,000 cars placed end to end, making a train 1900 miles long, or long enough to reach from Duluth to Portland, Oregon.

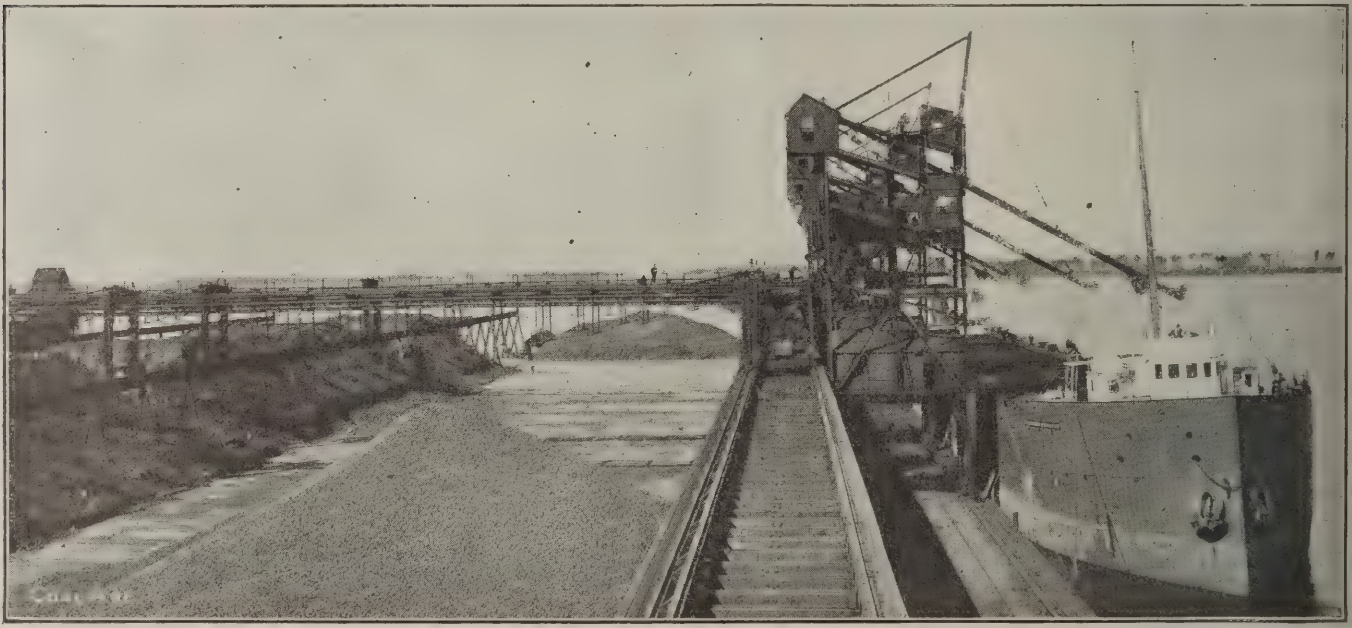
Inseparably connected with Duluth, is the thriving city of Superior on the opposite side of the harbor. It is not at all disparaging to Duluth to say that Superior receives the larger amount of coal. A glance at the contour of the harbor, as can be seen by the accompanying map, shows the confluence of the St. Louis River with the Duluth side of the harbor forms what is known as Connor's Point, all of which is on the Superior side and extends into the bay proper, forming a most advantageous location for coal docks. Here are located many of the large coal-handling plants.

Natural-Harbor Advantages

There are harbor advantages here not enjoyed by any other port. Large vessels must necessarily seek freight where they can be accommodated and operated economically. At either entrance to the Twin Ports the largest steamers can enter, dock, unload and depart under their own steam and without the use of tugs, which in many other ports forms a heavy item of expense.

With the modern coal-handling equipment in use, unloading is done here with the maximum dispatch, the boats then passing directly to some one of the mammoth ore docks or grain elevators and taking on a fresh load. This situation always insures a line of the best and fastest vessels plying on the Great Lakes. The immense freight carriers, some of them as long as two ordinary city blocks, push their way through the channel entrance and land at some ore or coal dock without ceremony. It takes but a half hour to accomplish this and almost immediately the process of loading or unloading begins.

A further study of the accompanying map indicates again how wisely nature had provided for this harbor. Stretching from the Duluth shore to the Superior side the sharp end of the Lake is cut off by a natural breakwater. This is a sand bar of sufficient width and heighth to make a more effective breakwater than could possibly be constructed by artificial means.



Unloading and Storage Plant of the Northwestern Fuel Co., at Superior, Wis.

The docks located on the Superior side of the harbor received last year, from May to December, 5,680,288 tons of coal out of a total of 8,585,039 tons received at the Twin Ports. During the 235 days' open season in 1912, the net registered tonnage entering and clearing the Superior Harbor exceeded that in the foreign commerce of the ports of New York, Philadelphia, Baltimore, New Orleans, Boston and Charleston all combined.

Lake Shipping in the Early Days

In 1855, the date of the opening of the Soo Canal, the records show 1414 tons of coal passed through the canal that year, shipped in small lots, most of it going

Map of Superior-Duluth (Twin Harbors) at the Head of the Lakes

to the copper country in upper Michigan. Not until 1871 was coal handled as a commercial enterprise from lower Lake Ports to the Head of the Lakes.

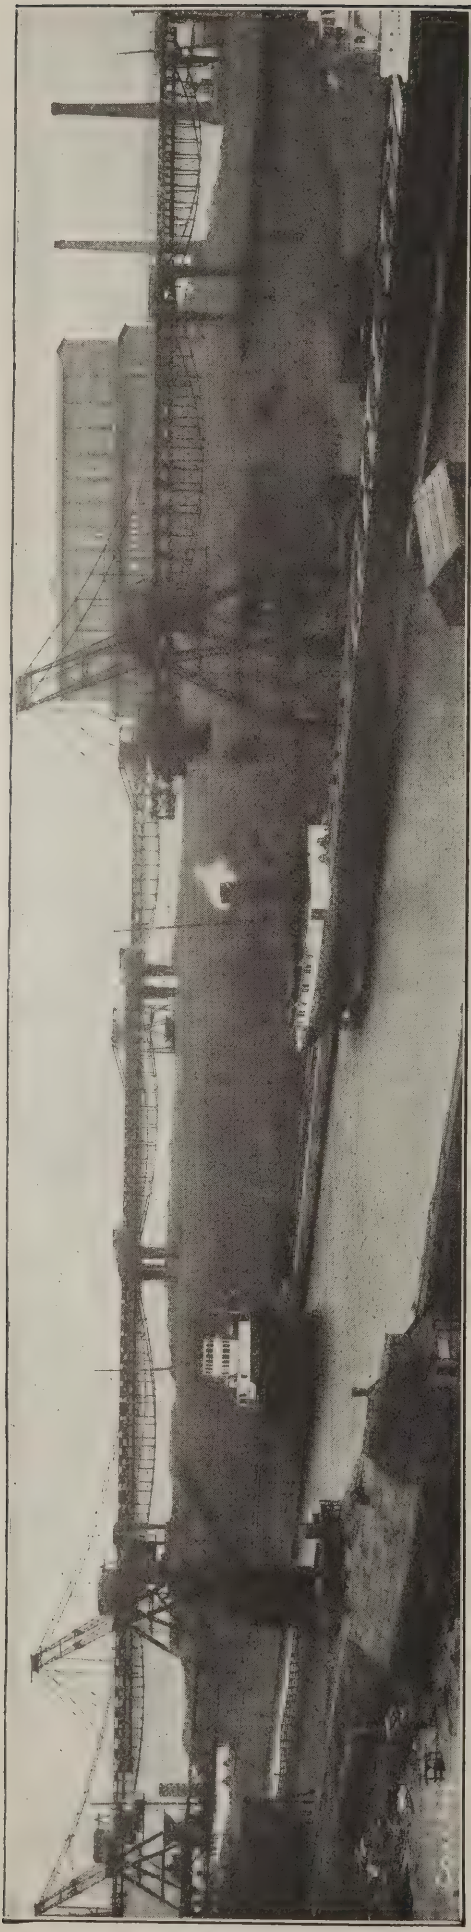
In that year, the late E. N. Saunders, the pioneer of the coal industry in the Northwest, unloaded at Duluth about 3000 tons. Connected with him was the present well known railroad magnate, James J. Hill. It is interesting to note that at that time all the coal handled came up the Lakes in boats of from 300 to 500 tons carrying capacity, and the machinery provided for handling these cargoes was most primitive in character when compared with that in use at the present time.

The leading dock men expect that about 10,000,000 tons of coal will be brought by vessel and distributed over the Head of the Lakes during the season of 1913. This tonnage will be transported in vessels carrying 8,000 to 14,000 tons each, and with present unloading facilities, the largest cargoes can be discharged in from 12 to 24 hr. At one of the new modern docks, three of the largest vessels can be unloaded at the same time, the machinery being capable of taking the coal out of the boats and storing it on the dock at the rate of 2000 tons per hour. The record cargo last season was the "Wm. P. Snyder, Jr.," which contained 12,664 tons.

The Northwestern Fuel Co.'s Dock

There has just been completed on dock No. 1 of the North Western Fuel Co., the largest handling bridge in the world. This mammoth piece of work is the most modern device there is in the line of coal dock equipment. Docks planned and completed only three or four years ago, are already out of date. The length of this wonderful piece of mechanism is 755 ft. over all, length of span 551 ft., height from floor to top of truss, 131 ft. and the total weight, 3,000,000 lb. The bridge is supported by an inverted pier at one end and the shear leg at the other, thus taking up the least possible space. The entire structure is mounted on wheels which are driven by electric motors by which means the bridge is moved at the rate of about 200 ft. per minute, while traveling from hatch to hatch of a boat being unloaded, or from one point to another on the dock when loading the coal into cars.

The most modern type of man-trolley electrically operated and equipped, with complete air system for braking, will operate on the bridge, using a specially designed bucket for digging the coal out of the hold of the vessel and another for scraping it together in a pile and cleaning up the bottom of the hold.



Pittsburgh Coal Co.'s No. 7 Dock at Duluth, Equipped with Brownhoist Machinery

The digging bucket is of the clam-shell type and has a spread of 24 ft., while the clean-up bucket has a spread of 27 ft. The huge clam shell raises 10 tons of coal each trip and places it in the stock pile. In the early days this used to be considered a big car load. Heretofore six tons has been the limit of clam-shell capacity on the docks. This clam shell stands 17 ft. high, and four men standing on top of one another just reach the top. With this equipment the dock can unload a 10,000-ton cargo in 18 to 20 hr., which formerly would take 40 hours.

In the accompanying illustration is shown the coal-handling equipment of the Northwestern Fuel Co., installed several years ago by the Brown Hoisting Machinery Co.

As will be noted the equipment consists of four fast unloaders, three bridge tramways, and two electric-transfer carriages. The coal is unloaded from the vessels by means of grab buckets from which it is dumped into the hoppers on the piers. The pier spans two railroad tracks so that the coal may be either loaded directly from the hopper into railroad cars beneath, or into self-dumping tubs located on the transfer carriages. Each one of the bridge tramways consists of three spans covering the entire storage yard, and they are all equipped with a man trolley fitted with a 4-ton shovel bucket which is used in reloading the coal.

The self-dumping tub is picked up by means of the man trolley and conveyed to the desired place in the storage yard, where the coal is held for future shipment. The fast plants, transfer carriages and bridge tramways are all electrically operated and self-propelled along their respective tracks.

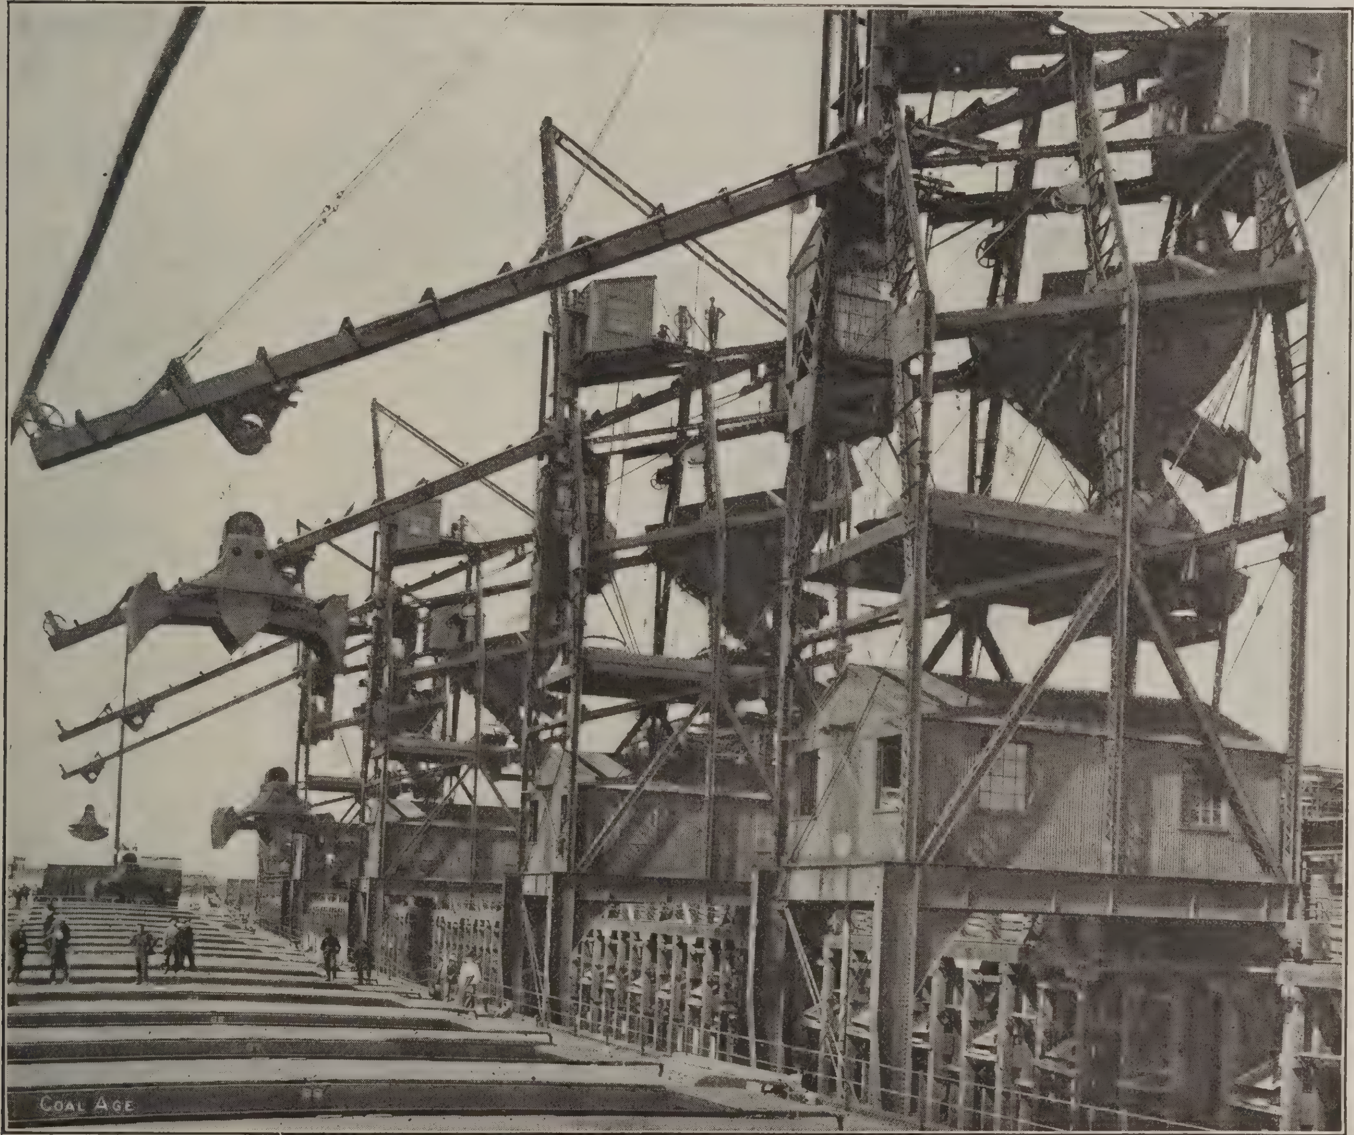
Growth of the Lake Shipping

A glance backward over the tonnage handled in former years indicates a healthy increasing demand year by year. The records show receipts of both anthracite and bituminous at the Duluth-Superior docks as follows:

1909	5,662,707
1910	8,171,644
1911	8,434,905
1912	8,585,039

It is estimated by those intimately acquainted with coal distribution in the Northwestern territory that there is a yearly increasing demand of about 10 per cent. On the basis of last year's receipts this would mean a tonnage for 1913 of approximately 10,000,000 tons. With the improvements completed and under way, dock storage will be close to 10,000,000 tons, which means a possible handling capacity of over 15,000,000 tons. During the active season, much of the coal does not go into the stock pile; after unloading from the boat it passes through the screening operation and direct to cars for shipment to dealers' bins in the country. When there is a large tonnage going to the storage bins of the trade in the early part of the fall, when cars are plentiful, it gives the docks a chance to bring up a sufficient supply and store it for the heavy demand during the close of navigation.

Until about five years ago, the distributors of coal from the Head of the Lakes were the Northwestern Fuel Co., the Pittsburgh Coal Co., the Lehigh Valley Coal Sales Co., the Philadelphia & Reading Coal & Iron Co., the Zenith Furnace Co., the M. A. Hanna Coal Co., the Northern Coal & Dock Co., and the St. Paul & Western Coal Co., distributors of Sunday Creek Hocking. Practically all of these have rebuilt their docks and put on modern handling equipment and substantially increased their handling capacity. Others have come in with modern dock facilities, such as the Berwind Fuel Co., making a specialty of Pocahontas Smokeless; the Carnegie Fuel Co. have also made rapid strides, having recently completed a large modern structure, and the latest addition is the fine new dock of the Island Creek Coal Sales Co., which is devoted exclusively to their product.



Brownhoist Unloading Apparatus on the Northwestern Fuel Co.'s Dock at Superior, Wis.

Briquetting and Variety of Coal Handled

The Stott Briquette Co. about five years ago started manufacturing anthracite screenings into merchantable briquettes, while the Berwind Fuel Co. has been successfully operating a large briquette plant, using their smokeless screenings. They are now putting up a duplicate of their briquetting plant. Other dock companies operating here are the Great Lakes Coal & Dock Co., who are about to make extensive improvements, the C. Riess Coal Co., of Sheboygan, Wis., operating a chain of docks along Lakes Superior and Michigan, and the Clarkson Coal & Dock Co., who operate a dock at Ashland, Wis.

Formerly, the principal soft coals handled were Ohio Hocking and Youghiogheny, but now the West Virginia smokeless and splint coals form a large percentage of the tonnage, and of late years a strong demand has come for the high-grade coals from Kentucky-Tennessee, and large quantities of these are stored on the docks regularly. Ohio Hocking still has a firm hold on the consumer. It has been a popular domestic coal for many years, and in spite of the crowding in of others, the yearly tonnage holds about the same.

The territory reached from the Head of the Lakes is commonly designated as dock territory, reaching into the upper part of Wisconsin, all of Minnesota, northern Iowa, northwestern Nebraska, South Dakota, North Dakota and Montana. More dock coal from the Head of the Lakes is going into the Canadian Northwest every year. There is a point, however, where rates on dock coal equalize with all-rail coals from Illinois, Indiana and Kentucky, and below an imaginary line where that division occurs, competition between dock coal and all-rail coal is always keen.

Preparation of the coals has developed in the West to such an extent that often the best preparation is the deciding point. The better grades of Illinois coals obtained a foothold in dock territory solely on their excellent preparation. Dock men at one time never thought of giving their soft coal any sizing or screening, but they finally had to come to it, and today all modern docks are equipped with expensive screening plants and are effecting a splendid preparation.

RAILROAD FACILITIES

No port has better railroad facilities for the distribution of the coal tonnage handled over the docks than Duluth. The vast amount of ore, grain and merchandise brought here to be transhipped by water insures a steady and abundant car supply. The grain fields of Minnesota, South Dakota, North Dakota and Montana practically empty their entire harvests into the Head of the Lakes elevators during September, October, November and December at a rate that taxes all the railroads having their terminus at the Twin Ports. This brings a stream of cars loaded with grain to Duluth-Superior and when emptied they are switched to the docks for loading with coal and within a day are back on their way to the interior.

The Northern Pacific, the Great Northern, the Soo and the Omaha have all greatly improved their terminal facilities and are as much interested in keeping transportation from becoming congested as the dock companies. Since the congestion several years ago, there has been no serious blockade or car shortage. There need not be any if the buyer will do his part in ordering supplies forward in the early summer. If, however, ordering by the country trade is delayed until late fall, the handling of the immense tonnage during the three months time becomes a physical impossibility.

(*To be Continued*)

⁂

Wyoming Coal Production in 1912

The coal production of Wyoming in 1912, according to E. W. Parker, of the U. S. Geological Survey, amounted to 7,368,124 short tons valued at $11,648,088, an increase of 623,260 short tons in quantity and $1,139,225 in value over the figures for 1911. With the single exception of the year 1910, the output of 1912 was the largest in the history of the state. In 1910, however, conditions were abnormal, a shortage of fuel caused by a six months' strike among the coal miners in the central and southwestern states having caused an unusual demand upon the coal-producing districts of the Rocky Mountain states. The production in 1911, while less than that in 1910, showed a normal gain over 1909, and that of 1912 exhibited a normal increase over 1911.

The region supplied by Wyoming coal was blessed with bountiful crops in 1912 and the metallurgical and other industries were in a prosperous condition, which was reflected not only in the increase in production over 1911, but in an advance in the average price per ton from $1.55 to $1.58.

Coal mining in Wyoming gave employment to 8036 men for an average of 238 days in 1912, against 7924 men for an average of 230 days in 1911. The labor efficiency in Wyoming is among the highest in the country, usually showing an average production per man per year of over 900 tons. In 1912, this average was 917. According to the United States Bureau of Mines, there were 34 deaths by accident in the coal mines of Wyoming during 1912, an increase of one over 1911.

Probably more than half of the entire area of Wyoming is coal bearing. Coal is believed to exist in every county of the state, although in some portions it lies under so heavy a cover as to be unworkable under present conditions. The reserves are estimated at approximately 424 billion short tons, a supply exceeding that of any other state, with the possible exception of North Dakota. The coals of North Dakota, however, are almost entirely lignite, with a small amount of sub-bituminous, whereas those of Wyoming range from sub-bituminous to medium-grade bituminous. Some of the Wyoming coals go to markets as far distant as the Pacific Coast.

The coalfields of Wyoming are numerous; some of them are large and contain many beds, some of which are very thick. One bed in the southwestern part of the state is about 90 ft. in thickness; the largest coalfield is the Powder River field in the northeastern part of the state. At least 11,000 of the 15,000 sq.m. contained in this area are underlain by coal beds of known workable thickness.

OUTCROPPINGS

Most great edifices are supported by stones hidden in the ground.

⁂

Nothing astonishes men so much as common sense and plain dealing.

⁂

A newspaper in a Mississippi valley town recently printed the following concerning a possible coal development in that vicinity:

> About 19 years ago, Mr. ———— was digging a well on his farm when he struck the coal vein at a depth of about 40 ft. He at once had competent chemists examine the coal, and they stated that it would take about 20 years from that time for the coal to be in condition to mine profitably, as it was then in the process of making a paying vein.
>
> Mr. ———— is now an old man, and he says that he has waited 19 years and believes that it is time for him to again investigate the matter, etc.

As authorities agree that it has taken many thousands of years to form our present coal measures the "competent chemists" above mentioned must have been highly desirous of allowing Mother Nature to put the last finishing touches upon that particular deposit.

⁂

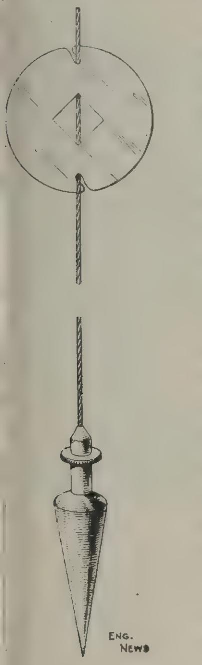
It is not exactly good taste for a paper to blow its own horn. If a journal is accomplishing something, others will soon find it out, and the good deeds will forthwith be heralded broadcast. However, the following letter from J. W. Bischoff of the Davis Colliery Co., in West Virginia may carry a suggestion to other mine managers and superintendents in various fields:

> Am inclosing you copy of letter sent from this office. We have, for some time, been greatly interested and pleased with the sentiments expressed in your forewords along the line indicated in that of June 21.
>
> Believe that too little attention has been paid to the "Human Element" by those having to deal with it. We ourselves have made a study of this and have tried to impress our ideas in our own weak way upon our associates, and feel encouraged that such a medium as "Coal Age" has seen fit to take the matter up.
>
> We are sure you are doing mining interests an almost inestimable favor by treating these subjects in the way you do.

The above is only one of numerous letters received by "Coal Age," and all going to prove that coal men are as human as any other class of individuals in any other industry. The pages in "Coal Age" devoted to the "human side" of mining have proved a great success, and if we are to believe our friends, this class of literature has been both interesting and beneficial.

A Plumb-Line Target

As a rule, suggestions from engineers in other branches, n methods in underground surveying, are usually somehing old to the colliery engineer, or embody some unractical refinement that will not stand the test of hard, practical usage. However, the *Engineering News* has come forward with a simple device, which should be of value in underground work. It is described as follows:



The accompanying illustration is self-explanatory. The target is made of white celluloid. It is of convenient size to carry in the pocket and is readily attached or detached to the plumb-bob line by slots shown in the illustration. It is claimed to be most appreciated when sighting in dark or shady places, or toward dusk when the light is failing. In such cases a match held behind the cut in the target will enable the transitman to quickly locate the plumb line. It is also claimed to be particularly serviceable where the background is dark as is the case of grass or foliage. The only possible objection we can see to its use is the resistance it would offer in a breeze and hence make it more difficult to center the bob. This device is alled the "Fulton" pocket target and is made and sold y Kolesch & Co., 138 Fulton St., New York City. The rice is 35c. each, or $3.50 per dozen.

⁂

Mine Inspection in Arkansas

Following are copies of letters, recently sent out, by Iine Inspector Thomas H. Shaw, to the mine owners and perators, and to members of the U. M. W. A., in Arkansas, in an earnest endeavor to secure their coöperation or the betterment of mining conditions in the state:

To Mine Owners and Operators

Gentlemen: I am anxious to bring about an improvement f coal mining in this state; I feel both miner and operator vill coöperate with me, and realize that my intentions are to ring about safer conditions under which coal will be mined. therefore respectfully call your attention to the following onditions which I find to be the most common causes of anger.

Ventilation—Under Acts 1905, Act No. 225, you are reuired to furnish 200 cubic feet of air to the working face. Our Supreme Court has passed on this question in the 75 rkansas, p. 76.) To comply with this, you will have to gure the amount of air consumed by various sources; for nstance, it is estimated each mule will consume 500 cubic eet. Figure your air supply accordingly. Air must be conucted to the working face.

Entries, Air Courses and Crosscuts—Article 7, Act 225 eads as follows: "Two entries, parallel with each other, must e driven for the ingress and egress of the air, and crosscuts ust be made at intervals not to exceed 40 ft. apart. Where as exists, they shall be driven 30 ft. apart, or a crosscut e made at any other place ordered by the management to o so. No room shall be turned inside the last crosscut."

Refuge Holes and Dusty Entries—Section 5534 of Kirby's igest requires refuge holes to be made not more than 30 t. apart. Dusty entries must be cleaned up and sprinkled.

Escapement Shaft—Must be kept in good repair and steps igged with banisters.

Duty of Miners—Miners must make entries, air crosses, nd crosscuts not less than 7 ft. wide. And must burn pure ard oil in lamps. I hope to have your hearty coöperation in bringing about a betterment of mining conditions in this state. I do not wish to work hardships on operator or miner, but must insist on the mining laws being lived up to. Trusting that these suggestions will meet with your approval and prompt compliance, I am,

Very truly,
TOM SHAW,
State Mine Inspector.

To Members of the U. M. W. A.

Gentlemen: I am trying very hard to place the working of mines on a safer basis, and in order to do this I must have the hearty coöperation of all the miners in the state. It is impossible to bring about the improvements that are necessary in the mines unless the miners do their part, and you cannot expect the mine owners to live up to the laws unless you, also, live up to the laws.

The principles of the U. M. W. A. are and always have been for justice and a square deal. I mean to see that every miner has a square deal from the operator, but in turn it is only fair, that the operator is given a square deal from the miner. And if you expect a strict compliance of the mining laws from the operator, it is necessary for you to also comply with these laws. The law makes several requirements of the miners. The following rules and regulations I wish to call to your specific attention, and would like to have your local take it up and discuss it with a view of seeing that the following rules are strictly complied with.

All drill dust must be moved from the vicinity before shots are fired. All entries, air courses, and crosscuts must be made not less than 7 ft. wide. They must be kept clean and cleared from dirt. All miners must burn pure lard oil in lamps. See that shotfirers fire no shots where dust has been left, and that all dusty entries are left until they are cleaned and sprinkled. Also, see that no shot is fired that is considered dangerous.

I will appreciate information at any time of the violation of any of the mining laws, either by the operator or individual. I trust, in this effort to bring about safety in mining, that I will have the active coöperation of every miner and every local within the State of Arkansas.

Very truly,
TOM SHAW,
State Mine Inspector.

⁂

Coal in Southern Manchuria

According to the Daily Consular and Trade Reports, the exportation of coal from Newchwang only began to appear in the Customs returns in 1907, and has grown steadily, reaching 193,125 tons in 1912. The supply comes mainly from Fushun near Mukden, but also from Penhsihu on the Mukden-Antung Ry., and from Yent'ai, near Liaoyang. In another direction, northwest of Chinchow, good coal is found at two places, named Peipao and Hsinch'iu, and it has been partly in the hope of providing an outlet for these mines that the harbor works at Hulutao have been commenced, and the railway from Chinchow toward Aigun projected.

COMING SOCIETY MEETINGS

First Aid Meet., Philadelphia & Reading Coal & Iron Co.—The annual meeting of this company will be held at Lakeside Park, East Mahanoy Junction, Penn., Sept. 20.

National Conservation Exposition—Miners' Field Day, to be held under the auspices of the Tennessee Mine Foremen's Association, with the coöperation of the Bureau of Mines and the American Red Cross, on Sept. 20, at Knoxville, Tenn.

American Mine Safety Association—The second meeting of this society will be held at the Bureau of Mines, Pittsburgh, Sept. 22-24. H. M. Wilson is chairman.

American Mining Congress—This society meets for its 16th annual session at Philadelphia, Oct. 20-24; the secretary is J. F. Callbreath, who has opened quarters in the Land Title Building.

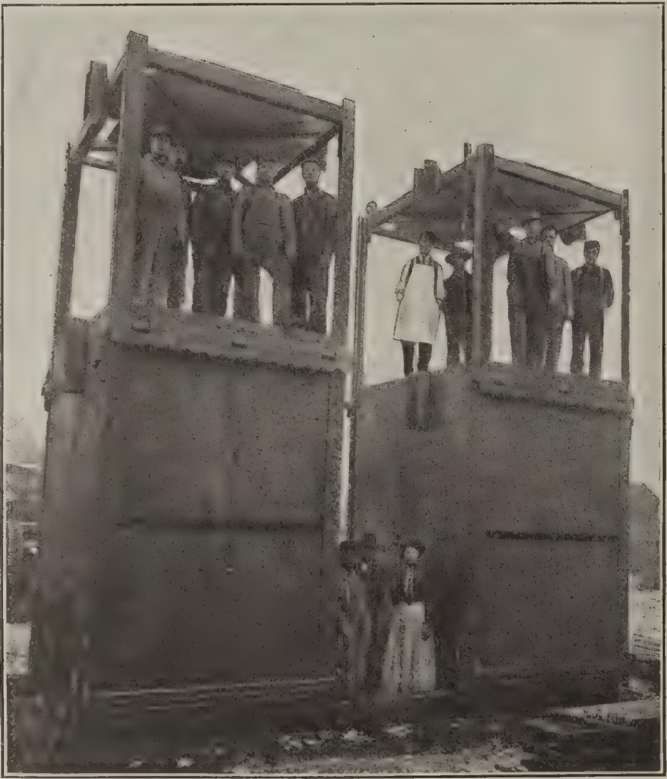
Coal Mining Institute of America—Winter Session meets Dec. 4 and 5 at the Fort Pitt Hotel, Pittsburgh, Penn. C. L. Fay, secretary, Wilkes-Barre, Penn.

A New Coal-Hoisting System

In shaft mining it seems to be an all but universal practice to hoist the loaded car of coal out of the shaft before dumping. Furthermore, most cages are equipped to hoist only one car at a time. In many mines the amount of time thus lost in the transit of the cars up and down becomes a considerable quantity.

Mr. Andrew Flesher, of Taylorville, Ill., has devised a scheme which renders it unnecessary to move the car from the shaft bottom, and at the same time considerably increases the amount of coal which may be handled in a given length of time.

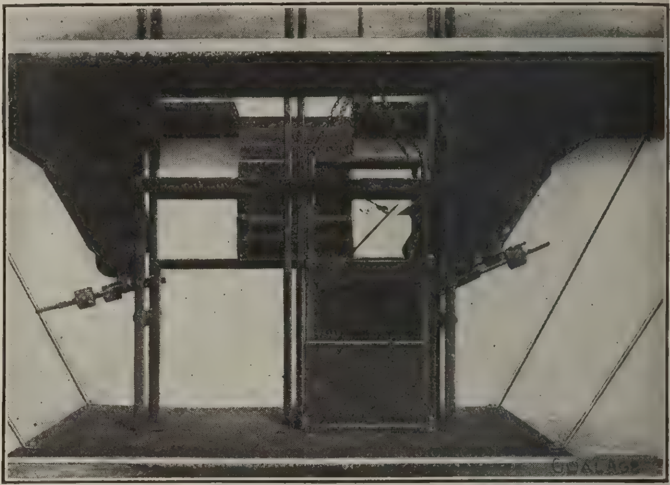
Briefly stated, this system consists of two automatic dumps at the shaft bottom discharging into hoppers which communicate, by means of a suitable gate, to either compartment of the hoisting shaft. Instead of placing the ordinary cages upon the hoisting rope, large steel buckets of suitable size and shape are provided. These are so arranged that when lowered to the bottom of the shaft they automatically operate the gates of the coal hoppers above mentioned, one bucket, of course, operating the gate of the hopper upon one side of the shaft, and the other bucket operating that located upon the other side. The two buckets are arranged precisely as the ordinary cages, one traveling up, while the other moves downward, and while one is filling at its underground hopper, the other is discharging its load in the tipple in the ordinary manner.



These Cages Have a Record of Hoisting 497 Tons in One Hour

These buckets may be made of any desirable size, but are usually constructed to carry from six to eight tons, thus having a considerably larger capacity than the ordinary mine car, while the time required for filling or discharge is reduced to a minimum.

It may readily be seen from the foregoing that a mine properly equipped with a pair of these buckets for hoisting will have a capacity equal to the same mine equipped with double or triple-deck cages. Furthermore, that when the buckets are employed hoists can be made with greater rapidity, as no time is lost in either caging the cars or dumping them, and the output of the mine will be governed largely by the ability to keep the loading hopper supplied with coal. Furthermore, no time will be lost in raising or lowering cars, since, as quick as a car is dumped, it is immediately run back into the workings ready to be loaded again.



A Cage at Shaft Bottom, Showing Operation of Chutes

We understand that this system has received a practical test in operation at one of the mines in southern Illinois, and that a pair of buckets, together with a pair of hoppers suitable for operation with them, are on exhibition at the works of the Foundry & Machine Co., at Taylorville, Ill.

⁂

Covering the Blowoff Pipe

Every engineer knows how bothersome it is to protect blowoff pipes inside the boiler setting. I have found a new way to protect mine, says W. E. Chandler, in *Power* of Aug. 26, 1913. Instead of bothering with cast-iron sleeves which seldom fit, or brick covers that split and fall down, to say nothing of filling the space in the combustion chamber, I simply cover the blowoff pipe from the boiler to the wall with $\frac{7}{8}$-in. asbestos rope. I then make a plaster of equal parts of asbestos meal and fireclay and add one pint of fine salt to a 16-qt. pailfull of plaster, using just enough water to make a stiff mass. This is plastered over the rope with the hands and crowded in between the strands

⁂

Dipping coal seams should usually be ventilated by the ascensional system of ventilation, that is, the intake or fresh air should be conducted as directly as possible to the lowest part of the workings; and then made to circulate through the working places, starting with the lowest levels and gradually passing up the pitch toward the mouth of the mine. By this method the return air, which is commonly warmer and lighter than the intake, will be always rising toward the mouth of the mine and will, at the same time, be carrying the gases away from the men, so that the possibility of forming a dangerous mixture is constantly less.

POWER DEPARTMENT

A Modern Compressor Plant

By Frank H. Kneeland

SYNOPSIS—Where the underground conditions preclude the employment of electricity, compressed air is the next best medium of power transmission. The plant here described is a representative of a good type of compressor installation.

⁂

So strong has been the trend of practice toward the employment of electric transmission in the construction of mining power plants during the past few years, that the mention of such a plant immediately brings a vision of a collection of steam turbines or high-speed engines direct-connected to revolving-field generators of high voltage. Conditions, however, frequently alter cases, and present difficulties in the way of safety, which may render the employment of electricity underground, in the judgment of certain state mine inspectors at least, scarcely less than suicidal.

Under such circumstances, there appears to be no alternative, but to revert to the older and less efficient, albeit the safer method, of power transmission in gaseous mines, namely, compressed air. Such is the case at Marianna, Penn., and the type and quality of the machinery employed show well the possibilities of this mode of storing and transporting energy.

At this plant electricity is employed only upon the surface. All operations performed underground, requiring the use of power, are accomplished by means of compressed air, and as a consequence a compressor plant of arge capacity is required.

The power plant as a whole consists of two parts, the boiler house and the power house proper. The latter building is approximately 50x111 ft. inside. It is a steel-frame structure inclosed in brick with steel roof trusses and a concrete slab roof reinforced with wire netting. The floor is of concrete, neatly grooved to represent tile.

Upon coming in at the main entrance of the building the first machine encountered is a 26x46-in. Mesta simple Corliss engine, direct-connected to a 500-kw., 300-volt Westinghouse direct-current generator, operating at 100 r.p.m. The flywheel of this machine is of large size, beng approximately 20 ft. in diameter, with a rim of about 12x14 in. cross-section. This is the only generator upon the main floor of the building, and is operated to accommodate the day load, which consists of all tipple machinery (23 motors), all coke larries (3), the machine shop, chain car haul, the electric lights in the mine, and in the repair shop, and when necessary the street lights and those in the houses of the town.

The second machine is an Ingersoll-Rand cross-compound, two-stage air compressor, operating at 75 r.p.m. The steam end has a modified Corliss valve gear, and the compression is what is known as straight line. The high- and low-pressure steam cylinders are 24 and 36 in. n diameter, respectively, the air cylinders being 20 and 34 in. in diameter, while the stroke is 30 in. This machine compresses to 100 lb. pressure per square inch, and has a plate-steel intercooler. The high- and low-pressure air-admission valves are mechanically operated, while the discharge valves are automatic in action.

The next machine is a Mesta low-pressure cross-compound Corliss straight-line, two-stage air compressor. The high- and low-pressure steam cylinders are 22 in. and 36 in. in diameter, respectively; the air cylinders are 20 in. and 34 in. in diameter, while the common stroke is 48 in. This machine operates at 75 r.p.m., and compresses to 100 lb. pressure. The air valves are similar to those of the machine above described, in that the inlet valves are mechanically operated, and the discharge valves are automatic. Both steam and air cylinders are, however, upon the same side of the shaft. Both of the above compressors have automatic air governors controlling the air pressure within a 2-lb. limit.

The next machine is a high-pressure duplex straight-line Corliss, three-stage air compressor. The steam cylinders are 29 in. in diameter, and the air cylinders are 21 in., 15 in. and 6¾ in. in diameter, while the stroke is 24 in. The machine operates at 75 r.p.m., and compresses to 1000 lb. pressure. The air cylinders are tandem triplex, six cylinders in all. There are two intercoolers and one aftercooler on each side of the machine. All air valves, both inlet and discharge, are automatic in action.

The next machine is a Mesta high-pressure, duplex, cross-compound, Corliss, four-stage air compressor, with eight air cylinders in all, four on each side. The high- and low-pressure steam cylinders are 22 in and 34 in. in diameter, respectively. The air cylinders are 29 in., 16 in., 7½ in., and 5¼ in. in diameter, while the stroke is 36 in. This machine runs at 100 r.p.m., and compresses air to 1000 lb. It is supplied with automatic regulators governing the stages, the first compression being to 40 lb., the second to 125 lb., the third to 300 lb., and the fourth to 1000 lb.

A Good Crane Is Provided

This completes the equipment of the power units upon the main floor of the building. A Case Manufacturing Co. 20-ton hand-operated traveling crane spans the width of the building, and traverses its complete length. A tram track leads into the building a sufficient distance so that any material may be run in upon a car and picked up by this crane.

The main bearings of all machines are lubricated by a gravity oiling system, while the cylinders are supplied by forced-feed oil pumps. All main steam piping is carried beneath the floor, with suitable goosenecks connecting to the various machines.

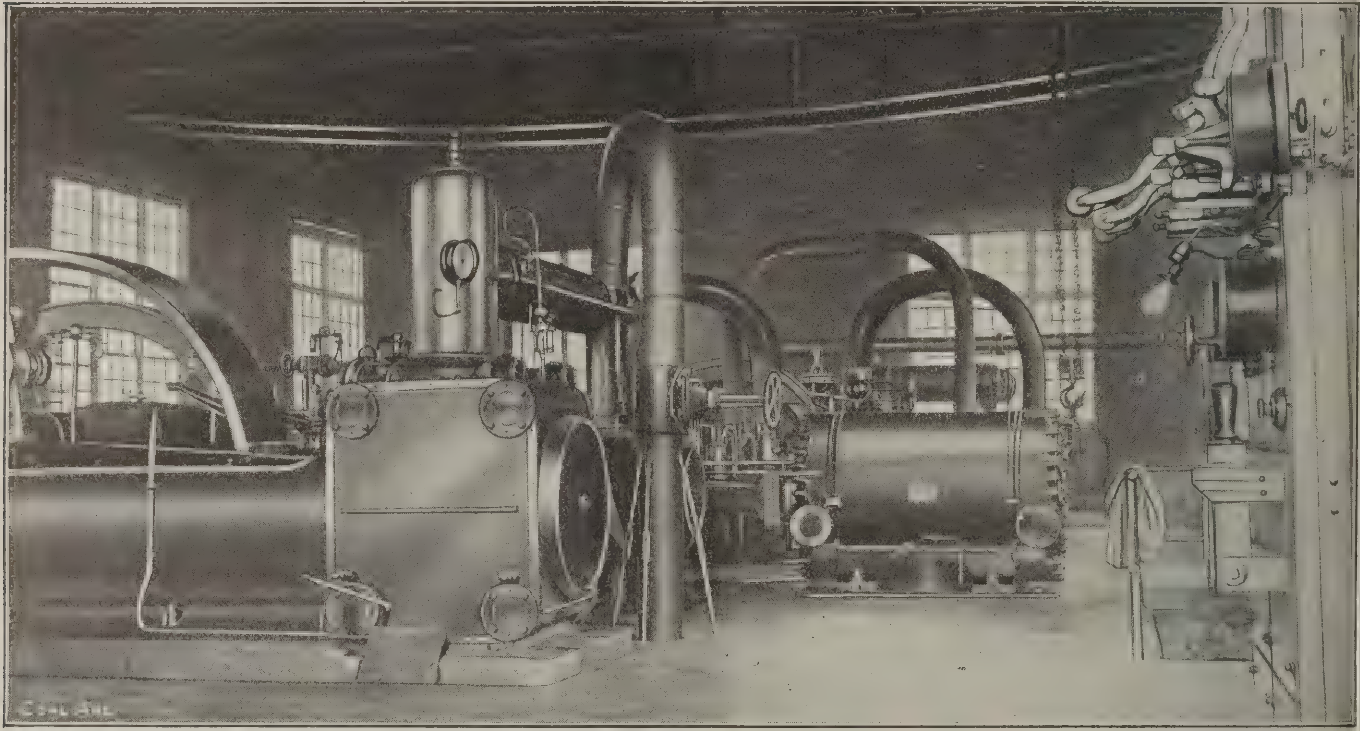
The low-pressure air, or that at 100 lb. pressure, is employed to operate all coal-cutting machines and punchers, as well as all pumps underground. The high-pressure air, or that at 1000 lb. pressure, is employed in the underground haulage locomotives, of which there are 23 in use.

Not the least noticeable features of the plant are the polished brass pipe railings, placed wherever necessary, and the tidy and handy wrench boards. A telephone booth is also conveniently located in the engine room.

The neat, clean, ship-shape appearance of this plant speaks vastly more for the efficiency and morale of the working force than could any number of power-house reports.

In the basement of the building is located a Russel tandem-compound engine direct-connected to a Westinghouse 100-kw., 300-volt, 400-amp. generator. The high- and low-pressure cylinders of this machine are 14 in. and 20 in. in diameter, respectively. The stroke is 20 in. and the speed is 275 r.p.m.

In the boiler house there are installed seven 500-hp. Stirling boilers, four of which are equipped for utilizing waste heat from the coke ovens. Three of these latter have Green chain-grate stokers, and the fourth is furnished with a B. & W. chain grate. The other three boilers are fired by Jones underfeed stokers, with three retorts to each boiler. Coal for all boilers is supplied from an overhead steel bin, each boiler having its own compartment therein.



Interior of Power Plant, Showing Air Compressors, Switchboard and Traveling Crane

The boilers are fed by four 10x6x12-in. Epping-Carpenter duplex feed pumps. A 15x9x18-in. Yough pump forces all the water which has passed from the jackets and intercoolers of the compressors to a hotwell outside the building, back to the supply tanks above the power house, from which all water for the plant is taken. This pump may also be turned onto the boiler-feed line if necessary, and the boiler-feed pumps put on the hotwell.

Forced draft for the Jones stokers is furnished by a 9x3-ft. fan, direct-connected to Troy 8x8-in. vertical engines, operating at 300 r.p.m. These engines are in duplicate, placed upon either side of the fan and connected thereto by a flange coupling. The air supply is automatic, so that when the steam goes down the fan speeds up.

Steam is ordinarily carried at about 150 lb., the pop valves being set for 152 lb.

The firing alley in front of the boilers is unusually wide, being about 16 ft. across; 7 ft. is also allowed between boilers, all units being set singly. Two separate boiler-feed lines are installed, automatic feed-water regulators being supplied, together with high- and low-water alarms. The feed pumps are also equipped with pressure regulators.

How Coal and Ashes Are Handled

Coal is dumped into a bin outside the building, from which it is conveyed to the boiler house by a 20-in., 4-ply rubber-belt conveyor, driven by a 30-hp. motor. It is distributed to the boilers by a movable tripper. The ashes from the furnaces are wheeled and dumped into a car in a pit beneath the boiler-room floor. The car is run upon a track to a point outside the building, where it is elevated in a self-dumping cage and emptied into a concrete bin with a capacity of about 20 cars. From this bin the ashes are drawn into an electric larry, which conveys them to the ash pile.

All engines and compressors except the Mesta high-pressure compressor exhaust through two Lowell Manufacturing Co. open feed-water heaters of about 500 hp. each. The compressor above mentioned exhausts direct to the atmosphere.

In addition to supplying steam for the power house, the boilers also supply steam to hoisting engines of large size and capacity handling the cages in the mine shafts. The house supply and other pumps are also operated from them.

The Pittsburgh-Buffalo Co. justly prides itself upon the mine and the neat, clean, sanitary town of Marianna. There is perhaps no mining community in western Pennsylvania that is more often spoken of as model of excellence. The power plant above described is, however, in thorough keeping with its surroundings. It, too, should be the source of no little self-elation and satisfaction to the management.

EDITORIALS

Asepsis in the Mine

Some time ago we called attention editorially to the freedom from tetanus enjoyed by those who are injured in the mines. Today we desire to refer to the comparative immunity of such wounds from pus formation. We are aware that it will be said that care should always be taken to guard against infection, and in no other way can absolute safety be assured. This is indeed true, but the study of first aid is so large that it is important that stress be laid on the principal elements and not on those which are less important. Nevertheless aseptic treatment must be especially emphasized in cases when men are injured on the surface or in deep mines.

The "bacteria" which are parasites of men and other warm-blooded animals, are in their nature best adapted to blood temperatures. They do not thrive in the mine unless they remain with their host, for their microscopic bodies are not piped with heating systems like the bodies of vertebrate animals. Consequently their living conditions are not favorable where temperatures of 55 to 60 deg. are encountered, as in mines.

The pus-formers (*"pyogenes"*) are usually infinitesimal seed-like bodies, which are known as *"micrococci."* That germ most numerously found in pus is a coccus which occurs in bunches like grapes, earning it the name of *"staphylococcus,"* and these bunches are yellow, hence the expression *"aureus,"* golden. The action of heat on that germ will be seen in the table, as also the effect on the *"streptococcus pyogenes,"* which gains the initial part of its first name from its tendency to colonize in chains. There are other germs beside those which are given in the table, but they are of less importance; some are seed-like *"micrococci"* and some rod-like bacilli. It must be said that Sternberg's figures for the point at which rapid multiplication of micrococci occurs appear somewhat high, for Kruse and Pansini state of the *pneumococcus* and allied *streptococci* that: "Although, as a rule, no development occurs at 68 deg. F., certain varieties were obtained, which after long cultivation in artificial media, showed decided growth at 64 deg. F." All of which makes us wonder if the second column of the table gives sufficiently high figures where the micrococci have been reared in the human body and not in chicken-broth or agar-agar.

Name of germ	Multiplies most freely	Multiplies rapidly
Staphylococcus pyogenes aureus	86° to 99° F.	64° to 68° F.
Streptococcus pyogenes	86° to 99° F.	61° to 68° F
Pneumococcus	95° to 99° F.	61° to 68° F.
Micrococcus pneumoniae crouposae	5° to 99° F.	72° to 75° F.

In all these organisms it is seen that rapid development demands a higher temperature than is usually found n an American mine. On leaving the human body by weat, mucus or the breath, the germs become incapable f multiplication. Moreover, like most "bacteria," they re killed or their vitality is lessened by acids. The second germ in the table is alleged by Von Lingelsheim o be killed within two hours in a 0.4 per cent. solution of sulphuric acid, and the fourth germ, while not destroyed in a saturated solution of ferric sulphate, is restrained from development in a 0.5 per cent. solution of that salt, is killed in a 0.5 per cent. solution of sulphuric acid and fails to develop in a solution one-fourth as strong.

We are prepared to admit that all "bacteria" passing directly from the mouth or carried by sweat to a wound doubtless have nearly the full germinative effect, so that breathing, spitting or placing a tobacco quid on a wound and picking over the exposed face of the injury with the finger nails are nefarious practices.

And we believe that rule 23 of the National Mine Safety Association is right in saying that "If no antiseptic or sterilized dressing is available, no dressing should be applied to the wound." All clothing removed from the body, all handkerchiefs, whether worn around the neck or secreted in the pocket, being warm, doubtless contain not only innumerable germs, but retain them in a condition in which they can immediately infect a wound.

But passing a sweatless hand over a dressing which will ultimately come against an open cut or tear will probably do no harm in the mine. The palm of the hand sweats but little and in the mine is usually dry and acid from contact with sulphates. A little ineptness, therefore, in opening a dressing or placing it, is not a cardinal sin.

In short, as we study the possibilities of infection, we are convinced that there are many gross sins against asepsis, but that only the most venial are committed at a first-aid meet. Will a contestant breathe on a wound? Will he use a tobacco quid? Will he use his handkerchief or his shirt sleeve as a dressing where better material is provided? It is almost unthinkable that he will do any of these things.

In fact, the first-aid meet has this defect, that it is like a drill, all pipeclay and polished shoes, and has as much resemblance to mine service as the parade ground has to the field of battle. What officer would list demerits for looting houses and stealing corn and chickens if he were making a schedule of demerits for a grand parade? Yet faults such as these are far more vital in war than breaking the line or performing any of the tricks of the awkward squad, for which demerits are provided.

As for the air-borne bacteria, Wainwright has shown us how they are removed. We have been shown how they are made listless and enervated by temperature conditions and acid. Do they get back all their vitality on reentering a host? Possibly not, at least not at once. Like a snake when spring comes, they are only slowly revived by the genial heat. Tetanus is most severe in tropical climates where the germ never gets chilled and Malta fever has no terrors when transported to the inhospitable shores of Great Britain. As the virulence of "bacteria" is weakened by excessive heat, and by propagation through resistant hosts and unfavorable media, and as it is said to be reduced by physical violence, perhaps also cold and acids have a similar benumbing effect, leaving the microbes helpless before the bactericidal action of the plasma of the blood.

That there is in this belief some degree of truth may be deduced from the fact that miners' wounds heal without difficulty while Fourth of July and summer injuries frequently have fatal results. Dr. F. L. McKee at the first, and so far the only, meeting of the American Mine Safety Association, declared that whenever miners had their wounds dressed at the hospital the failure to sterilize the wound in the mine had no evil results, a striking testimony to mining conditions which many another doctor could doubtless confirm. Dr. W. S. Roundtree declared that he "had seen only a few infections in two or three years in cases where the first-aid men got hold of the injured soon after the injury was received."

With this statement Dr. G. H. Halberstadt could not agree, saying that "in the anthracite region, the contrary is the case." It must be remembered that Dr. Halberstadt's experience is gained at some of the deepest mines in the country, where the heat is such that the *micrococci* are not materially numbed and some other inhibiting conditions may not be so marked in anthracite as in bituminous mines. In England, where mines are deep, doctors have testified that septicæmia has been due to injuries received from impact of coal.

⁂

Summer Boiler Complaints

The late summer or early fall is frequently a trying season to many colliery power-house men. This is particularly true if the feed-water supply is drawn from surface streams or stagnant pools. During this time of the year, lakes, creeks and rivers are usually low, and the heat hastens the decomposition of any animal or vegetable matter which the water may contain.

Many boiler-feed waters carry chemicals in solution which are alkaline in their reaction, and these, together with any compounds which may be fed to the boilers to prevent scaling, may, with organic oils from the decomposition above mentioned, form a soap, which is almost certain to cause foaming if it accumulates in sufficient quantities. Sewage also, even though present in but small quantities, may carry sufficient organic matter to cause decided foaming or priming.

On the other hand, decaying vegetable matter in ponds or marshes frequently results in the formation of organic acids, which may cause severe pitting or corrosion of the boiler plates. This, however, will not ordinarily occur if the surfaces are even slightly protected by scale.

Colliery boilers are frequently called upon for sudden and heavy deliveries of steam. This in itself is a difficult condition to meet. No boiler, under good steaming conditions, will deliver a dry product, the steam invariably containing small amounts of water in finely divided particles. Of course, passing the steam through a superheater after it has left the boiler proper, will evaporate this water held in suspension, and deliver a perfectly gaseous product to the steam header. Superheaters are, however, not often employed in mining power plants.

The amount of water carried over from the ordinary saturated steam boiler is seldom large enough to cause damage. It is only when water leaves the boiler in masses commonly called "slugs," which are too large for eliminators or steam traps to handle, that there is danger of blowing an engine cylinder head out, which accident is always accompanied with more or less peril to the attendants.

The danger of priming through rapid ebullition, caused by a sudden demand upon the boiler, may be overcome by the installation of an auxiliary steam receiver, or dome, while that arising from organic oils in the feed water may be eliminated or at least materially lessened by installing an efficient coke or charcoal oil filter.

⁂

First-Aid Demerits

We publish today the rules governing the first-aid contest at Knoxville, Tenn. They confirm our idea that the American Mine Safety Association is a live and worthy institution, for, if indications point truly, it has cleaned off the old slate, and a new list of penalties is put in place of the old. No longer does failure to be aseptic appear as the worst sin in the first-aid calendar.

Ineffective artificial respiration and improper treatment each score an equal number of demerits, and only lack of neatness is considered so venial as to deserve the light fine of two discounts. Formerly you could let a man die from inefficient resuscitation methods and yet score 98 per cent. The criminal code of the association was certainly a fearful and wonderful thing.

We have added up the original schedule and the present, and find that there were 50 discounts in the old list whereas there are 95 in the new. It is easy to see how failure to be aseptic, which still counts for 10 demerits has been made a less important offense by the new rulings.

We do not know that Coal Age effected this reformation. Those two dozen physicians doubtless did no need the prodding of that mysterious physician who wrote the "First Aid Muddle," nor were the sequen editorial remarks necessary to awaken their sense of fitness. The surgeons on the committee on first-aid contests, we assume, made the changes as a result of their own careful deliberations, and we expect that they wil make others before long, as indications point the need Only narrow men refuse to rectify errors, and the Mine Safety Association appears to have shown that it is sufficiently broad-gaged to review its own acts.

⁂

Building Activity in Coal Fields

For more than a year anthracite and bituminous coa companies have been actively engaged in rebuilding old plants and developing new ones. The coal business has been rather an exception to the quiet conditions prevailing in American industrial circles. Coal prices were higher last year than in any normal year of the trade' history. The increase in value of the total output, a the mines, was nearly seventy million dollars. The pas twelve months was the first time in years that many companies were able to earn interest on their bonds, and i is to the credit of the industry that those operators now able to see daylight are giving first thought to the betterment of their plants as regards safety and efficiency rather than to the payment of long-awaited dividends.

LEGAL DEPARTMENT

Validity of Coal Trade-Names

By A. L. H. Street*

SYNOPSIS—A name which describes the character of coal or the district in which it is produced, cannot be regarded as a private designation applicable only to the coal produced by the firm using that name. But if a coal is not mined in the district after which it is named, and if its quality is clearly inferior to that of the coal produced in that district, it is likely that the courts will decide that it is not entitled to that name, for a decision indicating this view of the courts has been rendered in a flour suit.

⁂

Several important court decisions show that the limits set by the law on the right to the exclusive use of a trade-name in the selling of coal are often not clearly understood. Below I give the general rules of law on this subject, with brief reference to decisions announced by appellate courts in cases which arose in the coal trade under those principles.

Generic Names Cannot Be Exclusively Appropriated

Newly coined words or words which have had no previous significance in the trade may be monopolized as trade-names by the first person, firm or company that adopts them, but any name which is merely descriptive of the nature or quality of the commodity to which it is applied cannot be exclusively appropriated. Thus, the Kansas City Court of Appeals held in the case of McGrew Coal Company vs. Menefee, 144 Southwestern Reporter, 869, that since the word "Electric," as applied to bituminous coal, has a well understood meaning as signifying production by the use of electric-mining machinery, plaintiff did not acquire the right to monopolize the words "Electric Lump Coal" as a trade-name.

The court said: "The words do not denote the origin or ownership of the commodity to which they refer, but are merely descriptive of the quality of a commodity of general consumption." In other words, the law insists that a valid trade-name be limited to the purpose of designating a particular person, firm or company as the producer of the commodity to which it is applied, without giving the exclusive right to monopolize a generic name, to the use of which all producers of the same class of commodity are fairly entiled.

Geographical Names Cannot Become Personal Property

As to geographical names, the United States Supreme Court has ruled: "The same reasons which forbid the exclusive appropriation of generic names, or of those merely descriptive of the article manufactured, and which can be employed with truth by other manufacturers, apply with equal force to the appropriation of geographical names, designating districts of country. Their nature is such that they cannot point to the origin (personal origin) or ownership of the articles of trade to which they may be applied. They point only at the place of production, not to the producer; and could they be appropriated exclusively, the appropriation would result in mischievous monopolies." Accordingly the court held that the right to use the name "Lackawanna" (a word which is said in Hollister's History of the Lackawanna Valley to be a corruption of the Indian words "Lahawhanna, signifying the meeting of two streams) was not subject to monopoly, though the coal of a particular producer had become well known by that name. (United States Supreme Court, Delaware & Hudson Canal Company vs. Clark, 13 Wall, 311.)

In a later case, Castner vs. Coffman, 20 Supreme Court Reporter, 842, the same court held that the name "Pocahontas Coal" was not subject to exclusive appropriation by selling agents for coal produced at or near a town named Pocahontas, especially as against the mine-owners for whom the agents had acted, even though the agents had enhanced the reputation of that field by careful inspection and grading of coal produced there. Following these decisions, the Supreme Court of Montana has held that the words "Owl Creek Coal" could not be monopolized to designate coal produced in a district known as the Owl Creek coal field, in which there was competitive mining. (Esselslyn vs. Holmes, 114 Pacific Reporter, 118.)

But a jobber who established an extensive trade in Nebraska for coal mined at Big Four, Colorado, where it was known as "Carbon Canon Coal," the jobber selling it under the name "Cristo Canon Coal" was held to be entitled to enjoin a former manager, who established a rival business, from using "Cristo Canon" as a trade name for the same class of fuel. (Nebraska Supreme Court, Consolidated Fuel Company vs. Brooks, 136 Northwestern Reporter, 60.)

Each District Is Probably Entitled to the Use of Its Own Name

But although a geographical name is not subject to monopoly as a trade name, it is probably certain that the courts would grant the producers in any field, especially if it should happen to be celebrated, an injunction against the sale by competitors of coal produced in another field under a name implying that it was produced in the first mentioned field. This is particularly true if the coal of that field should be of a higher quality than the other. As authority for this statement, the writer refers to a decision of the United States Circuit Court of Appeals for the Seventh Circuit, in the case of Pillsbury-Washburn Flour Mills Company vs. Eagle, 86 Federal Reporter, 608, wherein it was decided that the Minneapolis flour millers were entitled to enjoin sale of flour produced elsewhere under brands which implied that it was manufactured in Minneapolis.

SOCIOLOGICAL DEPARTMENT

Lehigh and Wilkes-Barre First-Aid Meet

Thirty-three first-aid teams from 14 collieries of the Lehigh & Wilkes-Barre Coal Co., by splendid demonstrations of first-aid work, made the fourth annual field day a big success. The contests were held at Sans Souci Park, near Wilkes-Barre, and several thousand people attended.

The outside team of the Nottingham colliery, Plymouth, carried off the big event, which was the last of the day. The teams which won in the other events were pitted against each other in the final contest, two problems being submitted to them for solution. The teams entered in the final contest were all well matched and capable and the judges found it somewhat difficult to select a winner. After careful consideration of the work of each team, the honors were finally awarded the Nottingham corps and each member of that team was presented with a bronze medal. Their names follow: William James, captain, John Pritchard, James Colbert, William Berkheiser, Michael Rubic, Anthony Adzoski.

All the problems were such as any team in the anthracite field is apt to encounter frequently in actual practice. No effort was made to puzzle the first-aid men, but the problems caused them to think rapidly, as they would if facing real conditions. Dr. E. C. Wagner and Dr. J. W. Giest, both of Wilkes-Barre, were the judges. After each event they announced only the points scored by the winning team.

INSIDE TEAM OF LANCE OR NO. 11 COLLIERY OF LEHIGH AND WILKES-BARRE COAL CO., NEAR PLYMOUTH, PENN.
(Left to right, Ray Lewis, captain, William Kirschner, Hugh O. Kane, Thomas Lewis and John Cummings with John Edwards as patient.)

One feature of the contest was the first-aid work of the boys' team from the Wanamie colliery. Six little fellows, none of whom are 16 years of age, make up this team and they gave a demonstration, which won much praise. They have been drilled for several months by William H. Craig, and the corps is as proficient in first-aid work as many of the older teams.

Following the contest, a banquet was served to the company officials and the first-aid teams. More than 600 men and boys gathered about the festive board. General Manager Charles F. Huber was toastmaster, and he thanked the men for their interest in first-aid work and then called upon John H. Bigelow, district attorney of Luzerne County, to present pennants to the teams winning the first seven events and bronze medals to the Nottingham outside team for carrying off the chief event. Following the banquet, the men spent the rest of the day in pleasure at the park.

The events and winners follow:

Event No. 1—All corps of outside men compete on the following problem: Treat a compound fracture of the lower third of the left thigh, bleeding in spurts; also a laceration of the left ear and an injury to the right eye (Shock). Use roller bandage for dressing eye and ear. Event won by outside team of Buttonwood colliery. Score 100.

Event No. 2—All teams of inside men Wilkes-Barre and Ashley districts, compete on the following, problem: Treat a compound fracture of both bones of right leg, bleeding severely; also gas burns of both hands, right arm and shoulder and right side of face and ear (Shock). Use roller bandage for head dressing. Event won by inside team of Empire colliery. Score 100.

Event No. 3—All inside teams, Plymouth district and Honey Brook division, compete on the following problem.

reat a compound fracture of the middle of the right thigh, evere bleeding; also severe burns of face, neck, right hand nd forearm, complicated with a fracture of burned forearm Shock.) Use roller bandages for dressing the burn and fracured forearm. Event won by inside team Parrish Colliery. core 100.

Event No. 4—All outside and inside teams, Wilkes-Barre istrict, compete on the following problem. Dress a puncure wound of right side of abdomen (Shock); also a laceraion over left knee, using triangular bandage for knee and bout four turns 4-in. roller bandage for abdomen. Event von by outside team Stanton colliery. Score 100.

Event No. 5—All outside and inside teams, Ashley district, ompete on the following: Dress a puncture wound of right hest between the fifth and sixth ribs (Shock); also a ractured left knee cap using triangular bandage for knee nd about four turns 4-in. roller bandage for chest. Event von by inside team Sugar Notch colliery. Score 100.

Event No. 6—All outside and inside teams, Honey Brook ivision, compete on this problem: Treat a fracture of the eft collar bone and a laceration of the top of the right foot, using a triangular bandage for the collar bone and a spica or the foot. Event won by outside team Audenreid coliery. Score 100.

Event No. 7—All outside and inside teams, Plymouth disrict, compete on this problem: Treat a compound fracture f both bones of the left forearm, bleeding in spurts; also acerations of palm of right hand and fingers (Shock) using 2-in. roller bandage for dressing the forearm and the palm f the hand, and making gauntlet bandage for fingers. Event von by outside team of Nottingham Colliery. Score 100.

Boys' Team, Wanamie Colliery, a Mine of the Lehigh and Wilkes-Barre Coal Co., near Nanticoke, Penn.

(Left to right, back row, John Craig, captain, Frank Stoj, homas Crouse; front row, Stanley Shershing, Walter Shershng and Forrest Rineheimer.)

(Left to right, back row, John Craig, captain, Stanley Shershing, William H. Craig, instructor, Frank Stoi, Thomas Crouse; front row, Forrest Rineheimer and Walter Shershing.)

Event No. 8—The Boys team of the Wanamie colliery gave n exhibition, no points being scored.

Event No. 9—Winners of events from Numbers 1 to 7 nclusive compete on two problems. Problem No. 1—Treat a acerated scalp wound on top of head, and a wound of the ight groin using 2-in. recurrent bandage for the head and an scending 3-in. spica for groin. Problem No. 2—Treat a racture of spine or broken back. Event won by outside eam of Nottingham colliery. Score 100.

The following teams participated, their membership eing as follows:

Hollenback Colliery—Outside team—Arthur Hughes, capain, Andrew Letzko, Frank Hunsinger, Thomas Meighan, Iichael A. Flaherty, Anthony Kennedy.

Inside team—William H. Evans, captain, David T. Davis, Edward Evans, Joseph Moyles, John Murray, John Hughes.

Empire Colliery—Inside team—Joseph Stevens, captain, Valter Powell, John Flanagan, Roy Lowe, John Moran, aniel Ward.

South Wilkes-Barre Colliery—Outside team—M. J. Connolly, captain, Andrew Kratz, Harry Pollard, George Gould, arry Reedy, William Austin.

No. 3 shaft—Ernest Seymour, captain, Watkin Williams, arry Thompson, Hayden Evans, Evan Cann, David Villiams.

No. 5 shaft—Richard Morgans, captain, James Evans, ames P. Evans, Evan Phillips, James Morris, Daniel Rees.

Stanton Colliery—Outside team—W. H. Hetherby, captain, William Rainow, Thomas Harten, Anthony Monahan, John Minnick, John Flaherty.

No. 7 shaft—Edward Griffith, captain, George Irving, John L. Williams, Emmanuel Bennett, Fred Horlacher, Joseph Griswold.

No. 4 slope—Theophilus Richards, captain, Samuel Thomas, John X. Thomas, James Davis, Evan Morgan, Paul Butcher.

Sugar Notch Colliery—Outside team—Manus Kane, captain, Bert Shoemaker, Arthur Lewis, Alfred Williams, Anthony Swartz, William Carr.

Inside team—Thomas Roach, captain, Harry McDermott, Edward Roach, Benjamin Comstedt, Anthony Morris.

Lance colliery—Outside team—Roy Stark, captain, David Cummings, Charles Meyers, Charles Atwell, Walter Kostruza, Emlyn Williams.

Inside team—Ray Lewis, captain, John Cummings, Hugh Kane, James J. Lewis, Thomas Lewis, John D. Edwards.

Nottingham Colliery—Outside team—William James, captain, John Pritchard, James Colbert, William Berkeiser, Michael Rubic, Anthony Adozski.

Inside team—George Griffith, captain, John Matthews, Thomas Ashton, Isaac Thomas, William H. Jones, Martin Cusma.

Reynolds Colliery—Inside team—John Edwards, captain. H. James Edwards, Harry Miller, Patrick Driscoll, Ignatius Hosey, Stanley Socka.

Wanamie Colliery—Outside team—Irve Vandermark, captain, Charles Womelsdorf, A. L. Engler, Oscar Spaide, Theodore Womelsdorf, John E. Burke.

No. 2 slope—William Craig, captain; James Phillips, Frank Gizinski, Evan Edwards, William Hibbard, John O. Evans.

No. 3 slope—John Murphy, captain; E. C. Barrett, William Briggs, Thomas Murphy, William E. Roberts, William Marshall.

Maxwell Colliery—Outside team—Brian McGuire, captain, Westy Bierly, David Morgan, Nathan Kelly, Edmund Krogulski, Stanley Brown.

Baltimore shaft—Albert Stead, captain, Michael Gorham, John Lavin, Michael Cuff, Richard McElligott, Edward Cuff.

Red Ash shaft—Michael Cavanaugh, captain, Griff Hughes, Thomas Grady, Henry Williams, John R. Roberts, Benjamin Llewellyn.

Buttonwood Colliery—Outside team—David J. Williams, captain, Walter Griffith, Gottleib Schwall, John Emmanuel, Harry Bryany, Edward Jacobs.

Inside team—John A. Thomas, captain, William W. Thomas, William J. Thomas, Howard Thomas, Rube Gliddon, David M. Jenkins.

Parrish Colliery—Harry Trebilcox, captain, John Ayres, Ernest Curnow, Benjamin Snyder, David Anthony, Hayden Jones.

Inside team—William J. Jones, captain, Alfred Reed, William Morris, Wade Maxwell, Edward Laughlin, David Jones.

Audenreid Colliery—Outside team—T. O. Mader, captain, Arthur Young, James Dougherty, James Roberts, Philip Lewis, Charles Gildea.

Inside team—John Hackett, captain, Thomas Jones, James McFadden, John Schwartz, Michael Billick, George Slodigo.

Honey Brook Colliery—Outside team—T. D. Muirhead, captain, William McCann, John Donlin, Neal Close, James Cull, George Mazurick.

No. 15 slope—John Liptock, captain, Emro Olyer, Barney Fogerty, William McFadden, John Upshaw, Edward Mears.

No. 20 slope—James McFadden captain, John Fogerty, William John Billick, Michael Pucher, Michael Servibeski.

Green Mount slope—Edward Fritz, captain, Steve Furish, William Kleckner, John Maticko, Hubbard Doud, Steve Lukus.

Wanamie Boys Corps—John Craig, captain, Thomas Stoker, Thomas Crouse, Frank Stoj, Walter Shershing, Forrest Rineheimer.

⁂

Revised First-Aid Contest Rules

The committee on rules, discounts and events of the Knoxville meet has prepared the following rules to govern the contest. These rules will doubtless be generally copied. They show evidences of careful formulation. As the regulations differ considerably from those of the American Mine Safety Association they are worthy of most careful consideration. It has not been announced whether they are rules formulated by the first-aid contest committee of that Association but it is reasonable to assume that they emanated from that body.

RULES GOVERNING FIRST AID CONTEST

1. A team is composed of five men and a captain. Any one in the employ of a coal or metal company may be a member of a contesting team, providing he is not a physician or a trained nurse.
2. The captain will select the patient and designate the member or members of the team to perform the event.
3. The captain will control his team in their field work by giving audible commands.
4. The captain may select himself as one of the members who will perform the event.
5. The captain or other members will not prompt the person performing the event unless he is one of the performers. This will not apply to full team events.
6. At the conclusion of any event, the captain will raise his right hand and announce his team number. The team will remain at its post until relieved by the judges.
7. The teams will bring their own first-aid material, including bandages, splints, blankets, stretchers, etc., and will not be allowed to leave the patient to secure material.
8. The triangular bandage will be regarded as standard in the contest, but roller bandages may be used and those teams which use the latter will be given credits equal to those received by teams which use the triangle if the roller bandage is properly manipulated.
9. All splints must be prepared on the field for each event requiring their use. Specially designed splints may be used, but they must be assembled during the progress of the event in which they are to be used.
10. No practicing will be allowed on the field before the beginning of the contest.
11. The teams will be numbered consecutively, beginning at No. 1 and they will occupy their consecutive position on the field.
12. The judges will perform their work progressively, judging such number of teams in each event as the judges may determine and announce before the beginning of the contest.
13. In events involving resuscitation, the rescue of the patient and stretcher drill, the judges may require the teams to perform separately.
14. Each judge will mark the team number, event, and discount for each team judged, sign his name and deliver his record to the recorder.
15. The recorder will foot up the discounts and mark points made by each team in each event. The total points will be divided by the number of the events and the quotient will be the average for each team for the whole contest.
16. Time will not be an element unless the team or men performing run over the allotted time or fail to give treatment properly. All events shall commence and be finished at the sounding of a gong.
17. All exceptions to these rules must be made to the committee on rules, not later than ten (10) days prior to the day of the contest. The decision of the committee will be final.
18. The prizes will be listed by the committee of awards.

DISCOUNTS FOR FIRST-AID CONTEST

1.	For not doing the most important thing first.	5
2.	For captain's failure to command properly.	2
3.	For slowness in work and lack of attention.	4
4.	For failure to cover the wound entirely, or being unable to give location of injury.	4
5.	For ineffective artificial respiration.	10
6.	For splint improperly padded or applied.	2
7.	For tight, loose, or improperly applied bandage.	6
8.	For insecure or granny knot.	5
9.	For unclean first-aid material.	5
10.	For failure to have on hand sufficient and proper material to complete a dressing	5
11.	For lack of neatness.	2
12.	For awkward handling of patient.	5
13.	For assistance lent by patient.	5
14.	For tourniquet improperly applied.	5
15.	For failure to stop bleeding.	5
16.	For not treating shock.	5
17.	For failure to be aseptic.	10
18.	For improper treatment.	10

⁂

Playground at Mining Town

The Jamison Coal & Coke Company has three mines in the Pittsburgh bed near Farmington, Marion County, W. Va., along a branch of the Baltimore & Ohio R.R. between Fairmount, W. Va., and Moundsville, Ohio. At Jamison No. 9 of this company, is probably the first playground in the Fairmont region to be equipped with amusement appliances. The equipment has been supplied by the mining company.

The Playground of the School at Jamison No. 9, Equipped by the Jamison Coal & Coke Co.

To the extreme left will be seen a see-saw. Behind is an iron framework of three parts, one supporting a swing, and another, gymnasium rings on which in the picture a boy is standing and swinging. A third part of the framework serves as a horizontal bar. Near the school house is a roly-poly on which in the picture, a girl is balancing. In the front of the school is a giant's stride and a merry-go-round.

⁂

Auto-Truck for Rescue Work

The Bureau of Mines has added an automobile truck to its Pittsburgh, Penn., equipment. This will carry a small complement of men, oxygen helmets and rescue apparatus, and can be used within a radius of 100 miles from Pittsburgh. It will be able to reach points not easily accessible by railroad.

The Marvel News

The *Marvel News* is a four-page newspaper issued by he Roden Coal Co. every two weeks. It measures 5¼x22 in. and is distributed free to the employees. The rst issue was dated Apr. 26, 1913.

It is not, of course, as pretentious a publication as the *mployees' Magazine* of the Lehigh Valley Coal Co., ut it is interesting to learn that its first issue predates hat publication. About two columns are devoted to ocals and personals. B. F. Roden, the president of the ompany utilizes another column to warn his employees gainst unprofitable and dangerous speculations. A rominent notice reads:

MINERS' EARNINGS FOR MAY

3 miners earned over $150, average....................	$181
3 miners earned between $100 and $150, average......	114
4 miners earned between $75 and $100, average........	85
4 miners earned between $50 and $75, average.........	63
verage earnings of 174 miners........................	88

We are proud of this record and only wish all could be in he $150 class. Which class are you in? Can't you get in a igher class for June?

These earnings are after deducting all labor and explo-ives. Can your friends at other mines make as good a howing?

The Fourth of July program follows with an account f the athletic exercises which were open to all who were r had been residents of Marvel. The Women's Depart-nent is written by E. B. Roden. The Church News ccupies another column. Several cooking receipts are iven by residents. The store advertises a two-days' in-entory sale at cut prices with millinery at cost. The eart of the paper is filled with most interesting "boiler late," with a story on the rear page. A few local firms dvertise lumber, livery and insurance. A newspaper is welcome innovation in a town as small as Marvel and he venture reflects much credit on the Roden Coal Co.

It may be said that the wages stated are what remains fter all assistance, which some of the miners employ and ll charges for powder are deducted. The average earn-ngs are those of miners only and company men who are aid by the day were not included in the estimate. About 0 per cent. of the men are white and 40 per cent. col-red. Comparatively few are foreigners.

The 74 men described as earning an average of $63 orked less than 15 days in the month. The *daily* earn-ngs of all the men are surprisingly close. The monthly ifference is due to the fewer days some of the men orked. The average number of days worked by all the iners was only 17 days and as Mr. Roden declares, few rofessional men could make a living, working only 17 ays per month.

⁂

Mining Accidents Studied in Public Schools

An effort is being made by J. H. Dague, educational ecretary of the Y. M. C. A., and Sam Phillips, who ormerly held the same position, but is now a state-ining inspector, to have the illustrated textbook "Mine ccidents and Their Prevention," which was published a ear or two ago by the Delaware, Lackawanna & West-rn Railroad Co. Coal Department, slightly modified in xt and adopted as a reader in the Scranton public hools. They are making the effort through the super-ntendent of schools, George W. Howell.

State Help for Mine Schools

The appropriation, this month, of $140,000 by the State of Pennsylvania for vocational training puts the rapidly growing mine schools in the anthracite region on a firmer basis than they have ever been before. Under an act passed May 1, 1913, this appropriation can be used to reimburse all vocational schools for two-thirds of their expenses of the previous year, up to a maximum of $5000, provided that the State Board of Education has approved of their organization, control, location, equipment, courses of study, the qualifications of their teachers, the methods of instruction, the conditions of admission, the employment of pupils and the expenditures of money.

The schools at Nanticoke, where the Susquehanna Coal Co., the Delaware, Lackawanna & Western Railroad Co., and the Lehigh & Wilkes-Barre Coal Co., have operations, and at Shamokin, where the Lehigh Valley Coal Co., the Mineral Railroad & Mining Co., and the Philadelphia & Reading Coal & Iron Co. are operating, have been growing by leaps and bounds. The number of classes has more than quadrupled.

The third annual report of the Nanticoke district institute and classes shows a membership of 679 for the former and eight meetings with an average attendance of 199. The classes had only two dozen students in 1910, but increased to 657 in 1912. At the examination for mine foremen's and assistant mine foremen's certificates, held in Nanticoke last March, four members of this school passed the state examinations for the former, and 24 members passed the state examinations for the latter.

The third annual report of the Shamokin-Mt. Carmel district institute and classes shows a membership of 571 for the former and seven meetings, with an average attendance of 127. There were 450 men at the first banquet, at which Morris Williams, president of the Susquehanna Coal Co., presided and spoke. The classes had 25 students in 1910, 56 in 1911, and increased to 763 last year. At the examinations for mine foremen's and assistant mine foremen's certificates, held at Pottsville last March, members of this school secured two of the former and six of the latter.

The classes at both Nanticoke and Shamokin are held in the local school houses in the evenings from October to March each year. It is aimed to locate them as centrally as possible and to hold them three nights a week so that as great a percentage as possible of those enrolled can attend regularly. No trouble is anticipated in conforming to the state requirements, especially as it will lend its supervision next year, and it was the school boards in these districts who conducted these schools last year and fostered and gave the whole movement its present impetus.

⁂

Perseverance in Resuscitation

Joseph Mango, of St. Clair, was overcome with gas at Wadesville colliery, Aug. 27, and had been given up as dead, but members of the first-aid corps, after working for an hour, revived him. Mango was removed to his home very ill, but he will recover.

Although his body was cold and stiff, and his pulse had apparently ceased, the rescuers, George Phulright, Joseph Cook and William Webb, wrapped him in a blanket and forced oxygen into his lungs with a pulmotor.

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 14—An opinion prevails, to a certain extent among miners and some mine officials, that the exclusive use of the safety lamp in a mine means that the ventilation can be neglected and gas allowed to accumulate and that miners can safely work in it with these lamps, which are supposed to insure safety and protection to the miner, in a gassy mine, under almost any condition. The safety lamp, when used with precaution and care, in a mine generating gas, is a means of safety many times to the miner; but if not so used, it is unwise and unsafe to work in gas, even with the safety lamp.

When it becomes necessary to put a mine on the exclusive use of safety lamps, that does not signify that the ventilation of that mine is to be neglected in the least. A mine worked altogether with safety lamps should be ventilated as efficiently as the one with open lights. A mine operated wholly with safety lamps should be ventilated to a degree that, after an inspection has been made, an open light could be taken to any portion of the working face with safety.

In my opinion, a dry and dusty mine, in which the formation of the seam changes frequently and the mine generates more or less gas, at times, and sudden outbursts of gas are known to occur, should be operated with safety lamps only. But a damp mine, generating gas in some sections only and free from any sudden outbursts, can be worked safely with mixed lights.

Suppose, for example, a certain mine gives off little gas in general, but a certain entry going sharply to the rise is generating gas, to some extent. Suppose this heading is advanced far enough from the last breakthrough for another connection and the air current is not ample to keep the face clear of gas at this distance. By means of a temporary brattice extended from the last breakthrough up the entry to a point near the face, the current is made to sweep the face and keep it free from gas so that open lights can be used. But if the brattice work is torn down by an overcharged shot, and, during the night, a considerable amount of gas has gathered in this heading, it would be advisable and safer to use safety lamps to replace the brattice, than to use open lights for that purpose, although open lights are being used in all other parts of the mine. Under conditions of the kind I have named, I deem it safe and advisable to use mixed lights in mining.

John Rose,
District Mine Inspector.

Dayton, Tenn.

Letter No. 15—After reading the different opinions of so many practical men, in relation to the use of mixed lights in coal mines, I cannot understand why any mining company or mine superintendent should attempt to use open lights in one section of a mine and closed lights in another section, whether the mine be rated as a gaseous or a nongaseous mine.

If, at any time, a mine becomes in such a condition that it requires the introduction of safety lamps in a particular section while the use of open lights is allowed elsewhere in the mine there will always be the fear of some careless or reckless person, with an open light on his head, setting off some gas and causing a violent explosion; whereas, if safety lamps were used exclusively, this could not occur.

In my opinion, greater safety is assured by the use of safety lamps, in any coal mine whether generating gas or not; because there is always greater risk where open lights are in use. There have been numerous accidents caused by sparks falling from an open light into a can of powder and burning miners almost beyond recognition. Mines have also been set afire by sparks from lamps falling among oily waste.

Therefore, in my opinion, the company that uses mixed lights in coal mines, is employing a penny-wise and pound-foolish policy.

John A. McDonald, Mgr.,
Dominion No. 8.

Bridgeport, N. S., Canada.

⁂

Unsuspected Causes of Mine Explosions

During the past year, I have received several letters asking for my opinion as to the origin and cause of dust explosions. Having noticed the interest manifested in your columns, in reference to the investigation of what may be termed unsuspected causes of mine explosions, I decided that there was no better method of complying with the request of correspondents than by discussing the question of these possible causes in Coal Age. Your editorial, Aug. 23, p. 273, commenting on the Brookside explosion of Aug. 2, draws attention again to the possible effect on the mine air, produced by the heat of compression due to numerous causes.

Some years ago, I made a microscopic examination of coal dust taken from the McAlester mines, in Indian Territory, now Oklahoma. This examination revealed many millions of molecular particles of a rhomboidal form, resembling minute balloons, each incased with a filmy substance that appeared like bitumen and which a chemical analysis proved to be a composition of bitumen and carbon. When this dust was placed in a beaker and treated with a 0.1 per cent. solution of sulphuric acid, a gas was given off, in copious quantity, that was hydrogeniferous. This gas, in combination with about seven parts of oxygen, formed a very explosive compound and burned in a Bunsen jet like an oxyhydrogen flame.

Further investigation led me to the conclusion that these fine particles of dust left undisturbed would, in time, decompose and become harmless, the escaping gas being diluted by the air sufficiently to render it nonexplosive. When disturbed, however, these molecular balloons were seemingly fractured, and the quantity of gas then given off rendered the air explosive. This would occur in mine workings as the result of a sudden concus-

on, such as might be produced by a "windy shot" or
eavy roof fall. The ignition of such an atmosphere
ould surely cause a terrific mine explosion.

To illustrate this condition in mining practice, let us
ippose that a shotfirer has 14 shots to fire. Each suc-
essive shot disturbs more dust and fractures a certain
ercentage of the so called molecular balloons, until suffi-
ient gas has been generated to cause an explosion when
gnited by a following shot or by the shotfirer's open
ght. A careful analysis of the dust from the Cokedale
iine, after the explosion, Feb. 9, 1911, compared with
ie results of the analysis of the dust taken from the
IcAlester mine, convinced me that there was every rea-
on to believe that the hydrogeniferous gas produced
om the coal dust, in both these mines, was the primary
iuse of explosion in each case.

If we accept this theory as a possible cause of mine
xplosions, the question arises what remedy can we sug-
est to prevent the same. In answer to this important
uestion, I would state that: 1. A longer interval of
me should be allowed between the firing of successive
iots, to give the air current an opportunity to remove
ie gases generated by the last shot. This is especially
nportant where dust is present. 2. Provide an ample
ell-split ventilating current and carefully watch its hu-
iidity. 3. Provide an efficient sprinkling or spraying
stem. In this connection, I would urge the use of a solution of the following formula: One part sodium chloride in 100 parts of water, or a 1 per cent. solution of sodium chloride.

My reason for recommending this salt solution is that a long series of experiments have proved its efficiency. The affinity of the salt for water renders it capable of retaining moisture for a long period of time, under conditions that would otherwise produce the rapid evaporation of the water. It is well known that some salts are "hygroscopic," meaning that they absorb moisture from the air and from other substances. Other salts completely dissolve in the water they absorb, and these are termed "deliquescent." The use of these salts in sprinkling keeps the mine in a semimoist condition. Also, the chlorine of the sodium chloride has a tendency to attack the film of the molecular balloons and liberate the gas gradually, which is thus diluted and rendered harmless by the air. The use of this solution is equal, in effect, to 20 applications of water, which greatly reduces the number of sprinklings required. I, therefore, recommend it as being safer and more economical. I shall be glad to correspond further and answer any questions in the same connection, having devoted much time and study to the analysis of mine dust.

THOMAS H. EDWARDS,
Mining Engineer.

Golden, Colo.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

DIVISION

The operation of division is the reverse of that of multipli-
ition. By this process, a number is divided into two or more
iual parts; or it is found how many times one number called
ie "divisor" is contained in another number called the "divi-
nd." The resultant number is called the "quotient."

The sign of division (÷) written between two numbers
gnifies that the first is to be divided by the second. The
eration is simply expressed by the formula

$$\textit{Dividend} \div \textit{divisor} = \textit{quotient}$$

r, by example, $8 \div 2 = 4$

hich is read: eight divided by two equals four.

The operation of division is often expressed by writing the
vidend above the divisor, with a line between them, which
pression is called a "fraction": thus,

$$\frac{\textit{Dividend}}{\textit{Divisor}} = \textit{quotient} \qquad \text{Or,} \quad \frac{8}{2} = 4$$

The operation is also frequently expressed by writing a
agonal line between the two numbers; thus $8/2 = 4$.

Proof by Multiplication—To prove that the work is cor-
ct, the operation is reversed and the divisor multiplied by
e quotient. If the work is correct, the product will be equal
the dividend; thus

$$\textit{Divisor} \times \textit{quotient} = \textit{dividend}$$

r, by example, $2 \times 4 = 8$

Division of Larger Numbers—When the dividend contains
veral figures and the divisor is a single figure only, the
ocess known as "Short division" is employed. But if the
visor, also, contains several figures, a different process,
iown as "Long division," must be used.

Short Division—The process is best explained by an ex-
nple. Let it be required to divide 7,814,508 by 2 and 3, re-
ectively. Write the divisor on the left of the dividend and
oceed to divide the figures of the dividend, separately, by
e divisor, and write the quotient figure, each time, under-
ath the corresponding figure of the dividend. If, in any
se, the division is not even, there being a remainder, this
ust be carried and prefixed as a tens figure to the next fig-
e of the dividend, as illustrated in the following example,
here the remainder to be carried is indicated by the small
ures written above the figures of the dividend.

$$\begin{array}{r} 2\,)\,\overset{1}{7},814,508 \\ \hline 3,907,254 \end{array} \qquad \begin{array}{r} 3\,)\,\overset{1}{7},8\overset{1}{1}\overset{2}{4},\overset{1}{5}\overset{1}{0}8 \\ \hline 2,604,836 \end{array}$$

The several steps in these two examples are as follows:

(1) $7 \div 2 = 3$, remainder 1;
$18 \div 2 = 9$;
$1 \div 2 = 0$, remainder 1;
$14 \div 2 = 7$;
$5 \div 2 = 2$, remainder 1;
$10 \div 2 = 5$;
$8 \div 2 = 4$.

(2) $7 \div 3 = 2$, remainder 1;
$18 \div 3 = 6$;
$1 \div 3 = 0$, remainder 1;
$14 \div 3 = 4$, remainder 2;
$25 \div 3 = 8$, remainder 1;
$10 \div 3 = 3$, remainder 1;
$18 \div 3 = 6$.

The Coal Age Pocket Book

Long Division—The process here is similar to that of short division, except that there being two or more figures in the divisor, it is necessary to set down each several product, in turn, and subtract it from its corresponding period of the dividend to obtain the remainder which is prefixed to the next figure of the dividend, as shown below.

```
   Divisor  Dividend   Quotient
        346 ) 156747480 ( 453027
 1st prod.     1384            346 × 4 = 1384

  1st rem.      1834          1567 — 1384 = 183       Proof
   2d prod.     1730           346 × 5 = 1730        453027  Quotient
                                                        346  Divisor
    2d rem.      1047         1834 — 1730 = 104      -------
     3d prod.    1038          346 × 3 = 1038        2718162
                                                    1812108
      3d rem.      948         1047 — 1038 = 9      1359081
       4th prod.   692          346 × 2 = 692            138  Remainder
                                                    ---------
        4th rem.   2560         948 — 692 = 256     156747480  Dividend
         5th prod. 2422         346 × 7 = 2422

 Final remainder,  138        2560 — 2422 = 138
```

In the above long division, the several products and remainders and each separate operation are indicated in small type. It is important to notice that the remainder before bringing down the next figure of the dividend is always smaller than the divisor; if not, increase that figure of the quotient and repeat the multiplication till a remainder is found that is less than the divisor.

If, after bringing down the next figure of the dividend, the number so increased is still less than the divisor, as in the case of the third remainder above, no division is possible; a cipher must be placed in the quotient and a second figure brought down and a third, if necessary, till the remainder so increased is greater than the divisor. For each figure of the dividend brought down a figure must be written in the quotient—a cipher whenever the increased remainder is too small for division. The number of figures in the quotient when the division is complete is always one greater than the number of figures brought down from the dividend.

Incomplete Division—It generally happens, as in the above example, after all the figures of the dividend have been brought down there is yet a remainder, which shows that the division is not a complete division. In other words, the divisor is not contained an exact number of times in the dividend; but there is a remainder too small for complete division.

This is best illustrated as follows: When 8 apples are divided among 4 boys each boy has 2 apples; thus $8 \div 4 = 2$. But if there were 9 apples and 4 boys, each boy would have 2 apples and there would be 1 apple left, which if divided equally would give each boy one-fourth; because there is 1 apple and 4 boys—only enough to give each boy a fraction, which is written ¼; and this makes each boy's share 2¼ apples.

Therefore, when the division is not complete write the last remainder over the divisor and annex to the quotient; thus, $9 \div 4 = 2\frac{1}{4}$.

INQUIRIES OF GENERAL INTEREST

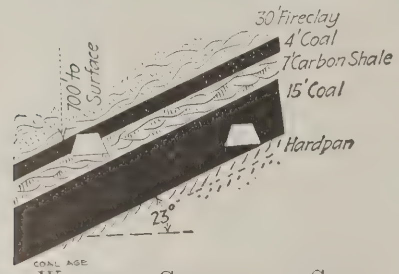
Working Inclined Contiguous Seams

Kindly describe and illustrate the working of a section of two seams of coal at an average depth of 700 ft., vertical measurement, from the surface to the pavement of the lower seam. The strata are inclined at an angle of 23 deg. from the horizontal. The upper seam is 4 ft. thick, overlaid with a bed of fireclay 30 ft. in thickness. A carboniferous shale 7 ft. thick separates the two seams. The lower seam of coal is 15 ft. thick, with a moderately hard pavement or floor.

Mine Foreman.

Johnstown, Penn.

The relation of these seams and their associated strata is shown in the accompanying figure. Assuming that the surface conditions, with respect to the location of the property and facilities for transportation are favorable, if the coal outcrops on the property at a suitable point for the installation of the surface equipment and the shipment of coal, the mine should be opened by a slope driven on the double- or triple-entry system, according to the conditions to be encountered. These main-slope openings should be driven on the floor of the lower seam and the dimensions should be such as to provide amply for the expected tonnage and the proper ventilation of the mine workings in both seams.



Working Contiguous Seams by Cross-Tunnel

If the seams do not outcrop on the company's property, a shaft should be sunk at a suitable point for the location of the surface equipment and affording suitable shipping facilities. This shaft should be located as far as practicable to the dip of the seam; but the location, in this respect, must be determined by giving due consideration to both the underground conditions of haulage and drainage, and the surface conditions previously mentioned.

From the foot of the shaft, the main-slope haulage roads and airways are driven to the rise, on the floor of the lower seam. If the coal is to be worked to the dip, this section should be developed in advance of the rise workings. Levels or gangways should be driven to the right and left of the main slope and airways. These levels should be driven on the double-entry system, approximately as shown in the figure. Chambers or chutes should be driven to the rise of these gangways, in each seam. The chambers in the thin overlying seam should be driven in advance, so that the pillars can be drawn back before the corresponding chambers in the lower seam are worked.

The chambers in the lower seam are driven up in the lower bench of coal, unless it is found advantageous to work the entire thickness of the seam at once. It will generally prove more practicable to extract the upper bench of coal in the thick seam when drawing back the pillars. The lower levels should be worked out in advance of those above.

⁂

Mining under a Soft Roof

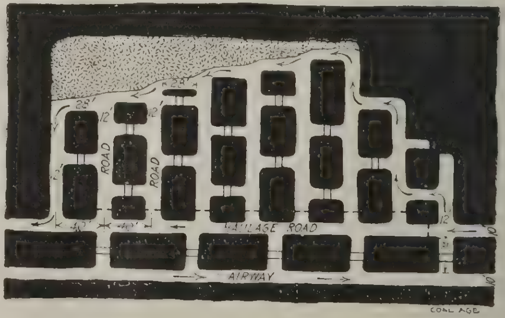
In the mine where I am employed, we are working a bituminous seam of coal 8 ft. thick and overlaid with a very soft top that gives much trouble; the bottom being also soft. It is necessary to take down 8 ft. of the top overlying the coal and haul it away, which makes the mining expensive. The coal lies 300 ft. below the surface. The rooms are driven on 55-ft. centers, with a slight pitch, about 2 per cent. Thus far we have been unable to devise any means of holding up the slate while taking out the coal. There is little water, the mine being well drained. I would be glad to receive any suggestions that would enable us to hold the roof so that the coal can be mined with safety.

Joseph Hahula.

Southwest, Penn.

The difficulty in holding a weak top, especially when working a thick seam of soft coal, is due largely to driving too wide an opening. We would suggest that the rooms, in this case, should be driven up narrow, say not to exceed 12 ft. in width; and under this frail top, the rooms should not be driven further than, say from 40 to 50 yd., which practically determines the distance between the cross-entries. The width of the room pillars, for this depth and thickness of seam, should not be less than 21 ft., which will make the room centers 33 ft.

An even better plan than this would be to drive double rooms, as shown in the accompanying figure, making the openings or stalls 12 ft. wide and 40 ft. center to center.



Plan of Driving Double Stalls

This would leave 28-ft. pillars between the respective stalls and give each miner 14 ft. of pillar to draw back, two miners working on each road except the first. When the rooms have reached their limit, say 40 or 50 yd., the work of drawing back the pillars should be commenced, and care should be taken to keep the pillar work in line. All standing timber should be drawn as the work proceeds so as to allow the roof to fall and relieve the load on the pillars.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—In post timbering in mines, what should be the ratio of the diameter to the length of the post, in order that it shall present an equal resistance to crushing and bending?

Ans.—For practically all kinds of mine timber in use, the ratio of the diameter to the length of the post, in order to fulfill these conditions, is 1:12, both dimensions being expressed in inches. This gives the simple rule: The diameter of the post in inches, measured at the small end, should not be less than the length of the post in feet.

Ques.—What are the advantages and disadvantages of drawing pillars uphill, on a pitch, say from 5 to 15 deg. or less? State fully.

Ans.—Assuming that the rooms have been driven to the dip and that the pillars are to be drawn back in a direction up the pitch, as the work progresses the weight of the roof rests more and more on the lower loose end of the pillar. While this has the advantage of assisting to break the coal from the pillar more easily, it has the disadvantage of crushing the pillar to a great extent, and the coal mined falls back into the waste where its recovery is dangerous and much of the coal is lost. The miner is also in greater danger from a sudden fall of roof or coal than when drawing pillars downhill. When drawing back pillars downhill the pillar gives greater support to the broken roof than when drawing uphill; although, in the former case, the miner must protect himself more carefully by setting timbers below the falls. Again, when drawing pillars uphill the water drains from the face of the pillar, but may accumulate in sufficient quantity as to require pumping, while the coal must be hauled up the pitch instead of sliding down a chute, as when drawing downhill.

This question may refer, however, to drawing a number of pillars starting from the basin and progressing uphill. In this case, the rooms are evidently driven on the strike of the seam, and there is a distinct advantage in drawing the lower pillars first, since the roof weight is better supported and the coal less crushed than when the work advances toward the basin. When drawing uphill, in this way, no pumping will be required; while, if the work progressed downhill, the accumulation of water at the dip would greatly impede the work on the pillars, at that point and require to be pumped.

Ques.—What kind and size of hoisting engine would you install to hoist 1200 tons of coal from a shaft 400 ft. deep, in eight hours, with a steam pressure of 70 lb. gage? The weight of coal in each car is 3000 lb. Allow 20 per cent. for resistance of engine, ropes and pulleys; also make allowance for the time lost in caging.

Ans.—The number of hoists per hour is

$$\frac{1200 \times 2000}{8 \times 3000} = 100 \textit{ hoists}$$

In hoisting-engine practice, it is customary to allow a certain time for unavoidable delays, say five minutes per hour. The time per hoist is then

$$\frac{55 \times 60}{100} = 33 \textit{ sec.}$$

Now, allowing, say 13 seconds as the time lost in starting and stopping each trip, and caging the coal, the actual net time of hoisting at a maximum speed, is 33 — 13 = 20 sec. per hoist; and the maximum speed of hoisting is then

$$\frac{400}{20} = 20 \textit{ ft. per sec.}$$

Before the load on the engine can be determined, it is necessary to calculate the size of rope required to hoist the following load: Coal, 3000 lb.; and, say car, 1600 lb. and cage, 2400 lb.; total, 7000 lb.; and adding 10 per cent., for friction, gives for the total load on the rope, 7700 lb. The diameter of the rope to support this load, using a factor of safety $f = 8$, is then

$$d = \sqrt{\frac{fL}{34}} = \sqrt{\frac{8 \times 7700}{34 \times 2000}} = 0.94, \textit{ say } 1 \textit{ in.}$$

The weight of a 1-in. rope is 1.58 lb. per running foot; and the total weight of the rope hanging in the shaft is then 400 × 1.58 = say 640 lb.

The unbalanced load hanging in the shaft is, now, as follows: Coal, 3000 lb.; rope, 640 lb.; total, 3640 lb.; and, allowing 20 per cent. for resistance of engines, rope and pulleys, as stated, the effective load or load hoisted, including frictional resistance, is 3640 ÷ 0.80 = 4550, which is the load on the engine.

The required horsepower of the engine is then

$$H = \frac{4550 \times 20 \times 60}{33{,}000} = 165+ \textit{ hp.}$$

The engine to be used for this hoist should be a duplex, direct-connected engine, having a piston speed of 600 ft. per min., and an efficiency of, say 85 per cent. Assuming a slide-valve engine, cutting off at two-thirds stroke, the mean effective pressure (M.e.p.), in the cylinder, for a pressure of 70 lb. gage at the throttle, is

$$M.e.p. = 0.9\ [0.917\ (70 + 14.7) - 17] = 54.6 \textit{ lb. per sq.in.}$$

Then, for an efficiency of $f = 85$ per cent. and a mean effective pressure of $p = 54.6$ lb. per sq.in., the diameter of the steam cylinder is

$$d = 205 \sqrt{\frac{H}{fpS}} = 205 \sqrt{\frac{165}{0.85 \times 54.6 \times 600}} = \textit{say } 16 \textit{ in.}$$

And, assuming a stroke of 18 in., the engine will make

$$(600 \times 12) \div (2 \times 18) = 200 \textit{ r.p.m.}$$

The size of duplex, direct-connected engine required in this case, assuming a double-compartment hoist, is, therefore, 16x18 in., running at a speed of 200 r.p.m. and developing 165 horsepower.

COAL AND COKE NEWS

Washington, D. C.

James E. Callbreath, secretary of the American Mining Congress, has issued the usual call and program for the forthcoming session of the congress to meet at Philadelphia Oct. 20 to 24. In the general description and discussion of the ground to be covered, Mr. Callbreath says that particular attention will be given to the question of coal mining and development and conservation of coal resources in general. He first points out some of the popular interpretations of the convervation idea as applied to coal mining and indicates the points at which these ideas are considered defective, by the public. Then he speaks of the proper interpretation of the consergation idea and says:

> The best conservation of coal resources, i.e., the highest use and the least possible economic waste, is a matter of vital public concern, but of particular interest to every industrial center depending upon coal for power. This rests not alone upon the importance of the coal-mining business, but upon the magnitude of the industries to which coal is an absolute necessity.
>
> Any increase in average production cost made necessary to conserve the more expensively mined coal reserves which is less than the transportation cost for a more distant supply, will find economic justification.
>
> Every theory of coal conservation must consider the right of the coal operator to a fair profit, the miner to fair wages and the public to have its fuel at the lowest price consistent with good mining methods.
>
> As a whole the coal-mining business is the most indispensable, the most unprofitable, the most maligned and misunderstood of all the mediums through which the welfare of the people is secured. It is the most important and the most helpless, having in it the power to command and yet being a non-resistant mass, accepting with only feeble protest the criticisms of a misinformed public. The public looks to a cheapening of this essential product by destroying the productive machinery which now furnishes it the cheapest fuel in the world.
>
> The consumer must understand that in the end he must pay the value of the coal in the ground, the wages of the miner, the expense of special safety appliances, and any additional cost of production occasioned by the public demand for conservation, which means the saving of more expensively mined coals, in addition to the regular costs of production and a reasonable profit to the operator.
>
> The coal operators cannot ignore the question of profit if they would. The wiping out of present profits must result in the destruction of the productive machinery so engaged, which would entail an enormous increase of future costs.
>
> These questions concern the laborer, the manufacturer, the investor, the mine operator and the general public, which depends upon local industrial activity. Leaders of thought representing the various phases involved, will discuss this subject.

Special study will also be given to the question of an interstate trade commission to be intrusted with the duty of making special studies of the coal-mining industry as well as other problems that have figured largely in mining discussion during the past year or so.

A Revised Resolution Is Introduced

Representative Murray, of Massachusetts, has prepared and introduced a revised form of his resolution relating to coal in which he calls upon the several executive departments for all data in their posession bearing on:

> First. Capitalization, ownership and control of the Pennsylvania anthracite mines.
>
> Second. Intercorporate relationship of the coal-mining, coal-handling and coal-selling companies and the companies transporting coal by water or rail, or both.
>
> Third. Comparative freight rates on anthracite coal and on articles of similar bulk from the principal anthracite-shipping points to the principal seaports and interior cities.
>
> Fourth. Comparative rates on bituminous coal for shipments under essentially the same conditions and for equal distances as in the third paragraph.
>
> Fifth. Cost of mining, transporting, and selling anthracite coal; the information to be in such detail as to show the relative costs of the different companies.
>
> Sixth. The total revenues, expenses and profits of the anthracite-mining companies since the year nineteen hundred.
>
> Seventh. The total revenues, expenses, and profits of the anthracite-carrying railroads since the year nineteen hundred.
>
> Eighth. Wholesale prices of anthracite coal at the mines and at the principal distributing points, and retail prices of coal in the principal cities since the year nineteen hundred.

HARRISBURG, PENN.

The appropriation of $140,000 by the State of Pennsylvania for vocational schools, which give definite preparation for a definite occupation, puts the rapidly growing mining schools conducted under the auspices of the various coal companies throughout Pennsylvania, on a firmer basis than they have ever been before.

Under Act. No. 92, approved May 1, 1913, this appropriation can be used to reimburse vocational schools, and reads as follows:

> This Commonwealth, in order to aid in the maintenance of approved local and joint industrial . . . . schools or departments, shall as provided in this act, pay annually from the treasury to school districts and unions of school districts, maintaining such schools or departments, an amount equal to two-thirds of the sum which has been expended during the previous school year by such a school district . . . . for instruction in practical subjects and in such related technical and academic subjects as may be necessary to complete well-rounded courses of training: Provided, No one school district shall receive more than five thousand dollars in any one school year.

These schools will be under the supervision of the state Superintendent of Public Instruction, as to organization, control, location, equipment, courses of study, qualifications of teachers, methods of instruction, conditions of admission, expenditures of money, etc.

The mining schools have been growing by leaps and bounds and the number of classes has more than quadrupled in the last year. In placing new schools it is aimed to locate them centrally and hold them three nights a week so that as great a percentage as possible of those enrolled can attend regularly. No trouble is anticipated in conforming to the state's requirements, especially as it will lend its aid and supervision next year. It was the school boards of these mining districts who conducted these schools last year and fostered and gave the present impetus to the whole movement.

The good accomplished by the mining institutes and schools, together with the splendid efforts of the Y. M. C. A., the International School of Correspondence, the University of Pittsburgh, and several of the coal companies is shown by the number of pupils which are among those receiving state certificates for mine foreman, assistant mine foreman, fire boss, etc., which are now ready for distribution by the Department of Mines.

This appropriation is something new and is largely experimental. If there is an increase in vocational schools, the Legislature will doubtlessly be induced to increase the grant at its next session. It is a small beginning at meeting the modern demand for something more practical in the school system. The progress of the schools will be watched with much interest.

A Thorough Inspection Is Ordered

The Chief of the Department of Mines Hon. James E. Roderick, has ordered an investigation of all electrical equipment in the anthracite region and the Randolph Means Co., consulting engineers of Pittsburgh, has been designated by Mr. Roderick to make the inspections. This company has been doing similar work in the bituminous region of the state.

At present the work will be confined to inspection of equipment in the mines throughout the Lackawanna region, and will be extended as soon as possible until the whole anthracite field is thoroughly inspected.

It is the intention of the Department of Mines to institute a thorough examination and wherever the installations are not in keeping with the standard methods, recommendations will be made that will reduce the hazards from electricity to a small percentage. Electricity in the anthracite region is rapidly gaining in favor as a transmitting medium to the different mechanical operations around the collieries.

PENNSYLVANIA

Anthracite

Scranton—Five properties at Park St. and Capouse Ave. were damaged by a mine cave recently, the fissures that wrecked the buildings extending to the middle of the thoroughfare.

Wilkes-Barre—The Delaware and Hudson Co. has made an offer to the Sacred Heart Church for a settlement on a basis of $600 for damage done to the cemetry owned by the congregation, by mining operation of the company's Pine Ridge Colliery. Members of the congregation will probably insist on the damaged burying plot being repaired or in having the bodies re-interred from the worst affected graves.

Hazleton—Over 700 foremen and clerks of the Lehigh Valley Coal Co. from points between Pittston and Shamokin, on Saturday Aug. 23, held their annual outing at Hazle Park. The collieries of the company were closed to permit the men to attend the picnic.

Bituminous

Sykesville—The 200 men who went on strike at the mines of the Cascade Coal Co. about three weeks ago, returned to work Aug. 27. The strike was occasioned as a protest against poor working conditions, and the agreement effected was in the men's favor.

DuBois—C. P. Munch, who formerly leased the mines at Caylor, Armstrong County, then owned by the Great Lakes Coal Co., has been charged by the Union with having embezzled money which was deducted by him from the miner's pay on behalf of the United Mine Workers of America. He has entered bail before the Justice of the Peace for $500. An endeavor is also being made by several miners to collect from him by civil action wages which are said to be still due them for labor performed.

Bakerton—Two new mines are soon to be opened in the northern end of Cambria County. The first opening will be on the White farm and some 3000 acres will be operated. New houses are to be erected by the Barnes-Tucker interests, which are the operators of the new mines, and in a short time a large mining town will rise near the operations. Electric haulage and other modern devices are to be installed, and the workings will be run on a thoroughly uptodate plan. The Pennsylvania R.R. has a line near the field and will handle the output.

Charleroi—The first coal was run recently at the new plant of the Carnegie Coal Co. at this place. Two hundred men are now employed and it is expected that in a short time, this will be increased to 800. This is the first time the mine has been in operation for three years. The new operation contains about 1200 acres of coal, which was purchased for approximately $1,500,000.

WEST VIRGINIA

Charleston—Since his return to Charleston from a short trip West, President Thomas Cairns, of District No. 17, United Mine Workers of America, has received many urgent letters requesting him to send organizers into the Fairmont and Norfolk & Western coalfields. This matter must, however, be taken up with the higher officers of the United Mine Workers before organizers can be sent.

Work on the opening of a new mine by the Virginia Coal Co. on the Coal Fork of Campbell's Creek, is progressing rapidly, and it is expected that coal will be taken from this mine within a few days.

Williamson—By decree of the Mingo Circuit Court and the Common Pleas Court of Hamilton County, Ohio, the receivers have been directed to sell at public outcry the assets of the James R. Shanklin Coal Co., whose principal office is in Cincinnati. The sale will be made at the company's works at Blocton.

ALABAMA

Jasper—C. B. Stalnaker and associates, of Jasper, Alabama, have acquired a tract of coal land on the Northern Alabama Ry., near Jasper, containing a 9-ft. bed of Big Seam coal, and are making arrangements to operate same at an early date.

KENTUCKY

De Koven—Fire caused by lightning recently destroyed the general company store of the Ohio Valley Mining Co., at De Koven, Ky., causing a loss of about $20,000. The postoffice was located in the building, and was also burned.

Lexington—Twenty-one mine foremen's certificates were recently granted by the Kentucky Mining Department, at Lexington, after the completion of the examinations held the last week in August, to ascertain the qualiificaitionis of the applicants. Of the certificates granted, six were first-class and the remainder second-class.

Corbin—A disiastrous fire, at Corbin, located at the junction of the main line of the Louisville & Nashville with its Mididlesboro branch, and about 100 miles north of Knoxville, Tenn., caused damage estimated at a quarter of a million dollars, destroying eight stores, two hotels and a dwelling. The town is one of the most active in the southeastern Kentucky coal fields, being the seat of many operating companies, as well as an important railroad point.

OHIO

Columbus—The commission appointed by Governor Cox to investigate the conditions surrounding the payment for coal mined in Ohio, has examined a number of mining districts of the state. Among the counties visited were: Jackson, Coshocton, Stark, Columbiana, Tuscarawas, Guernsey, Belmont, Jefferson, Muskingum and Perry.

The commission left Sept. 2 for a trip in the coal fields of Illinois, where it will collect information of use in this work. It has been decided not to investigate conditions in the mines of the Pomeroy Bend district, because of the fact that they are so similar to those prevailing in eastern Ohio.

John C. Davies, state mine inspector and a member of the commission, says it will probably be Dec. 1 before a final report is ready and it will require hard work to get it completed by that time. The report will be submitted to a special session of the Ohio General Assembly, to be called the coming winter.

Maynard—A fall of stone at the Purseglove mine, near Maynard, caused it to be closed for several hours, Aug. 27. The fall occurred in an old entry and blocked the main road, over which the haulage motors operate. No one was near the place when the fall occurred, and no one was injured.

INDIANA

Francisco—While a deep water well was being driven on Judge O. M. Welborn's farm, two miles west of here, the drill, at a depth of 200 ft., passed through a 6½-ft. vein of excellent coal, indicating that the Francisco field is at least two miles wide.

Petersburg—The Vandalia Coal Co., of Indianapolis, now has options on 5000 acres of the best coal land in Pike County, the options covering a territory of seven square miles. In some places two or three veins exist, ranging from four to seven feet thick.

By hard work, 250 miners who were in the Littles mine, near Petersburg, Ind., were taken out when fire broke out at the mine recently. The fire started in the fan house, and was confined there by the efforts of 200 men while the miners in the workings were being removed. The united efforts of the miners and others subdued the blaze after a time, and the damage was repaired in three or four days after the fire.

Washington—Samuel Elswick has opened a new coal mine south of this city and is taking out coal of good quality. He has a vein 4½ ft. thick, and though employing only a small force of miners at the present time, he expects to have room for many more during the winter months.

ILLINOIS

Ladd—The mine of the Illinois Third Vein Coal Co., which has been closed down for about six weeks, undergoing some needed repairs, has recently resumed operations.

Seatonville—The No. 4 mine of the Spring Valley Coal Co., located at Seatonville, has suspended operations for a period of perhaps six weeks, for repairs preparatory to a good run during the fall and winter months.

Springfield—Mine A of the Citizens' Coal Co. will resume operations soon, as will also the mines of the Central Co-operative Coal Co., which have been closed down for the summer months. There seems to be a shortage of men in some parts of the state, but the mines generally are working a little better than formerly.

Belleville—The Boyd Coal & Coke Co., has applied to the Circuit court for an injunction to restrain the officers of the United Mine Workers from "aiding and abetting" a strike by paying benefits to striking miners. The company claims that by paying strike benefits the union officials are preventing the operation of the mine.

Du Quoin—The strike at the Majestic and Queen mines came to a climax recently, when Superintendent A. C. Eaton, of the mining company, shot and killed William Sisney, a member of the pit committee at the Majestic mine. It is understood that the men met and got into a controversy over the differences of the oposing factions. Following the shooting, both parties got together and the trouble has been settled.

De Soto—The mine of the Kuckemeier Coal Co. will likely resume operations in the course of the next month, after the re-lining of the main shaft. A boulder moving in quicksand, and weighing seven tons, caused the shaft to cave in and this had to be blasted out.

ARKANSAS

Fort Smith—The controversy over the water situation at the Western Coal & Mining Co. property at Jenny Lind which has called forth much criticism is now at an end. The operators are repairing their wells and seeking a new water supply, and according to Judge Hester an amicable settlement has been reached satisfactory to all concerned.

COLORADO

Colorado Springs—The organization work which is being carried out all over Colorado by the United Mine Workers of America has been extended to the coal mines in El Paso County. The miners here number only about 350 or 400 men, but about 100 have joined the local union.

Denver—Officials of the United Mine Workers of America on Aug. 25 issued a signed statement denying that the open shop would be considered as a basis of negotiation with the operating companies. This statement also affirms, however, the intention of the union officials to exhaust all honorable means to bring about a settlement before a strike order is issued.

FOREIGN NEWS

Vancouver, B. C.—Public indignation over the forced importation of Japanese coal, as a result of the refusal of the operators to arbitrate the strikes in mines near here, is liable to effect, it is said, the opening of government mines in Alaska. The mine operators declare that they will import Japanese coal until the strikers return to work and the owners are being bitterly denounced as responsible for this situation.

PERSONALS

J. F. A. Williams, of New Orleans, has been appointed sales manager of the West Kentucky Coal Co. with headquarters at Paducah succeeding W. E. Gage, who resigned several weeks ago.

Earl A. Henry, inspector of the 5th West Virginia mining district, has been appointed chief inspector of the state department of mines succeeding John Laing, resigned, effective Sept. 1. Mr. Henry has been a district inspector for 14 years.

Carrol A. Garner, who, for a number of years, was employed as an instructor in the mining department of the Pennsylvania State College, has resigned, and accepted a position with the Lehigh Valley Coal Co., as a mining engineer, in the Hazelton Division.

CONSTRUCTION NEWS

Pottsville, Penn.—The Maderia Hill Coal Co., of Pottsville, expects to build a 3000-ton capacity breaker in the near future.

St. David, Ill.—The contractors who will do the construction work on the head frame of the No. 2 mine of the Big Creek Coal Co., which was destroyed by fire about three weeks ago are on the job and will begin work soon. It is estimated that 60 days will be required to place the mine in condition for operation.

Kenova, W. Va.—In order to connect up its proposed Beaver Creek branch line with its main line, whose nearest point is Kenova, W. Va., 100 miles distant, the Baltimore & Ohio R.R. is said to be planning a line from Kenova up the Big Sandy Rivier, which will give an outlet to the various large operations along Beaver Creek, as well as on the newly completed line at the mouth of Shelby Creek, 20 miles east of the Beaver Creek line.

Pittsburgh, Penn.—The purchase of the Belmont Central R.R. built a number of years ago to tap the Belmont County, Ohio, coalfields has revived talk of the construction of a connecting line between the Newark and Cleveland divisions of the Baltimore & Ohio. It was the latter line which recently purchased the Belmont Central. The road extends from Lafferty, Ohio, toward Morristown and if the connecting link is constructed will pass through the latter place connecting with the Newark division at Belmont.

Morgantown, W. Va.—The Polard Coke Co., which owns 1100 acres of coal along Dunkard Creek in Greene County, Penn., expects to begin work about Oct. 1, on 220 new ovens of the Mitchell type. Some ovens are at present in operation, and the entire plant of 250 ovens is to be in blast by July 1, 1914. A contract has also been awarded to the A. K. Jenkins Lumber Co., of Point Marion, for 30 new houses. This company is the first to begin actual operation in the Greene County field made available to the coke and coal market by the extension of the Monongahela Railroad to the state line, where it connects with the Buckhannon & Northern Ry.

Whitesburg, Ky.—It is reported that the Lexington & Eastern will soon begin the construction of a branch line three miles in length up Potter's Fork, in order to reach the holdings of the Mineral Fuel Co. It is expected that the Mineral Fuel Co. will build a town at the end of this branch plans having been prepared providing for the building o over a thousand houses, including dwellings, hotels, boarding houses, stores, churches and schools. The work of ballasting the entire upper end of the Lexington & Eastern is nearing completion, making the line a first-class one i every respect as far as Whitesburg.

San Francisco, Calif.—Capitalists on the Pacific coast ar figuring on establishing a by-product coke plant at San Francisco, expecting to receive coal for this plant from the Atlantic sea board, the coal to be transported through the Panama Canal when same is opened to navigation. At present a great deal of coke is used on the Pacific coast, being received from Australia. A by-product coke plant at San Francisco would have a good market for all the by-product so that there would be no loss from any source. It is believed by many that such a plant receiving coal from Pennsylvania, West Virginia or Virginia would be a decidedly paying proposition.

Johnstown, Penn.—What is declared to be the final survey preparatory to the beginning of actual construction i now being made by a large corps of surveyors working i Somerset County under the direction of the Western Maryland R.R. The proposed road will leave the main line nea Rockwood and go north through the Husband field to Jenners, tapping some of the richest coal land in Somerse County. The New York Central is gradually extending it coal branches down through Cambria and Indiana Counties directly toward the northward extension of the Wester Maryland. It is predicted that these two lines will mee in Johnstown, and will have no diifficulty in making connections, thus tapping another heavy freight district. line through here would give the New York Central anothe route into the rich West Virginia coal fields, which hav been extensively investigated by the Vanderbilt interests o late.

NEW INCORPORATIONS

Memphis, Tenn.—The Mercer Coal Co., of Mercer, Tenn has been incorporated with a capital stock of $50,000 t develop coal mines.

St. Louis, Mo.—The Briquette Coal Manufacturing Co., o St. Louis, has been authorized to sell its stock and engage i business. This concern is capitalized at $160,000.

Philadelphia, Penn.—The Eastern Pennsylvania Coal C of Philadelphia, has filed notice with the Secretary of Stat of increase of stock from $200,000 to $7,500,000.

New York, N. Y.—The Alexander Coal & Coke Corporation has been incorporated with a capital stock of $100,0 by W. H. Alexander, D. M. Stokes and A. Van Fosson.

Pittsburgh, Penn.—The Appalachian Coal & Timber C has been incorporated with a capital stock of $50,000 by T. Manning, P. H. Reniers, M. J. Sebolt, all of Pittsburgh.

Somerset, Penn.—Application will be made Sept. 22 b Harry J. Filer, Frank P. Filer and Enoch W. Filer for th charter of an intended corporation to be called the Lak Trade Coal Mining Co.

Pineville, Ky.—The Looney Creek Coal Co. has filed articles of incorporation at Frankfort. The company will operate in Harlan County above Poor Fork, close to the workings of the Wisconsin Steel Co.

Knoxville, Tenn.—The Golden Ash Coal Co. has been incorporated in Knox County with a capital stock of $40,00 The Southern Mining Co. has also been incorporated i Knox County with a capital stock of $30,000.

New York, N. Y.—Rubel, Nager & Rubel have been incorporated in Brooklyn to deal in coal, coke, etc. The capita stock is $100,000 and the incorporators are S. Nager, J Rockville Center, S. A. Telsey and S. Rubel, of Brooklyn.

St. Louis, Mo.—The East Kentucky Coal & Coke Co. hav filed articles of incorporation in St. Louis. The incorporato are S. R. Johnson, H. T. Ochterbeck, W. D. Condie and W. Spinney. The object of the firm is to buy, sell and mi al, coke, iron and other mineral products and the capi- stock which is wholly paid is $2000.

Connellsville, Penn.—The Pittsburgh Steam Coal Co. and e Stoner Coal Co. have consolidated under the name of the nnellsville Coal & Coke Co. The Pittsburgh Steam Coal operated plants at Montana and Opekiska, W. Va., while e Stoner Co. had plants at Alverton in Westmoreland unty, Penn.

Charleston, W. Va.—The Barton Coal Mining Co. has been corporated at Philadelphia to mine, manufacture and deal coal, coke, lumber and other commodities and products. ie authorized capital is $25,000 and the incorporators are alter S. Simms, of Philadelphia, W. F. Jacoby, Morristown, nn., J. Leon De Hart, of Philadelphia, and others.

Toledo, Ohio—The S. C. Schenck Co. has been organized Toledo with Dan Schenck, well known in coal circles, the head of the new concern. The new company was corporated under the laws of Ohio with a capital stock of 00,000, and will take over the business formerly conducted S. C. Schenck, deceased, and will retain its former head- arters on Superior St. The Chicago office will also be aintained. The officers are: President, D. D. Schenck; ce-president, H. E. Schenck; secretary and treasurer, L. R. henck. C. L. Dering has been appointed manager of the icago branch.

INDUSTRIAL NEWS

San Francisco, Calif.—The Goldschmidt Thermit Co. has oved its office from 432-436 Folsom St., to 329-333 Folsom ., San Francisco.

Pottsville, Penn.—The Wolf Creek Coal Co., of Hazleton considering shipping all of its product to the colliery at w Boston, and its preparation for market at that place.

Gebo, Wyo.—The Owl Creek Coal Co. has recently pur- ased from the Kerr Turbine Co., Wellsville, N. Y., a 200- v. direct-current Economy turbo-generator for installation Gebo.

Manila, P. I.—The Norwegian steamer "Titania" has en taken under time charter for a period of four years, d is to ply between Japanese ports and the Philippines th coal.

Sebree, Ky.—It is reported that a syndicate has acquired al rights in the western end of Webster County, cover- g about 40,000 acres, at prices averaging approximately 0 an acre.

Portland, Ore.—On completing her forthcoming voyage China from Portland, with a lumber cargo, the Norwegian amp "Thor," Captain Kroger, will load back for the Coast d then go into the coal trade between British Columbia, n Francisco and Portland.

Moundsville, W. Va.—The Ben Franklin Coal Co., of West rginia, is installing a Christie box car loader at its Panama ne. The siding tracks are also being raised about 8 ft. ese improvements are being made because of an increase the number of orders.

Portland, Ore.—The British steamer "Harlow" is now in rtland Harbor to load. She brought over from Rotter- m to San Francisco the largest coal cargo on record on e Pacific Coast. The cargo was 9554 tons, and was for n Francisco coal dealers.

Provo, Utah—The Spring Cañon Coal Co. will place in op- ation in its mines at Helper, Utah, 6-ton and 15-ton, 40-in. ge electric mining locomotives, and will install in its power ant a switchboard, all the apparatus having been ordered om the General Electric Co.

Pottsville, Penn.—The prolonged drouth in this region has used the collieries and washeries to run short of water, d many mines must soon close unless heavy rains come. me collieries are using the strong sulphur water from the nes for steam purposes, although it is extremely injurious the boilers.

Parsons, Kan.—A fire which started in 31,000 tons of coal red in the yards of the Missouri, Kansas & Texas Rail- y Co. six weeks ago is still burning. It is estimated that e company has lost 6000 tons of coal since the fire started. e gas and fumes from the burning coal makes it almost possible for a person to live in that part of town.

Whitesburg, Ky.—It is reported that John Litts and asso- tes, of Wise County, Va., are closing deals on a boundary between 15,000 and 18,000 acres of rich coal and timber d lying along Rockhouse Creek and Carr's Fork, west of hitesburg, along the borders of Letcher and Knott Coun- s.

Birmingham, Ala.—The American Concentrator Co., of Joplin, Mo., have effected an arrangement with the Roberts & Schaefer Co., whereby the latter company is to design and build the new coal-washing plant for the Tennessee Coal, Iron & R.R. Co., at Birmingham, Ala., for which the American Concentrator Co. recently contracted, and in which plant their "Elmore" coal jigs will be used.

Somerset, Penn.—A deal involving the transfer of 215 acres of the surface and mineral rights of the Geo. B. Mangus farm near the new mining town of Cairnbrook was closed Aug. 26 by M. L. Reiman, of Johnstown who held an option on the property, making the transfer to John Lochrie, of Windber for a consideration, that was in the neighborhood of $30,000. It is the intention of Mr. Lochrie to develop the mineral.

Connellsville, Penn.—The probability that the constitutionality of the recent act placing a tax of 2½ per cent. on the value of anthracite coal at the mines will be tested is indicated by the action of some of the companies in segregating this tax and keeping a complete record of the persons from whom it is received, so that should the act be declared unconstitutional there will be little trouble in making the proper refund.

Philadelphia, Penn.—The Pennsylvania R.R. is soon to install a wireless telephone system on the trains of that road for the use of the engineers and conductors. It is said that this new scheme will do much toward the prevention of accidents. Preliminary tests have already been completed over the Huntington and Broad Top line and the freight and coal trains of the road are now being equipped with the new wireless system.

Canonsburg, Penn.—The Joseph Cowden heirs have sold their farm of 240 acres near Bishop in Cecil township to people representing the Montour Railroad Co. for $250 an acre. The tract of land contains 240 acres, so that the total sum involved in the deal was $60,000. As the farm was badly cut up by the new railroad, the owners refused to consider the amount offered by the company for right of way and insisted on selling outright.

Pittsburgh, Penn.—The freight traffic on the New York Central lines through northern Cambria and Clearfield counties is increasing rapidly, and some big improvements are being contemplated by officials of the road. The coal companies operating along the Cairnbrook-Windber branch are storing train loads of coal to be shipped as soon as the branch is in operation, and it is feared that there will be a freight rush when this line is finished.

Harrisburg, Penn.—The United Mine Workers are determined to force the question of eliminating electric motors from anthracite mines, which are considered dangerous by reason of the presence of gas. Several accidents happening recently have brought attention to the fact that a spark from a motor has set off the gas. Acting upon instruction from the subdisitrict convention, held by the union recently, the officials have presented the facts to the Department of Mines and will insist that the danger be eliminated.

Duluth, Minn.—Hard coal shipments from the head of the lake for the month of August will not equal the coal tonnage of August a year ago by approximately 20 per cent. There appears to be no dimunition in the demand for coal, but at the present time there is no certain shortage, and hence no apparent hurry for customers to order their coal. Coal is moving from the dock slowly, and this fact has determined the amount that is coming up the lakes. Railroad men do not anticipate a heavy movement from the docks until later in the Fall.

Waynesburg, Penn.—One of the largest deals in coal acreage in Greene County has been practically closed between J. V. Thompson of Uniontown, and the Youngstown Sheet & Tube Co. Over 5000 acres of the finest coking coal lands situated in Cumberland and Monongahela township are involved in this deal, and the consideration named is nearly $5,000,000, or an average of about $1000 an acre. In addition to the coal rights the surface land is included, and it is expected that mining and coking operations are to be opened on a large scale shortly. Several hundred ovens will be erected and several shafts sunk.

Philadelphia, Penn.—Another attempt to smash the anthracite coal trust was begun Sept. 2, when the Government filed a civil suit under the Sherman law. The Reading system, the railroad, coal producing and subsidiary rail and coal corporations was attacked.

That the system owns 75 per cent. and transports 50 per cent. of all the anthracite coal in Pennsylvania was alleged by the Government. The bill declares unless the present combination is smashed the Reading will in time "control every ton of commercially valuable anthracite known to exisit."

COAL TRADE REVIEWS

GENERAL REVIEW

Full winter circular on hard coal now in effect and business temporarily restricted. High prices on bituminous diverting some demand to the anthracite steam grades. Seasonal business in soft coal far ahead of any previous record. Demand continues as strong and insistent as ever.

With the full winter circular on hard coal now in effect there has naturally been a temporary curtailment in business. However, anthracite occupies a strong position. An unusually large volume of orders has been carried over from the summer still unfilled; the retail trade is already beginning to tune up and the current month will see considerable activity. The high prices prevailing on bituminous is diverting some business to the smaller grades of hard coal.

Although there is a feeling in the bituminous trade that buyers have accumulated large advance stocks, it is probable now that the production about balances the demand and the realization of any one of the several impending favorable conditions, will precipitate a sharp advance. There is no question but what the seasonal average business on soft coal has been greatly exceeded, and if the market can be held steady over the next few weeks the colder weather will bring a natural support that will carry it through the balance of the season. However, the West Virginia grades are firmer in spite of excellent loading dispatch at the terminals, and it hardly seems possible that there can be any easing off in the buying power. The better grades generally are well filled up, and with the scarcity of labor and cars the market should have no difficulty in maintaining its position.

The demand for prompt coal from the Pittsburgh district in the Lake trade is good with moderate premiums being obtained. Some uncertainity is expressed over the future, but the present situation could not be improved upon, although it is probable that there is considerable buying in anticipation of the biennial wage agreement Apr. 1 next. The production is up to the full rated capacity, and the car supply fair. Rumors are current of a congestion at the head of the lakes, which may eventually divert considerable of the Pittsburgh district coal into other markets. As yet there is no apparent increase in the supply, however, and everyone continues to be short of coal.

The car shortage has become quite acute in Ohio and promises to interfere with the Lake shipping unless relief is obtained shortly. However, both steam and domestic grades are strong and a large tonnage is moving into the Northwest. A new advanced circular was put into effect Sept. 1. The dumpings at Hampton Roads were heavy during the week, principally in the New England trade, foreign shipments being relatively light. Vessels have been loaded promptly, although some agencies have been compelled to go into the spot market for tonnage to fill out their requirements; the car supply is much improved in this section. The demand in the Southern market is strong, with prices at a slightly higher level; the car shortage is causing some operators to fall behind on their contracts, and this is the worst feature in the local situation.

There is considerable pressure on the screenings market in the Middle West, but otherwise the trade is strong and indications are good for an excellent business this month. Producers generally have long-term contracts at satisfactory figures and are taking an optimistic view of the situation. Some trouble is being experienced in obtaining the desired kind of railroad equipment, and the possibility of labor trouble in certain districts is also adding an element of uncertainty to the situation. The mines in the Rocky Mountain regions are beginning to tune up to full capacity on improved conditions in the market; indications of a coming car shortage are noted by the scarcity of box cars.

BOSTON, MASS.

Pocahontas and New River slightly firmer, with ample business for the present. Georges Creek less plentiful. The better Pennsylvania grades practically unchanged. Anthracite unusually active for the season.

Bituminous—The market on Pocahontas and New River this week is a shade firmer. Sales have been made rather freely at $2.90 f.o.b. for coal to be taken in the next 30 days and this in spite of large receipts and excellent loading dispatch at all the terminals. Several of the agencies were
pecting to be actively in pursuit of new business by this ti
but orders still keep ahead of the output. At New Engla
distributing points the supply about balances the dema
The outlook, therefore, is hopeful and any one of a numl
of things that might happen would be enough to send pri
higher. It is generally felt, however, that buyers have
been laying in heavy advance stocks and that when their
quirements in that direction are fully satisfied much of
buying power will be withdrawn. There is also a tender
to buy farther into the next contract year than has ordinar
been the case.

Arrivals here have been heavy the past week, 60,000 t
having been entered at the B. & M. wharf alone, this bei
about twice the normal figure. There has probably not b
a time in recent years when mills and other corporatic
were so intent on accumulating coal. In Georges Creek th
has been another spurt, so that supplies are less plenti
than a week ago. The demand from the line and offsh
trade has been exceptional and for the present shipments
tide will be somewhat curtailed.

Pennsylvania coals are less heard from just now, but t
price remains practically unchanged. Most of the operat
have sufficient contract business in hand so they are
worrying much over spot coal. The quality grades are w
sold up for the present, the output being still less than n
mal. There is much interest in the outlook this fall
Pennsylvania bituminous, but it is early to make predictio
It is rumored the all-rail sales have not been as heavy
proportion as those at tide-water and therefore that the w
ter months may show a mild flurry on rail coals when t
tide-water trade is running along smoothly.

Anthracite—September opens with an unusually large v
ume of orders still unshipped and there is no doubt now th
the hard-coal market will maintain its strong positi
throughout the season. Most dealers as well as such co
sumers as the large gas companies are running along
hand-to-mouth shipments of broken, and stocks of stove a
not any too large. The retail trade is beginning to come
strong, and September is likely to be a heavy month for lo
deliveries.

Wholesale quotations on bituminous are about as follov

	Clearfields	Cambrias Somersets	Georges Creek	Pocah New Ri
Mines*	$1.10@1.50	$1.35@1.65	$1.67@1.77

NEW YORK

**Anthracite companies carrying small stocks of prepar
sizes over. Stove and broken in short supply and pea b
coming tighter. Soft coal shows a further stiffening due
car shortage and the holiday cessation of work.**

Anthracite—There seems to be little or no change in t
anthracite situation at this time. Broken coal continu
scarce; egg is a little easy, stove also scarce and chestn
plentiful. The demand for pea is getting strong on the li
trade. Buckwheat is very plentiful, rice is becoming a dr
and No. 3 Buckwheat while plentiful is improving. The co
panies are carrying little or no prepared coal in stock ou
side of chestnut and have but a moderate amount of sma
sizes in storage.

The hard-coal market is quoted on about the followi
basis.

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individu
Broken	$5.00		$4.95	
Egg	5.25	$5.15@5.25	5.20	$5.10@5

Rice	2.25	2.25	1.95@2.20	1.70@2
Barley	1.75	1.60@1.75	1.70	1.30@1

The Bituminous market seems to have strengthened som
what over its condition of last week due no doubt to t

shortage of cars on the Pennsylvania Railroad Thursday and Saturday of last week and the holidays this week. Any weakness that appears in the market seems to be on coal standing at the piers unsold. All of the operating companies have plenty of orders at the mines and most of those producing higher grades of coal are unable to promise shipment for the next week or two. The demand is not strong. The New England market while steady is receiving a heavy tonnage and contracts are getting good attention. Lake shipments are continueing on a large basis but there is a feeling that the docks at the head of the lakes are getting filled up and shippers are under the impression that they may find it necessary to sell some coal in the Eastern market in the near future.

Gas coal is strong and firm as yet with slack scarcer than it has been and up about ten cents in price. The market is quotable on the following basis:

West Virginia steam, \$2.60@2.65, fair grades of Pennsylvania, \$2.70@2.75; good grades of Pennsylvania, \$2.80@2.85; best Miller Pennsylvania, \$3.10@3.20; George's Creek, \$3.15@3.25.

PHILADELPHIA, PENN.

Anthracite market shows little or no improvement. Broken coal still a feature, with the demand good and supply deficient. The middle of September indicated as a possible turning point. Bituminous market a trifle easier; prices well maintained, but deliveries better.

The first week in September, which is the initial month of the full circular prices, has not opened up in a particularly auspicious manner. Curtailed operations at the mines still continue effective, and except for the demand for broken and stove coal, there is practically no market. The high prices for bituminous has had the effect of creating a slightly better call for the steam sizes, but on the whole, there is no very marked improvement. Until the middle of September there is not likely to be any change for the better, this period generally being considered the ending of the summer dullness, and the beginning of fall activity.

The retail market still reports conditions to be anything but good. Odd lots here and there mark the return of the householders who have been absent during the heated term, and when the cool evenings make themselves manifest, business should pick up. The celebration of Old Home week at Mahanoy City has further curtailed the output of coal inasmuch as many of the collieries in the vicinity of that town suspended work in order to take part in the festivities.

The bituminous situation showed a tendency to ease off during the last week. Not that prices have in any way sagged, but there appeared to be a little more coal offering, and slightly better inducements offered in the way of prompt deliveries. Prices still range around \$1.15 to \$1.20 for almost any kind of coal, although there are reports of slack being sold at less than \$1.

ATS

PITTSBURGH, PENN.

Coal production at full capacity. Prompt supply insufficient. Additional sales for the lake trade. Connellsville coke price maintained despite bear efforts. Hostetter Connellsville output in the market.

Bituminous—Mines continue to operate at substantially full capacity, except for occasional stoppages like that of last Saturday, when the annual picnic of the miners of the Monongahela valley occurred and Labor Day this week. Car supply has been fairly good only, but is expected to be improved somewhat by the breathing spell given the railroads through these interruptions to mining. Demand for odd lots of coal continues fairly good, with offerings light. There has been a considerable demand for additional coal for lake shipment and \$1.35 has been readily obtained on such lots as could be spared.

On the whole the coal situation could hardly be better, though satisfaction over the heavy movement is tempered somewhat by reflection that a part of it is probably due to anticipation of an unusually severe contest over the biennial scale, which comes up for readjustment against the close of the present scale period, Mar. 31 next. We continue to quote regular prices, subject to premiums frequently for prompt coal: Slack, 90c.; nut and slack, \$1.05; nut, \$1.25; mine-run, \$1.30; ¾-in., \$1.40; 1¼-in. steam, \$1.50; 1¼-in. domestic, \$1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—Recent rumors of irregularities in furnace coke prices when traced to their source seem to hinge partly upon the offering of coke under standard at slight cuts from the regular figure of \$2.50, and to the desire of a merchant house, so it is alleged, to break the market. The test of actual buying has brought out actual contracts for September at the full price of \$2.50, for standard grade coke, and a fair volume of prompt business has also been done at this figure. Negotiations have been on the past few days which when concluded will probably cover all the furnace coke needed for September in addition to regular contracts, and at full prices for standard grade. The output of furnace coke, some 25,000 to 30,000 tons monthly, of the Hostetter-Connellsville Coke Co. controlled by the United States Steel Corporation, is temporarily on the market. The August tonnage was quietly disposed of at the full price, and a large part of the September output has already been closed, with negotiations on for the balance, all at the full figure. There are prospects that the coke will not be offered for October, being required by the steel corporation, and the absorption of this extra tonnage for August and September is taken as a clear indication of the strength of the market. We continue to quote: Prompt furnace, \$2.50; contract furnace, \$2.50; prompt foundry, \$3; contract foundry, \$3, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 23 at 369,476 tons, a decrease of 27,141 tons, and shipments at 269,323 tons, a decrease of 28,954 tons. The weekly average of production and shipments during the first half of the year was 410,000 tons, the average in July having been about 378,000 tons and thus far in August about 387,000 tons.

BALTIMORE, MD.

Bituminous market remains excellent, the demand being far above the seasonal average. Anthracite business increasing, especially for assorted sizes.

The soft-coal market remains exceptionally good for this time of the year. Not only is the seasonal average being surpassed, but instead of a cessation the demand seems to be on the increase. Most coal men are rather at a loss to explain the present state of business, but all agree that affairs are good just now. Prices remain firm, quotations generally being about on a par with those of the past week. Complaint is being made of a shortage of slack and still higher figures for that grade seem in store. As a matter of fact, if the market can be held steady for a few weeks longer the winter demand will open up.

There is only one discordant note to the present situation from a strictly local viewpoint, and that is that while loadings were fairly heavy at the piers the past week, a smaller number of charters than usual was announced. This slow down was in regard to coastwise and foreign business alike. Scarcity of miners is cutting a considerable figure at present, and this, with a renewal of the car scarcity, is preventing the tonnage movement from being quite as large as the present call for coal would seem to warrant.

Anthracite conditions are highly satisfactory. Quite a number of consumers who want assorted sizes are now urging prompt delivery. While all kinds of hard coal is to be had just now without especial difficulty, the experience of past years has taught many consumers that this may not be the case a month or so from now.

BUFFALO, N. Y.

Some difference of opinion as to the outlook. Certain dealers are afraid the lake trade is running down. Local demand as heavy as ever. Coke weak.

Bituminous—There is some difference of opinion as to the future of the bituminous trade,though none as to the continued strength of it here at present. A few dealers hear reports of a congestion on the upper-lake docks and say that much of the coal intended for that market will be diverted this way before long if the upper lakes are really getting in their full season's supply; but that is merely an inference as yet.

On the other hand it is stated that a certain large manufacturing concern has just asked for a supply of slack from now to April at \$1.25 f.o.b., without obtaining an offer. All that can be said of the actual situation here is that there is no weakening of prices and no increase in the supply. Practically everyone is short and there is no consignment coal on track anywhere within reach of this market. Operators can see nothing in the reported weakness. There is very little contracting. The consumers are offering what would look like good prices at almost any other time, but sellers are cautious; they do not know what to ask and besides they are afraid they would be unable to get the coal unless they control the mine. Even when they have mines behind them they have often contracted so much that they are obliged to go into the open market and buy at whatever is asked.

Still the shipper who predicts a \$2 price for slack before long is looked on as visionary; slack is much scarcer than it was awhile ago, but it would take a decided panic for it to make any such advance. Still it is difficult to say what will take place when the lakes close three months hence. Often there is a short flurry and the former prices are resumed.

Bituminous quotations will therefore have to be placed at former figures, $2.90 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run and $2.15 for slack, with Allegheny Valley 15 to 20c. lower.

Coke—The coke trade is not strong, some jobbers reporting offers from the ovens at some reduction from former prices. It seems to be the idea, though, that prices are at the bottom, from the fact that there is still little stock coke offered. With best Connellsville foundry selling at $4.65, f.o.b. Buffalo, stock prices are $4.25, with off-grade 48-hr. furnace at about the stock price.

Anthracite—There is a slight stir in the local retail demand for anthracite and some of the rail lines are increasing their orders, but the business is not what the shippers expected. They say that it is bound to come all at once in a month or so, just as it has always done. Shippers of independent anthracite are selling a moderate amount of the smaller sizes at circular prices, but are not able to do anything with egg yet. Lake shipments of anthracite were 145,000 tons for the week, which is somewhat less than the summer average, on account of the scarcity of coal.

TOLEDO, OHIO

Fears that a car shortage may interfere with the Lake movement. Railroads still feeling the effects of the spring floods. Prices firm and the demand strong.

Toledo dealers are busy filling orders and watching their cars. There seems to be something of a shortage of cars at the mines, which has not as yet affected the lake business, but which shippers greatly fear will cut down the movement if it grows any worse. For some time past murmurs of a slight congestion has been coming in from the northern lines, but the first effects to be really felt here came during the past week.

Considerable fear is expressed at many points at the inability of the railroads to cope with the situation as fully as could be desired this season owing to the fact that they were badly crippled by the washouts occasioned by the March floods. There is a firm demand for steam coal and the domestic situation is favorable. Concerns are now busy filling contracts, including school and municipal contracts. Quite a number of large vessels cleared from the local docks during the past week and there are a few now awaiting accommodation.

Prices as quoted here follow:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.70	$2.50	$1.75	$2.50	$1.35	$1.35
Egg	2.50	1.35	2.50	1.50	2.50	....	....
Nut	2.00	1.20	2.25	1.50	2.50	....	....
⅞ lump	....	1.60	....	....	....	1.25	1.25
Mine-run	1.60	1.35	....	....	....	1.15	1.15
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

Activity still characterizes the Ohio trade. The demand for domestic and steam grades is good and the tonnage moving to the Northwest large. An advance in prices was announced effective Sept. 1. Car shortage is increasing.

The coal trade here during the past week has been active in every way. The new circular became effective Sept. 1, which boosts prices to a higher level and the demand for all grades is active. The tone of the market is satisfactory in every respect and operators, shippers and dealers look forward to a good trade for the remainder of the year.

About the only disturbing factor is the growing car shortage which is curtailing production in certain districts. In eastern Ohio the shortage is probably the worse and as a result the output during the week has been about 55 per cent. normal. There is also a lack of cars in the Pomeroy Bend district and the production there is estimated at 65 per cent. In the Hocking Valley and domestic producing fields the car supply has been better and a larger tonnage was produced.

The domestic trade is probably the strogest point in the market at this time. Dealers are gradually laying in stocks for the rush which is expected soon. There is a good demand for the splints and rescreened varieties. Large householders have placed their orders and deliveries are being made. One of the features of the domestic trade is the fact that winter fuel supplies are being laid in earlier than usual.

Steam business is also strong as manufacturing generally is in good condition; iron and steel plants are good purchasers of fuel and railroads are also buying a considerable tonnage. Very few steam contracts are expiring at this time and much of the tonnage is being purchased on the open market. The demand for the small sizes is strong and an advance has been made in the past week.

The lake trade is also active and will continue so right up to the close of navigation. The docks at the upper lake ports are fairly free as the interior movement is good. Chartering of bottoms is being carried on actually and the tonnage shipped from Ohio ports during the past week shows a large increase over the previous week. The retail trade is good and dealers are busy taking care of small orders. Retail prices are higher in accordance with the advanced circular.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburg	Pomeroy	Kanawha
Domestic lump	$1.75 @ 1.70	....	$1.85 @ 1.75	$1.70 @ 1.65
3-4 inch	1.60 @ 1.55	$1.30 @ 1.25	1.55 @ 1.60	1.55 @ 1.50
Nut	1.30 @ 1.20	....	1.35 @ 1.30	....
Mine-run	1.35 @ 1.25	1.20 @ 1.15	1.30 @ 1.25	1.25 @ 1.20
Nut, pea and slack	0.80 @ 0.75	....	0.70 @ 0.65	0.75 @ 0.70
Coarse slack	0.70 @ 0.65	0.75 @ 0.70	0.60 @ 0.55	0.65 @ 0.60

HAMPTON ROADS, VA.

Heavy dumping particularly at Sewalls Point. Vessels being loaded promptly. Foreign shipments lighter, but coastwise heavier. Stronger demand inland.

Dumpings over the tidewater piers for the week have been good. This is especially true as regards the movement from Sewalls Point, the loading at that pier being extra heavy and it is believed that a new record will be established this month. While the foreign movement has not been very satisfactory there have been some large shipments to the New England market. Practically all vessel tonnage arriving at Hampton Roads has been taken care of promptly although some of the suppliers have been compelled to go into the open market and purchase coal to apply on contract business.

Prices quoted for spot coal have been from $2.80 to $3, but it is impossible to ascertain whether any sales have been made at the latter figure. The demand inland has been fair, but only for New River and Pocahontas, and while there have been some sales of Kanawha and other high volatile coals, prices have not been very satisfactory.

Foreign shipments during the week have been to Para, Manos, St. Lucia, Cuban ports and Vera Cruz. The Atlantic fleet has been in the Roads some days taking in stores and a supply of bunker coal.

LOUISVILLE, KY.

Demand continues strong. Car supply better and may effect an easier situation shortly. Still a heavy movement into the Northwest. New rumors of an impending strike.

The demand for all grades of coal continues strong, as might be expected with the approach of the Fall season. The shortage of cars, however, which threatened to further aggravate the situation, is showing every indication of improvement, and now seems to be indefinitely postponed. Mines in all parts of the state have been getting all the equipment they required, but whether this will continue, particularly with the heavy movement from eastern Kentucky into the Northwest, remains to be seen.

The movement into the Northwest, as noted, continues as heavy as before, and as this is almost entirely on contract, the indications are that it will continue steady throughout the season. There is also a good volume of domestic trade; dealers were rather conservative about putting in supplies during the summer, and with a fair demand now coming in from their customers their storage supplies are being rapidly cleaned up. In event of the anticipated shortage developing into a reality, many dealers will find they are unable to supply their customers.

The possibility of a strike is the most serious factor in the market at the present time. It is stated on reliable authority that a determined effort will be made to organize the miners in the eastern Kentucky field, and that recognition of the union will be enforced. Reports are to the effcect that the move will be initiated on Oct. 1, and there have already been some preliminary skirmishes which have resulted favorably to the operators. There is no controversy in the matter of wages, the trouble hinging entirely on recognition of the union and the consequent closed shop.

Prices are now on the September basis, the better grades of block selling at $2 to $2.25, with block and lump at $1.90 to $2.15, round $1.40 to $1.50 and nut and slack at 70 to 85c. The second grades are quoted at from 10 to 25c. less and the demand is strong in all departments.

BIRMINGHAM, ALA.

Demand strong and prices good, showing a slight advance. Car shortage causing some shippers to fall behind on contracts. Coke quiet but fairly steady.

The coal and coke market here shows little change over last week; the demand is strong and prices good, with a slight advance. The car situation is still annoying the operators, as all mines are running on short time for lack of equipment, and contract shipments are slightly behind on this account. The Southern Railway has just closed a contract with a Northern car works for 1720 fifty-ton all-steel cars, and 15 large freight locomotives, to be delivered as fast as possible; while this will not help the present situation, it will give this district additional equipment this winter, when it is most needed.

The coke market is quiet, especially on the foundry coke, and no improvement is looked for in this line until the pig-iron market picks up and furnaces now out of blast put back; this does not seem probable at a near date because of the low price of iron. The iron market is holding up well, sales being smaller than last week, but at better prices, which is a good indication that the market is steady.

NEW ORLEANS

Dealers prepare for fall rush. Opening of cotton season causes gins to lay in fuel supplies. Exports to Latin American ports.

Local dealers are getting their equipment in shape for the rush of fall business. Owing to the limited amount of fuel required for heating purposes in New Mexico, orders for domestic supplies do not begin until the middle of September. With the first cold snap, however, orders come in great volume.

Dealers in Alabama coal report the first pinches of actual car shortage. That this condition will grow steadily worse is practically certain. Operation of cotton gins throughout the state now is becoming general. Owing to the high prices of fuel oil many of the gins have returned to the use of coal.

Exports of coal during the week were to Frontera, Mex.; Ceiba, Honduras; Cape Gracias and Bluefields, Nicaragua; Puerto Barrios, Guatemala; Belize and Stann Creek, British Honduras. All exports were in less than cargo shipments.

DETROIT, MICH.

Market stronger than at any time during the summer. Stiffening particularly noticeable on the smaller sizes. West Virginia grades in heavy demand.

Bituminous—Soft coal is still continuing to show a steady improvement and is much stronger right now than it has been at any time during the summer. The better grades are about the same as last week, but the smaller sizes have shown a tendency to stiffen still further with indications for a steady improvement, from now on; the demand for these sizes is in excess of the supply, and some large consumers who have crushers are being forced to make their own slack from the larger coal.

Both the West Virginia grades and three-fourths lump are also in excellent demand. The latter is being held rather closely at $1.05 minimum, with mine-run the same and slack being quoted at 95c. to $1; indications point to an advance to about $1.10 on this last, before the middle of the current month. Prices on the domestic grades are steady with a hardening tendency, due to the heavy demand. Pocahontas is becoming quite scarce with the demand far in excess of the supply, so far as the local market is concerned.

The market is quotable on about the following basis, prices generally firm:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.65	....	$1.75	....	....	$2.75	$2.50
Egg	1.65	....	1.75	....	....	2.75	2.50
Steam lump	1.50	....	....	....	....	....	....
¾-in. lump	1.25	$1.25	1.25	$1.25	$1.25	....	....
Mine-run	1.15	1.15	1.15	1.15	1.15	1.50	....
Slack	0.90	0.90	0.65	0.70	0.70	....	....

Anthracite—The anthracite market is beginning to show indications of some activity and this business from now on will depend entirely on weather conditions. A premium of 25c. is being asked in occasional instances on stove and egg.

Coke—Coke producers are holding firm at $3, sales involving several thousand tons, having been concluded on this basis during the past two weeks. Semet Solvay is now quoted at $3, Connellsville $3 and gas house $2.75.

INDIANAPOLIS, IND.

August showed considerable improvement over July. Screenings weak but the outlook on the whole is excellent. Summer buying heavier than usual.

August has shown considerable improvement over July in the volume of business in the coal fields of Indiana, mines having come much nearer a full running schedule. There is car trouble at many operations, which are long on hoppers and short on gondolas, but the railroads say they can do better now on gondolas.

The industrial situation is mixed but on the whole satisfactory. August is a vacation month, a time for inventories and for overhauling in many manufacturing establishments. It has also been an exceedingly hot month in Indiana and this factor alone has something to do with a falling off in the demand for screenings, which grade is now pressing for sale. The coal men have made large contracts and they speak optimistically of the outlook. The retail business continues good. Apparently there has been more than the usual summer buying. Retailers have bought better than their customers, at that, and are long on Eastern coals, particularly Pocahontas.

Mine quotations are around the following figures:

No. 4 screenings	$0.60	Egg	$1.50
Nos. 5 and 6 screenings	0.50	4-in. domestic	1.60
No. 4 mine-run	1.15	Brazil block	2.20
Nos. 5 and 6 mine-run	1.10	Washed coal	1.75 @ 2.25
1½-in. steam lump and nut	1.30		

CHICAGO

Large buyers, keeping out of the market, have forced screenings down to 45c. Franklin County operators have advanced prices and report satisfactory sales. Prices for smokeless coals are strong. A slight weakness in the domestic coke trade is noted.

A marked drop in the volume of business in the steam coal market in Chicago has been noted within the past week. As a result of action taken by a number of the large buyers in keeping their orders off the market, screenings were reduced, on the average, to 45c. a ton.

Despite the action of the Franklin County operators in advancing prices for lump, egg and nut coal to $1.75 a ton, the mines, sales of that fuel generally have been satisfactory. In the Carterville district, the operators are divided into two groups. The majority of the standard mines in that field are charging $1.50 a ton, but there are a few which are obtaining $1.60. There has been a slight softening in the market so far as the domestic coke trade is concerned. As a rule, prices for gas-house coke are easy.

Prices for smokeless coal continue strong, mine-run selling at $1.50 to $1.65. The circular price on lump and egg coal is $2.25 with sellers of free tonnage obtaining $2.50. A price of $1.60 a ton is being asked for inferior grades of 1¼-in. Hocking lump, the standard producers, however, obtaining $1.70.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07@2.32	$2.55@2.80	$2.27	
Steam lump	1.92		2.07	
Egg		2.55@2.80		$4.30@4.55
Mine-run	1.82	2.30	1.87	3.55@3.65
Screenings	1.22@1.32	1.60@1.75	1.22@1.32	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-product, egg, stove and nut, $4.75@4.85; gas house, $4.65@4.75.

ST. LOUIS, MO.

Indications splendid for a good September business. Prices advancing on all except Standard. Car shortage still prevailing. Anthracite weak, with smokeless and coke normal.

Prospects were never brighter for a good month in the coal trade than they are at this time. There is some uncertainty, however, as to just how much coal will be offered. The first few days of the month practically none was produced in southern Illinois, on account of the holidays; also, several mines were tied up by petty grievances on the part of the miners, and there has been an extraordinarily large advance sale of screened sizes, so that up to Sept. 10 or 15 there will be practically no coal to offer, and the car shortage will be severe enough by that time to steady up the market.

Coal in the Standard field is still being sold at about cost. Screenings are down to 30c. and mine-run has been offered the past week for 75c. There is no hope for any money in this field until the car shortage curtails work to about two days per week and there is an extraordinary good demand.

Anthracite is still moving in at from 25 to 30c. under the circular. There has been a fairly good demand for smokeless the past week, and coke is moving a little more freely than it has for a month. There is absolutely no washed coal market here at the present time.

The circular prices are:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.00@1.10
3-in. lump	....	....	$1.30	....
6-in. lump	$1.70 @ 1.85	....	1.50	1.25@1.35
Lump and egg	1.50 @ 1.60	$2.15	1.60	....
No. 1 nut	1.30 @ 1.40	....	1.05	0.87½
Screenings	0.55	....	0.40	0.85
Mine-run	1.50	....	....	0.75
No. 1 washed nut	1.60	....	1.60	....
No. 2 washed nut	1.35	....	1.50	....
No. 3 washed nut	1.20	....	....	....
No. 4 washed nut	1.00	....	....	....
No. 5 washed nut	0.60	....	....	....

OGDEN, UTAH

Market conditions improving slowly, with mines gradually reaching capacity. First indications of a car shortage appear, with a scarcity of box cars. Mine price advanced Sept. 1.

August has gone down on record as a month presenting new and peculiar conditions in the coal market. The usual storage period ended on Aug. 1, with little coal in stock, although the operators expected August to be a very busy month. Anticipating this the mine price was increased 25c. by some producers, and 50c. by others, although the latter was shortly reduced to the 25c. advance. Those operators who advanced to 50c. expected the dealer and consumer to buy heavily during August, but in the early part of the month it became apparent that the market was still in a sluggish condition and buyers not ready to place orders. The territory has been worked and reworked by all the salesmen, with only moderate results. No large orders are being placed and most of the coal bought is for immediate use.

Most of the mines were able to run at a little better than half time during the last week in August, showing some encouragement. Owing to a better demand for lump, some operations are getting a little long on nut, and indications are that there will be a surplus of this grade during September.

All the sugar factories have completed shipments on their storage orders for slack and very little coal will be consigned to them during the first half of September, which will no doubt cause a surplus of this grade. The first indications of a shortage of coal equipment occurred Aug. 29, when the mines were compelled to load commercial coal in open cars, the railroads being short of box cars. The intermountain territory has a large crop this year, and most of the closed cars will be used in handling the crop.

The new circular went in effect Sept. 1, the market now being quotable on the following basis: Lump, \$2.75; egg, \$2.50; nut, \$2.25; mine-run, \$1.85; slack, \$1.

PORTLAND, ORE.

No material change in coal situation here the past week. Indications favor fair volume of business in the fall.

There has been practically no change in the coal situation here the past week. The volume of business is light, as is to be expected, at this time, but dealers look for an improvement in the movement in the near future with preparations for the winter season. Prices remain unchanged for the present with no indication of any occurring until winter quotations go into effect, which will mean \$1 additional per ton, as compared with the summer rates. There is no indication of importations of Australian coal this fall.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a comparative statement of the coal and coke movement over this road for July and the first seven months of this year and last year:

	July		Seven Months	
	1913	1912	1913	1912
Coal	2,938,723	2,519,881	19,604,691	17,668,329
Coke	391,485	368,720	2,839,373	2,653,612
Total	3,330,208	2,888,601	22,444,064	20,321,941

FOREIGN MARKETS

GREAT BRITAIN

Aug. 20—For early loading admiralty coals are almost unobtainable. Enquiries for forward loading are more numerous and firm prices are quoted. Quotations are approximately as follows:

Best Welsh steam	\$4.98@5.04	Best Monmouthshires	\$4.20@4.26
Best seconds	4.74@4.86	Seconds	4.02@4.08
Seconds	4.62@4.74	Best Cardiff smalls	2.76@2.88
Best dry coals	4.32@4.56	Seconds	2.46@2.58

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while these for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

British Exports—The following is a comparative statement of British exports for July and the first seven months of the last three years, in long tons:

	July		7 Months		
	1912	1913	1911	1912	1913
Anthracite	304,022	295,993	1,366,747	1,278,215	1,703,090
Steam	4,961,888	5,056,308	26,427,909	23,682,045	31,090,553
Gas	1,260,008	1,114,572	5,958,632	5,747,845	6,624,980
Household	161,813	168,061	829,466	802,268	1,023,436
Other sorts	354,135	340,277	1,790,763	1,704,806	2,059,387
Total	7,041,866	6,975,211	36,373,517	33,215,189	42,501,446
Coke	85,978	99,605	545,210	474,086	599,275
Manufactured fuel	191,945	200,814	981,094	327,228	1,223,046
Grand total	7,319,789	7,275,630	37,899,821	34,516,503	44,323,767
Bunker coal	1,632,501	1,883,676	....	9,758,398	11,970,713

COAL SECURITIES

No Important Dividends were announced during the week.

⁂

American Coal Products Co.—The common stock of this concern amounts to \$50,000,000 of which \$10,539,300 are outstanding; the authorized preferred is \$5,000,000, 7% cumulative of which \$2,500,000 are outstanding and are redeemable after three years at 120. It is provided that the full paid common stock must always be not less than twice the preferred stock and that no additional mortgage or bonded debt can be placed against the property or its subsidiaries without the consent of two-thirds of the stockholders. The company paid regular dividends of 5½% from the time of its organization up to Oct., 1909; in 1910 it paid 6%; 6½% in 1911, and 7% in 1912.

Colorado Fuel & Iron Co.—The disastrous result of the strike, which this company went through in 1903, caused the report for the year ended June 30, 1904, to show the lowest earnings in the history of the company. Last year the company did nearly three times as much business as in 1904; during this latter year the company earned sufficient to pay off the \$1,500,000 accrued dividends and leave a balance of approximately \$300,000.

COAL FREIGHT DECISIONS

Fourth Section Applications Nos. 774 and 5301.—In the matter of coal rates from the anthracite fields to points on the New Haven R.R.

Respondent allowed to make a less charge than is made to intermediate points on prepared sizes of anthracite coal, all-rail, from mines in the anthracite region to Boston, Needham, Needham Heights, and Newton Upper Falls, Mass. **Opinion No. 2419.**

Crab Locomotive 7-ton type, hauling coal from side entry in mine of Monongahela River Consolidated Coal and Coke Co., California, Penn.

An Actual Record
of the service rendered by
Baldwin-Westinghouse
Electric Mine Locomotives

Standard Westinghouse bronze armature bearing with oil and waste lubrication as supplied on these locomotives.

At the mines of the Ray Consolidated Copper Company, Ray, Arizona, there are eleven ten-ton Baldwin-Westinghouse Electric Mine Locomotives in operation. The following information is proof of the phenomenal record of **low repair and maintenance** cost made by these locomotives:

Brushes and Commutators

The first shipment of locomotives was put into operation May, 1911, and additions have been made from time to time until now a total of 11 locomotives are in use. In this time not a single brush has been changed, nor a single commutator turned down.

Bearings

In the spring of the present year, one of the motors was removed from the first locomotive installed to ascertain the general condition and amount of wear in the bearings. General condition of the motor was A-1. The armature, commutator and brushes were in perfect shape. A careful test of the armature bearings showed that in practically two years of operation the wear was only .003.

Controllers and Resistors

A careful system of inspection is carried out at Ray, and when it is found that contact fingers become badly worn or burred, they are either smoothed up or replaced. Up to date not a single segment has been replaced on any of the controllers.

No trouble has been experienced with the grid resistors; only three grids having been replaced in three years time, and this was due solely to a collision, in which the grid was damaged.

Mechanical Parts

The foregoing does not cover repairs to wearing parts, such as brake shoes, trolley poles, etc., which of necessity must be replaced from time to time. With regard to wheels, however, only one pair of wheels has been changed in two years.

Two of these locomotives are used for general purposes, such as hauling mine timbers, etc. The remainder are used for hauling ore. The output of the mine is 6000 tons in 16 hours, at the present time. The average train consists of 20 to 25 cars holding 5 tons of ore each, and weighing approximately 2 tons each.

The above statement emphasizes the reliability of Baldwin-Westinghouse Mine Locomotives. The newer cast steel bar frame design has many features that are far superior to the earlier types, used by the Ray Company.

Full information about Baldwin-Westinghouse Electric Mine Locomotives can be obtained by addressing either company.

The Advertising of Today

The Weekly Ad-Talk Page

The day of the solid-gold watch given with every bottle of Dr. Killum's cure-all is over. The voice of the advertising faker is heard no more in the land. The bunks and the piffles that gave Advertising a parti-colored eye have been locked in the outhouse, and a *clean, truthful* Advertising has taken its place in the fore rank with other forms of legitimate salesmanship.

The State of Minnesota has recently passed an act making it a misdemeanor for any newspaper or any firm to print or cause to be printed any misstatement whatsoever of any goods or articles within the limits of the State.

The significance of this act is far reaching. It means that the State Government has recognized the correctness of the step long ago taken by the better grade of publications; i.e., the safeguarding of the public from unscrupulous advertisers.

All over the United States, committees have been working for the last two or three years in an endeavor to get rid of all chance or faking advertising. The work of these vigilance committees has shown excellent results. The "fire sales" have almost disappeared from our midst, and advertising has been given added impetus toward its ultimate goal—the entire and unquestioning confidence of every reader. Many a time your wife has tried a new brand of canned goods, or you yourself have switched from your previous favorite tobacco to a new kind, simply on a friend's recommendation. You depend on your friend's integrity and try the new article. Your friend, on the contrary, is not apt to misinform you, because he knows that if his information proves untrue that you will lose a certain amount of confidence in him; therefore he tells you only the truth.

This is exactly the case with every truly modern advertisement. By "modern" we mean the kind that recognizes only truth as a vehicle of expression. Dealers all over the country have come to learn that while you may be misled once into buying an inferior article through an advertisement, in the end the results will be all against the dishonest advertiser, because you will never reorder, and, further, you will never recommend his article to a friend. It is this recommendation of yours that the advertiser is after. A personal advertisement is better than any other form.

And it's because it pays advertisers to be truthful that it pays you to read their ads and buy their goods.

COAL AGE

Vol. 4 NEW YORK, SEPTEMBER 13, 1913 No. 11

Recently one of our boyhood friends was sentenced to prison for theft. Some days later another friend of our youth was elected president of a great industrial concern. Both had an equal start.

Thus the paths diverge as the years pass. The average man must row hard to even stand still—so strong is the current in life's stream. Any old scow can drift with the tide, and no skill or effort is required to go over the falls which are always nearby.

But when we row hard and straight, still making but little progress, it is naturally disconcerting to hear our friends tell tales of easy trips to some port of success. We say, "How do they do it?" and award ourselves booby prize for being chief of the grand tribe of mortal incompetents.

However, rest easy—smother your envy; the same fellows will be telling like tales next year. You'll find they seldom get into the harbor and never tie up at the dock. Something always slips just as they're going to land. Some day, gentle, forgiving folk will whisper "dreamers," while those less diplomatic will say "liars."

The longer we live, the more we are forced to realize that "getting on" in the world is a full-size man's job Investigators claim that but one man in twenty is even a moderate success in a material way. One per cent. of the population of this country owns nearly fifty per cent. of the nation's Wealth.

Therefore, if a fellow is doing a little better than breaking even, he is of the chosen few. There isn't any real difference between the man who lacks ability to earn more than a living wage, and the fellow who does earn more but saves nothing Both finish at the same tape. The water that has passed is of no further use to the miller. The only market to recognize money already spent is the "land of regrets."

No one has a right to be entirely satisfied. Self-content generally means stagnation. But it's not wise to get wrinkles worrying about the other fellow's success. The chances are, if we could read the secret history of his life, we would find in it enough sorrow and suffering to disarm all our envy. Besides, failure often wears a fur coat, false whiskers and rides in an automobile.

If Bill, or Tom, or John, who used to go to school with you has "got on in the world," don't tell all your neighbors how stupid he was as a boy, and how in the old days you could mine more coal in an hour than he could in a shift, or how you could make twice as many set-ups with your transit.

It's just possible his success is due more to his personality, coupled with a policy of attending strictly to his own business, than to any display of genius. Some men spend so much time minimizing the virtues and ability of others that but little is left to add worthwhile credits to their own record of personal effort.

We may as well seek the end of the rainbow for its bag of gold as expect to add one iota to our personal success by the practice of envy. This passion is only an awkward homage inferiority pays to merit; it corrupts a man's soul as rust corrodes iron. Why send back our mutton and go hungry just because the other fellow is eating venison? Be a booster.

The Atlas Co.'s Plant at Burgettstown, Penn.

By Lee Llewellyn*

SYNOPSIS—This is the second and concluding installment on this plant. The screening and other arrangements for treating and cleaning the coal are described. Particular attention is devoted to the mechanical details and the steel tipple construction is also discussed.

⁂

There are two gravity-screen rigs at this plant, each equipped with 3-ton weigh baskets. The rigs are duplicates, except that in one the nut, or nut and slack mixed, passes from the nut-screen chute direct by a spiral chute to one picking table, while in the other the material passes from the nut-screen chute to a shaking pan, which delivers it to the other picking table.

The lump-screen chute is 6 ft. wide by 19 ft. long and provided with 12 ft. of standard bar screen with $1\frac{1}{4}$-in. spaces for bypassing the screenings around the baskets. Chutes are equipped with extra-heavy fly gates for passing room cleanings to the cross bone-conveyor chute or rock to the rock bin. The screen bars are $2\text{x}\frac{5}{8}\text{x}\frac{3}{16}$-in. standard "Akron" bars, supported by $4\text{x}\frac{3}{4}$-in. bearing bars spaced on 24-in. centers. The upper dead plate has a 2-in. buckle at the center of its lower end to assist in distributing the coal evenly to the screen bars. The lower dead plate extends 12 in. beyond the lower end of the screen bars and is notched at upper end and bent down between the bars to raise any lumps that may ride between screen bars. This construction also prevents lumps, riding in this manner, from chipping on the sharp edge of the dead plates, as is the case in ordinary construction. These notches extend far enough beyond screen bars to catch any dust that may ride the bar. The fly gate for bypassing room cleanings and rock is of extra-heavy construction, consisting of two steel plates riveted to a 2-in. square trunnion shaft, which is turned at the ends to accommodate bearing plates attached to screen chute. Gates are counterweighted for easy operation and operated by a lever located near the dump attendant.

View of Tipple, Showing Hoisting-Engine, Power and Boiler Houses with Man Hoist on the Right

The weigh baskets are hung from structural steel weigh frames and arranged with counterweights for returning them to their normal position after dumping. The operation of the baskets is controlled by the weighmaster through a counterweighted brake wheel connected to a rope and lever system leading to the scale house. The weigh frames are suspended from 10-ton standard tipple scales provided with quick-weighing dials.

Each nut-screen chute is 6 ft. wide by 26 ft. long and provided with 16 ft. of screening surface. Screen bars are $1\frac{3}{4}\text{x}\frac{3}{8}\text{x}\frac{3}{16}$-in. "Akron" bars, supported by $4\text{x}\frac{5}{8}$-in. bearing bars, spaced on 24-in. centers. A lower deck is provided for gathering the slack, which is discharged into railroad cars over a chute common to both rigs; this chute is provided with a section of perforated plate, for taking the real fine dust out of the slack coal. The nut coal passes to a hopper, common to both rigs, and is loaded over a spiral end-loading chute, equipped with a hinged section for low cars. Both the nut- and the slack-loading chutes are equipped with gates operated from the car-trimmer's platform, to stop the flow of coal when shifting the railroad car. Screens are hung by adjustable rods, so that the angle may be varied to suit conditions.

A rock bin, common to both rigs, is provided for receiving rock from either dump. It is of heavy-plate construction and equipped with two substantial steel-plate gates for passing the rock to the dump cars.

Feeders and Picking Tables

There are two plate feeders for feeding the $1\frac{1}{4}$-in. lump to picking tables. They are of the reciprocating type and consist of a steel-plate chute section hung by forged-steel hangers underneath structural-steel cageways which receive the coal from the feeder hoppers. The rereciprocating chutes are beveled at such an angle as to insure an even distribution of coal on the tables. The reciprocating motion is imparted to the chutes from the feeder crankshafts through forged-steel connecting-rods and adjustable crankpins. Feeder crankshafts are driven from the picking-table countershaft through one steel thimble roller and one machine-molded bevel-gear transmission. By this arrangement of drives, when a picking table is stopped its feeder will also immediately stop.

---

*Chief engineer, Pittsburgh Coal Washer Co., Pittsburgh, Penn.

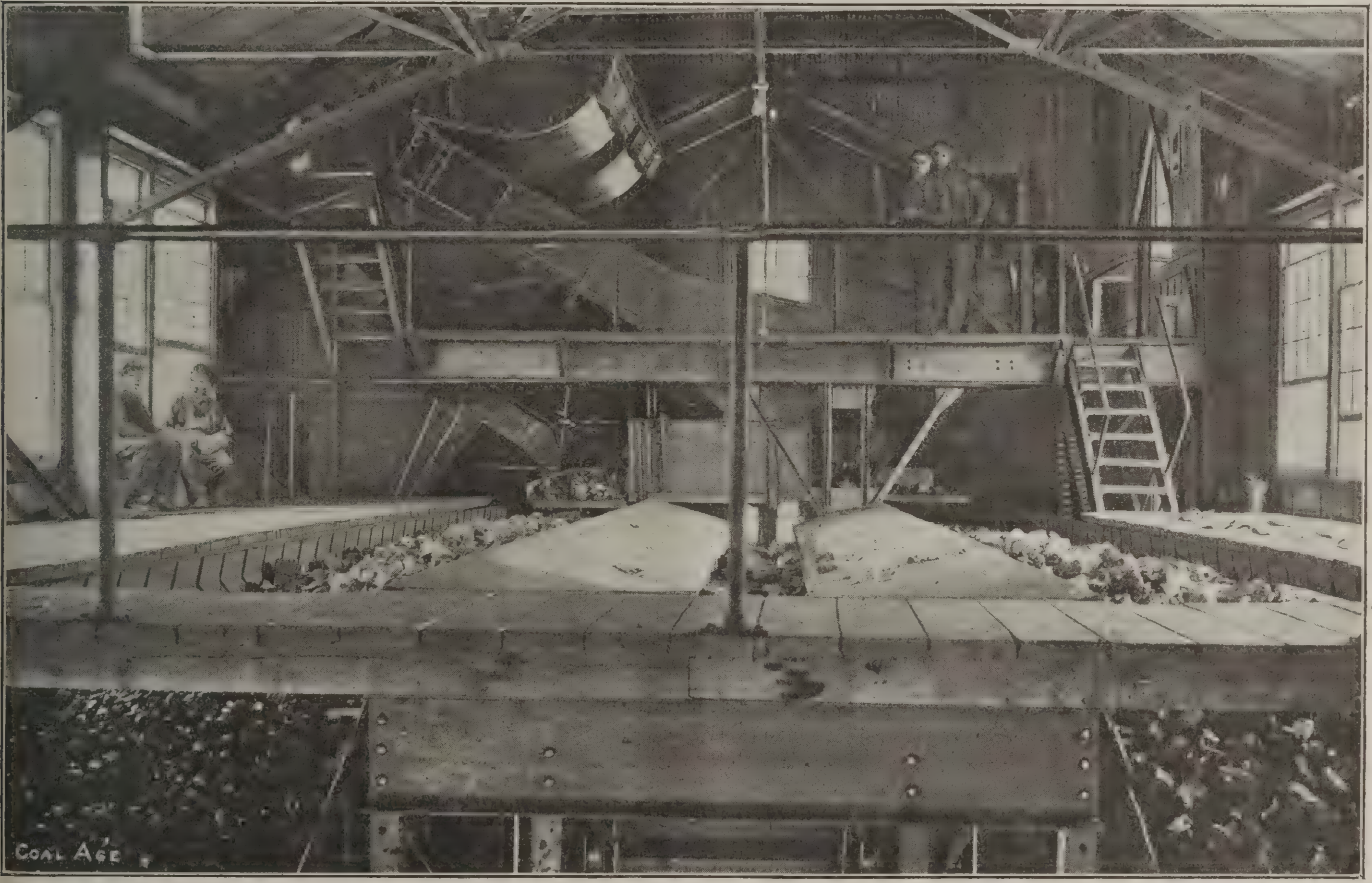
The tables are of duplicate design, and arranged with hinged chute sections for discharging into the cars. They consist of two strands of 12-in. pitch steel thimble-roller chain, to which is attached double-beaded pans 5 ft. long, with moving sides 10 in. high. The tables are arranged for 35 ft. of clear picking space. The speed is 40 ft. per min. and each table is capable of handling 275 tons of run-of-mine per hour, based on the maximum output of 3000 tons per eight-hour day, and assuming 65 per cent. of the output to be ¾-in. lump, the average thickness of lump coal on the tables will be 6 inches.

The drive for the tables is by a 15-hp. motor (which also drives bone conveyor, feeders and shaking pan), through one belt and one cut spur-gear transmission to the line shaft, from which each table is driven by one machine-molded spur gear and one steel thimble roller-drive chain transmission. The driving pinion of each table is fitted with a friction clutch, operated through levers, pipe toggles and bell cranks, from the car-tender's platform.

The tables are mounted on structural-steel frames, supported by the picking-house floor beams, and each is provided with a set of special loading chutes, designed to load and top three different-height cars, viz: 8 ft., 10 ft. and 11 ft. 3 in. high. The first, or stationary chute section, is hung with the discharge point 14 ft. above the top of the rail for topping 11-ft. 3-in. cars. The second and third sections are hinged and hung so the discharge ends will be 10 ft. and 12 ft. high, respectively, above the top of the rail, for topping 8-ft. and 10-ft. cars. Hand winches are used for operating the hinged chutes.

Bone Conveyors, Crushers and Elevator

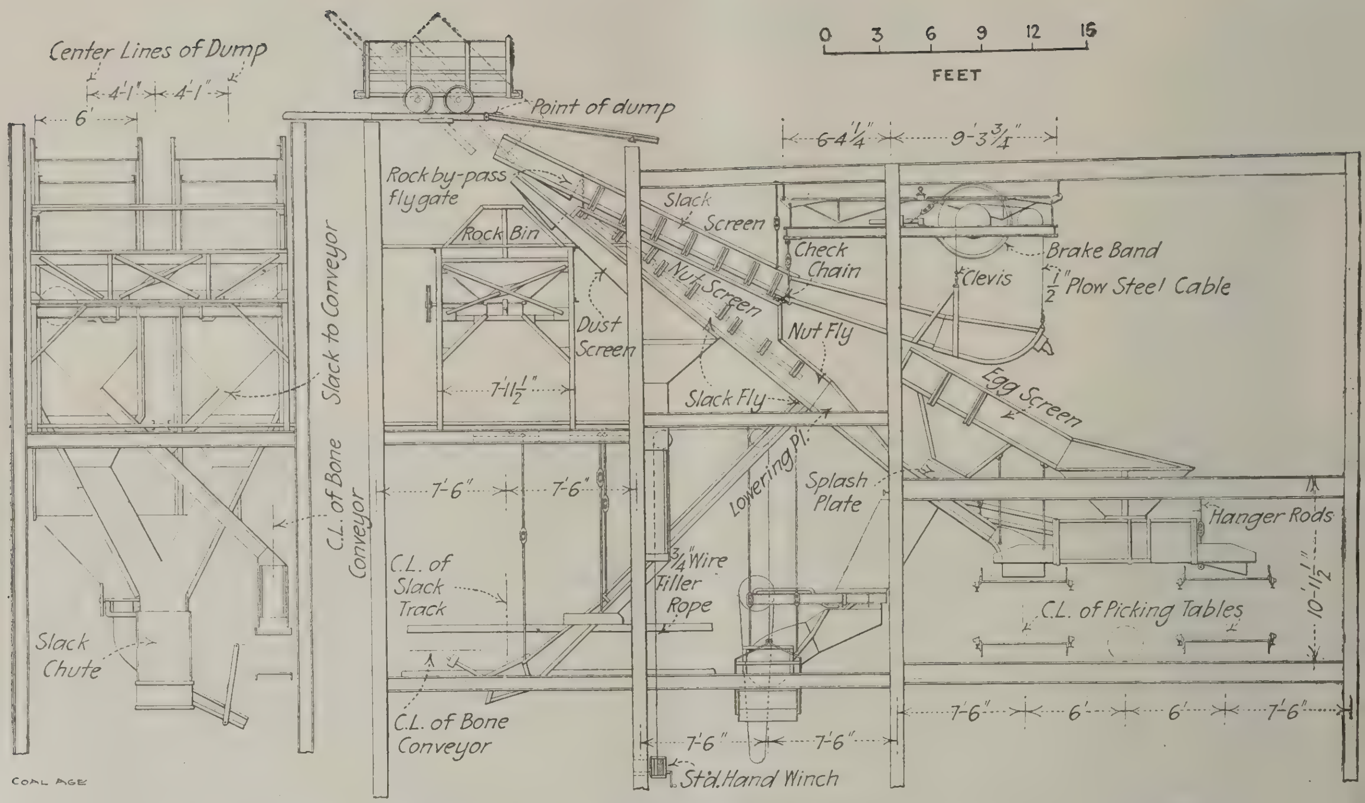
These conveyors are of the apron type and consist of two strands of 9-in. pitch steel thimble-roller chain, to which is attached double-beaded pans 2 ft. long with moving sides 4 in. high. The conveyor between the picking tables is driven from the picking-table countershaft through one steel thimble roller-chain transmission and the other is driven from the crusher countershaft through one belt and one machine-molded spur-gear transmission. The speed is 40 ft. per min. and capacity 35 tons per hour.



Weigh Baskets, Feeder Hopper, Picking Tables and Bone Conveyor. Note the Excellent Light on the Tables

The crusher is of the belted, toothed roll type, of extraheavy design, having rolls 24 in. in diameter by 24 in. long. The rolls are mounted on 3½-in. shafts supported by a cast-iron frame and provided with steel-plate housing. The drive is from a 15-hp. motor by belt to the crusher countershaft, which is mounted on the crusher frame and extended for outboard bearing. One roll is driven from the countershaft by one cut-steel spur-gear transmission and the other by belt transmission, equipped with the counterweighted idler pulley. The belt-driven roll is adjustable and equipped with safety springs to protect the rolls in case injurious foreign material is passed to them.

The elevator is of the perfect discharge type and about 40 ft. center to center of sprockets. It is composed of two strands of 9-in. pitch steel thimble-roller chain, to which are attached 9x12x20-in. buckets every 18-in. cen-



Longitudinal and End Elevation of Tipple with Details of Screens and Chutes

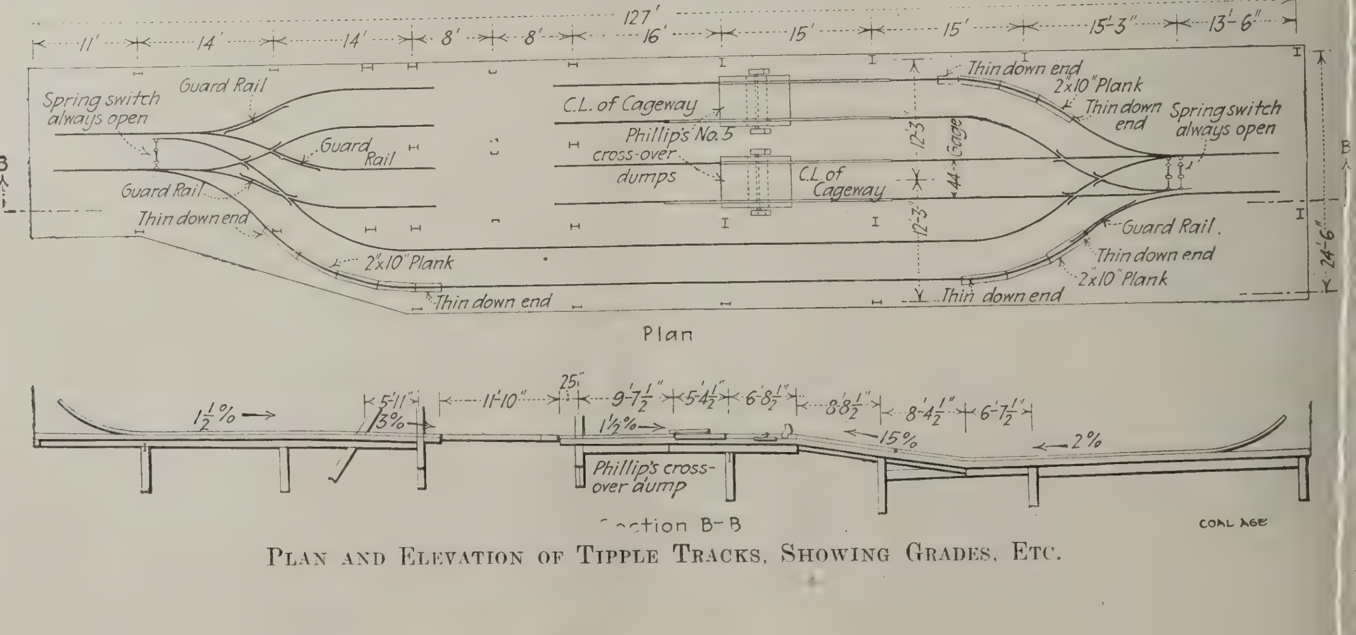
ters. The chain is a duplicate of bone-conveyor chains. The buckets are made of No. 10-gage steel and the digging lips reinforced by $1\frac{1}{2}$x$\frac{3}{8}$-in. wearing bars. The elevator is provided with a steel boot, casing, hood and steel discharge plates to insure perfect discharge. The elevator is driven from the car-haul countershaft through one machine-molded bevel gear, and one steel thimble roller-chain transmission. The speed is 60 ft. per min. and the capacity 40 tons per hour.

The Boiler-House Car has a capacity of 3½ tons of crushed coal. The hopper portion is built of ¼-in. steel plate, thoroughly stiffened and braced, and supported by a rigid channel-iron frame mounted on four 16-in. heavy cast-iron traction wheels, having chilled treads and 3-in. cold-rolled steel axles. The car is traversed by a General Electric mill-type series-wound motor, having a continuous rating of 3½ hp., through two sets of cut spur gears to the front axle of the car. The motor is controlled by an R-53 reversing controller placed in the operator's cab. Car is provided with a gate and structural-steel chute for passing the coal to the stoker hoppers. The chute is arranged so it can be readily drawn back out of the way when the car is traveling between the boiler house and storage bin.

Miscellaneous Details

Chain Drives—All drive chains for this installation are the steel thimble roller, of one size. Each drive chain is equipped with an idler sprocket to keep the loose side of the chain tight. Special care was taken to have as few sizes of sprockets as possible.

Shafts—All shafting is cold-rolled steel supported in



Plan and Elevation of Tipple Tracks, Showing Grades, Etc.

extra-heavy bearings equipped with compression grease cups. No size less than 2½-in. was used, except in gates.

Belts—All drive belts are of the best 5-ply rubber and made continuous for easy running.

Gears are either cut or machine-molded. Gears having a peripheral speed of 200 ft. per min. or over are cut. Pinions having a peripheral speed of 200 ft. or over are forged-steel; all others are cast-steel, machine-molded.

Motors are duplicates, of the General Electric Co. make, type CVC, and wound for 250 volts direct current. The size and units they drive are as follows:

One 15-hp. drives crusher and bone conveyor.
One 15-hp. drives picking-table machinery.
One 15-hp. drives car haul and bone elevator.

The computed horsepower necessary to drive the total equipment is 35.

Steel Work—The columns and batter braces for main headframe and the tipple columns, from foundations to tipple floor, are 10-in. H-sections. The picking-house columns are 10-in. I-beams. The tipple columns above the tipple floor are two 4x3x$\frac{5}{16}$-in. angles placed back to back. The air-hoist columns and batter braces are 8-in. H-sections. The boiler-house car-trestle columns are angle- and plate-supporting I-beam stringers, which themselves support 40-lb. rails for carrying the boiler-house car.

All steel is openhearth, conforming to the Manufacturer's Standard Specifications. All supports and struts are of beam construction. No latticed work was used. The steel framework for the tipple, boiler-house car, trestle and air-hoist headframe was sublet to the Pittsburgh Bridge & Iron Works, of Rochester, Penn., who fabricated and erected same from plans furnished by the Pittsburgh Coal Washer Co.

All roofing and siding is No. 22 corrugated protected asbestos metal. The roofs are laid with 1½ corrugation side lap and 4-in. end lap. Sides have one corrugation side lap and 4-in. end lap. Flashing in No. 24-gage and placed above all windows and doors where they are exposed to the weather.

Stair stringers are built of 8-in. channel irons with angle-iron clips for supporting the treads, which are 2-in. oak planks and bolted to clips on the stringers. All stairways are provided with neat 1¼-in. gas pipe hand rails.

The main tipple floor is 3-in. oak, all other floors, walkways and platforms being 2-in. oak. They are securely spiked to nailing strips bolted to the floor members. All platforms and walkways, where necessary, are protected by a 1¼-in. gas-pipe hand railing.

The main tipple windows are 12 lights, 10x12. The picking-house windows are 24 lights, 10x12. Standard doors are 3x7 ft. Window frames are white-pine mill frames and window sash, white pine. Doors and door frames are of the same material.

⁂

Coal in Turkey

Although Turkey produces about 1,000,000 tons of coal and possesses rare unexploited deposits ranging from lignite to anthracite, it imports annually coal to the amount of some $1,500,000, says the Daily Consular and Trade Reports. Most of this coal comes from Great Britain. Of late, certain railroads in Turkey have adopted liquid fuel. There is, nevertheless, an opening afforded in Turkey for American coal, both soft and hard. Negotiations are now being conducted between New York brokers and large commission houses in Constantinople that appear to promise the early introduction into Turkey of American coal as successfully as into Alexandria, Trieste and Genoa.

⁂

Illinois' Loss from Biennial Shutdowns

The coal miners of Illinois, according to E. W. Parker, of the U. S. Geological Survey, are probably better organized than those of any other bituminous coal-mining state. The result has been the establishment throughout the coal-mining regions of the 8-hr. day, but the habitual bi-yearly shutdown has naturally resulted in long periods of idleness and loss of income, both to operators and employees.

In 1906, practically all the important mines were shut down, and 49,792 men out of a total of 61,988, were idle for an average of 58 days each. This was equivalent to an average of 48 days of idleness for each of the 61,988 employees, or to 25 per cent. of the total time made.

In 1908, the suspension was not so long nor quite as many men affected, 47,456 out of a total of 68,035 being idle for an average of 37 days, equivalent to an idleness of 26 days for each of the 68,035 employees, or 14 per cent. of the total number of days worked by each man during the year.

In 1910, out of a total of 72,645 men, 67,218 were idle for an average of 136 days, and the total time off was equivalent to 9,133,953 working days. The total time made for the 72,645 men was 11,612,966 days, or an average of 160 days each. Thus, the idle time in 1910 was nearly 80 per cent, of the working time made.

The total number of men employed in 1912 was 78,098, who worked an average of 194 days. Idleness due to strikes or dissensions affected a total of 60,505 men, who lost an average of 33 days. The aggregate idle time due to labor troubles was thus 13 per cent. of the total time worked.

⁂

West Virginia Mines Are Flourishing

The last monthly statement of coal shipments over the Norfolk & Western Ry., tells an interesting story concerning the coal mines of West Virginia. For the seven months ending July 31, the total amount of coal and coke shipped was 14,526,695 net tons, as compared with 13,905,052 tons for the corresponding period of last year, or an increase of 4.47 per cent.

The shipments for July aggregated 2,254,601 tons, as compared with 2,096,477 tons for the corresponding month of 1912, which was an increase of 158,124 tons or 7½ per cent. This shows that the increase is growing from month to month. The highest percentage of gain was in coal shipped to Tidewater for export, which increased 33 per cent. in July over the corresponding month of last year, or from 116,339 tons to 155,762 tons.

The coal for export for the first seven months of the year aggregated 1,032,082 tons, an increase of 81,189 tons. Coal shipped to interior points in the seven months increased from 9,994,907 tons in 1912, to 10,318,605 tons in 1913. Representative operators affirm that they could have made a still better showing but for the scarcity of labor.

The Coal Production of Texas

According to the figures of the U. S. Geological Survey the production in coal in Texas in 1912 passed the 2,000,000-ton mark, with a value at the mines of $3,655,744. This is the record production of the state.

The coals of Texas occur in three geological systems, the carboniferous, the cretaceous and the tertiary. The carboniferous coals are bituminous in character, and are found in the north-central part of the state in an area covering approximately 11,000 square miles. The productive portion is confined to the central part of the field. The principal mining operations are in Eastland, Palo Pinto, Erath, Wise and Young Counties.

The cretaceous coals are in the southern part of the state and are mined near Eagle Pass in Maverick County. These are also classed as bituminous coals. Lignite beds of tertiary age extend entirely across the state from the eastern boundary at the Sabine River in a southwesterly direction to the Rio Grande. In the southwestern extremity near Laredo in Webb County the lignite merges into a coal of higher grade, and the production in this region is classed as bituminous.

The development of the lignite resources of Texas began in the last decade of the last century, and the advent of the gas producer in which lignite is found to serve excellently is giving a further impetus to production. The output of this quality of fuel in 1912 reached nearly 1,000,000 tons.

The number of men employed in the coal and lignite mines of Texas in 1912 was 5127, who worked an average of 230 days against 5353 men for an average of 226 days in 1911. The general average production per man was 427 tons for the year and 1.86 tons per day in 1912 against 369 tons and 1.63 tons respectfully in 1911.

There were only two fatal accidents at the coal or lignite mines of Texas last year.

⁂

Coal Production in Kansas

The coal production of Kansas in 1912, according to E. W. Parker of the U. S. Geological Survey, working in coöperation with the Geological Survey of Kansas, increased from 6,178,728 short tons valued at $9,472,572 in 1911, to 6,986,182 tons valued at $11,324,130, the gain amounting to 13 per cent. in quantity and 19½ per cent. in value.

The increased production in Kansas, as in the other southwestern states in 1912, may be attributed to the diminished supply of fuel oil and natural gas from the mid-continent field. These fuels, especially oil, have been virtually removed from the steam trade, and steam users have returned to coal.

In 1912, a total of 11,646 men, who worked an average of 202 days, were employed in the coal mines of Kansas, against 11,357 men for an average of 190 days in 1911.

The fatality record in Kansas exhibits the same improvement in 1912 that was evident in most of the coal-mining fields. The number of fatal accidents decreased from 42 to 28, a diminution of exactly one-third.

The coal-productive area of Kansas lies entirely in the eastern part of the state. The coal measures underlie approximately 20,000 square miles, of which about three-fourths may be considered as probably productive. Over 90 per cent. of the total production of the Kansas mines is derived from Cherokee and Crawford Counties. The principal coal bed in the district, the Cherokee, varies from 3 to 10 ft. in thickness, although the average is only about 3½ ft. The coal is bituminous, of good quality, and roof and floor conditions are excellent.

⁂

The Mine Pump

By Berton Braley

(Written expressly for "Coal Age.")

I chug and chug the whole day through
  As faithful as I "oughter,"
I always have my work to do
  To clear the mine of water.

The mine cars rattle to and fro
  In noisest endeavor,
But mine cars come and mine cars go
  While I go on forever.

By day and night, by night and day
  My valves have throbbed and thudded,
And I must keep right on that way
  Lest all the mine be flooded.

The cage may sometimes quit the job
  And men can use the ladder,
But if for long I ceased to throb
  Few breakdowns could be sadder.

But I am here to stop the flow
  With strength that wearies never,
And while the cages come and go,
  Still I go on forever.

The miners dig the buried coal
  Whatever depth it lurk in,
But I must see the "deep black hole"
  Is dry enough to work in.

For if they had to swim I know
  'Twould bother their endeavor—
So miners come and miners go
  But I go on forever.

I am not "fair to outward view"
  I never was a beauty,
My lines of loveliness are few,
  I'm built for heavy duty.

I know my humble job, and so
  I make my best endeavor,
For men and mules may come and go,
  But I go on forever.

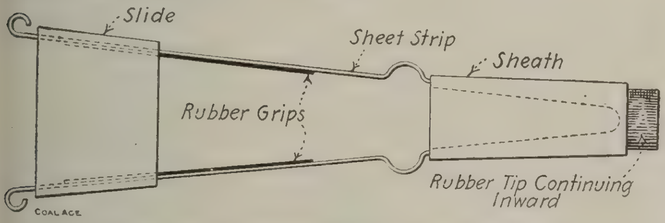
New methods supplement the old,
  New tools and new inventions,
New men the reins of power hold,
  The mine has new dimensions.

I note how wise the bosses grow
  How uptodate and clever,
But men and methods come and go
  While I go on forever.

A Pick-Point Protector

Attention has recently been directed in South Wales to a pick-point protector invented by Samuel Griffiths and Edward Thomas, which, although of very simple construction, should have considerable value in preventing the numerous accidents to life and limb arising from the careless handling, carrying and using of the miner's pick.

The apparatus, as shown in the sketch, is made of sheet tin with a rubber lining on the inside so arranged that the rubber grips the part of the pick adjacent to the point. The sliding sleeve is fitted on the two arms in such a way that when this is pushed toward the pick shank it causes the arms to grip the surface of the pick, holding the protector securely in place. To the arms is fitted a head containing a solid piece of rubber against which the pick point is placed.



How the Protector Is Constructed

In order to adjust the protector to the pick, the slide is drawn back, the pick point placed between the two arms touching or almost touching the head of rubber inside the case. The slide is then pushed up and tightened on the pick. Although this device is simple in adjustment, it is claimed that it will not slip when in use, its tendency being to tighten and not to slip. The protector weighs about one ounce and can easily be carried in the vest pocket.

⁂

Shooting off Solid in Illinois

Of the production of 59,885,226 short tons of coal in Illinois in 1912, 26,878,049 tons, or 44.9 per cent., was mined by machine; 7,675,805 tons, or 12.8 per cent., was pick mined, and 24,136,940 tons, or 40.3 per cent., was shot off the solid, according to E. W. Parker of the U. S. Geological Survey. In 1911, 45.6 per cent. of the total Illinois product was machine mined, and 40.3 per cent. was shot off the solid.

These figures show that a comparatively small proportion of Illinois coal is hand mined, and a relatively large amount is "powder mined." This is discreditable and inexcusable.

In this respect, Illinois stands in unfavorable comparison with West Virginia, where less than 1 per cent. of the production in 1912 was shot off the solid. The larger proportion of machine-mined tonnage in 1912 is gratifying, and bears out a prediction that the Illinois coal operators were determined to reduce as much as possible the pernicious practice of making the powder do the work.

The flat-lying character of the Illinois beds is favorable to machine mining, and there appears to be no good reason for permitting solid shooting to continue. The number of mining machines in use increased from 1402 in 1911 to 1654 in 1912.

New Developments in Anthracite Field

The Delaware & Hudson Co. is spending $300,000 on a new breaker at Archbold, the Susquehanna Coal Co. is sinking a shaft at Lykens, the Delaware, Lackawanna & Western Railroad Co. is expending a large sum on the new Loomis colliery, and the Lehigh Valley Coal Co. has appropriated $200,000 to build a new fireproof steel and concrete breaker at Franklin, abandoning the old breaker located there.

In addition to this the Lehigh Valley Coal Co. is spending approximately $200,000 on the thorough fireproofing of its buildings inside and outside the mines, and the Lehigh & Wilkes-Barre Coal Co. is remodeling the Inman breaker at the Buttonwood colliery of the Parrish Coal Co., taken over last February.

The necessity for all this expensive activity is due to the fact that machinery which met all requirements a few years ago is now out-of-date, and has to be supplanted by machinery which is more intricate and costly. There has been a steady increase for several years in the demand for "prepared" sizes of anthracite, and this tendency has brought about a corresponding increase in the cost of handling the coal.

This, however, is not the only factor which has compelled the dismantling of old breakers. Anthracite mining today is carried on in much poorer veins, and at greater depth, than in days past. The richer veins and those nearer the surface have been rapidly exhausted, and the companies are forced to mine coal which once would have been left untouched.

⁂

The Coals of Washington

The coals of Washington, while limited to a few scattered areas, chiefly along the eastern border of Puget Sound, range from anthracite to lignite in character. Lignites are found in the southwestern part of the state, in Cowlitz and Lewis Counties. In Lewis County, as the measures approach the mountains, the lignites grade upward into sub-bituminous and bituminous coal.

The areas along Puget Sound contain sub-bituminous and bituminous coal, some of the latter possessing fair coking qualities, and in the northwestern part of the state, on the slopes of Mt. Baker in Whatcom County, anthracite has been reported.

The coking coals of Washington are the only ones of that grade on the Pacific Coast. They are found in the Wilkeson-Carbonado district in Pierce County; in the North Puget Sound field in Skagit and Whatcom Counties, and in the northern part of the Roslyn field in Kittitas County, but at present coke is made only from the Wilkeson-Carbonado coal.

The production of coal in Washington reached its maximum in 1910, when according to the figures of E. W. Parker, of the U. S. Geological Survey, compiled in coöperation with the Washington State Geological Survey, the output amounted to 3,911,899 short tons. In 1912, the output was 3,360,932 tons. The value fell off from $8,174,170 to $8,042,871.

Reports to the United States Bureau of Mines show that the fatalities in the coal mines of Washington in 1912 were fewer by one-half than in 1911, the total number of men killed in 1912 being 14 against 27 the preceding year.

Coal Shipping on the Great Lakes

SPECIAL CORRESPONDENCE

SYNOPSIS—This installment of the Lake article gives an uptodate estimate of the capacity of the coal docks at the Twin Ports. There are also detail descriptions of two of the largest and mose important installations.

⁂

In a recent issue of the *Coal Trade Journal*, we find the following interesting remarks concerning the capacity of the principal dock companies:

THE SUPERIOR-DULUTH DOCKS

According to the latest available figures on dock capacities at the Twin Ports, which are as reasonably accurate as it is possible to make them, the docks at the head of the Lakes, including improvements now under construction, can store ten and a half million tons of bituminous and over a million and a half tons of anthracite, a total of over twelve million tons of fuel. The docks are equipped to handle, on the average, 50 per cent. more than this amount, and with the improved machinery now being installed by several of the more progressive mining companies, it is probable that twenty million tons of coal could be handled each season.

GENERAL VIEW OF THE CLARKSON COAL & DOCK CO.'S UNLOADING TANDEM

During the past year substantial additions to the total storage capacity of the Twin Ports docks have been made by the Berwind Fuel Co., which now is completing a million-ton dock; the North Western Fuel Co., whose dock No. 1 at Superior is being made into a model structure of its kind; the Pittsburgh Coal Co., which is making better and bigger docks of No. 5 at Superior and No. 7 at Duluth; the Carnegie Fuel Co., which has built a mammoth new dock at Duluth; the Island Creek Coal Dock Co., which is building a million-ton dock at Duluth, and several others which have made minor improvements and additions.

According to estimates made by the various dock superintendents, 200,000 tons of coal could be unloaded at Superior and Duluth daily under maximum working conditions and about half that amount could be loaded onto cars and shipped out. Records of this kind are difficult to compile, however.

For several years the storage capacity of the docks at the Twin Ports has increased at the average rate of a million tons per year and the end is not yet in sight. It is probable that next year several of the dock companies here will make improvements to property on which docks are now located and new structures also are rumored to be under consideration. Men high in the trade here look to see, perhaps shortly after the completion of the new steel plant here in 1915, a storage capacity of 20,000,000 tons of coal at the Head of the Lakes.

STORAGE, RECEIVING, SHIPPING

In the tables accompanying this article the Pittsburgh dock No. 7, at Duluth, includes No. 1, and the new dock, recently completed. Pittsburgh dock No. 2 is leased by the Clarkson Co. The Boston Coal Dock & Wharf Co. dock is given under the name of St. Paul & Western, which now operates the dock. At Superior the Reiss Coal Co. has under lease Pittsburgh docks Nos. 3 and 4, and the Island Creek Coal Co. is operating what was known as Dock No. 6. The old P. & R., or Great Northern dock, is at present occupied by the Great Lakes Co.

The capacity figures follow:

Superior

	Storage Capacity		Handling Capacity per day	
	Antnracite	Bituminous	Rec'pts	Shipm'ts
Pittsburgh Coal Co. No. 5	250,000	750,000	15,000	8,000

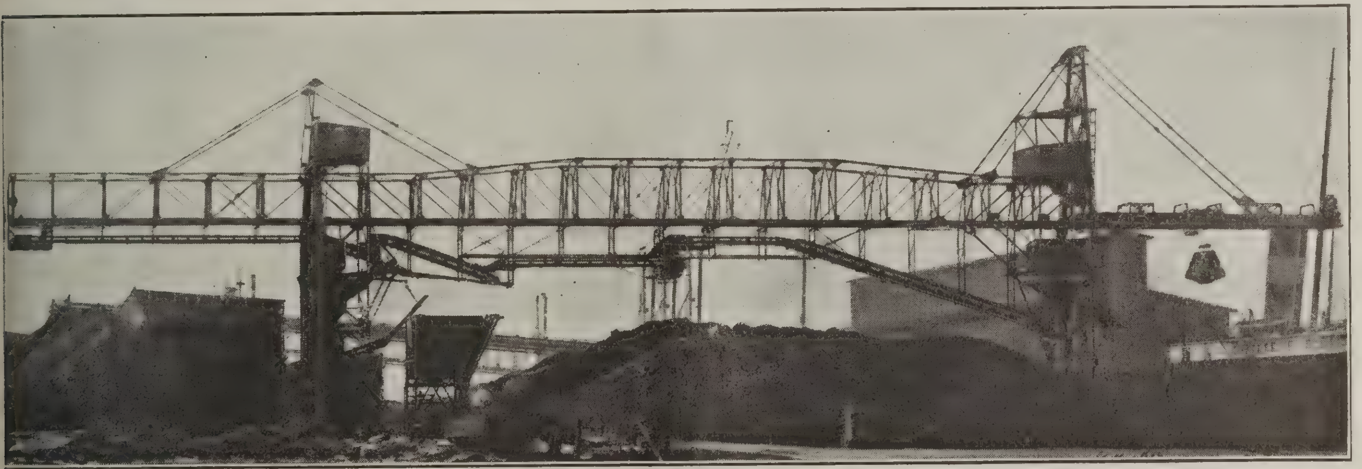
THE CLARKSON COAL & DOCK CO.'S PLANT*

In the early spring of 1912, the Clarkson Coal & Dock Co., of Duluth, realized the necessity for having a more modern coal-handling equipment on their dock in order to take care of their large increase in business. They, therefore, contracted with the Roberts & Schaefer Co. for two bridges of the Watson patent.

The Clarkson dock is approximately 600 ft. wide and 1000 ft. long. It, therefore, became necessary to work the two bridges tandem in order to cover this space. To unload vessels rapidly while depositing coal on the back part of the dock, it was also deemed advisable to use belt conveyors rather than attempt to run the unloading bucket to the back dock. The two bridges were built with identically the same equipment and with the same span, so that the front dock, if later extended in length, could be equipped with the bridge which is now used on the back dock, by merely swinging the bridge on a curved track around to the front dock; it does this under its own power.

Each bridge is equipped with a four-yard Andresen-Evans bucket, operated by means of two 60-hp. Westinghouse mill-type motors. The motors operating the bucket, instead of being carried on the carriage according to the usual method, are on stationary platforms in the towers of the bridges. These motors are geared direct to large cast-steel drums by means of Falk Herringbone gears, which eliminates the noise that usually accompanies the operation of such a high-speed machine.



BRIDGES, AT DULUTH, MINN., CONSTRUCTED BY THE ROBERTS & SCHAEFER CO.

DRIVING ARRANGEMENT, SCREENING PLANT, ETC.

A single ¾-in. cable leads from the drums to the carriage on the bridge. There are two drums on the carriage, one having two sections and the other three sections. The cable from the hoisting drums is attached to one section of each drum on the carriage, while the bucket having three lines is attached to the other three sections of the drums. The holding-line drum on the carriage is equipped with a magnetic brake, and the closing-line drum with a magnetic clutch. The brake is for the purpose of holding the bucket open while the clutch enables the operator to lower his bucket in the open position, both drums revolving together when the clutch is set.

When the coal is being stored on the dock, the bucket on No. 1, or the front dock bridge, runs only from the hatch in the vessel to a hopper in the front leg of the bridge. The coal is then fed from the hopper to a belt conveyor, which deposits it on either the front or back dock, as desired. This is accomplished by means of several fixed trippers and also by means of two shuttle belts, which operate back and forth underneath the fixed belts.

Each bridge is equipped with a complete screening outfit, and coal may be loaded direct from the vessel through the screening equipment of either bridge into cars, or may be reclaimed from the stock pile and loaded out through the screening plants. Each screening plant delivers coal to two tracks, so that cars may be loaded out on four tracks at the same time.

A portable box-car loader is installed in each bridge. These are pivoted to the bridges and swing parallel to, and within the clearance lines, of the bridges, so that they do not act as an obstruction when the bridges are traveling on the dock.

Each bridge has an unloading and screening capacity of 300 tons of coal per hour. The equipment on the Clarkson dock is considered to be one of the most efficient at the head of the lakes.

THE PITTSBURGH COAL, DOCK & WHARF CO.'S ALLOUEZ NO. 5 DOCK

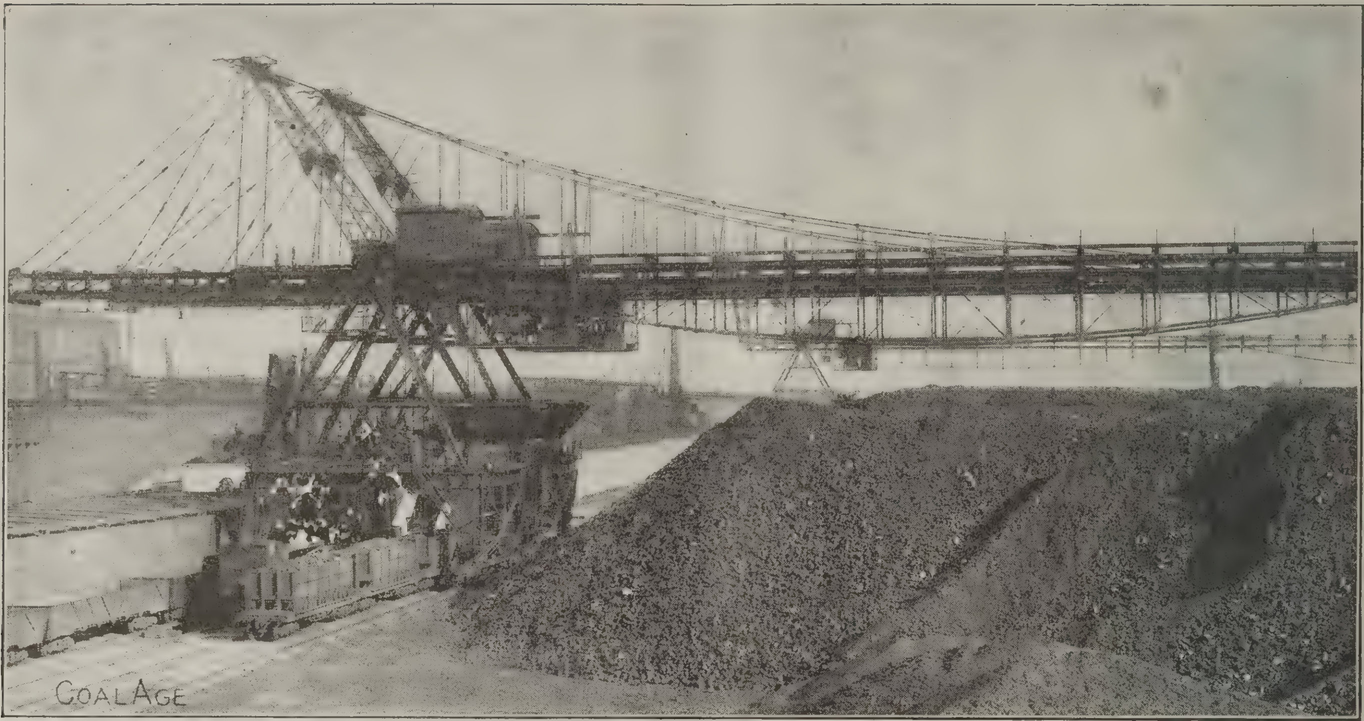
The Pittsburgh Coal, Dock & Wharf Co. is equipping one-half of its Allouez No. 5 dock, at Superior, Wis., to be one of the largest coal-dock properties in the world, if not the largest. The half of the dock, now being equipped, will have a storage capacity of about 800,000 tons of bituminous coal and 200,000 tons of anthracite. The entire dock, when completed, will have a total capacity of two million tons. The plant is being carefully laid out with railroad tracks and proper machinery so that large shipments can be easily and rapidly made.

The dock is being equipped with two Brownhoist 5½-ton man trolley bridge tramways, which are being manufactured and erected by the Brown Hoisting Machinery Co., of Cleveland, Ohio.

These two bridges will be identical in size and construction, except that one will have a more elaborate screening apparatus than the other. Each bridge will be supported by a shearleg of A-frame construction, at the front or water end, and a pier at the back end. The bridge will have a span of 342 ft. center to center of the

---

*By E. E. Barrett, chief engineer, Roberts & Schaefer Co., Chicago, Ill.



UNLOADING DIRECT FROM VESSEL TO RAILROAD CARS ON THE PITTSBURGH COAL CO.'S DOCK NO. 7, AT DULUTH

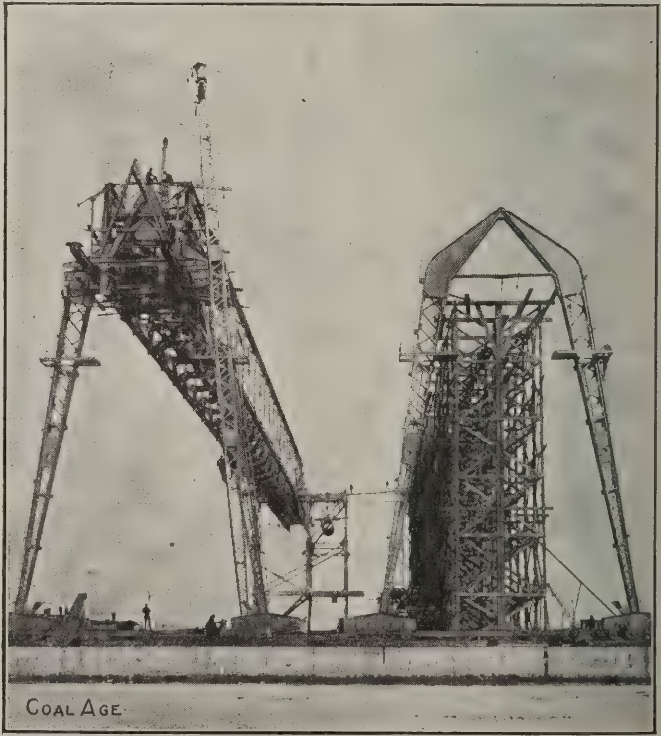
shearleg and the pier. There will be a cantilever at the pier end, 125 ft. 6 in. long, which will span the three railroad tracks and the screening pile. There will also be a cantilever at the water end 117 ft. 9 in. long, which will span three railroad tracks and extend over the water; at the end of this latter will be a hinged apron, which can be raised or lowered to allow the boats to dock. The shearleg and the pier are supported on equalizing trucks with flanged wheels, which travel along the dock on rails. The entire bridge is propelled by a motor, through suitable gearing and shafting.

The bridge, including the cantilevers and the hinged apron, is fitted with tracks on which a man trolley travels back and forth. The trolley is fitted with a cage, in which the operator rides and in which are placed all the switches and controllers for operating the entire bridge. There is suspended from the trolley a Brownhoist coal-grab bucket, of 5½-ton capacity. This bucket has a spread of 17 ft. 8 in., when opened, and is 6½ ft. wide. The bucket is suspended from a turntable on the trolley, thus enabling the operator to turn it through 90 deg., when desired. The operator on the trolley controls the operation of the bucket, the trolley, and also the bridge travel along the dock. The trolley and the bucket are equipped with powerful hand or foot brakes controlled by the operator. The bridge traveling mechanism is supplied with a solenoid brake, which will always be set whenever there is no current passing through the motor.

Each shearleg is equipped with a 50-ton bin, into which the coal is placed by the bucket. Run-of-mine only is loaded into this bin and it is discharged from the bin into a scraper conveyor, which loads it into railroad cars. The shearleg is also fitted with a box-car loader and a car puller.

The pier of Bridge No. 1 is equipped with a 500-ton bin, which receives the coal from the bucket. It is then discharged from the bin onto a shaker screen, located beneath, and passes through a chute onto a pivoted scraper conveyor. This conveyor in turn discharges into the railroad cars. The coal passing through the shaker screen will be discharged into an elevator, which in turn will discharge it onto a belt conveyor, which carries it either to the cars or to the stockpile.

The screening plant located on the pier of Bridge No. 2, is similar to that which is used by the company on their dock No. 7, at Duluth. It consists of a 50-ton receiving bin into which the coal is dumped by the bucket. Below this bin there is a shaker screen, onto which the



TWO NEW BROWNHOIST TRAMWAYS AT THE ALLOUEZ NO. 5 DOCK OF THE P. C. D. & W. CO.

coal is fed from the receiving bin through a power-driven reciprocating gate, which insures a constant discharge.

The coal passing over this screen is discharged into a scraper conveyor, which carries it to the railroad cars; that passing through the shaker screen falls onto an elevator, which carries it up to a rotary screen, where it is sorted into three sizes, stove, nut and screenings. Directly beneath the rotary screen, there is a bin divided into three compartments, one for each grade. Each one of these pockets is provided with a gate, through which the coal flows onto a horizontal belt conveyor, which takes it to the cars or the stockpile. Each compartment is also provided with a second chute for discharging the coal into the small chute at the foot of the shaker screen, to be carried by the scraper conveyor to the cars.

Sometimes the coal is taken from the screening pile and rescreened, being picked up by the bucket and discharged into the receiving bin. This bin is provided with an auxiliary chute, which feeds the screenings into the elevator, where they are discharged into the rotary screen.

The piers on both bridges are also equipped with a boxcar loader and a car puller. The operation of the entire plant is as follows:

The coal is unloaded from the boat by the buckets operating on the bridges. Some is then loaded directly into cars, through the bin on the shearleg. If the coal is for storage, it is placed on the large stockpile to await shipment, and if it is to be screened it is carried to the screening plant and then loaded into cars or is put on the screening stockpile. The bridges will also be used for unloading the anthracite and storing it in the hard-coal storage shed. The two bridges and all screening apparatus are electrically operated.

(To be continued)

⁂

Grecian Coal Importation

Whereas during 1911 the coal imported into Greece amounted to 639,822 tons says the Daily Consular and Trade Reports, only 476,695 tons were imported in 1912, showing a decrease of nearly 25 per cent. The causes of this decrease was the coal strike of the early summer n England, which country supplies the greater part of he coal consumed in Greece and the strike of the coal workers at Piræus, the port of discharge of most English coal. Another factor was the exclusion of Greek teamers from the Black Sea as a result of the Balkan War. The freight rate from Cardiff to Piræus has advanced from $1.52 to $3.16 per ton, which was the record rate during the Transvaal War.

The decrease in the importation of coal was not conned to Greece, but was general throughout the Balkans nd Asiatic Turkey, and is estimated during 1912 as follows: Greece, 163,000 tons; European Turkey, 99,000 ons; Asiatic Turkey, 8000 tons; Roumania, 29,000 tons; ulgaria, 54,000 tons; total, 353,000 tons.

The coal usually imported is Cardiff mixed with Newort for ordinary bunkering purposes with a few shipments of double screened. The coal used by the gas comanies is generally North Country, from Newcastle.

The railway companies imported about 10,000 tons of briquettes from Westphalian coal fields; altogether about 78,000 tons were imported from German coal fields. hese shipments included 8000 tons of coke and about 0,000 tons of anthracite. The general shortage of coal throughout the Levant will necessitate the placing of important orders as soon as peace is concluded, and the requirements of these markets will offer opportunity for American coal shippers.

⁂

Mexican Rebels Dynamite a Million-Dollar Coal Operation

The Roberts & Schaefer Co., of Chicago, Ill., have received the following communication from one of their clients, a high official of a large coal corporation operating in Northern Mexico:

Compania Carbonifera Agujita y Anexas, S. A.
Agujita, Coah., via Sabinas.
Aug. 25, 1913.

Gentlemen:

We beg to advise you that on Aug. 16 our entire plant at Lampacitos was destroyed by the Carranza forces in making their retreat northward from Hermanos, where they were badly defeated by the Federals. The destruction was premeditated, and as soon as word from Hermanos came that the fight there had been lost, it was immediately started.

The Carranza soldiers used dynamite and gasoline, and within two hours they had created a loss of fully one million dollars. The washer was completely destroyed, as was the warehouse with $40,000 worth of supplies. In the power plant the 200-kw., 150-kw., 100-kw. and 30-kw. generating units were first blown to pieces with dynamite, and then the building was burned.

At the mines the tipples were burned, and the fans and fan houses—which were fireproof—were destroyed with dynamite. All of the electric and steam hoists were destroyed with dynamite, and the houses burned. A large number of employees' houses and miners' houses were also burned and the home of the writer was destroyed with all contents.

VIEW OF THE RETORT OVENS AT LAMPACITOS, MEX.

We have been unable to get down there to estimate the total loss, but from the information gained from the last people to leave the place, there seems little hope of finding much left. The mines will soon fill with water, which will also be a greater loss. Our plant at Agujita has been threatened with similar disaster unless we pay $50,000 for "protection." This we cannot do. They have already taken from there all of our supplies, furniture, etc., and we fear that the property may be destroyed at any moment.

We are writing you in full regarding this matter, with a view of requesting that you give the matter some publicity, if possible. From what we read in the papers, there seems to be considerable feeling in the United States toward extending recognition to the rebel faction, and we would like to have some such things brought out to show what manner of so called "warfare" these people are carrying on. The wanton destruction of a large property that gave a good living to thousands of people, cannot be construed to be of any military advantage or necessity, the Carranzistas having weakly claimed that they destroyed the place in order to prevent the Federals from getting the coal for operating their trains, etc.

The writer would suggest that his name be withheld from any prominence, as he is staying in Mexico at this time looking after the interests at Agujita.

Thanking you for anything that you can do toward this matter, we are,

Yours very truly,
Cia. Carbonifera Agujita y Anexas, S. A.

A Modern Distribution and Storing Plant

By Alfred Gradenwitz*

SYNOPSIS—An efficient electric system designed to accumulate coal coming from the separation plant and intended for local consumption. This plan of transportation not only connects the home sales station with the separation plant, but permits two boiler houses, unfavorably located, to be supplied with coal. The line comprises no less than 27 curves, and is automatic in practically every detail.

⁂

Collieries are dependent on a suitable storing plant to make up for any fluctuations in the actual requirements, and to be able to acumulate sufficient stocks for the home sales which are generally crowded into a few hours of the day. Apart from the coal extracted from the mines, that coming from the dressing floors and separation plants has to be stored in separate bunkers.

The electric telpher line of the Deutschland mine, at Schwientochlowitz, Germany, which was designed and constructed by Messrs. Adolf Bleichert & Co., of Leipzig, is intended for accumulating the coal coming from the separation plant, exclusively for home consumption. While it would have been practically impossible with any other mechanical transporting device, to provide for a connection between the separation plant and the home sales station (separated from the former by several buildings), the telpher line here described proved especially advantageous insofar as it allowed at the same time the two boiler houses situated most unfavorably in regard to the separation plant, to be fed with coal. What local difficulties had to be overcome, can be inferred from the fact that this telpher line comprises no less than 27 curves.

Overcoming the Difference in Elevation

The rails below the separation plant, on which the trucks are loaded, are situated about 35 ft. lower than those above the bunkers into which the coal is taken. This level difference has been overcome in a most simple way by a cable-operated inclined lift, according to the "Bleichert" patented design, which has also been used advantageously for the charging of blast furnaces.

The trucks are, at the beginning of the incline, without breaking their journey, uncoupled automatically from the traction cable kept in permanent motion, being raised by it to the upper end of the incline or conveyed downward as the case may be. At the end of the incline, they are again loosened automatically from the cable, continuing their course with electric operation. This arrangement is far more advantageous than a vertical elevator, insofar as it works with absolute safety, and requires no attendance or superintendence. At the same time, the trucks may follow up one another at intervals as short as possible, thus realizing without any difficulty the greatest outputs. In fact, telpher lines for outputs of up to 300 tons have been designed on this system for the charging of blast furnaces.

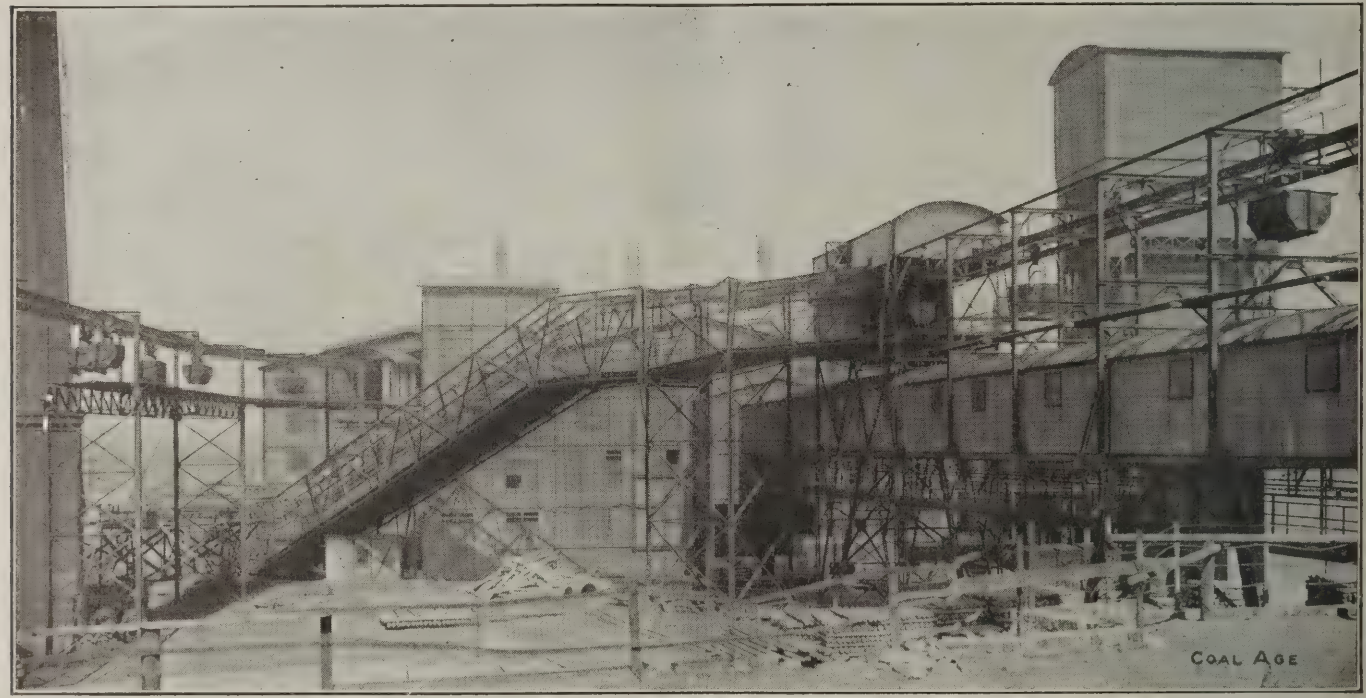


Fig. 1. General View of Electric Telpher Line

The distribution of coal to the various loading stations, the boiler-house bunkers and the various compartments of the unloading hopper, separately for each sort of coal, has been solved in a most satisfactory manner. Whereas in the earlier installations a man had to superintend the unloading, adjusting the stops intended to tip the trucks, Messrs. Bleicherts' adjusdting mechanism allows the operator already in the separation plant to fix the point at which the truck is to be tipped.

This is important because quite a number of different

---

*Berlin-Friedenau, Gosslerstrasse 20, Germany.

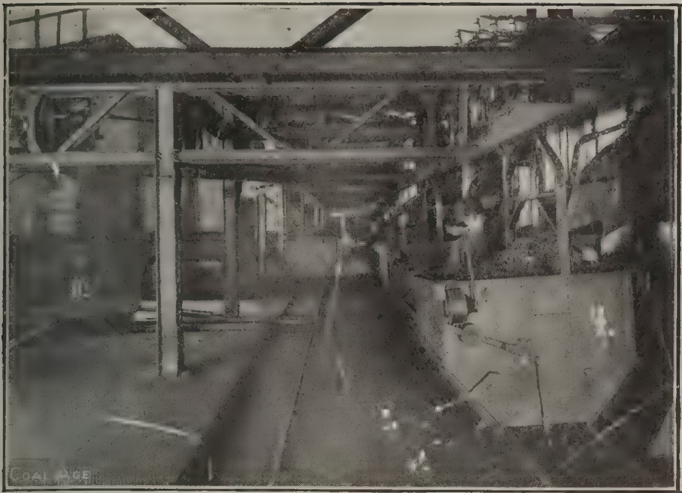

Fig. 2. Loading with Different Grades of Coal

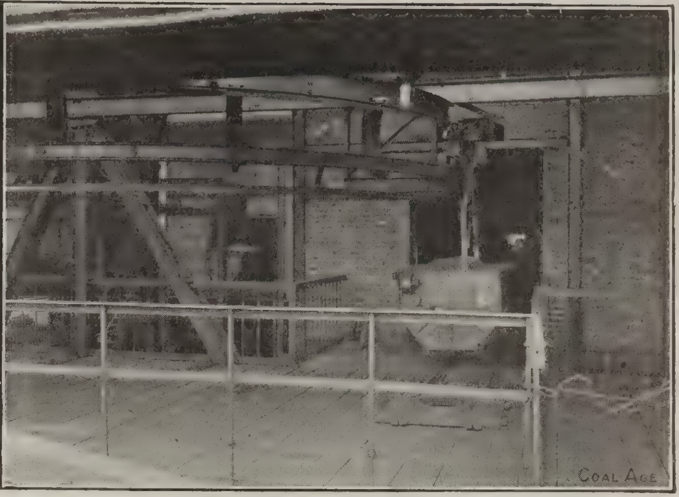

Fig. 3. Loaded Truck Leaving Separator Plant

sorts of coal have to be transported at a time, which would require a permanent adjusting at the loading station, giving rise to mistakes on account of the irregular sequence of trucks. In the Deutschland mine installation, such mistakes are practically precluded, the trucks being properly adjusted in advance.

Method of Operation

The operation of the telpher line may be described briefly as follows: The empty trucks entering the separation plant are kept back by the block system and arranged at given distances apart, in the event of the places in front of the loading chutes being taken up. After the starting of the loaded trucks, they move on automatically, stopping in front of the bunkers, where the operator, by opening a trap, loads the truck with the desired sort of coal (Fig. 2).

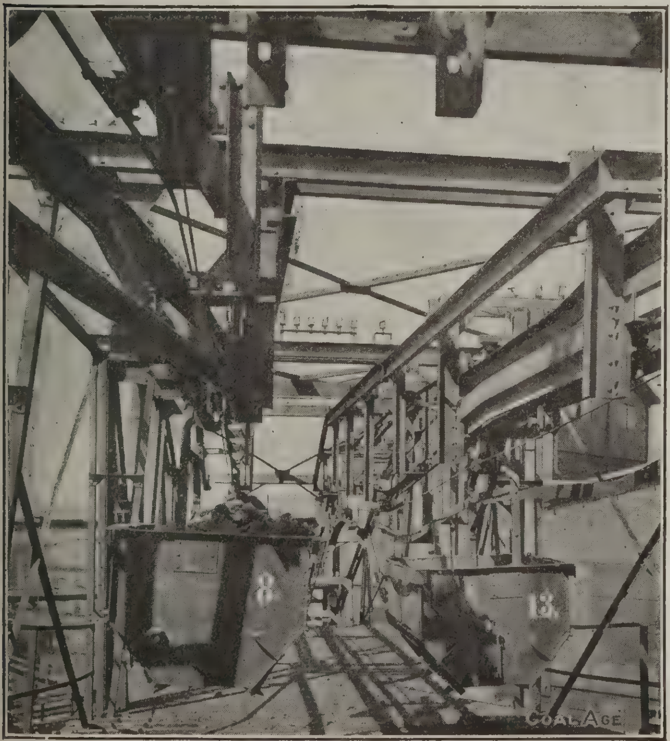

Fig. 4. Upper Section of Tramway

By operating a switch, he then starts the filled trucks, causing these to travel through the whole line, inclusive of the inclined lift and the unloading stations, at a speed automatically controlled, and at a distance apart corresponding to the block-system, tipping at the points adjusted for by the locking frame, without breaking their journey.

The issue from the separation plant, where the trucks deviate in a sharp curve toward the inclined lifts, is shown in Fig. 3, the inclined lift with part of the track traversing the court yard at 48 ft. height being visible in Fig. 1. In the left-hand part of the latter figure, there happens to be visible a section of the Bethlen-Falva Iron Works' telpher line, which is one of the oldest installations of the kind, having been in satisfactory operation since 1905, in spite of exacting working conditions. It may be said, in passing, that the Bethlen-Falva Iron Works in the meantime have had installed another electric telpher line on the same system for the conveying of hot ingots, for their fine-iron rolling mill.

Fig. 4 shows the upper part of the inclined lift with a filled truck just uncoupled, and an empty truck seizing the continually moving traction cable and being conveyed downward.

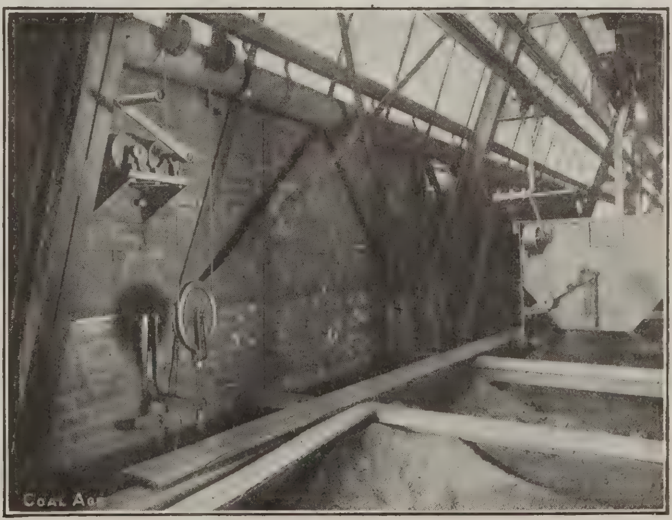

Fig. 5. Automatic Discharge at Boiler House

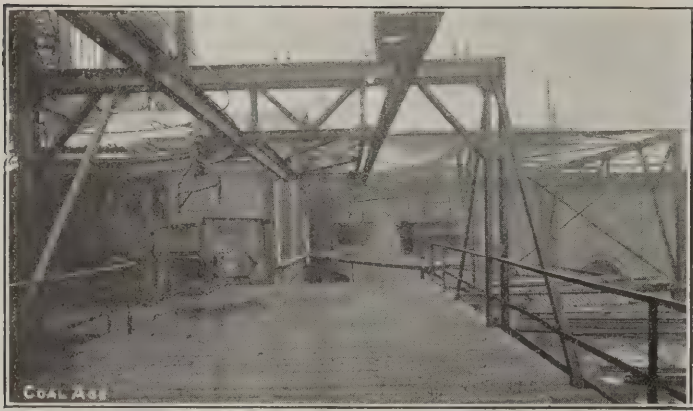

Fig. 6. Installation at Old Boiler House

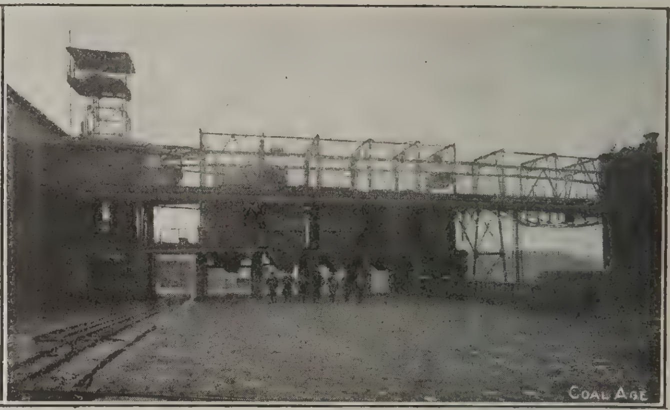

Fig. 7. Loading Hoppers for Home Sales

Course of Travel for Loaded Trucks

The trucks then travel through boiler house I, the home sales bunker and boiler-house II, the tipping, in accordance with the above plan of travel, being effected at predetermined points. In order that the stoker may be in a position accurately to adjust for the point of the boiler-house bunker where unloading is to take place, the stops in the boiler houses, as inferred from Fig. 5, have been made adjustable by means of the small hand-operated winch visible to the left in the foreground, from which an endless traction cable is seen to connect with the stop. A tightening pulley has been provided to keep the cable taut.

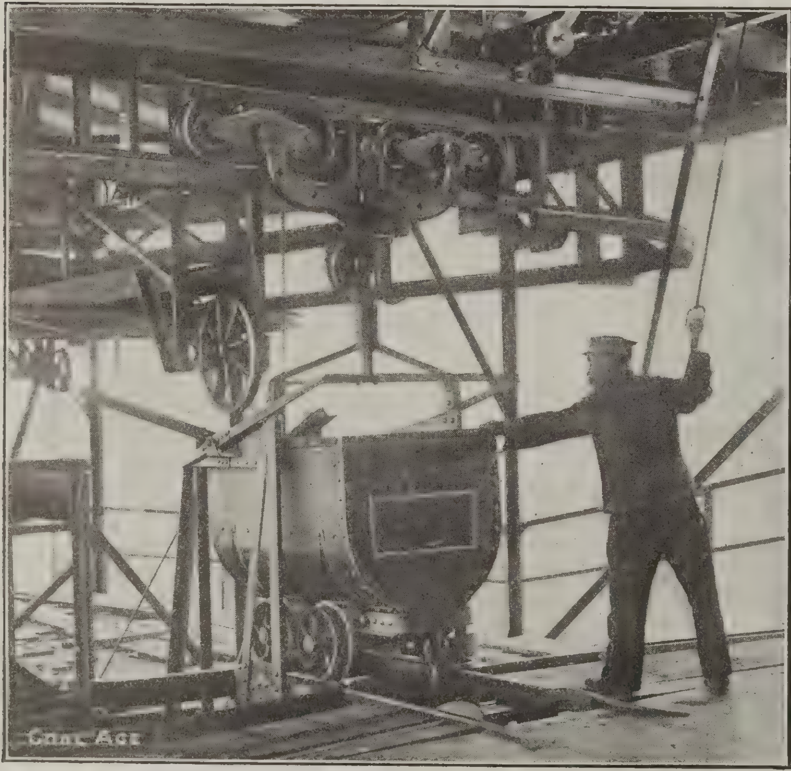

Fig. 8. Transfer Table for Mine Cars

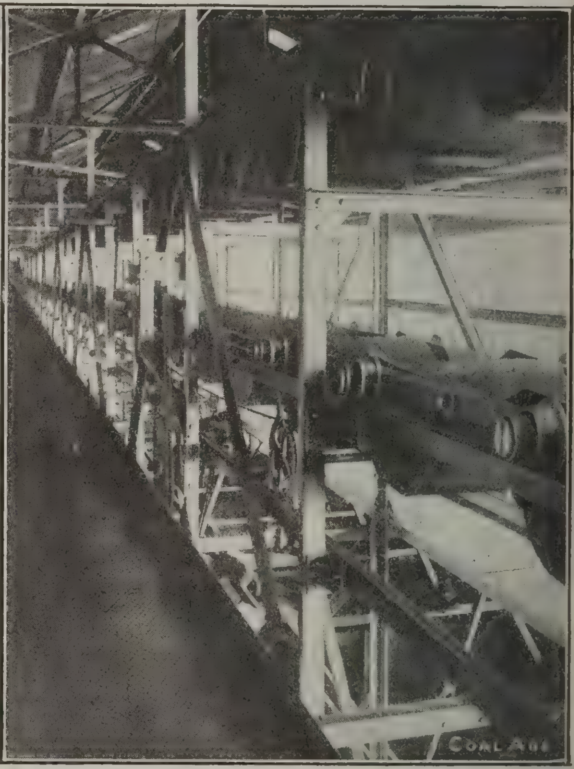

Fig. 9. Conveyor Line in Central Station

Fig. 6 shows the point in front of the old boiler house where several sections of the line are seen closely crowded together. Truck No. 2, coming from the new boiler house, is returning empty to the separation plant; truck 8 is entering the old boiler house filled, and truck 3 is just on its way to the home sales station, after passing the old boiler house. Fig. 7 is a front view of the loading hoppers for the home sales station, which are encompassed on one side by the pit building and the old boiler house, and on the other, by the new boiler house.

Fourteen trucks, each of 1764 lb. useful capacity, travel on the line, which arrangement permits the handling of 50 tons of coal per hour. The telpher line is about 2600 ft. in total length.

The Deutschland mine plant is a typical instance of the ease with which telpher lines on this system allow the most complicated problems to be solved in a simple and economical manner.

⁂

Gas should not be allowed to explode in a safety lamp if it can possibly be avoided. When examining to detect gas the lamp should not be raised higher than will allow the gas to be detected. If the gauze of a safety lamp becomes damaged while in use or if oil is spilled on the same or the chimney becomes cracked, the light should be extinguished at once and the lamp taken back to the light station for examination and repairs.

The United States vs. the Reading Co.

By A. T. Shurick

SYNOPSIS—A review of the latest attack on the hard-coal combine. For the first time the powerful Reading Co. has been put on the defensive. Government's case appears to be well established, but there is much diversity of opinion as to the outcome.

⁂

The partially successful governmental attack on the alleged anthracite trust, which resulted in the dissolution of the Temple Iron Co. and the abolition of certain other conditions, toward the close of last year, appears to have been but the preface of a determined effort to effect a complete disintegration of this combination. While this previous case nominally resulted in the defeat of the operators, it was generally conceded that the results were inconclusive, indeterminate and without any real material effect. But although the court ruled that the government had failed to prove its case in the more vital points at issue, it nevertheless dismissed these "without prejudice."

It cannot, therefore, be considered that Attorney-General McReynolds' renewal of the attack in any way resembles the taking up of a "lost cause." As a matter of fact, all indications point to the contrary. Mr. McReynolds is a serious and determined man and is, no doubt, thoroughly imbued with the righteousness of his case and absolutely sincere in his work. He has been engaged for years, under both the Roosevelt and Taft administrations, in carrying on proceedings against the anthracite companies and he knows the ground thoroughly. His great experience and past defeats have only served to make him a more formidable antagonist.

The Charges against the Reading

The new bill of complaint against the Reading first reviews the organization of the company and its various subsidiaries, together with their present relations. This is followed by a study of the ownership of the remaining available anthracite resources, regarding which the following statement is made:

> This combination is the backbone of the alleged monopoly of anthracite. It controls about two-thirds of the entire deposits, and its supply will outlast by many years that of any producer. In time, therefore, this combination, if not dissolved, will own or control every ton of commercially available anthracite known to exist, and while, in almost any other branch of industry it is at least possible for a monopoly to be broken by the influx of fresh capital, attracted by high profits, against a monopoly of anthracite, the supply of which is limited, there can be no protection—only the law can afford relief.

The Department of Justice then prays that the court find as follows:

1. That the Reading Co., the Philadelphia & Reading Coal & Iron Co. and the Philadelphia & Reading Railway Co. and their directors are engaged in combinations and conspiracies in restraint of interstate and foreign trade.
2. That the ownership by the Reading Co. of the stocks of the Reading coal and railway companies is an illegal combination in violation of the Sherman law, and that the Reading Co. be required to dispose of such stocks; that the dissolution of the Reading group be carried out under the direction of the court and not by persons connected with the management; that in the meantime the Reading Co. be enjoined from voting or receiving dividends from the coal and railway stocks.
3. That the ownership by the Reading Co. of the stock of the Schuylkill Navigation Co. is contrary to the Sherman law and that the Reading Co. be directed to dispose of the Schuylkill Navigation stock under the direction of the court and to persons not Reading stockholders.
4. That the ownership by the Reading Co. of the stock of the Wilmington & Northern Railroad Co. is an illegal combination contrary to the Sherman law and that the lease of the Wilmington & Northern physical property and franchises to the Philadelphia & Reading Railway Co. is also illegal; that the Reading Co. be required to dispose of the Wilmington & Northern stock and cancel the lease.
5. That the lease by the Lehigh Coal & Navigation Co., of the Lehigh & Susquehanna Railroad to the Central Railroad Co. of New Jersey, and the agreements relating thereto be declared illegal as restraints of trade and ordered cancelled unless the following alterations are consented to: Making the rental a fixed sum instead of being based on annual receipts as at present; striking out the covenant requiring the Lehigh Coal & Navigation Co. to ship the major part of its coal via the Lehigh & Susquehanna; striking out the agreement that rates to points common to the Lehigh & Susquehanna R.R. and the Lehigh Coal & Navigation Co.'s canal be fixed by mutual agreement.
6. That the ownership of a controlling interest in the Lehigh & Hudson River Railway Co., and the Lehigh & New England Railroad Co., by the Lehigh Coal & Navigation Co. and the Central Railroad Co. of New Jersey, "while themselves joined in a common interest" constitutes a combination in restraint of trade; that the Lehigh Coal & Navigation Co. and the Central Railroad Co. of New Jersey be ordered to dispose of their holdings in said stocks, under the direction of the court.
7. That the ownership by the Reading Co. of a majority of the stock of the Central Railroad Co. of New Jersey be declared an illegal combination in restraint of trade, contrary to the Sherman law, and that the Reading Co. be required to dispose of its stock in the Central Railroad Co. under direction of the court.
8. That the Reading Co. be declared "in and of itself" a combination in restraint of trade, in violation of the Sherman law.
9. That in view of the intercorporate relations existing, shipments by the Philadelphia & Reading Railway Co. of coal owned by the Philadelphia & Reading Coal & Iron Co. be declared to be in violation of the commodities clause of the Hepburn law, prohibiting railroad companies from transporting commodities owned by themselves.
10. That for similar reasons transportation by the Central Railroad of New Jersey of coal owned by the Lehigh & Wilkes-Barre Coal Co. and by the Lehigh & Susquehanna Railroad of coal owned by the Lehigh Coal & Navigation Co. be declared to be in violation of the commodities clause.

The Reading Financing

One of the most important conditions specified in the Reading suit is that the company shall dispose of its holdings in its subsidiaries to outside interests in no way affiliated with it. Owing to the peculiar financing of the company this is a condition that it may find difficult to comply with. The Reading Company has in past years advanced to the coal company, 73 million dollars, on which interest at the rate of only 1 or 2 per cent. has been paid.

But whereas the coal company has been operating at a loss, the revenues realized from the coal freights has more than made up this deficiency. It is essentially a condition of robbing Peter to pay Paul. Without at least a partial cancellation of this indebtedness the Reading will, of course, not be able to find a buyer. On the other hand, the Attorney General bitterly opposed the action of his predecessor, Mr. Wickersham, when the same principle was at issue in the Tobacco cases and flatly refused to consider any settlement in the Union Pacific-Southern Pacific controversy that did not provide for a well-defined separation of these two companies. There is no doubt, therefore, of his position on this feature and with a precedent now established he should be able to carry his point.

POWER DEPARTMENT

The Buckeye Locomobile

Special Correspondence

SYNOPSIS—With all of her boasted progress along mechanical lines America is often slow in adopting and applying proven methods of economy. A machine is herein described which utilizes the best principles of efficiency for reciprocating engines known to exist and upon which a guarantee of performance can be given, based not upon pounds of steam but pounds of fuel per horsepower-hour.

⁂

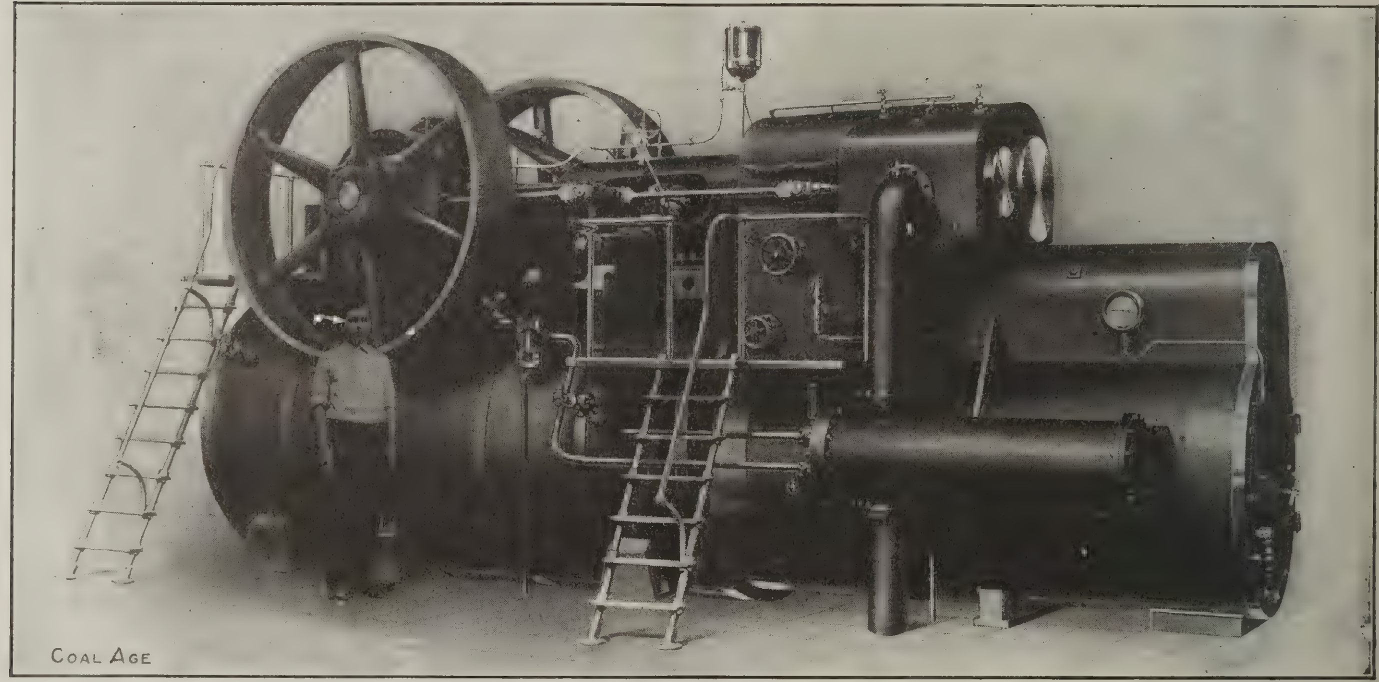
Among the most notable engineering achievements of the past 20 years has been the development in Europe of the high-efficiency steam engine and boiler unit known variously as the "Locomobile," "Overtype" and "Semi-Fixe." The economical results obtained by this device have been so marked that the Buckeye Engine Co., of Salem, Ohio, has made careful and thorough investigation of the principles employed with a view of offering to the American power-using public a machine of equal merit. During the past year they have constructed and tested a unit of this type which is herein illustrated and described.

The Buckeye-mobile is a complete self-contained power plant, consisting of an internally fired boiler on which is mounted a compound engine, the cylinders of which are inclosed in the smoke box. These cylinders are equipped with specially designed piston valves adapted for the use of highly superheated steam. The smoke box also contains a superheater, a reheater and all the necessary piping both for leading the steam from the boiler through the initial superheater to the high-pressure cylinder and that which conducts the steam from the high-pressure cylinder through the secondary superheater or reheater to the low-pressure cylinder.

The superheaters are inclosed in a special casing whereby the hot gases emerging from the boiler tubes are compelled to traverse first the initial superheater and next the reheater before being discharged into the smoke box proper.

The unit comprises also a boiler-feed pump driven directly from the engine valve gear, a closed feed-water heater in the exhaust line from the low-pressure cylinder and a suitable jet or surface condenser with a rotary air pump driven from the main shaft of the engine.

The initial superheater is a single coil of seamless steel tubing through which the steam passes in a direction counter to that of the hot gases. The reheater consists of two headers joined by a large number of small seamless tubes. An effective steam-jet blower enables the operator to thoroughly remove all soot and dust from these superheaters as well as the boiler tubes as often as may be necessary.



The Complete Self-Contained Unit. Note Size of Boiler Compared to Engine

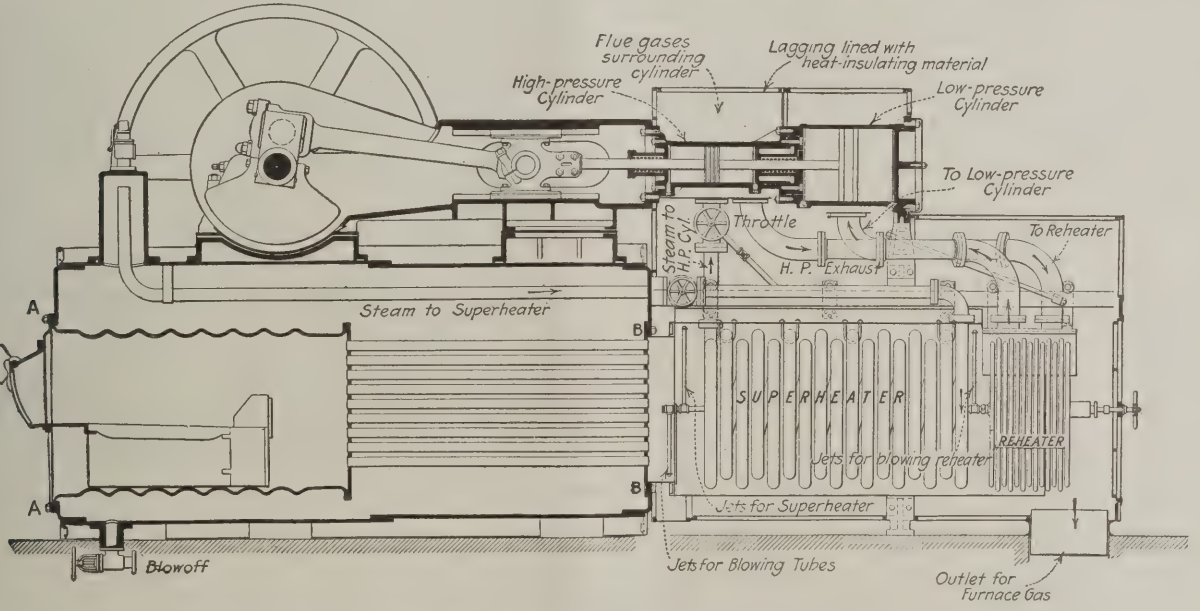
In order that the boiler may be thoroughly inspected and cleaned, the furnace and tubes are made removable by simply unscrewing a row of bolts on each end of the boiler. The boiler is supplied with a water column, injector, safety valves, blowoff valve, etc., to conform with the various state laws of the country.

Type and Mounting of Engine

The engine is of the center-crank type and is arranged for belting to line shaft, generator or other machinery or a generator may be driven direct through a flexible coupling. The engine bed-plate is rigidly secured at the main bearing end to a massive saddle which spans about one-third of the boiler's circumference. The guide-barrel end rests on a small saddle and is free to slide thereon, thus relieving the bed from the effects of the expansion and contraction of the boiler.

The piston rod passes through metallic packings of a special design which have proven their value for use with high superheat. This kind of packing is also used on the high-pressure valve stem. The unit is provided with suitable platforms, ladders and railings, giving access to all points requiring observation and adjustment.

The engine bearings are lubricated by a simple and effective gravity-oiling system, all the oil fed to the machine being gathered at one point and passed through a filter preparatory to being used over again. In the main bearings this system is supplemented by chain oilers. Both cylinders with their valves and piston-rod packings are served by a force-feed lubricator driven from the valve gear.



Cross-Section through Machine, Showing the Various Elements

This unit through its effective utilization of heat makes possible a power cost hitherto unobtainable by any type of small or moderate-sized steam plant. Small installations as a rule are wasteful of fuel, coal consumptions of 5 to 8 lb. per horsepower-hour being quite common. The cause for this may be found in the disposition to employ simple high-speed noncondensing engines using 30 lb. of steam or more per horsepower-hour and the failure to provide the heat-saving auxiliaries commonly installed in large plants. Radiation losses are relatively greater in small engines, boilers and piping than in large plants.

Economy tests of the Buckeye-mobile show that one horsepower can be generated on between 9 and 10 lb. of steam per hour or a trifle over one pound of coal. The fuel consumption curve is nearly flat, that is to say, this excellent economy is obtainable not only at normal load but at practically all loads above 50 per cent. of the rating and therefore the efficiency of the plant is varied but little by a changing load factor.

This expenditure of fuel not only represents that necessary to generate one horsepower at the engine flywheel but includes also the driving of the boiler-feed pump and condenser air pump. This unit makes it possible for the builder to make and fulfill a guarantee of a certain number of pounds of fuel per net delivered horsepower as against the usual custom of guaranteeing pounds of steam per horsepower.

Since one manufacturer makes and delivers the complete unit a division of responsibility between the makers of the various elements which enter into the usual type of power plant is avoided. Owing to the compactness of the plant, its simplicity and high efficiency the cost of operation and maintenance is materially reduced. The fact that such a small quantity of fuel has to be handled makes it possible to greatly decrease the labor cost usually chargeable to power-plant operation.

Only a Small Floor Space Is Required

The floor space required by a plant of this design is about one-half that required by any other form of steam plant, making any pretense to economy. The unit is extremely accessible in all its parts and has shown in practice a reliability fully equal to if not superior to that of any other prime mover. It is built in sizes from 75 hp. to 600 hp. and is applicable to all power purposes. It ordinarily operates condensing, but where exhaust steam is required for heating purposes the machine operates noncondensing with moderate increase in fuel consumption. In contrast with the internal-combustion engine the Buckeye-mobile is capable of utilizing any available fuel, coal, oil, lignite or refuse.

In the Buckeye-mobile, owing to the intimate connection between all the elements of the plant, there is no radiation loss from pipe lines since all steam lines with their fittings and valves are located in the smoke box and jacketed by the hot flue gases. Radiation from both high- and low-pressure cylinders is prevented by the same means, since both the cylinders and their valve chests are exposed to a current of hot waste gases. Radiation losses from the boiler are reduced to a minimum through the adoption of an internal furnace and effective jacketing of the boiler shell.

Inasmuch as the feed and air pumps are directly driven from the main engine the small amount of power required to drive them is produced with the same efficiency as that shown by the main engine.

The low steam consumption shown by engine proper reacts in every way to the advantage of the various elements of the unit. For example, since the engine uses only 9 to 10 lb. of steam per horsepower-hour as against 20 to 30 lb. required by other machines of like horsepower it is obvious that the capacity of all members of the unit whose function it is to evaporate, convey, superheat or condense this steam may be reduced in like proportion, thus decreasing radiation losses and power required to operate auxiliaries. Since but 9 to 10 lb. of steam are evaporated per horsepower-hour, the loss of heat to the ash pan and chimney is likewise reduced.

Inasmuch as the various elements which go to complete the power plant of the usual form are purchased from a number of different builders, it is seldom that all parts are properly adapted to each other, either as to capacity or suitability of type. Since the Buckeye-mobile is a product of one builder who is free to choose the most suitable conditions as to steam pressures, superheat, etc., he is enabled to so proportion all the elements of the unit as to secure the utmost efficiency of heat utilization consistent with mechanical simplicity and flexibility of application.

⁂

Graphite in Boilers

For a period of ten weeks I have been experimenting with graphite as a scale remover, says E. R. Pearce, in *Power*, of Aug. 26, 1913, and find that it proves satisfactory in our boilers. As the action of the graphite is very slow, various boiler compounds have been mixed with it, the idea being to soften the scale a little quicker and allow the graphite to get to the plate sooner.

After three trials, in which careful observations were made, the best results were found to be obtained when using a mixture composed of ½ lb. of graphite mixed with 1 lb. of soda ash, and feeding the mixture at the rate of 1 lb. of mixture to each 20,000 lb. of water. This mixture should undoubtedly vary with the nature of the feed water and working conditions.

The mixture is introduced along with the feed water, and feeds constantly through an ordinary composition feeder, the ash and graphite being thoroughly mixed dry and put into the feeder.

On closely examining the scale which has come away of its own accord, the surface which has been next to the shell will be seen to be dotted with graphite specks. These will be quite clear under a good glass. It has been our experience that practically no scale forms where the old has come off when graphite has been used.

The action of graphite in removing scale is not clear, but it certainly removes the scale, and I am under the impression that if one were to well rub the plates of a new boiler with graphite and water, or some other moistening medium, no trouble would be experienced from scale. It would be interesting to all engineers if some one who has a new boiler going into service would try the experiment and publish the results.

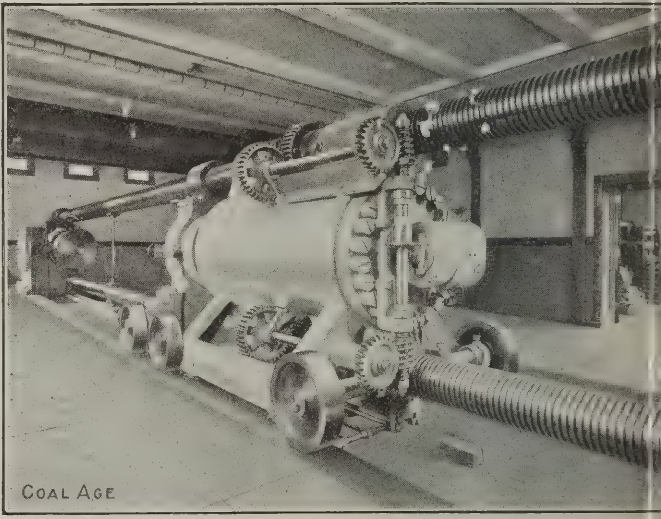
I am shortly going to try graphite in one plant that is badly scaled, and as many chemical works and other factories use the water before it comes to this mill, compounds have all failed, the feed not being of the same composition three hours a day. The only way to use this water is to allow the boilers to scale so as to protect the plate from the corrosive water. The scale is now so heavy as to subject the boiler to bagging at high pressures and temperatures.

⁂

The World's Largest Precision Testing Machine

The accompanying illustration is a view of the testing machine, recently installed by the U. S. Bureau of Standards, Washington, D. C. This machine is used for testing columns, blocks, beams, girders and other shapes of steel, wood, concrete or materials employed in construction, in order to determine the breaking strength, spring under load, and other engineering data.

This machine is sufficiently large to test specimens of any length up to 34 ft. It can exert a pull of 1,150,000 lb., or a compression of 2,300,000, yet is sufficiently delicate that the pressure of a finger upon it will be registered.



General View of Machine

The machine consists of two principal parts connected by two enormous screws; one part, the further one in the illustration, is stationary, and contains the mechanism by which the force exerted on the specimen is measured. The other, called the press, is movable, and consists essentially of a hydraulic cylinder mounted on wheels. It will be noted that the head of the hydraulic piston is carried upon wheels of its own, and can move independently of the cylinder. The oil which is used to produce the hydraulic pressure is supplied through a pipe which telescopes or elongates as the press is moved.

In testing, the press is moved to the proper point by the small Westinghouse motor, seen mounted upon it. The specimen to be tested is then placed in the machine. If it is to be placed under tension, each end is gripped by jaws, if it is to be subjected to compression, it is held between two heavy plates. The hydraulic piston is then slowly forced forward or pulled back, until the specimen is ruptured or crushed.

A Deane pump, driven by a 20-hp. Westinghouse motor, supplies the oil for operating the hydraulic piston. This pump is capable of delivering a pressure of 3500 lb. per sq.in.

EDITORIALS

The plan of providing baths for miners at European collieries has met with such favor that it is safe to predict the general installation of such facilities at all the important mines. Some points from foreign experience are worth noting. Investigation shows that in estimating for such a plant, eight gallons per man should be allowed, and the water maintained at a temperature of 100 deg. F. Six cents per week per head will cover all running charges, including soap and towels. In Westphalia the average capital outlay amounts to $25 per head. Where baths are provided, they have proved to be an important safeguard, owing to less liability of matches, pipes, cigarettes, etc., being inadvertently taken into the mine. It is also true that home conditions of miners are more satisfactory, both from social and moral aspects.

⁂

Legislation and Accidents

The present is an age that might properly be termed "The Legislative Era." When a casualty occurs on one of our railroads, in one of our mines, or at some industrial plant, a cry goes up for more stringent laws. The end that we seek to reach is laudable, but the hasty methods pursued in an attempt to quickly satisfy public clamor are much to be condemned.

Great Britain has likewise passed through a period of legislative activity, and the results obtained may be interesting to us as an indication of what we may ourselves experience. Sixty years ago the accident rate in British mines showed that one man was killed each year for every 249 employed. Conditions in the mines were gradually improved, so that half a century later the deaths equaled only one in 779. About this time (1900) there was a common demand for scores of new laws, designed to cover every possible contingency that might permit of an accident. The result was innumerable acts, which were passed with such rapidity that it was quite impossible for mine owners to observe in letter all the new regulations intended to govern coal mining.

The outcome of this condition was an increase in the British coal-mining death rate. In 1905-9 fatalities reached one in every 764 employed, while in 1910-12 it had risen to one in every 689 employed.

A particular cause for this increase in mining hazards was the inflexible nature of the "Eight Hours Act." This new law limiting the time of employment to an eight-hour shift is applied to all districts, mines and men, regardless of local, natural, economic or individual circumstances.

All around there is more rush and less care. In order to maintain output under the restricted hours, the owners have in many cases been speeding up the work at the expense of safety. More men are needed than heretofore, and there is a tendency to exercise less care in the selection of experienced miners.

Then there is the new one-sided "Workmen's Compensation Act." This law, by insisting upon the same compensation for an aged and delicate miner as for a younger and stronger workman, puts age and experience at a discount, and youth and recklessness at a premium. In places where these older men were weeded out, the result was an increase in the accident rate.

Any law which causes the elimination of aged, skilled and cautious men, spelling preference for young, inexperienced and reckless workmen is certain to encourage the introduction of more hazardous methods. It means an acceleration of haulage and hoisting, hasty and careless repair work at the week end, neglect of bar-setting and propping, and an inevitable increase of danger and death.

It should be understood by everyone that the coal-mining industry is a business where both the natural and economic circumstances vary more widely than in any other occupation. Great care must, therefore, be observed when we attempt to impose uniform working conditions upon all the owners of our coal mines. It is useless passing act after act and issuing regulation after regulation for the provision of safety devices and rescue appliances, if, at the same time, the state enforces other measures which aggravate old dangers and create new ones.

⁂

The Mexican Situation

On another page of this issue we print a communication from a large American coal operator located in Northern Mexico, giving details of the damages his company sustained at the hands of the revolutionists. Coal Age has in the past consistently refrained from commenting upon the unfortunate conditions prevailing in that war-ridden country. But a communication, such as the one referred to, coming as it does from an absolutely authentic source, brings the subject home in a way that much of the contradictory and inflammatory articles in the newspapers have failed to accomplish.

In this instance it appears that the rebel soldiers completely destroyed a million-dollar plant in the short space of about two hours. Having just sustained a defeat at the hands of the federal forces, the rebels started out on a campaign of destruction, offering as their excuse that they wished to prevent the government forces from obtaining coal supplies with which to operate the railroad. Those who know the district will appreciate the fact that this was merely an excuse, and a poor one at that. The Lampacitos plant is but a unit in the coal operations of Northern Mexico, and the fact that it is now destroyed will not interfere with the railroads obtaining a plentiful supply of fuel from neighboring mines, or if need be, from this country.

President Wilson's hesitating policy on the Mexican question has sorely tried the patience of the general public. In the meantime further indignities are being heaped on our subjects in that country and their residence there is steadily becoming more and more untenable. It is to be hoped that our government will soon find a sane and satisfactory solution for the problem without having to resort to war and its attendant horrors.

The Dietetics of Dust

He who would keep himself free from aspersions must not only state carefully the idea he desires to convey, but must also be equally clear in declaring what he does not believe and what points he regards as at present too difficult for his decision. So in passing, we now wish to make a preliminary statement, therein pronouncing our faith in stone dust as an immunizer against mine explosions and declaring our great regard for W. E. Garforth, as the discoverer of the advantages of the use of such dust. We would not have our criticism of a mere detail exalted into a denunciation of a wholesome practice which we believe should become almost universal.

But we think that though Mr. Garforth has so wisely given us a solution, partial or complete, of the coal-dust problem, we should not accept without question *all* that he has recommended. We fear that there is a tendency to regard him as a court of highest resort, but we think it would be wiser to weigh his judgments as carefully as we would those of others less eminent.

Mr. Garforth, in his desire to select dusts which will not injure the internal organs of the operatives exposed to their influence, has subjected the powdered materials to several tests. He has, for instance, taken their specific gravities to determine which of them will rise most easily to meet the advancing flame of an explosion. He has endeavored to ascertain what magnetic particles are in the dust as such materials are likely to be hard and gritty in the lungs. He has investigated the presence or absence of carbonaceous matter, for such material negatives the effect of incombustible dust. Material, such as is found in the roof at the Bruceton galleries, is hardly any better than the dust of a mine where the coal dust has been immunized with the quantity of stone dust recommended by Mr. Garforth.

In these inquiries we follow Mr. Garforth with approval. But he makes other tests which may be of value, but of which we cannot see the use. In fact, we may draw unfavorable conclusions regarding certain dusts from indications which his method of reasoning proves less harmful than other dust, and even entirely innocuous.

Mr. Garforth immerses the dust in digestive fluids to see what proportion of the material is thus removed. He argues that the irritating edges of the inhaled particles can be smoothed away by solution. If it is the action of the dust on the digestive organs which is in question, this might appear to have some reasonable validity. But the objection to dust has been that if sharp it will irritate the lungs and not that it is injurious to the alimentary canal. If the dust comes in contact with the salivary secretions, it will probably never reach the bronchial passages, so that its ability to dissolve in the secretions of the mouth is not an important factor. The dust in the lungs is subjected only to the solvent powers of perspiration and not to all the dissolving actions of the many fluids in the human body.

The digestive fluids of the various organs of the body are peculiar to those organs. The use therefore, of lactopeptine, pepsin, pancreatin, diastase, lactic and hydrochloric acids in tests of dust would be of value only if any like fluids, peculiar under all normal conditions to certain organs, are created in one specific organ, to wit, the lungs, which are not known to generate such secretions. The pulverulent material not being subjected either in turn or at one and the same time to these fluids will enter the bronchioles and alveoli unchanged and will remain to irritate and inflame their surfaces and make them subject to tubercular infection.

But let us suppose for argument that all the digestive fluids of the body are found in the lungs: Of what value would their action be? If the solvents would dissolve all the compounds in the dust into a harmless fluid, we can see that mechanical injury to the lungs as also to the intestines would be thereby obviated. But, we think that to dissolve a part and leave a part is in all probability worse than useless; the part being dissolved is probably colloidal and soft, the part remaining unaffected is likely to be irritant. In fact is not the dissolved part likely to be the sugar coating to the pill?

The unctuous soluble bodies may merely mask and render harmless the gritty and crystalline substances with which they are mixed. If a rock has much non-colloidal silica, it certainly will not be less objectionable after exposure to solution, for surely the silica crystals will be little digested, if at all.

We believe that perhaps some sort of abrasion or friction test is preferable to any form of test by solution. The amount of material abraded on a surface fed with such dust or the angle of rest of bodies sprinkled with it would serve to show its quality as a lung irritant better than any test of solubility or any chemical analysis. We prefer the friction test, however, as it gives the condition of the unaltered dust, whereas abrasion comminutes that dust and may accentuate or minimize its gritty characteristics. The microscopic examination also has merits.

In fact, it would be well that a careful investigation of the best test for dust be made lest we exalt a system of elimination, which will give all the honors to a dust of undesirable character.

⁂

The Small Mine Power Plant

The question of power for mining purposes is an ever-present one. This applies with particular emphasis to the isolated plant or mine which may be, and frequently is, beyond the reach of any central-station transmission line.

Heretofore the small mine has almost invariably been operated by a steam plant, which was in many cases an aggregation of misfits—engines too small or too large, possibly antiquated in design, and certainly ravenous in steam consumption; boilers which were too big or too little for the amount of steam required, probably bricked in by some local mason not accustomed to laying firebrick, and a system of steam and water piping which might be but ill adapted to the work in hand, and with but scant provision made for expansion and contraction.

During the past few years many such plants have been driven to the acceptance of central-station power which, even at a comparatively high price, is more economical than the prevailing type of isolated steam plant.

It is with no little interest, therefore, that we print on another page the description of a new American production, or rather an American adaptation of a machine which has long been successfully used in Europe. When the entire power-producing apparatus—boiler, engine, condenser, superheater, etc.—is constructed in one self-contained unit of remarkably high efficiency by a single builder, it would appear that the power problem of the small isolated mine had been at least successfully solved.

Legal Decision

Railroad Company's Liability for Discrimination—The ıeasure of damages recoverable against a railway company ·y a mine owner for unjust discrimination against him in efusing to furnish switching facilities, was the difference ·etween the market price of his coal received after the disrimination ceased and the higher price which he would have eceived for such coal as could reasonably have been mined nd shipped during the period of the discrimination. The ailway company cannot excuse the discrimination on the round of a shortage of cars; it being bound in any case o treat all shippers alike. (Pennsylvania Supreme Court, ox vs. Pennsylvania Railway Co., 87 Atlantic Reporter 581.)

Taxation of Coal in Place—A lease covering "all the merhantable anthracite coal in, upon and under" certain lands, nd all certain described veins of coal on the premises, onstitutes a sale of the coal in place, thus severing the ownrship of the surface from the minerals and making the essee liable for the taxes on the coal from the date of the ale, in the absence of agreement to the contrary. But if he lessor voluntarily pays the taxes for several years, he is ot entitled to recover the amounts so paid from the lessee nder an implied promise for such reimbursement. (87 Atantic Reporter 601.)

Liability on Order Drawn by Employee—An order drawn y an employee of a coal mining company, in favor of a mine hysician, authorizing the company to deduct a certain mount from the employee's wages and to pay the same to he physician, is, in legal effect, a draft; and the company s not liable thereon until the same has been presented to and ccepted by it. (Washington Supreme Court, Sheets vs. oast Coal Co., 133 Pacific Reporter 433.)

"Employee" and "Contractor" Distinguished—In a suit gainst a coal company for injury to a miner, he is not enitled to recover if he alleges in his complaint that he was n employee and the proof shows that at the time of the acident he was performing a contract to mine coal at a ertain price per ton, uncontrolled by the company as to the etails of performing the work. (Alabama Supreme Court, Varrior-Pratt Coal Co. vs. Shereda, 62 Southern Reporter 21.)

Allowance to Shipper not Amounting to Unlawful Rebate –Allowance by a railway company to a shipper of coal and oke for hauling his own shipments from his mine to the ompany's station does not amount to an unlawful rebate, here the published tariff is uniformly interpreted as inluding such haul, though the rate is specified from the staion. (United States Supreme Court, Mitchell Coal & Coke o. vs. Pennsylvania Railroad Co., 33 Supreme Court Reorter 916.)

Damages Recoverable Against Carrier for Discrimination -Under the direct provisions of an Act of Congress, the damges recoverable against a railway company by a shipper of oal who has been charged the lawful rates on interstate hipments, whereas unlawful rebates were allowed to other hippers over the same route on shipments carried at the ame time, is the pecuniary loss resulting to him in conseuence of the discrimination, and not the amount of the iscrimination in the rates. (United States Supreme Court, ennsylvania Railroad Co. vs. International Coal Mining Co., 3 Supreme Court Reporter 893.)

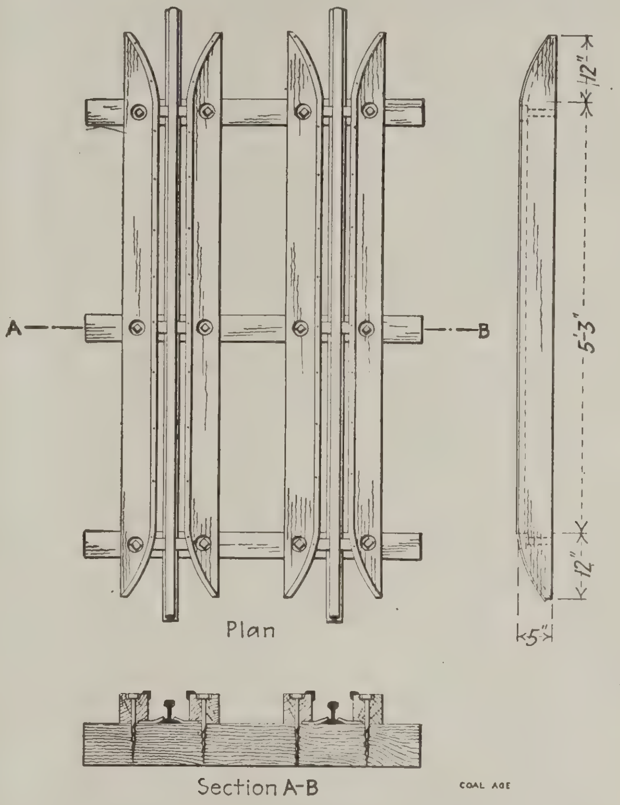
Right to Sue for Discrimination as to Cars—In interstate ommerce before suit will lie against a railway company for iscrimination in allotment of cars, in favor of plaintiff's ompetitors, a ruling of the Interstate Commerce Commision must be obtained, declaring that the company adopted an nreasonable method of distribution. (United States Supreme Court, Morrisdale Coal Co. vs. Pennsylvania Railroad o., 33 Supreme Court Reporter 938.)

Validity of Coal-Mine Regulation—A state law requiring ntries in coal mines, where employees are required to drive ine cars, to have an unobstructed space of at least two et wide outside the rails of the track, such as is in force Indiana, is a valid regulation, and not unconstitutional beuse it applies to bituminous coal mines and not to block oal mines. (United States Supreme Court, Barrett vs. State Indiana, 33 Supreme Court Reporter 692.)

Buyer's Remedy on Seller's Failure to Deliver—Under a ontract for a sale of coal and on the buyer being unable secure delivery according to the agreement, he is entitled buy coal at the market price at the nearest market and old the contract seller for the difference between the price aid elsewhere and the lower contract price. (California upreme Court. J. J. Moore & Co. vs. J. S. Guerin & Co., 132 acific Reporter 1038.)

Rerailing Device

The automatic rerailing device shown herewith is successfully used for mine cars in electric-haulage service at the Shamrock mine in the Herne district, Germany. It is described in the "Zeitschrift für das Berg- Hütten- und Salinenwesen," Vol. 61, No. 1. The guide blocks consist of oak posts about 5 in. square and 7 ft. 4 in. long, beveled at the ends to direct the car wheels. These rerailing blocks are usually placed behind the switch and fastened to the ties by wood screws. On the inside they are faced with angle irons, about 1½x1½x¼ in. in size.



Plan, Elevation and Section of Rerailer For Mine Cars

COMING SOCIETY MEETINGS

First Aid Meet., Philadelphia & Reading Coal & Iron Co. —The annual meeting of this company will be held at Lakeside Park, East Mahanoy Junction, Penn., Sept. 20.

National Conservation Exposition—Miners' Field Day, to be held under the auspices of the Tennessee Mine Foremen's Association, with the coöperation of the Bureau of Mines and the American Red Cross, on Sept. 20, at Knoxville, Tenn.

American Mine Safety Association—The second meeting of this society will be held at the Bureau of Mines, Pittsburgh, Sept. 22-24. H. M. Wilson is chairman.

National Safety Congress—The second meeting of this body will be held at the Hotel McAlpin, New York City, Sept. 22-25. C. L. Close, 71 Broadway, is chairman, the office of the secretary being 2135 Green St., Harrisburg, Penn.

American Mining Congress—This society meets for its 16th annual session at Philadelphia, Oct. 20-24; the secretary is J. F. Callbreath, who has opened quarters in the Land Title Building.

Coal Mining Institute of America—Winter Session meets Dec. 4 and 5 at the Fort Pitt Hotel, Pittsburgh, Penn. C. L. Fay, secretary, Wilkes-Barre, Penn.

SOCIOLOGICAL DEPARTMENT

Rules for Motormen

The *Engineering and Mining Journal* quotes the following rules for motormen from the Inland Steel Co.'s book of rules and with trifling changes they would serve for use in coal mines:

(1) Operators should see that their motors are in good working order and furnished with the necessary tools, supplies and signals. They should thoroughly inspect the motor and test the brakes at the beginning of each shift; see that they have a supply of sand; and immediately report any defects to the master mechanic.

(2) They should not leave the motor except in case of necessity, and then have some competent person in charge. No one except motormen and electricians should be permitted to operate the motors.

(3) Operate cars at such a speed as to have full control at all times. Avoid bumping cars violently.

(4) The trolley pole should follow and not lead the motor, except in places where this is impossible. When the trolley pole is ahead the motor should be moved slowly.

(5) The trolley pole should not be turned while the motor is in motion.

(6) There should be a red light on the advancing end of all trains when the motor is not in front and the light on the motor should be kept lighted at all times when the motor is in use.

(7) Motormen should ring the bells on their cars at frequent intervals and especially when approaching crossings, curves, narrow places in the drifts or crosscuts, or points where men are known to be working on or near the track.

(8) Motormen should promptly report any defective condition of electrical equipment to the electrician, mining foreman or shift boss.

(9) No one except motormen and brakemen should ride on a motor or car without special permission from the superintendent or foreman.

(10) Men not employed as motormen or switchmen should not couple cars, throw or alter the lineup of switches.

(11) Trammers, or other employees, should not leave cars at or near switches or crossings, in such a position that they will not clear motors or cars moving on another track.

(12) When cars are pushed from where they have been filled to a point where they can be handled by the motors, the trammers should notify the crew of the motor either by remaining near the cars or by placing lights on them. The same rule should be followed in the case of timber trucks or other equipment left standing on the tracks where motors are liable to approach from either direction.

(13) Men having occasion to work on motor-car tracks should protect themselves by placing blue lights on the track.

(14) Do not place any strain on mine timbers when replacing cars on track.

(15) Do not carry high explosives on electrically operated cars.

(16) Brakemen should always carry lanterns.

(17) Brakemen should not ride on the front end of cars except in case of urgent necessity.

(18) Operators and brakemen should exercise great care not to get caught between cars and timbers. When riding, they should not stick their feet out at the side of the car, as they are apt to do if in a kneeling position.

⁂

Qualifications for Rescue Work

S. J. Bridges describes the recovery work at the Cadeby Main mine, in the *Colliery Engineer,* and incidentally says: A man who volunteers for training should be physically strong, and have good lungs, and no heart troubles. When passing the doctor he should be quite candid in answering questions, and if he has the least doubt of his own nerve, he had better not take on the work, as he will be sure to hinder the work of the team to which he belongs, and may lose his own life and cause others to do the same. The writer has seen men attempt to do this work who bravely tried to do what they believed to be their duty, but owing to physical unfitness were incapable of proceeding, and had to be brought out by their comrades.

In other cases men otherwise fit have been kept at work too long without a proper interval for rest, and have returned to the work when they were not in a condition to stand it. The breathing of an artificial atmosphere acts differently on some men from others. Some of the men came out with pulses beating at 110 per min., and even more, and were soon all right again; others left the mine and were unable to go in again that day. In no case were the men able to do the two hours' work with which they had been tested.

The Unnerved Rescuer

The captain of a team should be an observant man. He must watch his aides and his apparatus while at work. Moreover his time limit must be controlled by the weakest of his party. Also when his team has been working several shifts and is accustomed to the work and apparatus, if he should then be obliged to take in a reserve man for the first time, he will have to watch him carefully, or his new comrade may cause a disaster. Especially is this the case when his men find dead bodies. The first seen and handled give most men a severe shock; this generally wears off, but a captain whose team does such work for the first time is in no enviable position.

If he has a man who faints or collapses, his task is then comparatively easy, but if the new rescue man loses his head and commences to run hysterically, falls and endeavors to run again, the captain and his men will be in great jeopardy. Their own apparatus can only be

vorn by exercising great care, and to have to hold or
arry a man frantic with fright is an impossibility, and
captain who meets with such an experience will be
ery fortunate if he and his comrades get out safely.

⁂

Don'ts for First-Aid Men

By Allen S. Snyder*

Don't touch a wound with the hands.
Don't disturb blood clots.
Don't be rough with the patient.
Don't probe for a bullet or any other body imbedded
the flesh.
Don't wash wounds unless you sterilize the water.
Don't pull or tear off clothing—cut it away.
Don't attempt to remove pitch, varnish or wax from a
rned surface.
Don't bring ammonia too close to the nostrils.
Don't touch the eye with dirty fingers or an unclean
oth.
Don't put bandages on too tight.
Don't let the patient know his condition is serious.

⁂

Program of American Mine Safety Association

On Sept. 22, 23 and 24 a large number of prominent mining
n, surgeons of mining companies, and the miners con-
:ted with the rescue and first-aid work from many parts
the United States will attend at Pittsburgh the second
eting of the American Mine Safety Association. Western
nsylvania and the Pittsburgh district in particular will be
gely represented. H. M. Wilson, chairman of the executive
nmittee of the American Mine Safety Association, says
t the reports received indicate that the meeting will be
gely attended, McAlester, Okla., Trinidad, Colo., and other
ally distant points sending big contingents of men who
interested in anything which will add to the safety of
ir mining operations. An interesting program of papers
l discussions has been prepared, and arrangements have
n made to visit points of interest in and about Pittsburgh.
Handsome prizes have been offered for the men who com-
e in the mine-rescue contest at Arsenal Park on Sept. 22.
Draeger Oxygen Apparatus Co. has donated an oxygen
alator, complete in a box; the Hirsch Electric Mine Lamp
will present a Hirsch silver-plated miner's electric cap
p, and the American Mine Safety Association provides
dsome medals which will be given individual contestants.
ries for this event have been received already from the
n-Mary Coal Co., the H. C. Frick Coke Co., and the
stmoreland and Jamison Coal & Coke Companies.
At the same time there will be held a first-aid contest
ewhat similar to those held elsewhere in the mining
ons. For this a number of handsome prizes have also
received, notably from Johnson & Johnson a first-aid
net and also a first-aid instruction outfit; from Bauer &
k a first-aid cabinet; from the American Red Cross and
American Mine Safety Association a set of medals for the
vidual contestants. The following entries have already
received for this event: Consolidation Coal Co. (two
ies), Wisconsin Steel Co., Allegheny Coal Co., Rochester
Pittsburgh Coal & Iron Co., Allegheny River Mining Co.,
er Hill Connellsville Coke Co., Penn-Mary Coal Co.,
ghiogheny & Ohio Coal Co., Oliver & Snyder Steel
Puritan Coke Co., Pittsburgh Terminal R.R. & Coal Co.,
or Gas Coal Co., Penn Gas Coal Co., Pittsburgh Balti-
e Coal Co., New Alexandria Coal Co., Westmoreland Coal
Jamison Coal & Coke Co., Vinton Colliery Co.
he Bureau of Mines has arranged a big experimental ex-
ion at their mine at Bruceton. This will be the first ex-
on exhibit given at the mine since its completion. There
an experimental explosion in the mine in 1911 on the
sion of the National Mine Safety Demonstration, and
her in 1912, but in both cases the mine was as yet only
ly opened, and the various electric recording apparatus,
the apparatus for controlling the explosion had not been placed, so that practically all that the mining public could see was an explosion of dust. On Sept. 23, however, it will be possible for those interested in such matters to see just exactly what causes the explosion; how the explosion wave acts; the speed and the pressure and other important items, as these will all be automatically recorded in the instrument room. A number of rescue men fitted with artificial breathing apparatus will enter the mine immediately after the explosion, so as to illustrate how they can go into a mine while it is still smoking and full of gas.

On the evening of the 23d a local committee of members of the American Mine Safety Association and the Bureau of Mines will give a smoker in the Fort Pitt Hotel to the visiting mining men. Music is expected, and there will be an exhibition of motion pictures exhibiting safe and unsafe practices in mining, and illustrating methods of digging coal, and of handling it both underground and on the surface.

⁂

First-Aid Meets

Invitations have been sent out for the fourth annual contest of the first-aid corps of several coal companies of the Shamokin region, to be held at Edgewood Park, Shamokin, Sept. 13. The companies to be represented in the contest are Susquehanna Coal Co., Mineral R.R. & Mining Co., Summit Branch Mining Co., Lytle Coal Co., and Lykens Water Co.

Considerable interest has been manifested at all the collieries under the control of the Lehigh Valley Coal Co., in the selection of first-aid teams from each division to fight for the championship of the entire company. The ten teams representing the various collieries of the Lackawanna division, with headquarters at Pittston, Penn., held a four-event contest to determine which team should represent the division, with the result that Westmoreland colliery was awarded first place with a percentage of 100. The Exeter colliery outside team finished second, with a rating of 99¾. Other collieries represented were William A. Heidelberg No. 1, Seneca, Stevens, Maltby, and two inside teams from Exeter.

The four events were as follows: (1) Open wound over the right temple, fracture of the left collarbone and fracture of the jaw. (2) Gas burns on face, head and left arm. (3) Fractured ribs on the left side and fractured left arm. (4) Compound fracture of the left leg and simple fracture of the right upper arm. The members of the winning teams are as follows: Westmoreland, James R. Morris, Capt., Edward Reap, Thomas Ridgly, Walter Jacoby, Joseph Johnson, Fred Halpin, subject; Exeter Outside, Charles Kluck, Capt., Charles Marlow, John Akens, Robert Reid, William Finn, Benjamin Thomas, subject. The Westmoreland team will represent the division at the meet to be held at Hazle Park, Sept. 13.

⁂

Weyanoke Gardens

The Weyanoke Coal & Coke Co. of Giatto, Mercer County, W. Va., has for five years given prizes for the best gardens at their mining villages, and has given the householders stable litter and lime to fertilize their flower and vegetable beds. The prizes amount every year to $110. The first prize was $20 and the other nine formed an arithmetical series diminishing regularly by $2. An additional $5 was given to the lady having the prettiest flowers, and a porch settee to the lady whose flower display was next in order of merit. The judges this year were Judge H. A. Ritz of Bluefield, E. A. Schubert, industrial agent of the Norfolk & Western Ry. and W. O. Frith of the "Princeton Progress."

Special consideration was given to the sanitary conditions around the houses, and the difficulties of location on the steep hillsides were also given due weight in according relative merits.

It was noted that those tenants who were not seeking to obtain a prize were keeping more sanitary and orderly premises than they were last year. The shower baths which the company was constructing last year have been completed, with compartments and lockers for the benefit of the miners. Five baths are set apart for the white and five for the colored employees, and they are all largely used and appreciated.

⁂

If the old workings in a mine are roughly stopped off there is always apt to be leakage of the confined gas, which fouls the air and may sometimes cause an explosion. There is always the possibility of inflammable gas gathering in old workings, in dangerous quantities when they are shut off, and the miners may accidentally hole into these old workings and cause an explosion; or this gas may be driven out, by roof falls, into the live workings and an explosion result.

Instructor in first aid, Cambria Steel Co., 1005 Somerset
Winber, Penn.

DISCUSSION BY READERS

The Liquor Problem in Mining

As to whether the drink evil is increasing or decreasing among miners, at this time, is not made very plain by the arguments that have been used on either side of this question; nor yet whether the drink evil increases or decreases with the advance or fall of wages. Opinions seem to differ, also, as to the best and most successful plan or method to be adopted for decreasing this evil among miners, as various suggestions and opinions have been advanced.

W. P. Oakes, vice-president of the Sunnyside Coal Co., Colo., in his argument for a mining-camp canteen, Coal Age, March 15, p. 420, makes the following statement:

> It is useless to argue against the existence of a saloon of one sort or another in or about a mining camp. If the men cannot get their beer, or whatever they want to drink, they will buy it from bootleggers, ... or they will go to some other camp where they can obtain it.

Are miners, as a class, down to the point where they *must* have drink? Does giving miners more opportunities and better facilities to drink, decrease the drinking? Will the establishment of more club and drink houses, in mining camps, solve or reduce the drink habit among miners? Is it not true that the more opportunities drinking miners have to drink and the less restraint they are under in this respect, the more they drink; and the more they drink, so much the more they want to drink; and the more unreliable and worthless they become as miners and the less valuable as citizens.

The tendency and influence of all saloons and drink houses are downward. They are not the places where the best thoughts are cultivated. Even in the best clubs or drinking houses, in mining camps (if there be any best), there is no moral and uplifting influence found. On the other hand, the influences in far too many of these drinking dives are foul and well adapted to the growth of idleness and anarchy. Why, then, establish any of these degrading institutions, hoping thereby to refine and reform drinking miners.

It requires no long argument to convince the average man that there is not so much drinking in a mining camp where the drink is difficult to obtain, as where it is plentiful. I admit it can scarcely be removed so far or made so difficult to get, but that the confirmed drinker will manage, in some way, to get it, at times. But the boys will not go to the same expense and trouble to get it as the old drinker. In a few years these boys will be men—men who care nothing for drink and drinking resorts. On their account, the saloons and drinking clubs should be removed from all mining camps. By the proper enforcement of law, saloons, drinking clubs and bootleggers can all be removed from mining camps and none should be more interested and more active in this movement than mine officials.

The solution of the liquor problem in mining is in the direction of enforcing and obeying laws, education and the improvement of conditions. The coal mines of the country need officials with more disciplinary powers and less drinking habits; men who have the confidence and respect of their best miners; men who are strictly sober and temperate themselves; men who take interest in bettering the physical and intellectual condition of the miner, by furnishing him with better houses, better streets, better sanitary conditions in the mine, better ventilation, better schools, better discipline and better system. These things will have a greater tendency toward reducing the drink habit among miners than the establishment of the canteen, in mining camps.

John Rose,
District Mine Inspector.

Dayton, Tenn.

⁂

The Mine Air Current and Explosions

The contribution of Mr. Parfitt on this subject, Coal Age, Aug. 9, p. 208, while interesting as a paper on ventilation, fails as a reply to the discussion on the Cincinnati mine explosion. The main feature of that discussion was the effect of the mine-ventilating pressure to increase or decrease the gaseous condition of the mine. Mr Parfitt makes no mention of this important factor, but draws attention to the fact that the pulmonary diseases suffered by miners are brought on by the vitiated atmosphere of many mines. This fact is commonly admitted by all.

At least one mine inspector, in England, has referred to the premature death of miners caused by insufficient ventilation. However, I fail to find in the previous articles, by myself and Mr. Verner, any reference suggesting such unsanitary conditions in the Cincinnati mine. Any argument along this line would naturally be taken as referring to conditions some time back, as, under the present system of mine inspection, if an inspector finds the ventilation of a mine inadequate, he simply shuts down the mine. We can, therefore, assume that there is sufficient air traveling in the average modern mine to make the workings sanitary, in every respect, and thus eliminate this question from the discussion. But, after all has been said and done, mine explosions still continue, which we are apparently helpless to prevent.

Mr. Parfitt is wrong in supposing that I suggested that the ventilating current diminished or prevented the outflow of gas from the strata. My claim was (July 5 p. 25) that while the exhaust system of ventilation allows the expansion of gas accumulated in the gobs, the compressive system of ventilation acts to drive this gas back and counteracts, to a certain extent, the effect of a falling barometer. In this reference, I only considered the relative tendency of these two systems of ventilation to increase or decrease the outflow of gas from the gobs. I also drew attention to the fact that the ventilating pressure could be increased, if desired, by the use of a regulator, without increasing the quantity of air in circulation.

The relative effect of the two systems of ventilation that I have mentioned may be illustrated by supposing that the ventilating pressure required in a certain mine is equivalent to a 2-in. water gage or $5.2 \times 2 = 10.4$ lb. per sq.ft. If the atmospheric pressure is 14.7 lb. per sq.in or $14.7 \times 144 = 2116.8$ lb. per sq.ft., the actual pressure on the air, in the compressive system, is $2116.8 + 10.4 = 2127.2$; and in the exhaustive system, $2116.8 - 10.4 = 2106.4$ lb. per sq.ft. The difference of pressure between the two systems is, therefore, twice the ventilating pressure or, in this case, $2 \times 10.4 = 20.8$ lb. per sq.ft.[*]

In the extraction of coal, there are many causes that operate to prevent the roof from settling uniformly; and it is commonly estimated that one-sixth of the original space occupied by the coal is available for the accumulation of gas. On this basis, 10,000 cu.ft. would be a small estimate for the possible accumulation of gas in old workings. Since the ratio of expansion of gas is equal to the inverse ratio of the pressure it supports, the expansion of this volume of gas, due to a fall of barometer from, say 30 to 29 in., is determined by the proportion

$$29:30::10{,}000:x = 10{,}345\ \textit{cu.ft.}$$

The quantity of gas thrown out onto the airways, by this fall of barometer, would be $10{,}345 - 10{,}000 = 345$ cu.ft. The danger would be greater if this fall of barometer took place suddenly or at a time when the ventilating current was impeded; or when, for any reason, proper attention was not given to the change of pressure. In this connection, it is important to notice that the waste places in mines where gas is liable to accumulate and often difficult to remove, can frequently be kept clear of gas by drill holes sunk from the surface, through which the gas may escape when the compressive system is employed.

It is worthy, also, of note that mines in which large quantities of carbon dioxide are generated will generally require a greater ventilating pressure in order to effectively remove this gas. The reason is due to the greater specific gravity of the gas, which causes it to sink to the low places in the mine and to offer an increased resistance to the ventilating current. The air has a tendency to pass over this gas, unless the same is distributed by the passing of cars or other cause. My own observation leads me to conclude that where a shorter airway is more or less obstructed by the presence of blackdamp, the air current will often travel a longer route, owing to the increased resistance in the shorter airway, caused by the gas. A higher ventilating pressure might, in a degree, overcome this difficulty.

In closing I want to say that the increase of ventilating pressure, or the use of the exhaustive or compressive system of ventilation, as I have suggested, does not imply a depletion of the ventilating current to which Mr. Parfitt alludes.

ROBERT McCUNE.

⁂

Recovering Thin Overlying Coal

I noticed the question of J. H. S., COAL AGE, Aug. 30, p. 319, who asked for the best method of drawing back the pillars in a 7-ft. seam of coal overlaid with from 4 to 7 ft. of sand slate, and, at the same time, recovering the 21 in. of coal above this slate.

I want to say, in the first place, that this mine should have been worked on the longwall plan, from the start. The mine should have been opened on the triple-entry system and cross-entries or headings driven to the boundary, to the right and the left of the main entries and 300 ft. apart. These headings should then be crosscut at the boundary line, from one to another, thereby forming a long line of working face, each section being 300 ft. in length.

Work should then be started on the retreating plan, and three rows of posts should be carried along the face to break the sand slate forming the roof. The back row of posts is drawn and the posts reset as the work progresses. It may be necessary to shoot the sand slate, at first, in order to start the break; but when this is once started the posts will be sufficient to break the roof. It may happen that explosive gas will be found in the upper seam overlying the slate and proper precaution should be taken in this regard.

I note, however, that you say this work has all been driven to the boundary line on the room-and-pillar system. In that case, the only thing left to do is to retreat, as above stated. Whether the rooms have been turned as right-hand or left-hand rooms will determine the question of where the work should be started. If the track follows the straight rib, the work of drawing back the pillars will be comparatively easy; but if the tracks are in the middle of the rooms, it makes a hard proposition, as the waste is said to have been stored in the rooms, which are probably full to their capacity. The width of the rooms or thickness of the pillars is not mentioned, but it looks as if the work of recovering the thin seam of coal above the slate will cost more than the coal is worth. I would say, if you can get all the pillar coal, you will be doing well.

SAMSON SMITH.

Mineral, Va.

⁂

Fire Protection in Mines

Referring to the question of adequate fire protection at mines, which has been recently mentioned in these columns (COAL AGE, July 26, p. 136), I notice that many of the mines I visit are neglecting this matter. I consider it of the greatest importance that mine officials should give closer attention to the protection of their properties from fire; and, in urging this important point, I want to make a few suggestions.

[*As a matter of fact, the difference in the actual pressure on the air, in the use of these two systems of ventilation, or twice the ventilating pressure is so slight as compared with the atmospheric pressure that the relative effect on the expansion of gases in the void or abandoned places, in mines, is almost inappreciable. Likewise, the relative effect on the emission of gas from the strata is practically inappreciable. There is, however, a great advantage possessed by the compressive system of ventilation as compared with the exhaustive system. This advantage relates to the mine pressure, in the compressive system, being greater than that of the atmosphere; while, in the exhaustive system, it is less than that of the atmosphere. As a result, the compressive system tends to drive the gases that accumulate in abandoned workings out through every crevice, fissure or opening, into the outside atmosphere, thus making these crevices and openings vents to the mine. On the other hand, the exhaustive system tends to draw these gases into the mine workings, owing to the pressure of the atmosphere through the same crevices or openings

Another important relative effect of the two systems of ventilation is that when a fan is running on the compressive system and an accident occurs to the fan or in the mine airway, by which the circulation is reduced and the mine pressure decreased, there is a sudden outflow of gas from the abandoned and void places in the mine that may cause trouble, being sudden and unexpected. On the other hand, when the fan is working on the exhaust system of ventilation, the same accident to the fan or in the airway, would result in an increase of pressure on the gases confined in the abandoned workings and other void places in the mine. This condition favors the exhaust system, but is a condition that should be provided for, as far as possible, by efficient mine equipment and inspection.—Ed.]

In the first place, every mine should have a good map, drawn to a scale of, say 40 or 50 ft. to the inch, and showing all wells or ponds, water lines and fire plugs. The map should show all structures located on the properties, stating brick or frame. Every company should have a properly organized fire-fighting force and a system of signals to summon the men, in case a fire should break out. These signals should be printed in clear, bold type and posted in a prominent place, so that the men could become familiar with them.

In order to maintain all fire appliances and apparatus in good condition and ready for use in case of emergency, I would suggest the following:

1. Wherever fire pails must be kept in places where the water will freeze, it may be almost entirely prevented by dissolving two or three ounces of common salt and as much salsoda in boiling water, allowing this amount of salt to each pail, or four or five pounds to a cask of water.

2. Examine all tanks and pipes, fittings and valves regularly, whether for steam heating, general water service or fire protection. The purpose of this is to see that none are frozen or have been frozen and broken; and to make sure that all are in good condition. If this examination shows that any are liable to freeze, provide the necessary protection to insure the entire system.

3. Open all valves and try all outlets to see that all pipes are free and ready for service.

4. Make it your business to know if all engineers fully understand the purpose and operation of every valve and pipe.

5. Try all pumps at regular periods and see that they are in proper working order. A pump that will not take water quickly is no good in case of fire.

6. Test all hydrants and indicators to see that they drain properly to prevent freezing in cold weather.

7. See that the night watchman is thoroughly versed in the rules and familiar with all valves, pipes, etc.

8. Examine all suction pipes to see that they are not partially clogged at the strainers so as to cut down the efficiency of the pump.

9. Do not let your fire extinguishers go over six months without recharging them.

Some companies have formed fire brigades in which the men take much interest. Another thing I should not forget to mention, as it is very important, is testing the lines of hose. This should be done at least once every three months, using the same water pressure that would be used in case of fire. If the hose is weak or wearing out the test will show the trouble, which should be remedied before it is too late.

If these suggestions are carried out and careful supervision kept, the works should not suffer much from fire.

PENNSYLVANIA ENGINEER.

Pittsburgh, Penn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

MEASUREMENT OF AIR CURRENTS

The measurement of air currents, in mining practice, involves the careful observation of the velocity and pressure of the current and the accurate measurement of the sectional area of the airway. From these data the volume and power of the air current are determined.

Requirements—The mining laws of the state, in most cases, require a specified volume of air per man, per minute, circulated throughout the mine. In order to meet this requirement, it is necessary to estimate the power that will produce such quantity in a given mine.

The Mine Potential—Every airway and every mine has a certain resisting power, in respect to the circulation of air. For this reason, the same power will circulate different quantities of air through airways that differ only in respect to their size and length.

The formulas of mine ventilation show the following relation of the quantity of air circulated to the power producing the circulation, and the sectional area to the rubbing surface of the airway.

$$\frac{\textit{Quantity}}{\sqrt[3]{\textit{Power}}} \quad \textit{varies as} \quad \sqrt[3]{\frac{\textit{sectional area}}{\textit{rubbing surface}}}$$

Or, say: quantity (cu.ft. per min.) = q; power (ft. lb. per min.) = u: sectional area (sq.ft.) = a; and rubbing surface (sq.ft.) = s; the unit resistance being k, we have

$$\frac{q}{\sqrt[3]{u}} = \frac{a}{\sqrt[3]{ks}}$$

The first of these expressions, being given in terms of the power and quantity of air circulated, may be called, properly, the "potential of the circulation"; while the second expression, being given in terms of the airway, is the "potential of the airway," or the "mine potential." The significance of the term "potential," in this connection, is apparent since it describes the capacity of an airway or mine in respect to the volume of air it will pass, per unit of power.

The Value of Mine Potential—Calling the potential factor X its value for any given mine or airway is calculated by the formula

$$X = \frac{a}{\sqrt[3]{ks}}$$

The value of the potential for the circulation of any quantity (q), by any power (u) or pressure (p), is found by the formula

$$X = \frac{q}{\sqrt[3]{u}} = \sqrt[3]{\frac{q^2}{p}}$$

The value of the potential lies in the fact that it gives to every mine or air split a definite value that enables a correct comparison to be made and the proper type of ventilator and system of ventilation to be chosen.

The Coal Age Pocket Book

CALCULATIONS

Potential of Airway—Calculate the potential of an airway 6x10 ft., in cross-section, and 2000 ft. long.

Solution—The sectional area of this airway is 6 × 10 = 60 sq.ft.; the rubbing surface is 2(6 + 10)2000 = 64,000 sq.ft. The potential of the airway is, therefore,

$$X = \frac{a}{\sqrt[3]{ks}} = \frac{60}{\sqrt[3]{0.00000002 \times 64{,}000}} = 552.6$$

Potential of Circulation—What is the value of the potential factor in the circulation of 60,000 cu.ft. of air ,by 10 hp.?

Solution—The potential of this circulation is

$$X = \frac{q}{\sqrt[3]{u}} = \frac{60{,}000}{\sqrt[3]{10 \times 33{,}000}} = 868.2$$

Find the potential value for the same volume of air circulated under a pressure of 8 lb. per sq ft.

Solution—The potential value, in this case, is

$$X = \sqrt[3]{\frac{q^2}{p}} = \sqrt[3]{\frac{60{,}000^2}{8}} = 766.3$$

Power, Pressure, Quantity—By transposing the formulas for potential, it is possible to calculate the power or pressure required to circulate any given quantity of air against any given mine potential; or to find the air volume a given power or pressure will produce, for any given mine potential.

Example—Find the (1) power, and (2) pressure required to circulate 24,000 cu.ft. of air through an airway 5x14 ft. in section and 3000 ft. long?

Solution—The area and rubbing surface of the airway are: a = 5 × 14 = 70 sq.ft.; and s = 2(5 + 14)3000 = 114,000 sq.ft. The potential factor of this airway is then

$$X = \frac{a}{\sqrt[3]{ks}} = \frac{70}{\sqrt[3]{0.00000002 \times 114{,}000}} = 531.8$$

(1) Power, $u = \left(\frac{q}{X}\right)^3 = \left(\frac{24{,}000}{531.8}\right)^3 = 91{,}900 \textit{ ft.-lb. per min.}$

(2) Pressure, $p = \frac{q^2}{X^3} = \frac{24{,}000^2}{531.8^3} = 3.83 \textit{ lb. per sq. ft.}$

or, $p = \frac{u}{q} = \frac{91{,}900}{24{,}000} = 3.83 \textit{ lb. per sq. ft.}$

Example—Find the volume of air circulated in the same mine, by (1) 10 hp.; (2) a pressure of 7.8 lb. per sq.ft.

Solution—

(1) By 10 hp., $q = X\sqrt[3]{u} = 531.8\sqrt[3]{10 \times 33{,}000} = 36{,}750 \textit{ cu. ft. per min.}$

(2) By 7.8 lb., $q = X\sqrt{Xp} = 531.8\sqrt{531.8 \times 7.8} = 34{,}250 \textit{ cu. ft. per min.}$

EXAMINATION QUESTIONS

Miscellaneous Questions

(*Answered by Request*)

Ques.—Under what circumstances may a body of gas fail to be removed after restoring the ventilation?

Ans.—It frequently happens that the brattices, stoppings, air bridges or doors have been destroyed, which prevents the air current from being properly distributed or conducted to the working face or other places where gas may have accumulated. The ventilating current is not properly restored until all these means for the distribution of the air have been replaced.

Another reason why the gas may not be removed when the current is restored is that a heavy fall of roof may have occurred in one of the airways, by reason of which the quantity of air, in that section of the mine, is reduced and the velocity of the air current is insufficient for the removal of the gas. It may happen, also, that gas is being generated, at the point in question, more rapidly than it is removed by the air current, which would make it appear that the gas was not being removed.

Ques.—Would you allow any class of workman to enter a return airway contaminated by gases emanating from a mine fire; and for what purpose?

Ans.—Only such persons as are required for the work of removing the gases should be permitted to enter the airway, and then only for the purpose stated. The men selected for the work should be competent men who are experienced in the handling of gases and the use of the safety lamp.

Ques.—What weight of electric motor will be required to haul four cars, gross weight 3 tons each, up a grade, the tangent of whose angle of inclination is 0.03492. Assume a coefficient of friction 0.025 and a coefficient of traction, 0.16.

Ans.—The gross weight of the loaded trip of four cars is $4\ (3 \times 2000) = 24{,}000$ lb. The grade being slight, practically 3.5 per cent., the gravity pull of the loaded trip is found by multiplying its gross weight by the tangent of the angle of inclination; thus,

Gravity pull, $24{,}000 \times 0.03492 = 838\ lb.$

In like manner, the friction pull is found by multiplying by the coefficient of friction; thus,

Friction pull, $24{,}000 \times 0.025 = 600\ lb.$

The drawbar pull is the sum of the gravity pull and friction pull of the load; thus,

Drawbar pull, $838 + 600 = 1433\ lb.$

This drawbar pull is equal to the tractive power of the locomotive, less the sum of the gravity and friction pulls of the locomotive. Calling the weight of the locomotive w, the tractive power is $0.16\,w$; the gravity pull of the locomotive is $0.03492\ w$ and the friction pull $0.025\ w$. The drawbar pull, calculated from the weight of the locomotive w, is then $0.16\ w - (0.03492 + 0.025)\ w =$ say $0.1\ w$. Equating this value of the drawbar pull with that calculated from the weight of the loaded trip,

$$0.1\ w = 1438;$$

and

$$w = \frac{1438}{0.1} = 14{,}380\ lb.$$

which is the required weight of the locomotive.

Ques.—What weight of rails (20 lb. per yd.), ties, 18 in. apart, splice-bars; bolts and nuts are required for laying one mile of road?

Ans.—One mile of road, assuming a single track, requires $2 \times 5280 \div 3 = 3520$ yd. of rail; and the weight of iron for this track is, therefore, $3520 \times 20 \div 2000 = 35.2$ tons. The number of ties is $5280 \times 12 \div 18 = 3520$. The number of splice-bars will depend upon the length of rails used. For 30-ft. rails, there are $2 \times 5280 \div 30 = 352$ joints, which will require the same number of pairs of splice-bars, and $4 \times 352 = 1408$ bolts and nuts, allowing four to each joint. There will be required, besides, four spikes to every tie, making $4 \times 3520 = 14{,}080$ spikes, or, say 27 kegs of $4\frac{1}{2} \times \frac{7}{16}$-in. spikes.

Ques.—What would be your method of timbering rooms 30 ft. wide, with 10 in. of good slate roof over the coal and a massive sandrock above the slate? How many rows of props would you use, and how far from the face should the first row be placed? The coal is cut by mining machines.

Ans.—The depth of the cover and thickness of the coal not being given, it may be stated, in general, that the posts should be set in rows parallel to the face and staggered. The distance of the posts apart will depend on the depth of cover, thickness of coal, the width of room pillars and the character of the floor. Under the conditions stated, there being a good roof slate, 10 in. thick, if the floor is reasonably good, the first row of posts should be set 6 ft. from the face, and 3 or possibly 4 rows of posts will be required to properly control the weight on the coal face, owing to the massive sandrock above the slate.

Ques.—How should props be placed if the top is broken and the bottom solid?

Ans.—Much will depend on the character of the broken roof. If the roof is an interlocking slate, a systematic system of timbering will generally prove the best; but if the breaks occur in such manner as to render the roof treacherous, it will generally be necessary to place the timbers where they are most needed; but, in this case, a close watch must be kept of the roof by a competent, experienced person, to insure safety.

Ques.—Find the diameter of a shaft 90 ft. deep, from which 261 cu.yd. of material have been excavated.

Ans.—First reduce the cubic yards to cubic feet; thus, $261 \times 27 = 7047$ cu.ft. Then find the sectional area, by dividing the cubical contents by the depth of the shaft; thus, $7047 \div 90 = 78.3$ sq.ft.

The diameter corresponding to this sectional area is then calculated by the formula

$$d = \sqrt{\frac{a}{0.7854}} = \sqrt{\frac{78.3}{0.7854}} = say\ 10\ ft.$$

COAL AND COKE NEWS

Washington, D. C.

On Sept. 3, the Attorney General of the Uuited States made public the fact that it was intended by the government to attack the so called anthracite-coal monopoly through the Reading R.R., and its affiliated concerns. This was followed by developments of a similar kind later in the week which showed conclusively the existence of an intent to press on along the same lines.

The plan of the government as now understood is to make a general assault on the anthracite-coal combination and to take up one by one the different elements in the trust so called, applying if possible a uniform type of method to the dissolution of the several elements, or if that prove impossible varying and adapting the methods as circumstances seem to demand. The suit against the Reading and a similar proceeding undertaken later against the Lackawanna, are, however, all that are apparently planned at present. It appears to be the disposition to wait and see how the methods employed in these suits seem to work and how the courts regard the propositions put before them by those who are engineering the cases in question.

An interesting feature of the Reading suit is seen in the fact that it includes an onslaught upon the road because of its alleged violation of the commodities clause of the Interstate Commerce Act. It has always been alleged that because of its being organized in a threefold way the Reading was immune from the prosecutions under the commodities clause of the act, but this view is doubted by the Attorney General. He takes the ground that the transportation by the Reading of coal produced by the P. & R. Coal & Iron Co. and transportation by the Central R.R. of New Jersey of coal produced and owned by the Lehigh & Wilkes-Barre Coal Co. violates the provision referred to and asks that such transportation be enjoined.

Other Suits Are Expected

Action taken by the Attorney General of the United States during the past week indicates a disposition to press further in the attempt to secure definite action in the prosecution of the Lackawanna Coal Co. and the Lackawanna R.R. Application is to be made to the federal court in New Jersey for the appointment of a master to take testimony in the case. It is understood that the counsel for the defendants will assent to this application and two assistant attorney generals have been assigned to the work of preparing and carying forward the government's side of the proceedings.

The Lackawanna case is similar to the Reading proceeding. In the latter there are two distinct phases. An attack is made under the legislation on the statute books against combinations in restraint of trade and one is made under the commodities clause of the Interstate Commerce Act. The petition asks in that case, as already noted, that the court ask the Reading company to dispose of the stocks it holds in the Philadelphia & Reading Ry. Co. and the Philadelphia & Reading Coal & Iron Co. The same plan will be followed regarding the Lackawanna.

HARRISBURG, PENN.

The letter sent out by the operators' press bureau deploring the attitude of the miners in refusing to work on holidays thereby restricting the output is resented by the coal diggers who assert that the companies do not follow the rule which they would have observed, closing down the collieries when they see fit without consulting the miners.

That the antnracite mine workers of northeastern Pennsylvania are satisfied with a certain annual income, that increase in pay means less work per man, is the conclusion to which operators have been forced by the present apathy of labor in that region. The public squares are constantly filled with mine workers who are taking a day off and it is confidently predicted that their annual average earnings for 1912 will not exceed those for 1911 in spite of the 10 per cent. increase granted last year.

In addition to their numerous holidays an approximate list of which is here printed, they seize upon the slightest pretext for staying away from work and sporadic "button strikes" abound. The holidays, some of which affect only a part of labor, but many of which close down every mine in the region, are as follows:

New Year's Day, Feast of the Epiphany, Greek Christmas, Greek New Years, Candlemas Day, Lincoln's Birthday, Ash Wednesday, Washington's Birthday, St. Patrick's Day, Annunciation Day, Anniversary of the Eight-Hour Day, Maundy Thursday, the day preceding Good Friday; Good Friday, Holy Saturday, Easter Monday, Odd Fellows Day, Ascension Day, Whit Monday, Memorial Day, Corpus Christi Day, St. Peter and St. Paul's Day, Independence Day, Feast of the Assumption, Labor Day, Feast of the Nativity of the Virgin Mary Columbus Day, Mitchell Day, All Saints Day, All Souls Day, Election Day, Thanksgiving Day, Feast of the Immaculate Conception and Christmas.

In 1911, which holds the high record for anthracite output and working days the mines worked 234 colliery days. This means that the mines were idle 47 days on account of strikes, accidents to machinery in the breakers or disinclination on the part of the miners to work and 84 days on account Sundays and holidays.

The same conditions as described above exist in the bituminous region, and men are also scarce. While there is plenty of work, the men seem to drift from one place to another, not because conditions are any better, but they seem to want the change.

PENNSYLVANIA

Anthracite

Girardville—On Sept. 4, a dynamite explosion in colliery No. 5, of the Lehigh Valley Coal Co., ignited gas which in turn set fire to the workings. In the opinion of some of the firebosses the mine will have to be flooded to cope with the fire. Half a dozen men were overcome by gas and fumes, but were revived and are out of danger.

Wilkes-Barre—Through its attorneys, the Delaware, Lackawanna & Western Railroad Co., on Sept. 2, commenced an attack on the assessment rate of $250 per foot-acre on coal land in this county. The company petitioned court for an injunction to have declared null and void the action of the county assessors in fixing a blanket rate on coal land.

Twelve hundred mine workers, employed at the South Wilkes-Barre colliery of the Lehigh & Wilkes-Barre Co., went on strike Sept. 3, on account of the refusal of 15 men to join the union and wear the button which indicates payment of dues.

Scranton—Because they objected to working with two men, who had not paid their dues in the miners' union, about 300 employees of the central colliery of the Lackawanna Coal Co. went on strike recently. The employees at Sloan shaft, which is a part of the working, remained at their places.

Summit Hill—The Lehigh Coal & Navigation Co. has donated to the borough of Summit Hill, a tract of land adjoining it to be used as a public park, upon which will be erected a soldiers' monument.

Bituminous

Grove City—After a strenuous two months' campaign, conducted by the officers of the United Mine Workers, every mine in the Mercer-Butler district is reported organized. This is the first organization of any account that the Mine Workers have attempted in this field since 1908, when their union was destroyed through the disastrous strike of that year.

Pittsburgh—Those concerned in the deal between the city of Pittsburgh, the Board of Education and the Federal Government, for the transfer of the Magee site, near Schenley Park, to the Bureau of Mines, in exchange for a portion of Arsenal Park, believe that the last obstacle to the prompt consummation of the exchange has been removed, and it is thought that the transfer will be made within a short time.

WEST VIRGINIA

Grafton—A movement has been started in this section, which has as its object the reporting of all coal mined in small quantities for local consumption from what are commonly called "coal banks." It is estimated that the output of these small mines aggregates something like 100,000 tons in a year, which would mean no small increase to the reported production of the state.

Charleston—Twelve West Virginia coal operators, representing the greater part of the coal tonnage on Paint and Cabin Creeks, accompanied by counsel, left Charleston on a special car, Sept. 2, for Washington, in order to be present when the sub-committee of the Senate resumed the investigation into the conditions which existed in the Kanawha district, and the causes which impelled Governor Glascock to proclaim martial law in that territory.

ALABAMA

Birmingham—The Banner mine of the Pratt Consolidated Coal Co. has just been inspected by the mine department of Alabama in regard to its sanitary condition, and the report is exceedingly complimentary to the management, it being in an excellent condition.

KENTUCKY

Whitesburg—The condemnation proceedings recently brought at Whitesburg, Ky., by the Consolidation Coal Co. against John H. Bentley, in order to acquire an acre of ground owned by the latter in the heart of the industrial town of Jenkins, Ky., resulted in a finding by the jury of $43,000 damages for Bentley, the company getting the property for railroad purposes. Bentley had refused smaller sums than this for the property, holding out for $100,000.

Middlesboro—M. R. James, of Charleston, W. Va., has been at Middlesboro, Ky., recently, making investigations form that point of the entire Middlesboro field, in order to determine the power requirements of the various mines in that section, with a view to locating near Pineville or Middlesboro a power plant with sufficient capacity to furnish current to the mines in that section. Mr. James is said to represent Eastern capitalists.

Jenkins—Beginning with Sept. 2 the post offce at Jenkins, Ky., was made a postal depository, the number of miners employed in the vicinity of the town making it certain that a large amount would be placed with the postal savings bank. On the same date the office was moved into larger and more convenient quarters.

OHIO

Columbus—A movement is on foot among the coal operators of Ohio for the formation of a strong organization comprising all of the mining districts of the state. This move is brought about by the fact that the operators must put up a strong fight against the miners union in its efforts to secure the passage of the anti screen bill. Operators in Ohio have not been able to form a strong state organization and as a result they have lost out in their fights with the miners union. It is believed that a meeting of operators will be called at Columbus sometime early in the year or even sooner.

Raymond—Three men were killed and three others seriously injured, Sept. 2, in a cave-in at the Portland mine of the Portland Coal Co., north of Wheeling, on the Ohio side of the river.

Rush Run—Pending an agreement between the operators and the mine-workers' officials, the Rush Run coal miners, who have been on strike for a week, returned to work, Sept. 6. The resumption is the result of a conference between C. J. Albasin, of the Ohio sub-district mine workers, and the operators.

INDIANA

Greenfield—A new trial has been granted in the case of Walter E. Krieble against the United Fourth Vein Coal Co. The case is of interest to coal mining companies because it involves the question of whether a coal company must supply props for the miners' use. A jury in a former trial awarded the plaintiff $12,000 damages for injuries received in a mine accident.

Terre Haute—Warren Soules, owner of 160 acres in Lost Creek township, Vigo County, has sold the coal and mineral rights to the Glen Ayr Coal Co., operated by Job, William and Clarence Freeman of this city, the last-named as manager. The consideration was $20,000. While the price looks high, several thousand acres in Fayette township were transferred sometime ago to Chicago capitalists at a higher figure, especially in the vicinity of the mines operated by the W. W. Ray interests of this city. Six hundred acres were purchased outright at $140 an acre and sixty acres at $300 an acre. The coal underlying the Soules land is said to be the best No. 4.

Sullivan—The Consolidated Indiana Coal Co. has brought suit in the circuit court against the Treat & Rowland Oil Co. to enjoin it from drilling through coal until proper arrangements have been made to take care of gas from the oil well. The complaint alleges that if gas is struck it would endanger the lives of the miners at work and might blow up the mine. It is alleged that although the hole drilled might not pass through an entry, at some future time an entry might be made and the gas well encountered. The suit raises an interesting question.

ILLINOIS

Harrisburg—The first cars were run, in the past week, over the new Southern Illinois Railway and Power Co.'s electric road between here and Eldorado. The road will also extend to Carrier Mills, eight miles south, and this will open up the entire mining field in this section to electric service. It is expected the line will be continued from Carrier Mills through the eastern Williamson County field, touching at Crab Orchard and Pittsburgh, with a terminus at Marion.

Springfield—The Illinois Mine Workers, through the Executive Board, have advanced the sum of $170,000 out of their $1,000,000 treasury fund to aid striking miners in other fields. One hundred thousand dollars goes to the Western Federation of Miners to aid strikers in the copper mines in Michigan, and the $70,000 goes to organization work in the disturbed fields in Colorado and other western states.

Two homes have been ruined and three others badly damaged, near Walden St. and North Grand Ave. during the past few weeks by a slow sinking of the land in that vicinity. This is believed to have been caused by a fall of ground in the south entry of the Peabody mine, which is directly behind these houses.

MICHIGAN

Kerby—Judge Jefferies, of Detroit, has been busying himself with the financing of a proposed coal mine, the shaft of which, it is said, will be sunk on what is known as the Clay Pit farm, near Kerby. It is understood that the leases held on a large area of land in the vicinity of the town will expire this fall, so preparations for mining, will have to be rushed. It is also reported, but without confirmation, that the promoters of the mine plan to produce 100 tons of coal per day, to be used in the operation of the cement plant at Fenton.

ARKANSAS

Fort Smith—It is reported in this vicinity that the coal industry in this field is in the finest condition that it has ever been. Mines are running full time, the only shutdowns being those that are necessary for the making of repairs. All companies have a large number of orders ahead and the relation between the men and operators is more harmonious than ever. It is also stated that the water conditions at Jenny Lind are being improved and the company is endeavoring to comply with the orders of the state mine commissioner as rapidly as possible.

OKLAHOMA

Oklahoma City—Citizens of Oklahoma City have taken definite steps to tap the oil and gas deposits believed to lie beneath the surface of Oklahoma County. A contract has been let for the drilling of a 3000-ft. well near this city, and the actual work will be begun at an early date.

FOREIGN NEWS

Shantung, China—The Shantung Mining Co., a Chinese concern, in 1912 produced 374,604 tons of coal at its Hungchan mine and 199,072 tons at its Sangtse mine, as compared with 288,752 and 170,405 tons, respectively, in 1911.

PERSONALS

David Shertzer has resigned his position as manager of the Conrad Brick Co. to accept the position of general manager of the Hamilton-Parker Fuel Co., a retail coal concern of Columbus, Ohio.

Isham Randolph has removed his offices to suite 1807, Commercial National Bank Bldg., northwest corner of Adams and Clark Sts., Chicago, where he will continue his practice as consulting engineer.

C. H. Hoyt, who represented the New York Coal Co., of Columbus, Ohio, in western Michigan territory has resigned to enter the retail business in Toledo. He has been succeeded by Harry Schweinsberger, an employee in the office of the New York Coal Co.

Colin M. Selph, whose appointment as postmaster for St. Louis was recently sent to the Senate, is president of the Anthracite Coalette Co. For several months past the company has not been operated, but it is likely that work will be resumed the coming winter.

C. M. Means has commenced his investigation into mining conditions in the neighborhood of Scranton for the state department of mines. His particular work will deal with the electrical equipment in the mines, with a view to suggesting possible safeguards to the chief of the state department of mines. If the investigation by Mr. Means in Lackawanna County shows that the electrical equipment in the mines is not up to the standard, his investigation will be enlarged so as to include the entire anthracite field.

TRADE CATALOGS

The Jeffrey Mfg. Co., Columbus, Ohio, Bulletin No. 118. "The Care and Operation of Jeffrey 28A Short-Wall Mining Machine." Twenty-four pages, 6x9-in.; illustrated.

The Buckeye Engine Co., Salem, O., The Buckeyemobile, Bulletin No. 10C. Fifteen pages 8x10, illustrating and describing the Buckeyemobile or American Locomobile.

The Draeger Oxygen Apparatus Co., Pittsburgh, Penn. "Oxygen, the Life Saver." Two hundred and twelve pages, 6x9-in., illustrating and describing various Draeger apparatus.

Henry R. Worthington, 115 Broadway, New York. "Conservation and Distribution of Water for Irrigation." Seventy-seven pages, 6x9-in., descriptive of irrigation and irrigating pumps; illustrated with many halftones and line drawings.

Improvements in Mounting for Percussive Coal Cutters and the Like. W. Mauss, Commercial Exchange Bldg., Johannesberg, Transvaal; 21,553 of 1912.

A Process for Freeing Slack Coal from Water. W. C. Simon, Essen-on-the-Ruhr, Germany; 1,063,296. June 3, 1913. Filed Aug. 6, 1912. Serial No. 713,621.

Mine Car Wheel—F. C. Hockensmith, assignor to Hockensmith Mine Car Co., Penn Station, Penn., 1,061,746, May 13, 1913. Filed Nov. 8, 1911. Serial No. 659,217.

Baffle System for Stirling Boilers. D. S. Jacobus, assignor to Babcock & Wilcox Co., Bayonne, N. J. 1,070,478, Aug. 19, 1913. Filed Jan. 2, 1913. Serial No. 739,721.

Means for Operating Gas Producers. H. E. Longwell, assignor to Colonial Trust Co., Trustee, Pittsburgh, Penn. 1,070,825, Aug. 19, 1913. Filed Dec. 23, 1909. Serial No. 534,615.

CONSTRUCTION NEWS

Sheboygan, Wis.—The C. Reiss Coal Co. will spend $100,000 in enlarging its No. 1 coal dock on St. Louis Bay and has awarded a contract to Wales-Campbell Co. to lengthen the dock 600 ft., widen it considerably and install a complete new equipment of hoists and similar apparatus electrically operated.

Charleston, W. Va.—The early development of 27,000 acres of coal lands recently leased to John Laing, former chief mine inspector and associates, is expected soon. Already the Island Creek branch of the Chesapeake & Ohio R.R. is being extended to the tract and an immense central power plant to furnish power to every operation on the lease, has been located. Work will be commenced immediately in opening 12 mines in the property, and coal will be shipped before the first of the year.

Paducah, Ky.—The West Kentucky Coal Co. has placed an order with the Sherrill-Russell Lumber Co., of Paducah, Ky., for lumber to build thirty coal barges, the total amount of timber required being 1,085,000 ft., or about 73 carloads. Douglas fir, long-leaf yellow pine and white oak will be comprised in the order. The barges will be built during the next few months, at the rate of ten a month, and it is hoped to have them completed in time for the movement of coal down the river for the winter market.

Chicago, Ill.—The Allen & Garcia Co. has been appointed constructing engineer in charge of the new mine of the

American Coal Mining Co. near Bicknell, Ind. It has also been appointed construction engineer to take charge of the new mine of the Shoal Creek Coal Co., near Hillsboro, Ill., which is to be completely electrified and will be designed to have a hoisting capacity in excess of any mine in the state. The Allen & Garcia Co. will have entire charge of these two mines, including the shaft sinking, underground development and all construction work.

Charleston, W. Va.—The Pocahontas Consolidated Collieries Co. is about to let the contract for the construction of a steel tipple at Lick Branch, seventeen miles west of Bluefield on the main line of the Norfolk & Western Ry. The tipple will have a capacity of 3000 tons in 10 hr., and is to replace a wooden one that has outlived its usefulness. It is intended to handle the product of the Lick Branch and Shamokin collieries. The cost will probably be in the vicinity of $65,000, and the tipple must be completed by Apr. 1, 1914.

Mobile, Ala.—Of interest to the Birmingham district is the recent organization of the Standard Steel Co., which will build a large modern plant for the manufacture of structural steel, shapes, etc., at Mobile, Ala. This company is going to expend $5,000,000 on this plant, $800,000 of which will be used for the building of a model town, to be called New Mobile, just out from Mobile. This town will be modeled after the industrial city of the United States Steel Corporation, Fairfield, Ala., near Birmingham, which is considered one of the most uptodate industrial cities in the country.

Dublin, Ala.—The Gas Light Coal & Coke Co., of Birmingham is developing 2000 acres of coal land at Dublin, Ala., on the Illinois Central R.R. in the northern part of the State. It will expend about $100,000 in improvements, including fifty new dwellings, large commissary, etc., modern tipple and washer. The coal will be mined with machines driven by compressed air, and about 175 men will be employed when the mine is fully developed. This mine will tap the hard Black Creek coal, one of the best in the South for all purposes, being especially suitable for gas making. This is the second mine to open up on the Illinois Central R.R., the other one being the Brilliant Coal Co., at Brilliant, Ala., only three and one-half miles from Dublin.

NEW INCORPORATIONS

McAlester, Okla.—The Gap Oil, Coal & Gas Co. has been organized at McAlester with a capital stock of $40,000. The incorporators are U. G. Crane, R. G. Chandler, of McAlester, and H. B. Rowdy, of Kiowa.

Indianapolis, Ind.—The Middle States Coal Corporation of New York, has certified to the Indiana secretary of state that $560,000 of its $2,000,000 capital stock is represented in Indiana, with headquarters in Indianapolis.

Chicago, Ill.—The Monarch Coal & Supply Co. has been organized with a capital stock of $10,000 to deal in coal, wood, coke and lumber. The incorporators are Frank J. Kolar, Guy Vanschock, and W. Arnold Amberg.

Middlesboro, Ky.—The J. T. Reed Coal Co. was organized recently at Middlesboro, Ky., with a capital stock of $5000, by James T. Reed, H. A. McCaney and R. E. Samuels. The company will conduct a small operation in the Middlesboro field.

Aberdeen, S. D.—The Haynes Coal Briquetting Co. of North Dakota has been organized with headquarters at Haynes, and business office in Chicago. The capital stock is $350,000 and the incorporators are R. D. Ruffin, H. G. Adams, W. P. J. Dinsmore, John W. May of Chicago, and James S. Sebree of Pierre.

Charleston, W. Va.—The Pocahontas Coal & Land Co. has been incorporated with an authorized capital stock of $50,000. This firm will have offices at Marlinton, Pocahontas County, and chief works in the Edray district of the same county. The incorporators are Hubert Echols, F. R. Hunter, S. L. Hogsett, J. W. Prie, and J. K. Marshall, all of Marlinton.

INDUSTRIAL NEWS

Castle Gate, Utah—The Castle Gate Coal Co. has recently placed an order with the Link-Belt Co. for a complete shaking screen and picking equipment, including a Link-Belt rotary tipple.

Cleveland, Ohio—The Cooke-Wilson Co., of Ohio, has removed its offices from 614 Columbia Bldg. to 1114 Williamson Bldg., Cleveland, Ohio, and will be at its new quarters on and after Sept. 8.

Ruffsdale, Penn.—The Link-Belt Co. has received a contract from the Winona Coal & Coke Co. of Ruffsdale, for a complete retarding conveyor and shaking screen equipment for their new tipple at Coffman, West Va.

Columbus, Ohio—The Jeffrey Mfg. Co. has recently sold the Delaware, Lackawanna & Western Railroad Co. twenty 7-ton and two 15-ton locomotives, together with some conveying machinery which will be used in the latter company's mines.

Johnstown, Penn.—The Operators Coal Co., of Johnstown, is securing title to a tract of 6000 acres of coal and 1000 acres of surface in East and West Wheatfield Townships. This is the tract of coal that the Pressed Steel Car Co. tried to purchase several years ago.

Chicago, Ill.—Due to its growth of business, the Allen & Garcia Co. has established an electrical department. This department will be in charge of W. F. Corl, who has had long experience in electrical power and mining work, in design, construction, maintenance and operation.

Salt Lake City, Utah—The Standard Coal Co. of Salt Lake City has placed a contract with the Link-Belt Co. for furnishing a complete shaking screen and conveying equipment, including a new type revolving dump and a re-screening equipment. The entire supporting structure will be of concrete.

Nashville, Tenn.—During 1912, the State of Tennessee produced 6,587,754 tons of coal, valued at the mines at $7,422,703. This exceeded the production of 1911 in both amount and value. During that year the state produced 6,466,224 tons, valued at $7,071,376. It is further believed that the 1913 production will exceed that of 1912.

Mansfield, Ohio—The Ohio Brass Co. is now manufacturing all-wire rail bonds, with pin-driven terminals. The new bonds embody the same features which have characterized the older type, that is, terminals and body made of the same strands, and the strands protected by thin copper sleeves at the point where they are welded together to form the terminal.

Pineville, Ky.—The Wilhoit coal properties in Harlan County have been taken over by N. J. Moss & Sons under the name of the Moss & Sons Coal Co., and will be under the management of Ray B. Moss. W. L. Moss is president, J. M. Moss is secretary and treasurer and Ray B. Moss general manager. The Wilhoit mine is one of the biggest and best properties in Harlan County.

San Francisco, Calif.—Judge Maurice T. Deeling, of the United States District Court, on Sept. 5, ordered a fine of $2000 imposed on the Western Fuel Co., and directed the imprisonment of D. C. Norcross, secretary of the company, for contempt because of the refusal to produce the company's books before the federal grand jury, which is investigating alleged customs weighing frauds.

Liverpool, Eng.—It is estimated that the quantity of coal consumed by vessels engaged in international commerce is about 55,000,000 tons per annum, valued at approximately $180,000,000. It is probable that the total price is even higher than this, for on a large proportion of the coal supplied at foreign coaling stations, immense freight charges have to be paid in view of their remote situation.

Dublin, Ireland—The situation brought about by the strike of transport workers in Dublin has been rendered more acute by a lockout in the coal trade. The merchants at a meeting decided that they would no longer employ men belonging to the Transport Workers' Union, which organization, they say, will not permit its members to deliver the coal of certain firms with which the union is at loggerheads.

New York, N. Y.—Ex-senator John C. Spooner, as counsel for the American Coal Products Co., Barrett Mfg. Co., and 23 other defendants in the government dissolution suit against the so called Coal Tar Trust, appeared before Judge George T. Holt, Sept. 4, and stated that his clients had, within the period prescribed, complied with the requirements of the decree of the Federal District Court made in the Sherman Law suit. The combination complained of is now considered to be legally dissolved.

Danville, Ill.—The fiscal year of 1912-13 was the most successful from the standpoint of accidents that has ever been experienced by the Dering Coal Co. in the Danville district. Despite the fact that the roof is the most treacherous in the state, and that the coal is shot off the solid, there has not been one fatal accident for the entire year. This company operates three mines in this district, the average number of men employed during the winter months being 1200, and during the summer, 900.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite market slowly readjusting itself to the fall trade and at the moment rather inactive. Bituminous maintaining its strength in the face of some adverse developments. Car shortage becoming more general.

The hard-coal market is now experiencing the uncertainties incident to a transitional period between the summer dullness and winter activity. While generally inactive, the first indications of improvement are beginning to appear. Prices on the whole are being well maintained, with the exception of the individuals, who, of course, are always ready to meet adverse conditions with concessions on the regular company circular. The handling of the new Pennsylvania State tax on anthracite is also causing some interesting manipulation in the market. Production is still being restricted, and will probably continue so throughout the balance of the current month, but indications point to a heavy demand this fall, and buyers who do not obtain their supply are liable to find themselves in a critical position within the next 60 or 90 days.

The withdrawal of the railroads from the Eastern market is the principal feature in the bituminous situation. These roads have been unusually heavy buyers for several months, and in fact have formed the backbone of the abnormally strong trade prevailing in bituminous. The disappearance of this sustaining power has introduced an element of uncertainty into the situation.

While the market has by no means developed any important weakness, shippers are, nevertheless, more willing to contract for deferred delivery and the situation is not so clear as it has been recently. A few water cargoes of consignment coal shipped into New England have not been well received, and unless inclement weather intervenes, the trade will be decidedly easier. The past conservatism has left much free coal on the open market, and sellers are showing a noticeable disposition to look for business. However, there is still a good demand in the prompt market, and as the season advances this will naturally improve.

The situation in the Pittsburgh district is less strong than formerly, the complaint being that too much coal was kept free for use in the spot market; no actual weakness has developed at the moment, and prices are being well maintained, but the demand for free coal is scarce. However, with the production well covered by contracts the conditions are by no means serious. In Ohio the hot weather and the holidays have caused the market to become rather inactive. The car shortage is steadily becoming more serious, and the Lake shipping is being somewhat delayed. The domestic business is the chief feature in the local situation, while the demand for steam and railroad coal is also good, with some buying in the open market; the Lake movement is being curtailed by the lack of sufficient transportation.

The dumpings at the Hampton Roads piers have been only fair during the week, and are mostly for shipment into New England. There is still a heavy movement from the mines, and operators are pushing their men for all the possible tonnage they can get. The situation in the Southern market is still unchanged, and the demand continues good, with an active fall business anticipated; the car shortage is becoming more noticeable.

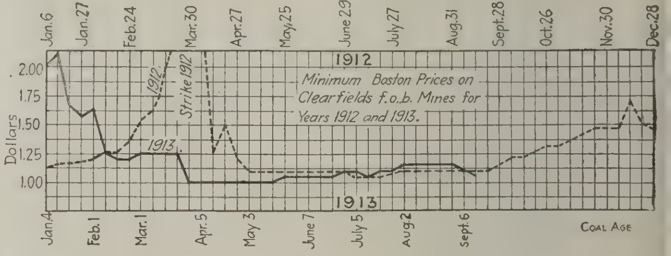
Conditions in the Middle Western market are bettering, with prices showing an advancing tendency. There is a lack of railroad equipment here, in addition to which some mines are experiencing trouble from other sources, such as insufficiency of water and numerous holidays.

BOSTON, MASS.

Pocahontas and New River remain firm, but with signs of an easier market later. Georges Creek in short supply with operators declining orders. More disposition on the part of Pennsylvania operators to seek future business. Anthracite strong.

Bituminous—The Hampton Roads coals remain firm, but the outlook for later in the fall is not so clear. Most of the shippers are offering at the contract figure for deferred delivery but they are still well supplied with spot business. There is increasing interest in the question whether stocks in this territory are piling up so fast that there will be a slackening demand within a few weeks. There are a few instances of cargoes shipped on the market which have not been well enough received to warrant much development along that line and it is being predicted that unless bad weather intervenes to slow up the movement the situation is likely to be decidedly easier. At the same time, prompt coal is hard to get and the advancing season, at least, is in favor of its continuing so.

Georges Creek for prompt loading is also hard to secure except on contract and more or less tonnage intended for Baltimore loading has been diverted to Hampton Roads where the dispatch is now about normal.



There is practically no news on the Pennsylvania grades. The operators seem still to have the situation well in hand although there is more disposition on the part of some to look now for late fall business. With so much conservatism in the attitude of the seller it is beginning to be wondered what is to become of the free coal that has been reserved for October and November. All-rail the movement is steady, with no material change either as to price or the volume of coal shipped.

Anthracite—The companies have ample business in hand for weeks to come and orders are still forthcoming for September coal. The prospect is excellent and the trade generally is in a wholesome condition. Individual coals are being offered at figures nearer the July than the September circular, but such cases are becoming rare and are not regarded as significant.

Quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*...............	$1.05@1.45	$1.35@1.60	$1.67@1.77	
Philadelphia*..........	2.30@2.70	2.60@2.85	2.92@3.02	
New York*............	2.60@3.00	2.90@3.15	3.22@3.32	
Baltimore*...........	....	....	2.85@2.95	
Hampton Roads*........	....	....	....	$2.85@2.90
Boston†...............	....	....	....	3.90@4.05
Providence†..........	....	....	....	3.83@3.93

NEW YORK

Anthracite uncertain but generally dull, with considerable coal still going into storage. The withdrawal of a number of railroads from market the feature in the bituminous situation. The effects are indeterminate as yet, but no weakness has developed at the moment.

Anthracite—Considerable uncertainty prevails in the local hard-coal market, some of the operators reporting that they are already unable to produce sufficient coal to supply all their orders. This condition, however, is probably due to the intermittent way in which the mines have been working, because of the restriction in output and the numerous holidays. Even those taking this optimistic view of the situation are free to concede that it is not due to any particular activity in the demand, but rather to the seeming impossibility of keeping production up to normal. There is a good supply of cars, but a decided shortage of labor.

Other producers are finding the market decidedly easier, if not dull. Much coal is being put into storage and the mines are only planning on working five days per week throughout the current month. Considerable pea is going into storage and chestnut is easy; stove coal is about the only grade on which there seems to be any insistent demand. However, the market is beginning to show some signs of activity, and all of the companies are anticipating a big business this fall and winter. Consumers who neglect to cover their requirements until late in the season, may find themselves in difficulties.

Prices remain practically unchanged with the exception of a small advance on chestnut and a somewhat stronger tone on barley. We quote New York hard-coal market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	....
Egg	5.25	$5.15@5.25	5.20	$5.00@5.20
Stove	5.25	5.25	5.20	5.20
Chestnut	5.50	5.40@5.50	5.45	5.35@5.45
Pea	3.50	3.35@3.50	3.45	3.30@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.30@2.70
Rice	2.25	2.25	1.95@2.20	1.70@2.20
Barley	1.75	1.70	1.70	1.40@1.70

Bituminous—The feature of the soft-coal market during the week was the sudden and unexplainable withdrawing from the market by a number of railroads, notably the Boston & Maine, the Boston & Albany, the Grand Trunk and the New Haven. These companies have been active buyers for some time, frequently inquiring about the prospects for doubling their orders. As a matter of fact, they have been the predominating influence in the abnormally strong conditions prevailing in the bituminous market, and the unexpected withdrawal of their support has undoubtedly introduced a great deal of uncertainty into the situation. It is even generally believed that the pursuance of this policy will eventually place the market in a critical position. One large operator is of the opinion that the roads will not again be in the market for about 30 days.

Aside from a somewhat indefinite weakness in the low-grade coals, the market fails to show any indications whatever of a break as yet. It is a trifle spotty, particularly locally, but it is hardly conceivable that it can suffer any very important reverse because of the large amount of contract business signed up. There is not much free coal in the open market, nor is there much demand for it. While the mines seem to be producing all the tonnage required, it is doubtful if a very material increase could be made, should occasion demand, because of labor difficulties of various kinds in the mining regions. The local prices have not changed any, and the market is still quotable on the following basis:

West Virginia steam, $2.60@2.65; fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

PHILADELPHIA, PENN.

Rumors of a slight weakening in the strong bituminous market. Prices are occasionally being made at a concession due to heavy consignments in this direction. Some coals, however, are still hard to get at any price, and there is really no material setback from the favorable conditions that have prevailed.

The first faint indications of activity in the anthracite-coal trade have begun to make their appearance. Inquiries are becoming more frequent in both the wholesale and retail trade, and the orders are being received in more volume than has been the case during the last two months. While this change is not marked as yet, at the same time it is a healthy premonition of better things to come.

The inception of the winter is likely to find the trade in a position to meet almost any contingency. Nearly all the companies have large stocks of coal, of all sizes, and are reasonably sure that the conditions of last winter when a fuel famine stared some localities in the face, will not be repeated. This is dependent, however, upon the fact that conditions remain about normal; any unusual demand, or an exceedingly strenuous winter is not likely to be covered under this statement.

The month of October usually marks the period when activity in this branch of the trade sets in, and there is nothing to indicate at the present time that this year will prove the exception. Prices are well maintained, with the exception of the individual operators, who are making conditions to fit the case, and while these concessions, as a rule, are not much, the aggregate amounts to considerable and proves an acceptable inducement for buyers, not to mention the absorption of the state tax, which is only added under the tacit understanding that it will be deducted when settlement is made. The manipulation of this tax for business would make interesting reading, and has been the means of diverting many dealers from their regular sources of supply.

BALTIMORE, MD.

Demand excellent for this season but the market is showing the first signs of weakness. Cheaper fuels at tide. Low-grade coals and coke easier.

While it is admitted in many places that there are some signs of weakness in the market, these are the first to be noted for a number of weeks past and they are not important as yet. While there was no great accumulation of coal at tide here, reports from Norfolk, Philadelphia and New York are to the effect that considerable cheap coal is being offered at those points. The rush of fuel to tide and to terminal points generally is conceded to be having its effect.

Better grade coals are holding their own in excellent shape, but there are numerous reports of offerings of poorer fuels at prices considerably below what has been the rule for several weeks. No one is willing to admit that this marks the beginning of anything like a slump in the soft-coal market. All believe that the trade is so well covered with contracts on the higher-grade fuels that these are protected come what may, and that the natural demand for the other class of coal will be such as to prevent any decided drop in prices.

The growing uncertainty concerning coal cars on the railroads feeding this territory is also a feature in the situation. Already there are times in the Fairmont and Somerset districts when the lack of cars is being keenly felt. For the present, there is plenty of fuel to meet the demand.

Coke has also eased off, and some of the producers are now seeking a market. Offerings of West Virginia coals at from $2 to $2.40 were heard during the week, with Connellsville held at from $2.25 to $2.60. The very warm spell has slacked up the anthracite trade here. The first days of the month saw a number of deliveries for September account, but the rest of the month is likely to be slack. The orders already on the books, however, seem to give promise of a very busy October.

PITTSBURGH, PENN.

Mines working at substantially full capacity on contract business, with very little prompt demand. Some uncertainty at mines not contracted to full capacity, expecting to sell prompt coal. Connellsville coke price still maintained, though with some difficulty, and further curtailment in output expected.

Bituminous—Mines in the Pittsburgh district continue to work at substantially full capacity, with fair labor supply and practically adequate car supply. About all the coal mined is applied against contracts, there being very little disposed of on prompt sales. Demand for free coal is decidedly light, but offerings are equally light. The situation does not appear to be altogether as strong as formerly, it being claimed there is an element of weakness through so many operators having contracted for less than their full output, expecting to dispose of considerable tonnages in the prompt market, and it now seems improbable that any large demand will develop in this direction. Thus far no actual weakness has appeared. Regular prices are well maintained, and we continue to quote: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¾-in. steam, $1.50; 1¼-in. domestic, $1.55 per ton at mine, Pittsburgh district.

There is a tendency among Connellsville coke operators to market coal instead of coke, arising in part from a belief that there will be a good demand for coal and in part from a desire to curtail coke production in order to maintain prices. One interest having two small plants has already announced its intention of blowing out the ovens and shipping coal.

Connellsville Coke—Operators have had more trouble than for July and August in closing up for September such furnaces as were not covered for longer periods. There have been rumors that some coke went at concessions from the $2.50 price, but these cannot be confirmed as relating to first-grade coke. At any rate, the major portion of the tonnage required for September has been taken at the fall price, with two or three consumers not yet fully covered for the month. The New Jersey Zinc Co. is understood to have purchased 25,000 or 30,000 tons for delivery from September over the last four months of the year at $2.50, but guaranteed against decline. It is stated on the part of certain operators that they will further curtail production to meet the situation. We quote: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $3; contract foundry, $3 per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 30 at 403,030 tons, an increase of 33,554 tons, and shipments at 405,115 tons, an increase of 35,792 tons. This makes the tonnages larger than the average for July and August, which was about 380,000 tons weekly, while the average in the first half of the year was 409,000 tons weekly. It is hard to understand how production and shipments could have been so large lately, considering the material decrease in pig-iron production, but as to shipments in the week ended Aug. 30, it is to be remembered the holiday at the beginning of the following week was doubtless being provided for.

BUFFALO, N. Y.

Bituminous as hard to get as ever. Cars growing scarcer and flat cars unobtainable. Canada still very short of money. Railroads buying considerable soft coal. Anthracite dull.

Bituminous—There is no increase in the bituminous supply. It has been a long time since there has been a car of unsold coal in this market and there is no prospect of any right away. The consumption is brisk and the movement of cars not what it was. The indications are that consumers will soon be obliged to take anything in the shape of steel hoppers that they can get. Shippers with contracts for delivery in low-side, flat-bottomed equipment say that they are away behind because they cannot get the cars. If there is a falling off in consumption anywhere, it is in Canada, and that is entirely on account of the money scarcity. What ready cash was not absorbed in land speculation has now been sent to the Northwest to move the crops.

Some of the Pennsylvania mines are considerably hampered by lack of water, so that it would be impossible to increase the output to any great extent, even if miners were plentiful and all disposed to work. The railroads are also in the market and they probably would not buy any more now than they needed if they did not look for a shortage before long. The Buffalo market is quiet enough, as the distance from the mines is not great, but it is a hard matter to get shipments through such a terminal point as this and as the season advances the difficulty will increase. It will not answer to allow a consignment to take its natural course from the mine to the consignee if he is at all near the end of his supply. When the grain crops begin to move freely there will be a lack of motive power to add to the other difficulties.

The quotations of bituminous remain strong at $2.90 for select Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run, and $2.15 for slack, which is especially strong.

Coke—There is some increased stiffness in the price of coke, said to be on account of shutting down of a good many of the ovens. Dealers now say that they cannot get the best Connellsville foundry short of $3 at the ovens, which would make the price $4.85 here without any profit to the jobber anywhere. Stock coke is as scarce as ever.

Anthracite—There is a return of warm weather that keeps the anthracite market dull, but people are now coming back from their vacations and they will go to buying as soon as the cool weather sets in. There is some special competition everywhere on account of some companies failing to make the addition to prices caused by the Pennsylvania tax; it is generally believed that the tax will never be collected.

Anthracite shipments by lake are not so heavy as formerly, on account of the congested condition of the upper-lake docks, but for the week were 148,000, for the month of August, 742,215 tons and for the season to September, 3,308,421 tons, as against 1,782,933 tons for the same time last season.

TOLEDO, OHIO

Hot weather and holiday cause the market to become inactive. Car shortage developing. Lake shipping somewhat delayed.

The coal trade has been rather inactive here during the past week, owing to the extremely warm weather. Labor Day following the Sunday holiday also made business dull. The demand for domestic coal has fallen off considerably but it is expected that as soon as the weather becomes cooler, business will open up briskly. There is considerable complaint among shippers of a car shortage but there has been little difficulty experienced here from this source as yet. Coal men generally, however, predict a shortage a little later when the crops begin to move more freely.

The city of Fremont, O., which suffered severely from the high waters of last March is already in the midst of a car famine and is anticipating an increase in the price of coal there this winter. Fremont is located on the Wheeling & Lake Erie railway, one of the largest coal carriers in the state and a congestion on this road is bound to affect Toledo. The lake shipping has been somewhat delayed owing to the short shipments but all the docks are working as hard as possible loading boats and getting their supplies off to the head of the lakes.

Prices quoted here continue as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.60	$2.50	$1.75	$2.50	$1.35	$1.35
Egg	2.25	1.20	2.50	1.50	2.50	....	....
Nut	1.80	1.20	2.25	1.50	2.50	....	....
⅞ lump	....	1.35	....	....	....	1.20	1.20
Mine-run	1.50	1.10	....	....	....	1.10	1.10
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

Activity prevails despite the intervention of a holiday and the growing car shortage; these two factors tended to decrease the production. Prices well maintained at the recent circular and no cutting of consequence is reported. The tone of the market is satisfactory and the outlook bright.

The chief feature of the trade has been the demand for domestic grades. Dealers in all sections are placing larger orders and are insisting upon prompt delivery. They have been busy delivering fuel to private consumers who are laying in their winter's supply somewhat earlier than usual. Retail prices are strong and inclined to advance; their stocks are not heavy and they are trying to increase them.

Steam business is also active and the demand for all steam grades is good. Railroads are taking a good tonnage as the freight movement continues high. Manufacturing concerns engaged in the iron and steel industry are good users of steam coal and other lines also show up well. A number of the steam users are buying their supply on the open market. Contracts are being renewed at higher figures than the previous year.

Lake trade is also good and the demand from the Northwest is strong. Chartering of boats is going on actively and the indications are bright for an active lake trade right up to the close of navigation. The Toledo docks of the Hocking Valley Railway company have handled almost two million tons during the present season.

Production has been curtailed during the past week by the shut down over Labor Day and also by a lack of transportation facilities. In the Eastern Ohio district the car shortage is probably the worst and as a result the output is estimated at 65 per cent. normal. In the domestic fields of Massillon and Jackson the output was larger. In the Pomeroy Bend district car shortage cut quite a figure and the production is estimated at 70 per cent. In the Hocking Valley district the supply of cars was better and the output is estimated at 80 per cent.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.75 @ 1.70	....	$1.85 @ 1.75	$1.70 @ 1.65
3-4 inch	1.60 @ 1.55	$1.30 @ 1.25	1.55 @ 1.60	1.55 @ 1.5
Nut	1.30 @ 1.20	....	1.35 @ 1.40	1.25 @ 1.20
Mine-run	1.40 @ 1.35	1.20 @ 1.15	1.30 @ 1.25	1.25 @ 1.20
Nut, pea and slack	0.80 @ 0.75	....	0.75 @ 0.70	0.75 @ 0.70
Coarse slack	0.70 @ 0.65	0.80 @ 0.75	0.65 @ 0.60	0.65 @ 0.60

HAMPTON ROADS

Movement of coal for the week only fair and mostly to the New England market. Sewalls Point makes record dumpings during month of August. Prices firm.

The movement of coal from tidewater has been fair, but it is doubtful if the dumpings will amount to anything like the quantity handled last week. The greater portion of the week's movement has been coastwise to the New England ports and has practically all been contract business. Foreign shipments were consigned to Cuban ports, Panama, and one large shipment to Italy.

Prices have been around $2.85@2.90, but it is difficult to say at exactly what figure any spot sales have been made as the suppliers seem to prefer to keep these private. There have been one or two small cargoes of high volatile coals moved to the New England market, but it is impossible to ascertain at what price it was sold.

During the month of August over one million tons of coal moved over the Hampton Roads piers, the exact tonnage amounting to 1,030,434 tons, of which Lamberts Point dumped 455,269, Sewalls Point making a record month with 283,385 tons and the C. & O. Ry. at Newport News dumped 291,780 or only about 8000 tons more than the one pier at Sewalls Point.

LOUISVILLE

Heavy shipments continue in spite of the warm weather. Strike possibility still the main uncertainty in the situation. Producers pushing the mines for all the tonnage possible.

The long continued summer weather is naturally having some effect upon the consumption of coal, but dealers are doing considerable storing in order to replenish their depleted supply, so that the movement from the mines continues heavy. This is true in both the Eastern and Western fields alike, a large part of the output in the former being used on contract shipments to points in the North and Northwest. Much of the Western Kentucky coal is going into Louisville for use both as a steam and domestic fuel. In event of the expected labor troubles in the Eastern Kentucky field coming to a head, their markets will have to be supplied from the Western district, and this at a time when the demand is the heaviest.

The higher grade fuels are still in the best demand in spite of the discrepancy of about $1.50 in price. The only uncertainty in the situation now is the possibility of a strike in the Eastern Kentucky field. Some of those best informed on the situation claim that a lockout is practically unavoidable. Most of the mines are running on full time at the present moment, there being plenty of cars with orders in excess of the capacity of the mines. From the best information available the labor trouble will not be precipi-ated until Oct. 1.

In the meantime operators are taking full advantage of the abnormally strong market, and are pushing the mines for all the possible tonnage they can produce. In spite of the fact that there is a heavy movement of the prepared grades, the high-grade screenings are particularly scarce and lifficult to buy. On the other hand, there is a surplus of the western Kentucky screenings. Domestic grades of east-rn Kentucky remain at $2 to $2.25, with the better grades of nut and slack at 85c. Second grade and western Kentucky nut and slack are quoted at 60 to 65 cents.

BIRMINGHAM, ALA.

Little change in the coal and coke market. Car shortage till prevails. Pig iron firmer, with larger sales.

This past week has brought about very little change in he situation here. The demand for both steam and domestic oal is good, especially considering that this is the dull eriod, and it is expected that a good fall business will be one, at fair prices, both for lump and steam coals. The car hortage continues evident, and will, no doubt, be felt very nuch more as the winter draws nearer.

The demand for coke, both furnace and foundry, is only air, as is also the case with smithing coal. Pig iron seems o be on a firmer basis, the large makers holding for their rice and not accepting anything offered just to book the usiness. Some large sales were made this past week, and at etter prices than have prevailed for several months. Alto-ether the iron market looks very hopeful.

INDIANAPOLIS, IND.

Market dull and quiet with mines working about half time. creenings weak. Indications point to an active business in ctober.

As the weather so far in September has been as hot as it as in August, there is only slight improvement in the ade. Retailers who cater to the country trade say farmers ill not haul coal over the dusty roads, with the thermometer howing 95 deg. in the shade. Most of the producers in the ate are running better than half time, and the cooler eather that will come this month is expected to put the ajority of the mines on full running schedule.

Screenings are cheap, according to the market, being uoted all the way from 10c. to 50c. Most operators, how-ver, hold out for 50c. to 60c. Industrial conditions are re-orted up to the average for the season, though somewhat ack in spots. There seems to be as much complaint of a ck of labor as of labor out of work. No advance in prices as made Sept. 1, and, feeling that there is sure to be one Oct. 1, domestic consumers are buying liberally and the rds will probably exceed the average September business.

CHICAGO

Conditions in the smokeless-coal market are not favorable d a decline in prices has been noted. Dealers also report a cession in anthracite. Screenings, as a rule, are selling at c., the mines.

Prices for smokeless coal have weakened slightly and hile some of this product is selling at $1.50, shrewd buyers e not encountering much trouble in obtaining smokeless ne-run at $1.40 with lump and egg at $2.25, the mines.

The car situation in the territory which produces Eastern al is less favorable and the same conditions prevail so far Western mines are concerned. There has been a recession the anthracite market and buyers are able to make pur-ases at from 25c. to 30c. a ton less than the circular price certain sizes. A large amount of central Pennsylvania al is being received in the Chicago market on the basis of 25 a ton, the mines, and is being disposed of as a substi-e for West Virginia semi-bituminous coal. Furnace and ndry coke are moving chiefly on contract. Producers of int coal report that they have comparatively little free l for all-rail shipment westward.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
nestic lump	$2.22@2.32	$2.70@2.80	$2.27	
m lump	1.92		2.07	
		2.70@2.80		$4.30
e-run	1.82	2.30	1.87	$3.45@3.55
enings	1.22@1.32	1.55@1.65	1.22@1.32	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-duct, egg, stove and nut, $4.75@4.85; gas house, $4.65@4.75.

DETROIT, MICH.

Stocks relatively light and market still strong. Slack in particularly good demand. Increase in prices anticipated soon.

Bituminous—The local market still continues very active; there is a good demand for all grades and the outlook is for a still further increase. Slack is coming in slowly and the demand is so heavy that the West Virginia grades are in some cases bringing as high as $1 per ton f.o.b. mines. Domestic orders are being received in good volume and dealers are busy making deliveries to their customers. Stocks on hand are relatively light and buyers are attempting to increase these as rapidly as possible to provide against the expected car shortage. Not much September business is being done, but it is expected that quotations for the month will show a slight advance before it is over. Manufacturers, who delayed closing contracts are very active buyers in the spot market. Some of these steam contracts are now being renewed at an advance over last year's figures, but producers, as a rule, are indifferent about signing up for any further tonnage, apparently preferring to keep some free coal for use in the open market.

The local market is now quotable on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.70	....	$1.75	....	....	$2.50	$2.40
Egg	1.70	....	1.75	....	....	2.50	2.40
Steam lump	1.25	....	....	....	....	....	....
¾-in. lump	1.15	$1.15	1.15	$1.15	$1.15	....	....
Mine-run	1.05	1.00	1.00	1.00	1.00	1.50	....
Slack	0.95	1.00	0.75	0.70	0.80	....	....

Anthracite—Hard coal has shown some slight improvement, but not of any great importance as yet. However, it is better than at any time since the cessation in activity last winter. Indications are that the middle of the month will see the beginning of the fall demand and it is probable that it will be an exceedingly active season for the companies.

ST. LOUIS, MO.

Market stronger, although the arrival of considerable speculative coal has caused some unsteadiness. However, mining is being interrupted and the movement is not heavy.

In a general way local conditions are improving. The market has gone up in the past week on standard coals, which is something that has been needed for some time. The Carterville and Franklin County market is not as steady as it might be on account of a large amount of coal coming in that was sold on speculation.

However, country prices are firm, which is accounted for by the car shortage, lack of water and the annual chain of county fairs that always take about two or three days a week of the miners' time. This will last for at least a couple of weeks longer, and as soon as the prevailing torrid spell is over and coal in demand, prices should continue to go higher.

The Standard operators have at last decided that they must get something for their coal, and Standard lump has gone up about 15c. per ton in the last ten days. Anthracite, coke and smokeless are still dragging, with no demand.

The prevailing market is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.15
3-in. lump	....	....	$1.50	....
6-in. lump	$1.70 @ 1.85	....	1.60	1.35
Lump and egg	1.50 @ 1.60	$2.15	1.60	....
No. 1 nut	1.30 @ 1.40	....	1.05	0.87½
Screenings	0.55	....	0.40	0.85
Mine-run	1.50	....	....	....
No. 1 washed nut	1.60	....	1.60	....
No. 2 washed nut	1.35	....	1.50	....
No. 3 washed nut	1.20	....	....	....
No. 4 washed nut	1.00	....	....	....
No. 5 washed nut	0.60	....	....	....

OGDEN, UTAH

Operators able to increase number of working days by forcing the market, buying being done in limited quantities, surplus of nut and slack at the mines. Considerable coal being sold below circular.

The operators in Wyoming and Utah are making a desperate attempt to induce buyers to accept immediate shipments in order to keep the mines running full time. Orders are coming in slowly and salesmen are still working hard with the trade to induce them to get coal in transit before the car shortage becomes severe at the mines. The present condition is attributed to the money market. A large percentage of coal is bought with borrowed money, and for the past five months the dealer has been unable to procure money from his bank with which to buy. The demand for lump coal is better than during the last week in August, but this is due to the cool weather in various sections.

With the slight increase in the demand for lump and consequent increase in production at the mines, there is a surplus of nut and slack coal. This condition will probably continue through September or until the demand for lump is greater, at which time the mines will be able to move all the nut coal produced. About Sept. 20 the sugar factories will resume shipment, and this will take care of the slack.

Owing to the weak condition of the Market the operators have been unable to maintain the circular at all times, and in order to move the tonnage some shipments are being made at concessions. However, with the approaching cold weather this condition will be removed.

The car shortage has not caused the Wyoming mines to loose time, although there has been a shortage of closed equipment, and some commercial coal has been loaded in open cars. The Utah mines have not fared so well, the Rio Grande has been unable to furnish them sufficient cars, and the mines are now loosing from two to three days per week.

Present quotations are:

Lump	$2.75
Egg nut	2.50
Nut	2.25
Mine run	1.85
Slack	1.00

PORTLAND, ORE.

Wyoming and Utah mines give notice of 50c. advance to become effective Sept. 8. Local prices will probably increase accordingly.

Coal dealers here were notified this week that on Sept. 8 prices at the mines on Wyoming and Utah coals will advance 50c. per ton. At present the retail price here ranges from $9 to $10, and while no decision has been reached, it is taken as probable that retail prices will be advanced accordingly. No reason is given here for the increase.

So far no Australian coal has been imported here this summer, but if prices on Wyoming and Utah products continue to advance it is regarded as probable that some importations will be made in the fall, for which there is yet time. The freight market being easier than last year, it is the more likely that some of this business will be done this season. Last year freights were high and coal prices here lower than now.

It will be about a year before the Southern Pacific will have its line between Eugene and Coos Bay open for operation, but its completion will undoubtedly mark a change in the coal situation here and in many communities in the Willamette Valley, for the coal mines on the bay will then have found an easy outlet for their product.

NEW ORLEANS

Keen competition stimulates interest as period for new contracts approaches. Cars more plentiful than last week, but shortage still in evidence. Storing continuing on large scale.

While lacking activity in the spot market the number of contracts about to expire is stimulating interest in the local situation. Before the end of the year new agreements will have to be signed with a number of the principal steamship lines making this port and with most of the largest local consumers. Alabama interests hope to make further inroads on the old companies that rely on the river for their coal supplies. Indication of the keen competition between the Alabama, Kentucky and Pennsylvania coal companies was seen in the struggle last week for the school board contract for this year.

The car shortage is still a factor, but there has been some relief since last week, when the trouble threatened to become acute immediately. While the stocks of coal in the city are larger than ever before, there is no indication of curtailing the work of storing. The North German Lloyd Line is to make this port regularly and will add another important contract to those already pending this fall.

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY

Total shipments of coal over this road for July of the current year were **321,626** tons as compared with 245,087 tons for the same month last year. For the six months to July 31 of the current year, the shipments were 2,522,659 tons as compared with 1,908,004 tons for the same period the year before.

FOREIGN MARKETS

GREAT BRITAIN

Aug. 29—The coal market is quiet without any materia change. Prices are firm for immediate loading, most of the collieries being well stemmed. There is little business passing for forward loading and prices have an easier tendency

Best Welsh steam	$4.92@5.04	Best Monmouthshires	$4.14@4.2
Best seconds	4.68@4.80	Seconds	4.02@4.1
Seconds	4.44@4.56	Best Cardiff smalls	2.64@2.7
Best dry coals	4.44@4.68	Seconds	2.46@2.5

The prices for Cardiff coals are f.o.b. Cardiff, Penarth o Barry, while these for Monmouthshire descriptions are f.o.b Newport; both exclusive of wharfage, and for cash in 30 days

FOREIGN TRADE OPPORTUNITIES

The United States Counsellor Service reports opportunities in foreign coal markets as follows; complete details regarding different items can be obtained on application to the Bureau of Foreign and Domestic Commerce, Washington, D. C. by giving numbers.

Europe—A large European importer, supplying railroads and a navy with coal, is desirous of establishing a permanent connection with an American exporter of coal. The inquiry refers particularly to briquettes and they must be of sufficiently high grade to compete with the foreign product. Replies should quote prices, covering insurance and freight t port of destination. **No. 11,269.**

COAL SECURITIES

No Important Dividends were announced during the week

⁂

The Colorado Fuel & Iron Co.—The Rockefeller interests are said to own one-third of the preferred stock of this company and about $20,000,000 of the total $33,000,000 of the Colorado Industrial Co. Under their management the company has shown a steady and consistent improvement, and indications are that the earnings for the current year will establish a new high record.

The Consolidation Coal Co.—During the year 1912 this company expended on improvements, betterments, extensions, enlargements and additions of a permanent nature only $329,773, as compared with $1,060,180 in 1911. However, they expended on Northern coal lands $1,261,127 last year, as compared with $146,521 in 1911. Profit and loss surplus in 1912 was $8,159,415, as compared with $7,039,192 the year before.

PRICES OF MINING SUPPLIES

MARKETS IN GENERAL

Price changes during the month have been unimportant, although the gradual advance in pig iron continued and renewed weakness has developed in finished-steel products. Metals have been very strong, with an excellent demand for copper forcing the price up to much higher levels. The severe drought in Missouri, Kansas and Oklahoma has been pretty thoroughly advertised, and while this will have a serious effect on the districts in these states, general agricultural conditions otherwise are fairly satisfactory. Returns are now available and show that the wheat crop will be a record-breaker, the corn crop about 800,000,000 bu. less than last year, but still a total crop of 2,300,000,000 bu. The cotton crop promises to be slightly less than last year.

The railroad situation is most unsatisfactory, and is having an effect on business throughout the country. Railway gross earnings are increasing rapidly, but net earnings show a decline, and it is evident that some of the important trunk lines of the country will have to reduce their dividends. This is not so important from the standpoint of the general wage earner as the fact that, with the reduction of dividends, comes the inability of railways to raise capital for new extensions and for improvements, something which gives employment to labor everywhere, and, moreover, the country has evidently caught up with its transportation facilities.

The production of pig iron during August showed a slight decline compared with July, and the advance in quotations indicates that all of this iron is rapidly being consumed. The country is now making pig iron within about 10% of its maximum capacity.

Financial conditions have steadily improved, and while it is by no means easy to secure long-time loans even when the security is desirable, still they can be secured, which was not the case three months ago. Conditions in this respect promise to improve with the season.

Unfilled orders of the U. S. Steel Corporation showed a smaller falling off than had been expected. The decrease was 175,888 tons, and the unfilled orders as of Aug. 1 aggregated 5,223,468 tons. The report of idle railway equipment was unfavorable, figuring as it did, an increase of 2881 idle care in the fortnight ending Sept. 1. In previous years, a decrease has always been recorded in the corresponding period.

LABOR

Disturbances in the ranks of labor have been less prevalent in the last four weeks than any time this year. Most disputes have been settled, and there seems to be little likelihood of any general outbreak before spring. In the meantime, the arbitration between the railway managers and the trainmen continues, and this is not likely to be settled for some time. From the West come complaints of shortage of labor in the harvest fields, and some of the railways operating in the States of New York and New Jersey had trouble in running their trains for a few days on account of the full crew law. This difficulty, however, will shortly disappear. Some improvement work on railways in the Northwest has been halted, owing to the inability to secure sufficient laborers to do the work. The strike of copper mines in the upper peninsula of Michigan continues and has been attended with much violence.

Ordinary outside labor commands $2 per day.

IRON AND STEEL PRODUCTS

The production of pig iron during August aggregated ,545,000 tons, compared with 2,560,000 tons in July. The difference in amount is practically negligible, and as prices of pig iron advanced slightly during the month, it is evident that no stocks are being accumulated. This is a negatively favorable argument, as it was generally believed that the production of pig iron would show a much larger falling off. Price changes during the month have been unimportant, but pig iron has trended toward higher levels, while finished steel products have been easier, even if no change in prices has been made. The inability of the railways to purchase equipment and make improvements, is largely responsible for the dullness in the steel market, but other consumers are buying almost as freely as they have at any time. It will not be at all surprising if legislative enactment is made some time in the near future compelling railways to substitute steel equipment in its passenger service. This, in itself, will make for tremendous activity in the car-building line.

Pig Iron—Sales of pig iron were larger in August than in July, and several sales of importance were made in the Southern market at $11 for Southern foundry No. 2. This represents an advance of $1 per ton over the recent low quotation, and indicates that the pronounced weakness, which was evident in that market in June, has disappeared; for the time being at least. It is understood that the furnaces making these sales have booked enough orders to keep their stacks running until the first of the year. The fact that the production of pig iron in August was nearly as large as in the preceding month was in itself satisfactory, and the knowledge that the furnaces going out of blast in September would be succeeded by furnaces of larger capacity going into blast, leads to the belief that the production of iron during September will be as large as in August. Another reassuring factor was that several of the large consumers of pig iron, such as manufacturers of electrical supplies, railway equipment and cast iron pipe, who seem to have the faculty of buying when the market is lowest, placed their orders for large amounts which will last them for many months to come. This was taken as an indication that the market for the time being had touched bottom. Southern foundry iron No. 2 in Cincinnati is quoted at $14 to $14.50; No. 2 Northern foundry in Chicago is $15 to $15.50; bessemer iron in Pittsburgh is $16.65 to $16.75, which price includes the 90c. freight rate from the valley to Pittsburgh.

Steel Rails—The principal railroads of the country have not placed their orders for 1914, and it is common talk in the steel trade that, if the railroads would show their confidence in the situation by placing orders, it would result in a much better feeling in the steel trade. Some improvement is evident in the export situation. All of the mills manufacturing rolling rails have enough business on their books to keep them actively engaged for the next two months.

Quotations are unchanged at $28 per ton for standard sections of bessemer rails, and $30 per ton for openhearth rails, both f.o.b. Pittsburgh. These prices represent a quotation of 1.25c. per lb. for standard sections weighing from 50 to 100 lb. per yd.; 1.21c. for 40- to 50-lb. rails; 1.30c. for 16- to 20-lb. rails. In Chicago, 16- to 20-lb. rails are 1.30c.; 12-lb. rails, 1.33c. Relaying rails in Chicago can be had at $24 per gross ton and in New York at $22.50.

Track Supplies—No inquiries of importance have appeared in the market, but it is evident that the railways will not be able to postpone the placing of orders much longer, and it is probable that the amount required will be as large as in 1913. Quotations are easier, spikes in large lots to railways being obtainable at $1.75 to $1.80 Pittsburgh, but for small lots $1.90 to $1.95 is demanded. In Chicago, spikes are quoted at $1.90 to $2; track bolts with square nuts, $2.25 to $2.40, and angle bars $1. 50.

Structural Steel—Building work in the Central West has been fairly active, and some of the leading fabricators in Pittsburgh, Chicago and the Ohio district have a fair amount of work on their books. Quite a little new work has come out for power houses in various parts of the country, and a contract for a new 18-story office building to be erected in Detroit was recently let. A new lodge building in Pittsburgh will require about 3000 tons. Railway work is especially inactive, and few bridges are being contracted for at the present time. The principal work in the East is for new subways in New York City, and a recent contract calls for the placing of 6000 tons. The steel, when bought, is being erected rapidly, and consumers have little or no complaint regarding deliveries. Fabricated work is fully as cheap as last month, and it is unusually low. Structural steel shapes are quoted at 1.45@1.50c. Pittsburgh, and 1.63@1.68c. Chicago. These prices are per lb. in large lots.

Pipe—The market for pipe is spotty. The demand for line pipe, or pipe that is used by oil and gas companies, has been unusually heavy, and some of the principal manufacturers of this kind of pipe are unable to take any more orders for delivery this year. On the other hand, the demand for smaller sizes of pipe used in steam work and for general industrial purposes, is not at all large. One of the largest inquiries in the market is for 20 miles of 8-in. pipe. There is some trouble over the puddling scale, and some of the workmen have not signed for the coming year. Quotations show no change since last month, but at that time there was a revision in discounts on ¾- to 2-in. pipe. Discounts and net prices are as follows:

	Black	Galvanized
¾- to 2-in. steel butt welded...........	80%	71½%
2½- to 6-in. steel lap welded...........	78%	69½%
7- to 12-in. steel lap welded............	75%	64½%

At these discounts the net prices of pipe per foot at Pittsburgh are as follows:

	Cents		Diameter	Cents	
	Black	Galvanized		Black	Galvanized
¾-in........	2.30	3.26	5-in........	30.50	45.00
1-in.........	3.40	4.83	6-in........	42.25	58.25
1¼-in.......	4.60	6.60	7-in........	59.50	85.00
1½-in.......	5.50	7.90	8-in........	62.50	89.00
2½-in.......	12.90	17.80	10-in.......	$1.03	$1.46
3-in.........	16.80	23.30	11-in.......	1.13	1.64
4-in.........	23.00	33.20	12-in.......	1.27	1.82

Sheets—New business is only fair, but some makers who were willing to accept orders on a basis of 2.15c. Pittsburgh for No. 28 black were able to secure enough tonnage to keep their mills running for some time. It is pointed out that the mills that are making this price are scarcely able to come out even, if they buy their sheet bars in the open market. The leading interest is now operating to about 70% of capacity, which is slightly better than last month One reason for the continued decline in sheets and the weakness in the market, is the fact that quite a little new capacity has sprung up in the last year, and competition is unusually keen. The following quotations are for small lots of a few bundles or more f.o.b. Pittsburgh and Chicago. The price for large lots is $1 per ton lower than last month, being quoted at $2.20 f.o.b. Pittsburgh for No. 28 black per 100 lb.

	Cents per pound			
	Pittsburgh		Chicago	
	Black	Galv.	Black	Galv.
Nos. 22 and 24...............	2.70	3.50	2.65	3.45
Nos. 25 and 26...............	2.75	3.65	2.70	3.60
No. 27	2.80	3.90	2.75	3.85
No. 28	2.85	3.95	2.80	3.90

WIRE PRODUCTS

Wire—The cut in prices made Aug. 1, brought business and some large orders were booked at the lower quotation. It is stated that the American Steel & Wire Co. booked orders for wire and wire products during August at the rate of 7000 tons per day. This will keep mills actively engaged for the remainder of the year, providing specifications follow in due course. Quotations are unchanged as follows: Annealed fence wire in large lots, $1.50; galvanized barbed wire, $2.15; annealed barbed wire, $1.75. These quotations are per 100 lb. f.o.b. Pittsburgh. In Chicago, plain wire is $1.73; painted barbed wire, $1.93 and galvanized, $2.33. These quotations are also for large lots.

Copper Wire—Announcement that considerable work would be done by the Norfolk & Western Ry. in the electrification of a mountain line, and indications that other railways will do similar work, was partially responsible for the sharp advance in copper. The market for wire is not especially active, but considerable business has been placed on a basis of 17½c. per lb., and quotations now are nearer 18c. than this lower figure. The trade continues extremely optimistic regarding the leading feature of business.

Telegraph Wire—For lots of fair size wire, measured in Birmingham wire gage, prices in cents per pound are as follows: "Extra best" No. 6 to 9, 4⅜c.; No. 10 and 11, 4½c.; No. 12, 4⅝c.; No. 14, 5⅜c.; "best best" No. 6 to 9, 3½c.; Nos. 10 and 11, 3⅜c.; No. 12, 3½c.; No. 14, 4c. Actual freight is allowed from Trenton, N. J., where it does not exceed 25c. per 100 lb.

METALS

Copper—Buoyant advances in copper throughout the month brought the price to 16¾c. per lb. This is an advance of 1c. per lb. in the last three weeks. Largely responsible for the advance were the continued heavy takings of copper by consumers in Europe and in the United States, and furthermore, the fact that the statistics would probably show a decrease in stocks. These were fully as favorable to the producers of the metal as anticipated, as the production of the United States was smaller than the previous month, being 131,000,000 lb., and the deliveries, both domestic and foreign, 146,000,000 lb. Stocks reported at the end of August were absolutely the smallest since the Association has been compiling statistics, being 38,000,000, lb. a decrease of 53,000,000 lb. in the four weeks. This was in spite of the fact that the exports of copper in the first eight months of the year were 2000 tons less than the corresponding time last year, and the imports were larger than last year by 3000 tons. The copper trade is highly optimistic, and many believe that prices will go to still higher levels, and perhaps 20c. may be quoted for copper before the turn is reached.

Tin—The market is higher and steadier than last month, and buying has been fair. Sales have been made as high as 43.50c. per lb., and the general quotation for small lots is around that figure.

Solder—Strictly half and half solder is about 1c. per lb. dearer, being quoted at 26 to 27c. per lb.

Lead—Continued scarcity of lead, due to the strike of the lead miners in Missouri, resulted in obtaining a price of around 5c. per lb.

HARDWARE

Nails—The cut in price made Aug. 1 stimulated business, and although nails can be had on the same basis as last month, it is felt that this quotation will not continue for any length of time. Wire nails are held at $1.75 in Pittsburgh, and $2.05 New York in kegs of 100 lb. in large lots. For small lots from jobbers' stores, $1.95 is quoted in Pittsburgh and $2.15 in Chicago.

Iron and Steel—Business continues especially active, and jobbers report that some sizes are broken. Prices from warehouse stocks in Pittsburgh and other distributing centers are as follows:

Refined iron:	Per lb.
1 to 1⅞ in., round and square..........................	2.10c.
1½ to 4 in. x ⅜ to 1 in.................................	2.10c.
1½ to 4 in. x ¼ in. to $\frac{5}{16}$ in..............................	2.30c.
Norway bars	3.60c.
Soft steel:	
¾ to 3 in., round and square..........................	2.05c.
1 to 6 in. x ⅜ to 1 in...................................	2.05c.
1 to 6 in. x ¼ and $\frac{5}{16}$ in...................................	2.20c.
Rods—⅝ and $\frac{11}{16}$ in...	2.15c.
Bands—1½ to 6$\frac{3}{16}$ in. to No. 8.............................	2.35c.
Beams and channels—3 to 15 in.......................	2.15c.

MISCELLANEOUS

Portland Cement—Business is large and steady. Some reports have been current that, with the completion of the work on the Panama Canal and the barge canal in New York State, there is likelihood of lower prices being named for cement, and a large amount of unsold cement being thrown on the market. This is scarcely probable, as the combined takings of these jobs have rarely exceeded 1,000,000 bbl. in any one year, and new uses are continually being found for cement, one of the largest being for concrete roads, and, should cement be used for this in general, it will be found that a very large amount of material will go into consumption in this line. Prices show no change. In Pittsburgh, the quotation is 90c. to $1; in Chicago, $1.25; Detroit, $1.34; St. Paul and Minneapolis, $1.45. These quotations are f.o.b. but do not include the cost of package. In general, consumers have to pay about 40c. per bbl, for the package, also the freight to destination. This amounts to $1.58 in New York and Pittsburgh.

Paints—The price of linseed oil has advanced slightly and is now quoted at 53 to 54c. per gal. in 5-bbl. lots. Spirits of turpentine is also higher, and is quoted at 41c. The higher prices of pig lead resulted in a revision of the quotation of white lead in oil, which is now quoted at 8c. per lb. in 100, 200- and 500-lb. kegs.

Bars, Concrete Reinforcing—Business is more active, but somewhat lower quotations have been made whenever a desirable order was in sight. Prices for small lots from Pittsburgh warehouse are as follows:

PITTSBURGH, CENTS PER POUND

	Warehouse Stock
¾-in.	1.95@2.05
⅝-in.	2.00@2.10
½-in.	2.05@2.15
⅜-in.	2.20@2.30

Brattice Cloth—Higher prices are probable despite some favorable concessions to consumers in the new tariff bill. The demand continues large, and private advices from abroad hint at the possibility of a strike at the mills. Consumers are buying in small lots but prices are more or less stationary.

COAL AGE

DEVOTED TO COAL MINING AND COKE MANUFACTURE

Volume 4, No. 12
Issued Every Saturday
Hill Publishing Company

NEW YORK, SEPTEMBER 20, 1913

Ten Cents per Copy
Contents, First Page

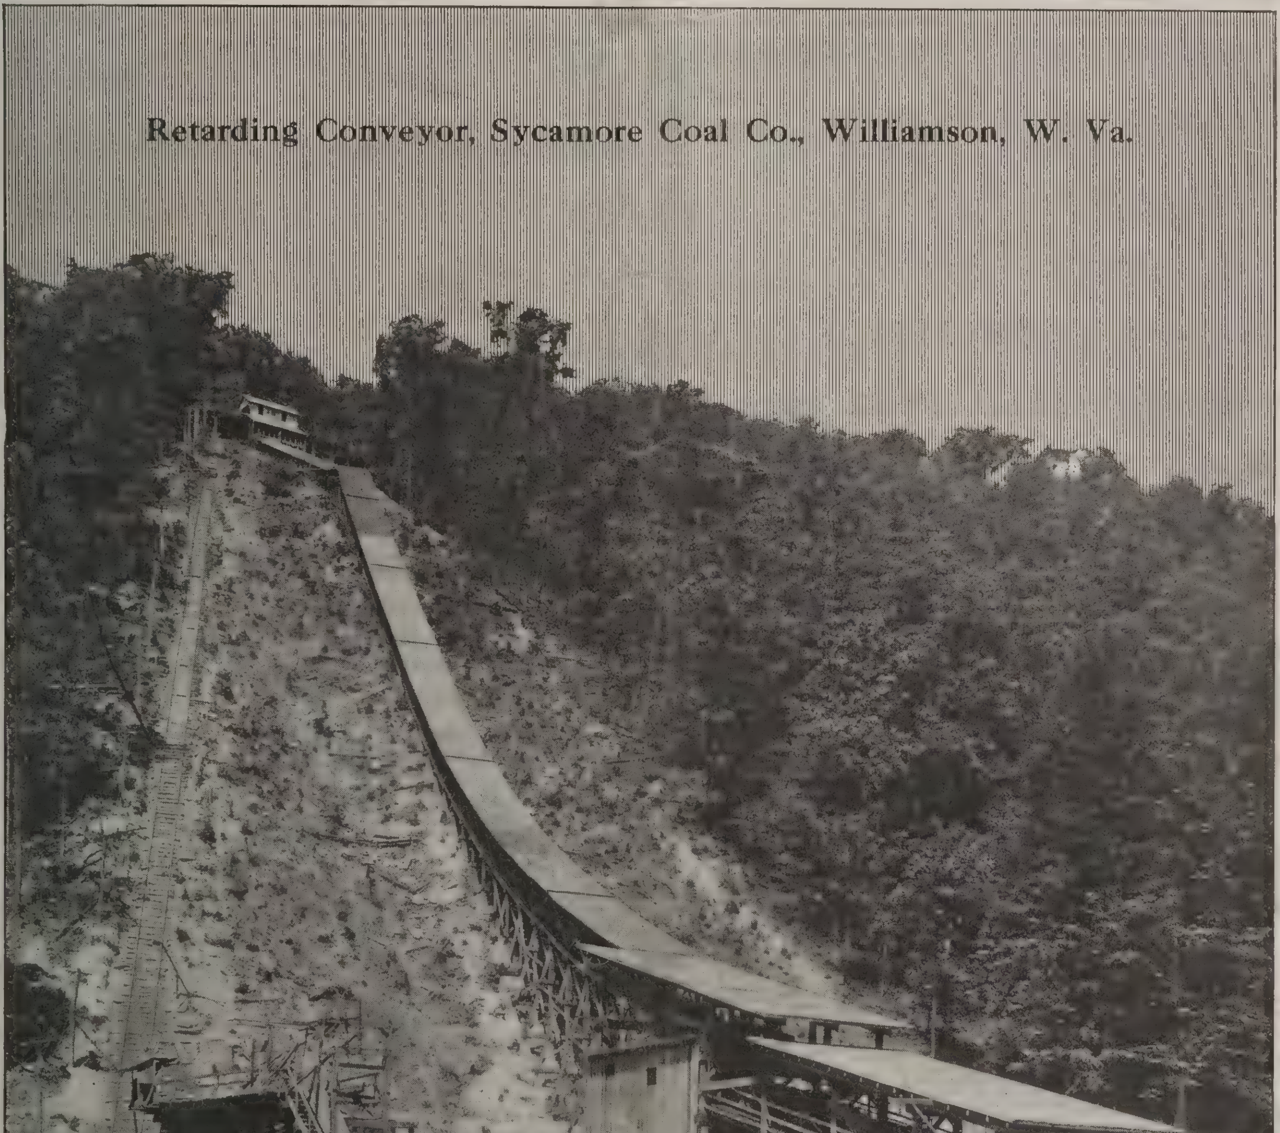
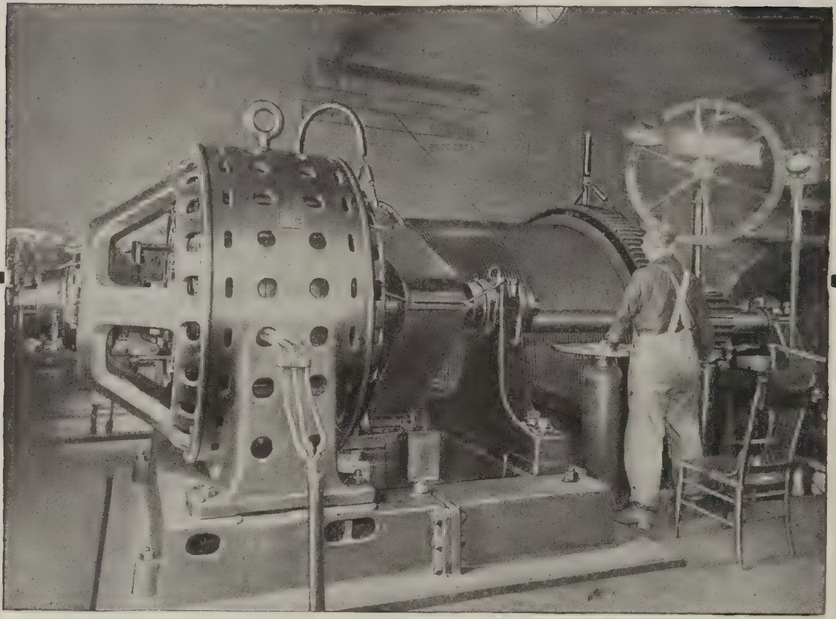
Retarding Conveyor, Sycamore Coal Co., Williamson, W. Va.





400 H. P. Westinghouse Motor for Driving Mine Hoist.

Westinghouse Motors for Mine Hoists

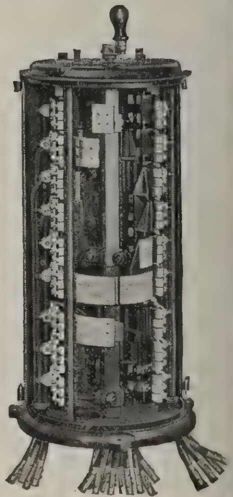
are made to withstand, without injury, the heaviest overloads encountered in normal service. They have been designed with the knowledge that any accident to the hoisting equipment will not only halt production until service is re-established but may also cause damage of the most serious nature.

Special attention has been paid to protecting these motors against the racking vibration of gears. The brackets are heavy and massive, the bearings large in area, and the shafts are extra large in diameter, and made of axle steel, the best material to withstand severe stresses.

Westinghouse Electric & Mfg. Company

East Pittsburgh, Pa.

Westinghouse Controllers for mine hoist motors can be furnished in several types to meet various requirements. Selection of the most suitable type for a given installation will be made upon request.



COAL AGE

VOLUME 4 SEPTEMBER 20, 1913 NUMBER 12

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

Foreword: *Page* 405

Suggests a plan or policy which might be followed advantageously by the editors of coal-company papers. The article advocates that these corporation organs confine themselves principally to local happenings and descriptions of a personal nature concerning the worth-while efforts of their employees. COAL AGE, Vol. 4.

Ideas and Suggestions: *Pages* 406-407

The Natural History of Coal—What about Your Vacation?—A Stitch in Time Saves Nine—*An Automatic Spring Switch.

*Coal Shipping on the Great Lakes: *Pages* 408-411

The third and concluding installment on the situation at the head of the lakes. A detailed description of another of the large unloading docks of the Pittsburgh Coal Co. Not only are there facilities for handling an enormous tonnage, but elaborate equipment is provided for screening the coal. COAL AGE, Vol. 4.

*Averting a Mine Fire in Germany: *Page* 411

Royalties as Percentages of Market Price: *Pages* 412-413

The public lands should be leased for long periods or perpetually. This will promote conservation and economic efficiency in operation. Leasing will enable the prospector to earn the fruits of his discovery, and he will not be disqualified from operating by a demand for the large payment necessary to purchase a fee-simple title to the land to be exploited. Wm. Griffith. COAL AGE, Vol. 4.

*Modernization of Conveying Plants: *Page* 413

A description of a telpher system that transports coke from the oven bench direct to the mouth of the blast furnace without removal from its original bucket. Breakage is thus reduced to a minimum. COAL AGE, Vol. 4.

*An Accounting System for Coal Companies: *Pages* 414-417

A brief description of a simple system of bookkeeping, applicable to any coal company, in which reliance is placed upon vouchers and loose-leaf forms, so that the amount of work to be done is reduced to a minimum. J. C. McNeil. COAL AGE, Vol. 4.

Mining Show and Annual Convention of the American Mining Congress: *Page* 417

*A Trackless Mine: *Page* 417

Power Department: *Pages* 418-422

DOES BITUMINOUS COAL MINING PAY?
Some interesting facts and figures are here presented, covering the coal production of the country during the past, and showing the steadily increasing amount mined per capita of population and its rising cost per ton. The principal opportunity for economy in mining cost is then discussed. A. E. Rickards. COAL AGE, Vol. 4.

Some Old Ads

The Weekly Ad-Talk Page

Advertising in some form or other is really as old as the institution of buying and selling.

In the days of ancient Rome and Athens merchants were wont to employ "barkers," or criers, who went about the streets shouting out the wares and alluring prices of their employers. They howled about "bargains" in those days and caused rushes of trade, we may suppose, just as the advertisements of to-day draw the throngs of shoppers.

Presently came written notices that were displayed on blank walls for the edification of the purchasing public. In the early days of London the shopkeepers had clerks who were stationed in front of the stores to shout their wares much after the fashion that used to obtain in Baxter Street, where the "barker" came into his own. These clerks were wont to preface their vocal advertisements of wares by shouting "What do ye lack? What do ye lack?"

The first genuine newspaper advertisement of which there appears to be any authentic record was printed in the "Mercurious Politicus" in London in January, 1652. It was a publishers' announcement and read thus:

" 'Irenodia Gratulatoria, an Heroick Poem,' being a congratulatory panegyrick for my Lord General's late return, summing up his successes in an exquisite manner. To be sold by John Holden, in the New Exchange, London. Printed by Tho. Newcourt, 1652."

The new method of letting the public know where it could get what it wanted was quickly snapped up, but in its early stages it furnishes some most remarkable examples of advertising. One of these quaint notices, appearing in a London publication soon after the introduction of newspaper advertising reads:

"The Publick Will Please Take Notice.—There ran away from my place on Thursday of last week an apprentice boy, called Dick Noodler, with a smutty complexion and black teeth, and he is as ugly as sin. Ten shillings reward will be paid to any person bringing him back to me."

Soon afterward this remarkable notice appeared in a Dublin newspaper, supposedly one of the first newspaper advertisements in Ireland:

"Ran Away From Patrick McDallagh.—Whereas, my wife, Mrs. McDallagh, has gone away with herself and left me with her four small children and her poor, blind mother, and nobody else to look after home and house, and I hear has taken up with Tim Gugan, the lame fiddler, the same that was put in the stocks last Easter for stealing Bardy Doody's gamecock, this is to give notice that I will not pay for bite or sup on her account to man or mortal, and that she had better never show the mark of her 10 toes near my home again. Patrick McDallagh. N. B. —Tim had better keep out of my sight."

Pat wanted to inform folks quickly and cheaply that he wouldn't stand for Mrs. Pat's shortcomings nor for her debts.

So he advertised.

He evidently knew something about the shortest distance between two things being a straight line.

COAL AGE

Vol. 4 NEW YORK, SEPTEMBER 20, 1913 No. 12

Now that the "Employees' Magazine" of the Lehigh Valley Coal Co. and the "Marvel News" of the Roden Coal Co. have blazed the way for the timid ones, we expect to see many similar papers launched in the near future. The possibilities for such educational mediums were realized and taken advantage of in other industries long ago.

Over in Charlotte, S. C., a daily paper, the "Evening Chronicle," possessing a large circulation among the cotton-mill people of that section, has carried on a little pioneering that deserves careful study by all who are interested in the results that may be attained by giving the right kind of publicity to our working classes. In a recent issue of the "Manufacturers' Record" Dorothy Mitchell of the "Chronicle" staff describes rather fully just what she has aimed at and how she has proceeded. She says:

"I have written stories about them, always searching for those things which show their advancement and laying stress upon the people who have achieved anything. Whenever a man is promoted a story is run about him, and if possible a photograph is secured and put in the paper. If a girl makes a success, or does anything worthy, it is mentioned in like manner. If a man saves his money and buys a home, this calls forth a good story, and sometimes a picture of his home is run in the paper.

"These items are published every Saturday, and are run just as the social items are run in the Sunday papers. The only difference is that I do not measure aristocracy or the getting of one's name in the paper by what the parents were, but what the person who is featured has actually done industrially. In all the work, everything is done to encourage those who have progressed, urging them on to greater things; their names and pictures are published as successful, steady and thrifty people.

"One of the worst faults the mill people have, and that which proves most detrimental to their success, is the habit of moving. In every mill community there will be found a "moving" element, and these are always the poverty-stricken ones and those who excite the sympathy of the betterment agitators. Usually they stay at a mill two or three weeks, or perhaps a month or so, and then seek other quarters for no better reason than the promise of a trifling increase in their weekly wage. Sometimes they leave because they do not like the superintendent, especially if he corrects them. In many instances there have been found cases where the people practically spend all they make outside of grocery bills to bear the expense of going from mill to mill.

"At all times I have discouraged moving and have written stories, as well as talked to them personally, about the disadvantages of it. I have encouraged the growing of gardens, flowers and trees about the premises, as well as the planting of fruit trees and fruit-yielding shrubs, and tried to get them to settle down in a place and make it a home in which to live a life worth while."

Coal corporations that seriously contemplate entering into this particular kind of uplift work, should consider the plan above outlined. The coal journals are able to cover common mining practice in its broad sense, but they cannot record local happenings of a personal nature, the publication of which by a company organ would tend to encourage and inspire the men.

IDEAS AND SUGGESTIONS

The Natural History of Coal

By L. K. Hirshberg*

Now from Cambridge University, England, comes a new treatise upon the Natural History of Coal, by Dr. E. A. Newell Arber. The peculiar value of Doctor Arber's researches are not dependent upon his historic account of coal problems of the present and the past, but on the problems now to be triumphantly surmounted in the near and immediate future. Not only does he present the great importance of more scientific knowledge of coal, but also its prospective commercial possibilities.

Thus he points out most wisely and in good time the fact that after all man is largely ignorant of the composition of coal as well as the manner in which coal was formed. Most of our so called knowledge is actually inference drawn from the rocks and minerals which lie below and above coal beds. Certainly such deductions may easily be as far-fetched as many other scientific theories turn out to be. As a general proposition, geologists have conspicuously failed to offer an entirely satisfactory and tangible explanation concerning the formation of coal. It therefore remains for paleobotanists, paleontologists, and physio-chemists to throw a bright light upon this dark matter.

New Discoveries about Coal

The most recent discoveries about coal have been made microscopically by the French savants, Doctors Bertrand and Renault. They soon ran down the clue and found that many kinds of coal minerals have been produced in open water and are for the most part made up of the remains of certain plants. Particularly is this true with those varieties of coal that are rich in hydrocarbons and combustible gases. Bituminous shales, oil shales, bogheads and many others are types.

Much less is now known about nonbituminous coals, indeed the less they approach the bituminous types, the less seems to be known about them. The reason of this may be due to the fact that the harder the coal, the less thin must its sections be when cut for microscopic purposes of investigation. To study them under the microscope it is desirable also to decolorize them. When thin slices are prepared for examination, it is usually found that these sections remain opaque, yet coal is undoubtedly homogeneous in structure.

Luckily for the newer investigators on the nature of what coal really is, most of these difficulties have at last been removed. It has now been found possible to prepare fairly thin and transparent slices by the same grinding method used by stone workers. Then by adding an appropriate dye or other coloring matter, the actual stuff present will be made apparent.

It is now generally agreed that all of the present-day theories about the origin of coal, such as the peat-antracite theory, are no longer plausible. These now discredited explanations of the formation of coal in the depths of the earth, are to be substituted by a theory based upon the newer biological and physio-chemical discoveries.

If it were possible with present analytical methods to understand the composition of coal thoroughly, a tenable hypothesis as to its origin could not be constructed unless we also knew the character of the plant fossils which go to make up the body of the coal. The subsequent effects of chemical and physical conditions cannot in any way change such a theory.

Therefore it is now up to the botanist more than to any practical coal man or other scientist, to instruct the world as to the true condition of the coal when originally laid down.

⁂

What about Your Vacation?

Summer has passed, but the very best months of the year are with us. Have you taken your vacation? It's not yet too late. Many of you will say, "No, I'm too busy; the Big Boss wants all the coal we can get and the cost must look right, too."

Some of you will say, "What good can I get out of two or three weeks' vacation?" A number of good honest men will repeat that they have not had a vacation in years, so why take one now. A few will say the expense of a vacation doesn't justify it.

To all of these we say, "Take a vacation, you need it and the cost is the last consideration." The man who needs it most is the one who has been sticking so close to the job that he feels like it could not run without him. Most of those in this class are as honest and loyal in their work as men can be and the impulse to take even a little vacation has been smothered by their strong sense of loyalty and their belief that the boss thinks of them as of a class who are always on the job. No doubt you have been urged by the management more than once to take a rest, but you could not believe they really meant it for you.

You are perhaps one of the superintendents or foremen who know very well the job will run without you, but cannot bear giving up the reins of control for a few weeks. You feel that certain lines of work will not have the close attention you give it and that when you come back you cannot pick up things in as good shape as when you left. You know your assistant is a good man, but you do not want to leave the job entirely with him.

To every man of you we say, "Take a vacation." Here are some of the benefits that will inevitably accrue to you:

You will get out of the rut you have been running in, and you know the only difference between a rut and the grave is in length and breadth. The old saying, "A new broom sweeps clean" can only have been born of the truth that one man on taking up another's work sees the whole plan of affairs with a clearer vision. Too close contact with the daily grind of things dulls the senses. Too much time given to details does not leave time enough for the larger and more important affairs. There are still to be found plenty of you who cannot find time for safety work in its larger sense, that of accident prevention, because you are in the rut of giving all your time to getting out as much coal as possible. Have you ever thought that if your mine produces 1000 tons a day it will take from two to five days' run to compensate for every man you kill or seriously hurt? Yet the list of men killed and maimed in the coal-mining industry is appalling.

---

*Baltimore, Md.

After you have been on your vacation a few days and gotten far enough away from your work to realize that the part of the world you are in does not even know of your locality save as a geographical fact, you will begin to appreciate how small your sphere of work is and what is better for you, how little is your personality in the scheme of things. The next thing you know you are wondering how all these strangers, many of whom give evidence of success beyond you, accomplish it. You will have a feeling of ambition to put forth the best effort in you when you get home. This is nothing more or less than a broadening of your mind's activities as the result of giving it rest and relaxation from its grooved routine.

Problems Will Be Solved

All through your vacation period, even though you may not see or visit a plant like your own, you will find your senses perceptibly quickened by contact with new and bigger things. Your sense of little things will grow less and your appreciation of big things larger. Even while you are resting, perhaps while fishing in some lake, your mind will unconsciously find a better way to do some things at home. Problems that will really increase the output and reduce the cost will work themselves out in your mind. Like a flash it will come to you that an expenditure of ten thousand dollars to cut some drainage ditches through the mines to convey the water to a central pumping plant will enable you to shut down several expensive steam plants for all time. You know that you can show the management as soon as you get home how this can be done, and save the expense in a year or two.

Best of all you will get home refreshed in mind and body. It may appear a little strange to you, but everything has been running smoothly; the output has really been increased during your absence; there have been no serious accidents. In fact, the plant has been doing fine. Do you know why?

The fellow next to you has had his chance and has made good. You think more of his ability and you say hereafter I'll unload more work that counts on him. Good. Your vacation is producing results and pretty soon after you return the Big Boss will say to someone, "Things are humming at the new plant since J. C. took that little spell off."

Go ahead, and see the boss this week and arrange for a vacation. Honest, it will do you good.

A Stitch in Time Saves Nine

By Pennsylvania Superintendent

I wonder if we can apply the old adage—"a stitch in ime saves nine"—around our coal mines. Take, for intance, the coke oven: How many times have you noiced an oven which had a brick out of jamb, and passed t by to fix up another oven a little farther beyond, which, perhaps, had a whole jamb or maybe an entire arch that needed repairing. You did not even stop to think that by repairing just that one brick, you might have prevented the collapse of the entire arch, which fell in because this one brick was not replaced when it started coming out.

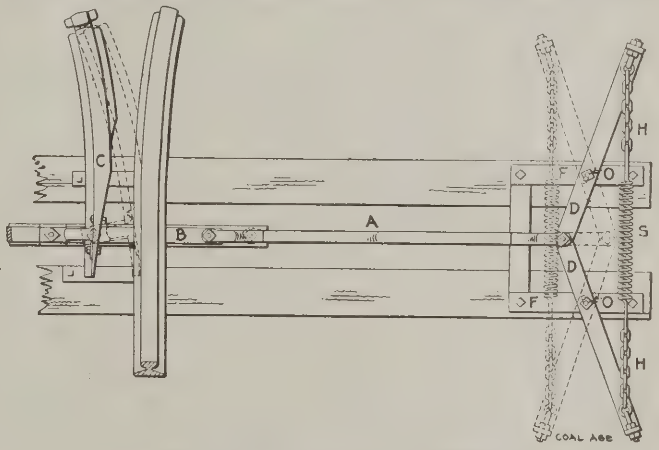
"A stitch in time saves nine," was ignored in this particular case, just as it is passed over in many other instances. This does not only apply to the coke ovens, but to the machinery around the mines and in the mines, as well as to the entry track and everything connected with the entire operation.

So if you want to be successful in whatever department you are employed, watch for "the stitch in time that will save nine"—*then do it now.*

An Automatic Spring Switch

It often happens, in mining practice, that the arrangement of the tracks leading from a slope or drift opening to the tipple is such that it is of advantage to have an automatic switch so arranged that the loaded trip coming out of the mine will set the switch ready for the return of the empties by the same track. Such a switch will often be found of advantage where different motors are hauling from particular sections of the mine, and, therefore, require to return by the same track to the district from which they came.

The accompanying diagram shows a special automatic spring switch, the suggestion of H. E. Lewis, supt., Consolidated Fuel Co., Hiawatha, Utah. This switch was intended to meet the requirements just described. The details of construction were designed or worked out by W. W. Jones, electrical engineer, Standard Coal Co., Helper, Utah.



Details of Automatic Switch

As shown in the figure, the switch rod *A* and the bar *B* serve to connect the switch point *C* with the movable arms *DD*. These arms have each a bearing or fulcrum at the fixed points *OO*, each being secured to the bed frame *F*, by a bolt at that point. A short slot cut in each arm allows the necessary movement when the switch is thrown by the passing cars. The dotted lines show the reversed positions of the switch point and the movable arm. The tension spring *S* exerts a pull of 100 lb. on the ends of the two arms, which is sufficient for the purposes intended, and holds the switch firmly in the position in which it was placed by the last trip coming from the mine.

Coal Shipping on the Great Lakes

SYNOPSIS—The third and concluding installment on the situation at the head of the lakes. A detailed description of another of the large unloading docks of the Pittsburgh Co. Not only are there facilities for handling an enormous tonnage but elaborate equipment is provided for screening the coal.

⁂

The plant of the Pittsburgh Coal-Dock Co., a subsidiary of the Pittsburgh Coal Co., at Duluth, is said to be one of the largest in the world for the handling of bituminous coal. It is designed for unloading coal from lake boats to the storage yard and for loading on cars. An interesting feature of the plant is a mechanical screening apparatus of new design and large capacity. The plant has a storage capacity of 1,000,000 tons and an unloading capacity, as shown by recent tests, of 900 tons an hour, including the delay in cleaning up the holds of vessels unloaded. While working in free coal it is estimated that the plant will discharge 1500 tons an hour from a boat to the storage yard. The plant was designed and erected by the Brown Hoisting Machinery Co., Cleveland, Ohio.

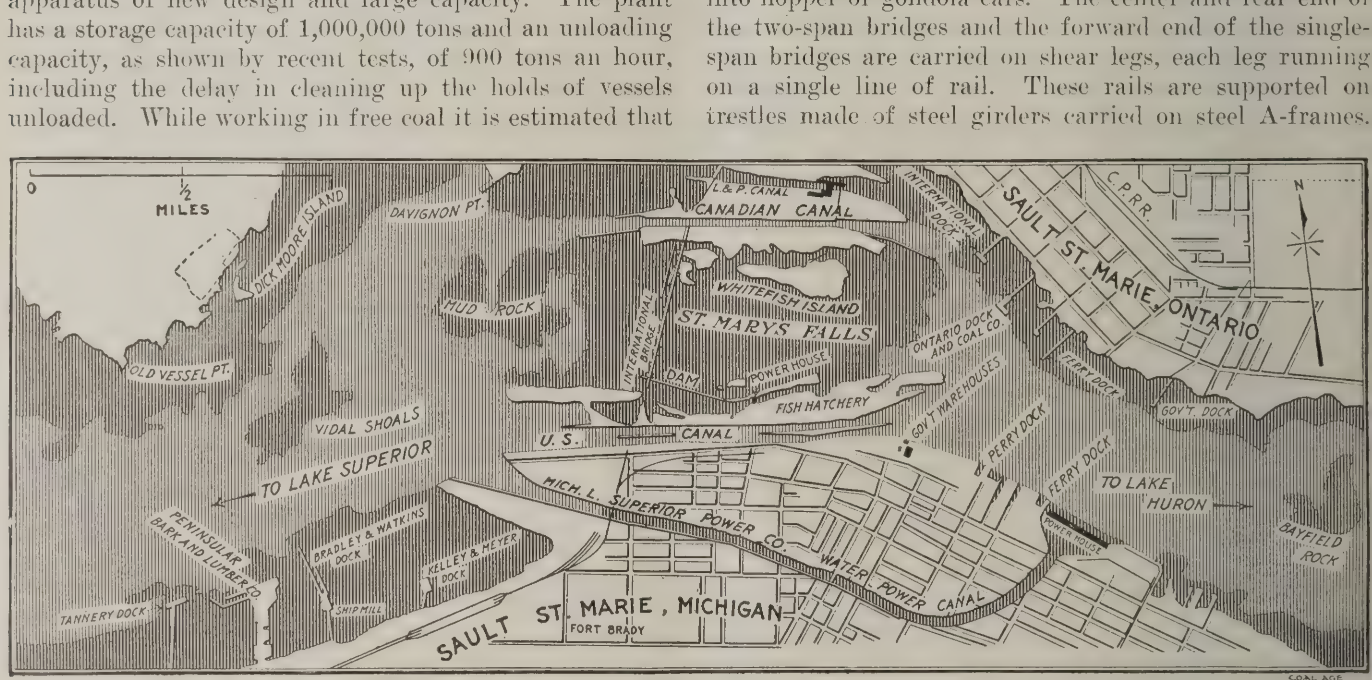
Unloading Machinery

The coal-handling equipment includes three two-span bridges, here shown, extending from the unloading dock, and two single-span bridges. Each span is of 242 ft. The yard is covered by the bridges, which are operated back and forth on a runway 1250 ft. long. Each two-span bridge and one of the single-span bridges is equipped with a man trolley, which carries a two-rope Brown grab-bucket, with a capacity of 230 cu.ft. or 5½ tons, and an operator's cab. The single-span bridges are arranged to register with any of the two-span bridges so as to make a three-span bridge or a continuous runway for a trolley over any one of the two-span bridges and one of the single spans, a total distance of 726 ft. The operating mechanism is arranged so that when a single-span bridge is connected with a two-span bridge the three spans are operated as a unit. The single spans may also be operated as independent bridges. The single span not provided with a trolley is so operated by using one of the trolleys from a two-span bridge. The two-span bridges have a cantilever extension of 78 ft. out over the dock and there is a 35-ft. cantilever extension from the rear end of the single-span bridges.

Each man trolley is designed to carry a load of 25,000 lb., to hoist the full load of the bucket at the rate of 225 ft. per minute and to travel along its runway at 1200 ft. per minute. Each bridge when carrying a loaded bucket can propel itself along its own runway at a speed of 60 ft. per minute.

The front or water end of each two-span bridge is carried on a portal pier, equipped with bins for loading coal into hopper or gondola cars. The center and rear end of the two-span bridges and the forward end of the single-span bridges are carried on shear legs, each leg running on a single line of rail. These rails are supported on trestles made of steel girders carried on steel A-frames. There is one single rail trestle or runway and one double rail trestle. The former is for the shear leg at the center of the two-span bridges and the latter is for the rear shear leg of the two-span bridges and the shear legs of the single spans. The distance from the foundations to the top of the rail on the trestles is 35 ft. 6 in. The rear ends of the single-span bridges are carried on inverted piers.

The piers for the two-span bridges are each supported on four equalizing trucks, each truck being mounted on four 24-in. double flanged cast-iron chilled-tread wheels. The wheels on each pier are connected by a train of gearing and shafting to the moving gear mechanism located on the bridge span, near the bridge support. Each inverted pier at the rear end of the single spans is carried on two sets of equalizing trucks, each truck supported on eight 24-in. single-flanged chilled-tread wheels. In addition, the rear pier that carries the screening apparatus has (for partially carrying that apparatus) one equalizing truck supported on six 24-in. wheels, each truck traveling on two lines of rails spaced 2 ft., center to center. The six-wheel truck acts as an idler only. All of the wheels in each of the eight-wheel trucks are driven, being



Detail Map of the Sault Ste. Marie Canals, the Entrance into Lake Superior

---

Note—From the "Iron Age," Dec. 7, 1911.

connected by a train of gearing and shafting to the moving gear mechanism located at the top of the pier. Under the other rear pier one-half of the wheels are similarly connected to the moving gear machanism. Each shear support in the bridges is mounted on two single-rail equalizing trucks, each truck being supported by four double-flanged cast-iron chilled-tread wheels. The wheels are all connected by shafting and gearing to the moving-gear mechanism located on the bridge span.

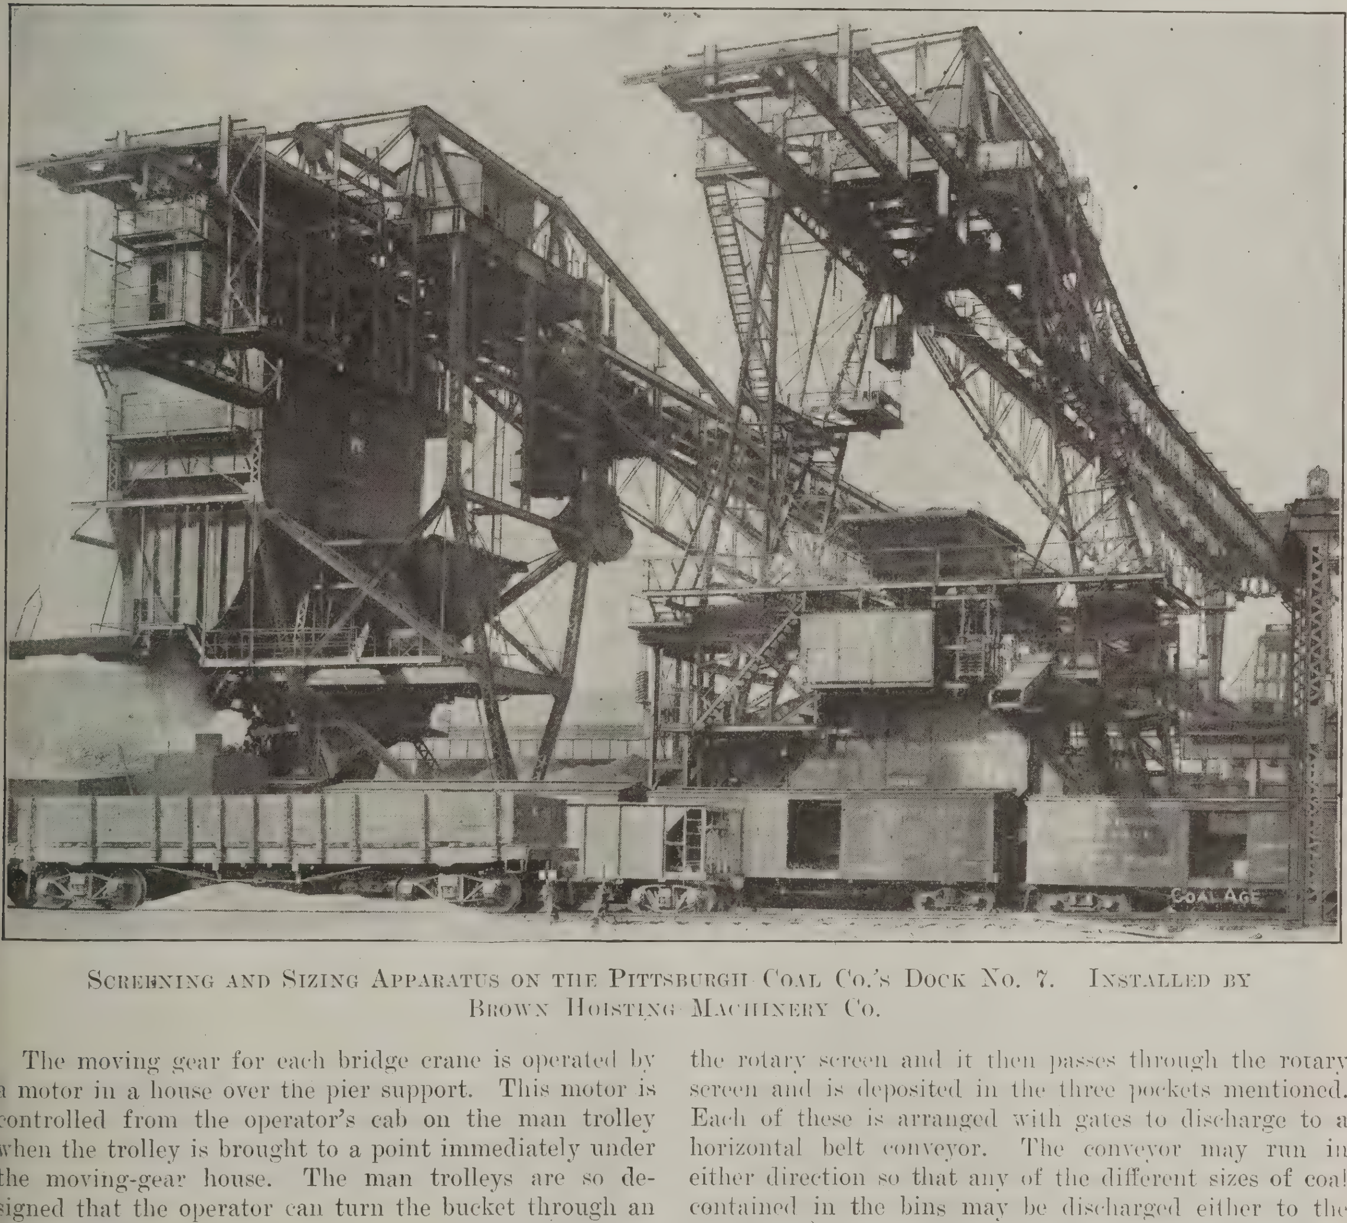
The shears support the bridge span on sliding bearings under the top chords. The cantilever extensions from the dock end of the two-span bridges are supported from the top of masts over the pier. Attached to the cantilevers are hinged aprons that can be raised and lowered. The moving gear for each bridge crane is operated by a motor in a house over the pier support. This motor is controlled from the operator's cab on the man trolley when the trolley is brought to a point immediately under the moving-gear house. The man trolleys are so designed that the operator can turn the bucket through an angle of 90 deg.

The Screening Equipment

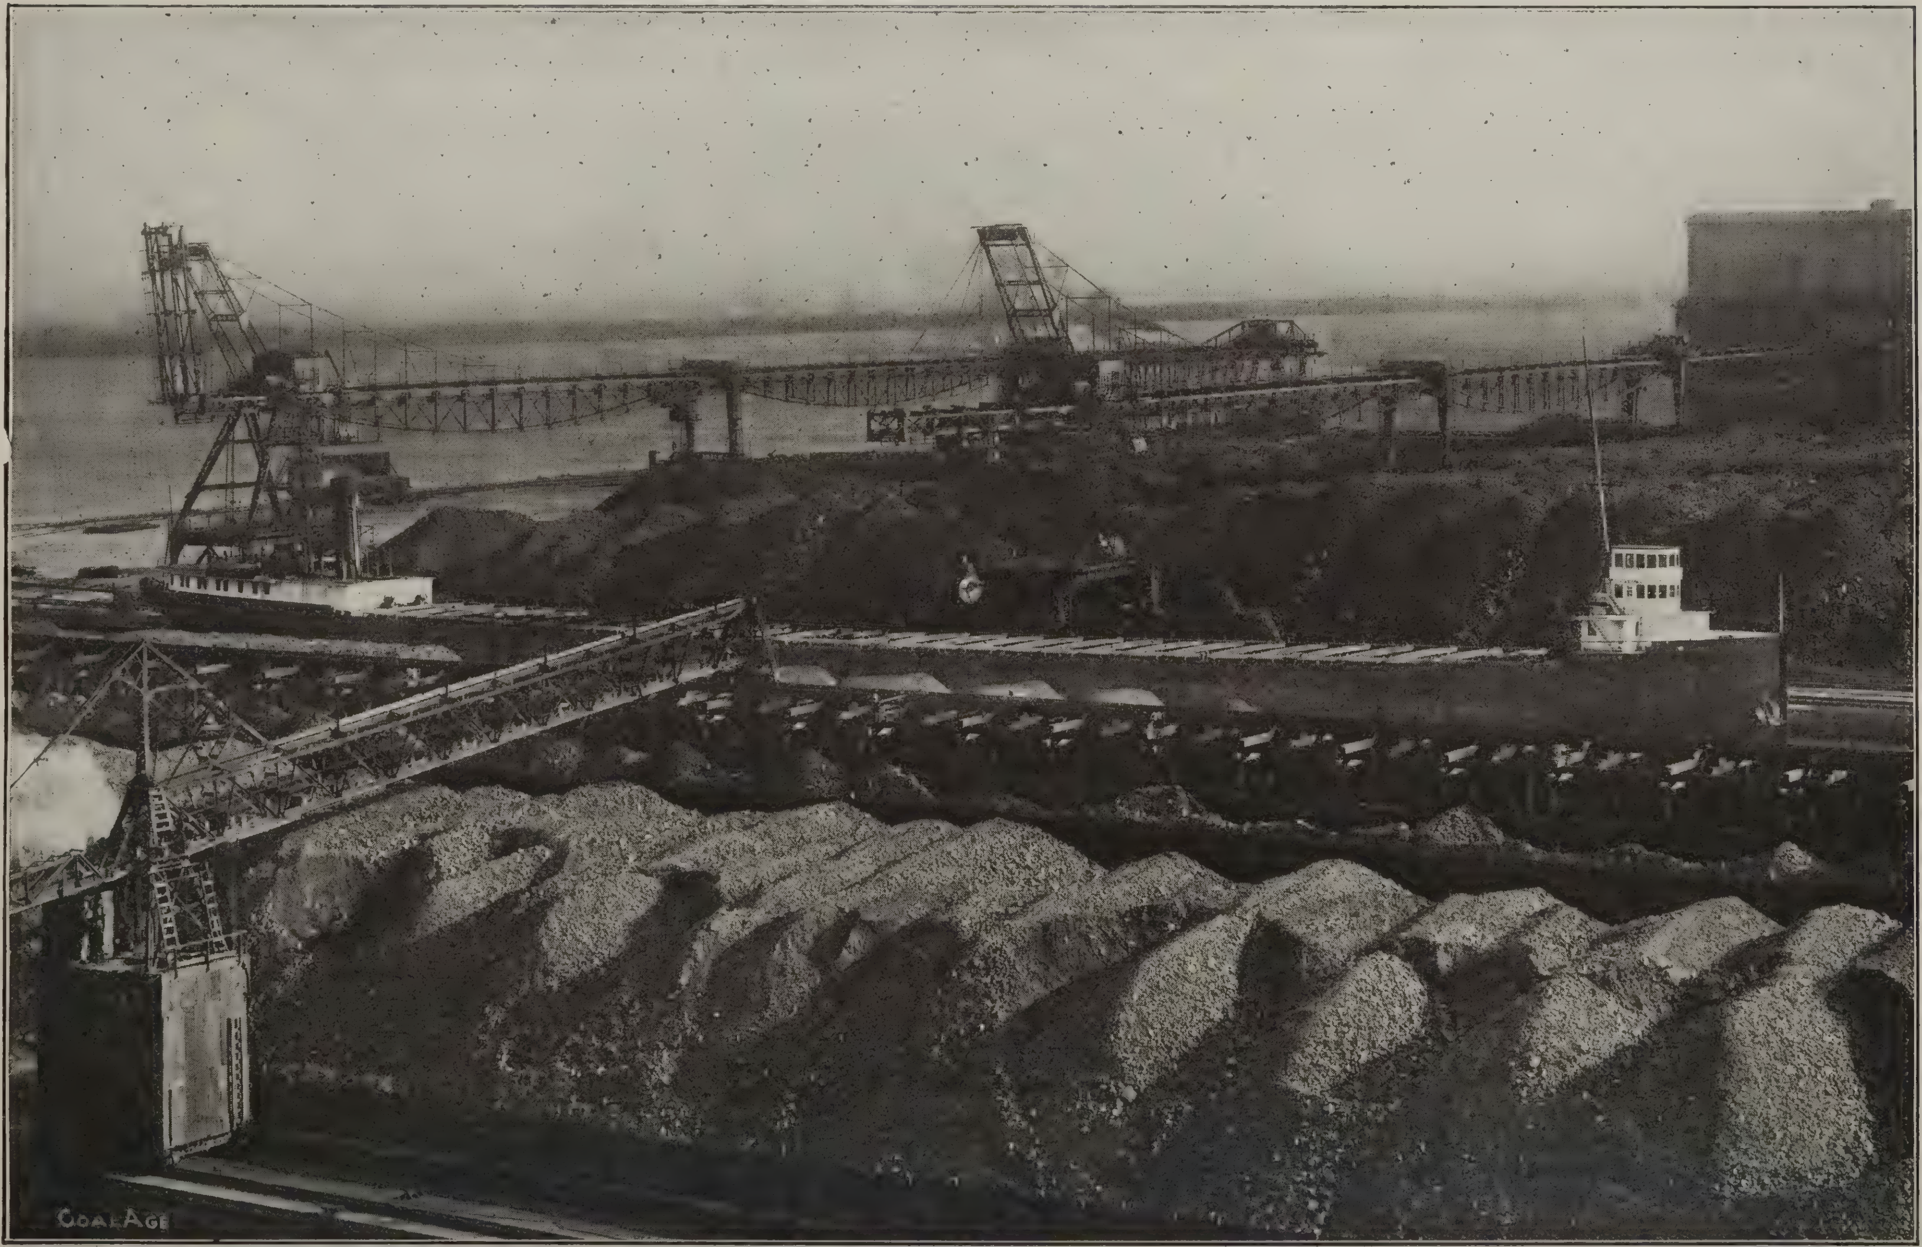
In the portion of the rear pier of the single-span bridge with which is connected the special screening equipment, is located a 30-ton receiving bin. This bin is provided for receiving the coal from the grab bucket on the bridge span and for properly controlling it as it is fed into the screening plant. At the side of the main part of the pier is another bin, which is divided into three compartments, each compartment having a capacity of 40 tons. Over this bin is arranged a rotary screen for sizing coal into the three different sizes commonly known to the trade as stove, nut and screenings, and discharging each size into separate compartments of the bin.

Beneath the 30-ton bin located in the main portion of the pier is a shaker screen. This is designed to discharge the coal passing over it into a small hopper, which in turn discharges the coal to a pivoted scraper conveyor. This conveyor carries the coal either into open gondola or hopper cars or into box cars. The coal passing through the shaker screen is discharged into a bin at the lower end of an inclined elevator. This elevator carries the coal to the rotary screen and it then passes through the rotary screen and is deposited in the three pockets mentioned. Each of these is arranged with gates to discharge to a horizontal belt conveyor. The conveyor may run in either direction so that any of the different sizes of coal contained in the bins may be discharged either to the stock pile or into open cars on a track outside of the pier.

Each bin beneath the rotary screen is also equipped with a separate chute and gate for discharging the contents into a small hopper at the foot of the shaker screen, which is arranged to discharge to the pivoted conveyor previously mentioned. By means of the scraper conveyor the various sizes of coal are loaded into box or gondola cars in the manner described for the coal passing over the shaker screen. The 30-ton receiving bin is provided with



Screening and Sizing Apparatus on the Pittsburgh Coal Co.'s Dock No. 7. Installed by Brown Hoisting Machinery Co.



General View of the Pittsburgh Coal Co.'s Dock No. 7 at Superior, Equipped with Brownhoist Machinery an auxiliary chute feeding into the lower end of the inclined elevator in order that coal taken from the screening stock pile may be sized over the revolving screen.

In general the operation of the screening apparatus is as follows: The coal is first placed in the 30-ton receiving bin. It is then passed over the shaker screen to the pivoted conveyor for delivering it into cars. The coal going through the shaker screen passes into a small bin beneath, delivering to the elevator, by which it is either conveyed to the revolving screens for preparing small sizes or directly into the screening bin for delivering it to a belt conveyor discharging on a screenings stock pile.

By this arrangement when lump coal is being loaded, a carload each of stove, nut and screenings may be taken at the same time. In case lump coal is being loaded and there are no orders for the smaller sizes, the screenings can be delivered from the elevator direct to the screening bin, which in turn will deliver the screenings to the belt conveyor for the stock pile. When taking general screenings from the stock pile for sizing and loading they are dumped by the grab bucket into the receiving bin.

The bins are of parabolic form. The 30-ton bin is equipped with a large reciprocating gate operated by power. The shaker screen is about 5 ft. wide and 15 ft. long. The reciprocating motion of this screen is accomplished by means of connecting links and eccentrics attached to a horizontal shaft belt connected to a 15-hp. motor. This motor also operates the reciprocating gate. The screens are easily removed so that different sizes can be used. The revolving screen is operated by a 20-hp. motor, which also drives the elevator. The belt conveyor is operated by a 15-hp. motor and the pivoted scraper conveyor is operated by a 10-hp. motor.

The other rear pier is equipped with a 30-ton bin, gate, and chute for unloading coal into gondola cars, a screening bin and elevator for screenings, and chutes for unloading screened coal into box cars in connection with box-car unloaders. Beneath the screening chute is a 50-ton bin for catching the screenings. In connection with this screening equipment is a bucket conveyor for raising the screenings to a point from where they are discharged by gravity to a screenings pile on the water side of the pier or carried by a belt conveyor and discharged in cars on the second track on the other side of the pier.

The electrical equipment is arranged to operate on 440-volt 3-phase 25-cycle alternating current. The motor equipment includes the following in addition to the motors mentioned in connection with the screening apparatus, all furnished by the General Electric Company: Three 112-hp. motors for moving the three two-span bridges and 112-hp. motor for operating the single-span bridge that has the extensive screening equipment; one 50-hp. motor for moving the other single-span bridge; one 225-hp. motor in each of the four trolleys for hoisting; two 112-hp. motors in each trolley for the trolley travel; one 5-hp. turntable motor in each trolley for rotating the grab buckets; one 2-hp. clutch motor in each trolley, and one 15-hp. continuous running motor for operating the screening elevator and conveyor in the pier of the single-span bridge not containing the extensive screening equipment. The travel motor on each bridge is operated by a General Electric drum-type controller. The hoist motor on each trolley is operated by a master operated magnetic controller. The trolley travel motors on each trolley are operated by a master-type controller.

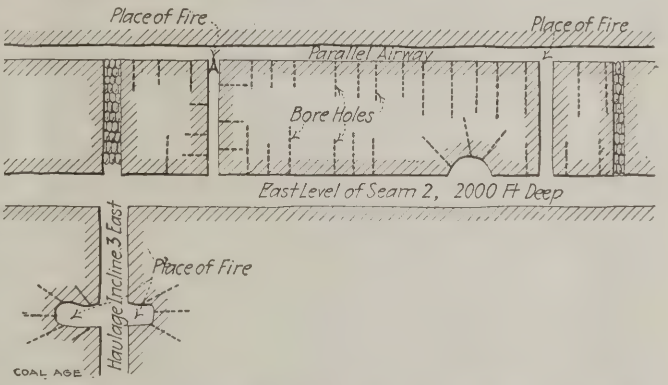
During tests of the plant recently made the Steamer "J. S. Ashley," with 8983 tons of lump coal, was unloaded in 10 hr. and 15 min. and the cargo of the "J. E. Upson," 8747 tons of the same grade, was taken out in 10 hr. and 55 min. actual working time. While working in free coal each bucket averaged nearly 6 tons to the lift.

⁂

Averting a Mine Fire in Germany

The following account of the suppression of an incipient mine fire by the saturation of the ribs, is translated from the "Zeitschrift für das Berg- Hütten- und Salinenwesen," Vol. 61, No. 1.

On May 16, 1912, a strong odor of fire was noticed in the east gallery of seam No. 2, in the 2000-ft. level of the gas-coal workings of the Gerhard Colliery, in the Saar district, Prussia. In the parallel entry, there was found at a point *A*, as marked in the figure, in close proximity to an old ventilating passage, already badly squeezed, a warm place in the coal, proving to the management that a mine fire was developing. It later became evident that the great pressure had heated the coal seam which was at this point 13 ft. thick. By hastily making a new crosscut, the heated coal was reached with a continuous and plentiful supply of water. Thus it was cooled off and the principal danger averted.



Spontaneous Combustion Was Checked by Water Forced into Drill Holes

Further investigation of the pillar showed the presence of still other places where the coal was in a state of incipient spontaneous combustion. As the rock between seams 2 and 3 had already been broken, it was impossible to flood the section imperilled without preventing the operation of the lower seam, consequently the Dorsfeld saturating apparatus, which had already been used in this mine was utilized for the suppression of the fire.

Along a pillar length of 300 ft., and ranged at distances of 17 to 35 ft. in the line of dip of the seam, bore holes were drilled 10 ft. deep, and into these the apparatus was introduced. This was connected with the existing water piping under a pressure of 300 lb. At the end of a few hours the water had penetrated through the pores and crevices of the partly crushed coal and was escaping into the level. After a few days the fire danger could be regarded as removed.

In the months of August and September, three other fires of similar character occurred. In these also the rib-saturating apparatus did good service. Here, at the same distances of 17 to 33 ft., as before, deep bore holes were drilled with the Crälius drilling machine, and the apparatus inserted.

Royalties as Percentages of Market Price

By William Griffith*

SYNOPSIS—The public lands should be leased for long periods or perpetually. This will promote conservation and economic efficiency in operation. Leasing will enable the prospector to earn the fruits of his discovery and he will not be disqualified from operating by a demand for the large payment necessary to purchase a fee-simple title to the land to be exploited. By making the royalty a percentage of the selling price, a perpetual contract could be made which would be equitable and advantageous to lessee and lessor alike.

⁂

Reformers, in their recent efforts to secure for the people a greater share of the proceeds of mining enterprises on public lands, have fixed upon the leasing method as the one best adapted to secure this end, and hope to substitute it for fee-simple sales. To avoid the chance that an increased market price for the products might result eventually in the royalty becoming unduly small compared with selling prices, they would exact short-tenure leases, that the royalty might be changed from time to time as the market value of the product varied. Thus they would reserve for the people a more equitable share of the proceeds.

Short Tenure and Waste

I submit, however, that this proposed plan of short-tenure leases is unsatisfactory, and one of the most wasteful that could be conceived as has been abundantly proved during the hundred years' life of the coal industry of Pennsylvania, during which time all sorts of titles have been held. Short tenure tends toward small operating units, careless methods, extravagant waste of national resources, with excessive loss of human life, while long tenure promotes large operating units, careful and scientific methods, with the greatest possible conservation of life and property. If the public lands of this country are to be leased, the holdings should be perpetual, or for not less than 50 years, unless the mineral is sooner exhausted, and rights of renewal should be accorded to the lessee. In order that the royalty may fit the fluctuating physical and market conditions, it should be arranged on a sliding scale, automatically adjustable, a percentage, if you please, of the market value of the product; thus obviating the necessity for frequent changes of lease and royalty.

The Perpetual Lease Helps the Prospector and Operator

A perpetual or long-term lease is best for the lessee. If he is a prospector, it encourages him to explore, and develop the property, and his reward would be secured with the least outlay, for if he shows a good prospect his lease is more salable than a fee-simple title, because there is less money at stake and less hazard on the part of the purchaser.

If a lessee is an operator, such leases are best for him, because the money which he would otherwise invest in a fee-simple title may be used to prove the property, and if found good, to develop and equip it. He thus secures the coal bed on its merits, and can regulate his investment accordingly. If the developments show the property to be worth the outlay he will be warranted in installing substantial equipment, and his title affords suitable security upon which, if desired, to borrow the necessary capital. If his provings show the property to be unsatisfactory, he may forfeit his lease, and thus save what would otherwise be lost through purchase of the fee-simple title.

Financial Advantages of Long-Time Leaseholds

Next to an outright ownership, a perpetual lease is the best from the viewpoint of the financier, because it tends toward more permanent equipment, larger outputs and profits, thus affording better security for loans. It permits long-term bonds which are more attractive to investors. Short-term leases or contracts, subject to changes at renewal periods, are poor security, and cannot be easily financed.

From the viewpoint of the conservationist the perpetual lease is preferable because the lessee expects to exhaust all the coal, and, therefore, conserves the supply for the future by avoiding waste in mining, and to secure this end, can afford the expense necessary to install permanent, uptodate plants, use the latest and best mining methods, employ competent engineering advice, and install means for preserving the lives and comfort of employees.

It is to the advantage of the operator, for conservation purposes, to experiment with and investigate new methods of mining and utilizing his product in order to make a market for inferior portions of the coal which might be otherwise wasted.

The quantity of ordinary waste or refuse material from large plants is so great that its possible value becomes an item of considerable importance, and is worth the expense of searching out new methods for its utilization.

Public Welfare Demands Perpetual Leases

Perpetual leases promote public welfare because: They stimulate prospecting and the discovery of new coal or mineral areas; they hasten developments more rapidly than any other sort of title; and they will produce revenue for school and territorial purposes.

The above general principles would seem to apply with double force to the coal lands of Alaska, because the best coals of the territory are high-grade, only because of their proximity to the volcanic rocks, and are, therefore, liable to be much broken, folded or crushed through the movements or quakings common to eruptive measures.

On account of the unfavorable physical conditions, added to the high cost of labor and material, and lack of transportation facilities, the preliminary expense of proving Alaska coal lands will be unusually large. The investigation must be made, however, before the operator is warranted in making the investments necessary to equip a mine plant. How much better, therefore, it would be under these circumstances if land could be purchased on its merits, by this installment plan, instead of first hazarding the cost of a fee-simple title, which might ultimately result in a dead loss.

---

*Mining engineer and geologist, Scranton, Penn.

Note—Article read before the Spokane, Wash., meeting of the American Mining Congress, entitled "Leasing of Mineral Lands."

In the Eastern United States no one favors the short-tenure lease. The coal-land owner, as the result of dire experiences, views it as the most ingenious device ever instituted for the purpose of wantonly wasting his substance, and the operator regards it as a delusion and a snare. It deludes him with the pleasant but often mistaken notion that he can pay out the investment with large profits before his short lease expires, and it becomes a snare when he gets in financially, and then finds that he can't get out.

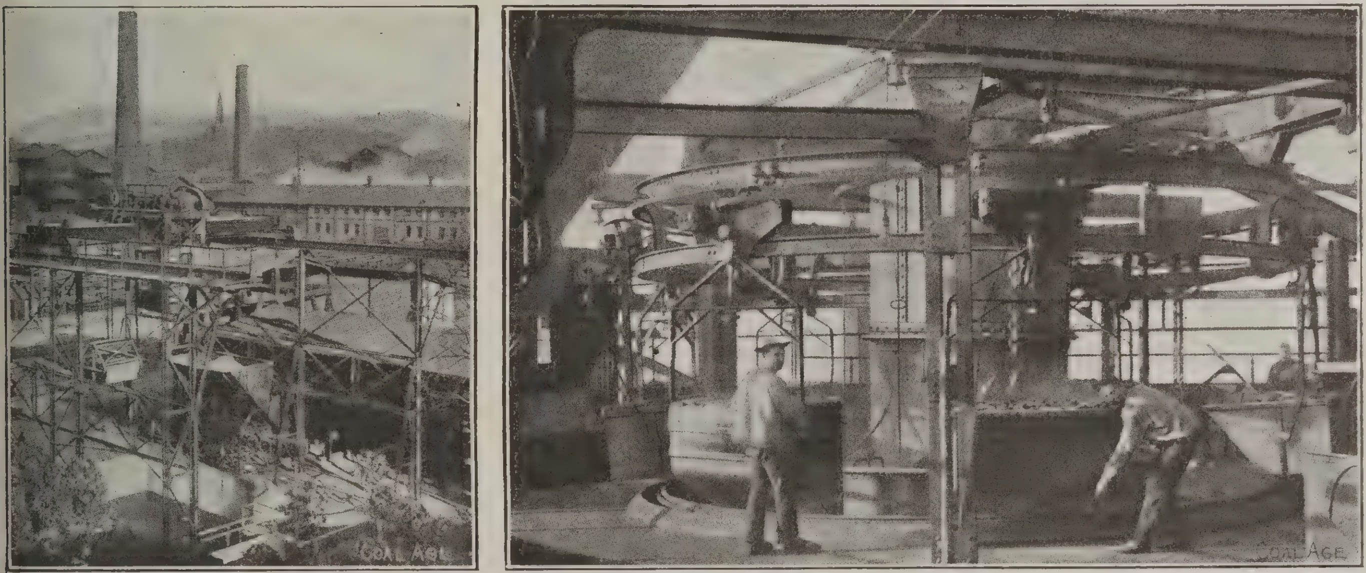
Modernization of Conveying Plants

Special Correspondence

SYNOPSIS—A description of a telpher system that transports coke from the oven bench direct to the mouth of the blast furnace without removal from its original bucket. Breakage is thus reduced to a minimum.

⁂

One effect of the great competition which at present exists in the production of iron and steel, as well as in allied industries, has been to render the whole process of production and smelting the subject of careful survey in order to detect any points of economy which could be adopted in the handling processes involved. It is nowadays realized that in many instances success or failure depends largely on a decimal point in the works production costs. Anything, therefore, which tends toward the elimination of useless labor and time has its definite value.



Two Views of the Suspended Telpher System

Old Plants Modernized

For this reason works which have been established for considerable periods have been modernized and revolutionized. Newer works have, of course, availed themselves of the most modern advantages in methods of handling material. Considered from a technical standpoint, it is perhaps most interesting to note the way in which the older plants have been thus brought up to date by the application of modern devices, one of the conspicuous examples of which is the Austrian plant situated at Trzynietz, belonging to the Austrian Mining & Ironworks Co.

One of the most difficult problems in the reconstruction of the conveying apparatus at this works was the conveyance of the coke from the ovens to the blast-furnace mouth. This was rather a difficult undertaking, as the coke-oven bench was separated from the blast furnaces not only by a number of buildings such as boiler houses and a smithy, but also by a storage ground for ore. It was important also to avoid rehandling, and to prevent any considerable fall into the furnace mouth.

The method adopted by Messrs. Adolf, Bleichert & Co., of Leipzig and London, who undertook this modernizing of the transport system, was the use of a telpher line combined with an inclined section having a rope drive leading to the charging platform. The coke is shoveled direct into the telpher cars from the quenching stage. At this point the workman in attendance starts the loaded cars by engaging a switch. The next empty bucket thus moves up and stops at the proper point for loading. The loaded car runs automatically without supervision on a suspended track around various curves between the buildings to the sorting line, where it passes over a weighing machine before taking up a position behind the preceding bucket at the regulation distance fixed by a block system.

When a coke charge is required, a signal is given from above and the man supervising the traffic below engages a switch, whereupon the carriers automatically start one after another. On arrival at the inclined section they couple automatically to the traction rope and uncouple again on reaching the top, proceeding to the mouth of one or the other of the two furnaces according to the position of the switches. Here they discharge by tipping. The drop is small and the coke suffers no damage. The buckets then return to the coke ovens.

The traffic is continuous and has a loop system, so that there is no change in the direction of travel. It will be seen that the transport of small quantities effected by this means offers special advantages when various classes of ores have to be smelted because it is simple and easy to make the necessary mixtures accurately.

An Accounting System for Coal Companies

By J. C. McNeil*

SYNOPSIS—A brief description of a simple system of bookkeeping applicable to any coal company, in which reliance is placed upon vouchers and loose-leaf forms, so that the amount of work to be done is reduced to a minimum.

⁂

The coal industry, is one of wasting assets and hence the accounts of the coal companies should be kept in such a manner as to exhibit at all times the true status of its affairs.

The revenues of a coal company are derived principally from four sources, viz.: Sales of coal and merchandise, tenement rentals and revenues from miscellaneous sources.

Coal Sales

Invoices should be rendered to each customer for all coal sales, showing such details as are needed for the business. They should be numbered consecutively, beginning on the first day of each month, or the first of each fiscal year, as may be deemed necessary, and should be entered in an invoice register ruled to give all the information shown on the invoice. One general ledger account should be kept for the debit "Invoices Rendered." The credit account should be "Coal Revenue," or if it is desired to exhibit the revenues from each grade of coal, proper credit accounts with the different grades should be set up. A side ledger should be opened for the purpose of opening accounts with the various customers, making the account Invoices Rendered, the controlling account for this ledger.

Merchandise Sales

While it is the custom of some companies to treat the merchandise scrip issued plus the cash sales as the merchandise sales for the month, this method is not accurate. A daily report of sales, divided as between cash and scrip, should be obtained from the manager of the stores and the total of these reports at the end of each month should be debited to the store manager and credited to merchandise sales. The office cash account should be debited with the cash received and the scrip issues account debited with scrip turned in and the total of these two debits passed to the credit of the store manager's account, which automatically clears that record. In this manner, the actual amount of the merchandise sales can be accurately determined and the credit balance standing in the scrip issues account will always show the amount of merchandise orders in the hands of employees and not redeemed.

Tenement Rentals

The usual method of handling these rentals is through the payrolls, the debits being made against the employees occupying the houses and the total of the column rent being passed to the credit of tenement-rent revenues. It would also be a good plan to make up a statement each month showing the numbers of the houses, which would have to be numbered for this purpose, the name of the occupant, the amount of rental and the payroll sheet and line numbers on which the deductions are made. In this way, a permanent record of the occupancy of the tenement houses would be on file.

Miscellaneous Revenues

Revenues are always received through the sale of some materials, purchased for other uses, from freight claims, and various items arising in the usual course of business, for which regular invoices should be prepared for proper record. It would not be wise to take these items through the invoices-rendered account, as it is desired that this account should represent the sales of coal. It would, therefore, be better to have a separate register for these miscellaneous bills, which should be numbered in a series separate and apart from the coal invoices, and also provide a side ledger for them. The controlling debit account for these items should be known as sundry accounts and the credit account would, of course, be the various accounts affected by each bill or invoice. The charges to this account would come from the bills, which should show the credit account for a corresponding amount, or from the vouchers for payments made for various accounts. As the corresponding credits for these charges are made from vouchers, they would come through the vouchers register and the bills would be issued for record and collection only. They should, therefore, only be entered in the record column of the sundry-accounts register.

Fig. 1. Voucher for Making Payments

Clearing Revenue Accounts

While it is customary to charge the revenue accounts and credit profit and loss direct, it would be better to carry an income account, the net balance of which should be charged to profit and loss at the end of each fiscal year. In this manner, the various revenue accounts would be debited and the total amount credited to income account, while the expenses would be handled as debits to income account and the various expense accounts credited. The balance would then be passed to the debit or credit of profit and loss and the contraentry made to income account. In this manner, the profit and loss account would show at a glance the net profits or losses of the business for the period represented.

---

*Artemus, Ky.

Expenses

The expenses of a coal-mining company would come under four general heads: Maintenance expenses, production expenses, sales expenses and general expenses. These accounts would, of course, be the general ledger-expense accounts and could be subdivided into various detailed accounts for statistical purposes in a manner which I shall later explain. These accounts, however, cover in the main all the expenses of a coal-mining company.

Maintenance expenses represent all the expenses made by the coal company for maintenance of its properties, such as mines, machinery, tenement houses. Maintenance of these properties would mean repairs; depreciation of the properties; ordinary renewals of machinery, mine cars, and other properties about the plants.

Fig. 2. Voucher for Filling

Production expenses should represent the total cost of producing the coal at the mines, including only the actual costs of production. Into this account should be charged the monthly amounts set aside for depletion of coal lands, etc.

Sales expenses should represent the entire cost of marketing the output. This account should be charged with the amounts expended for conducting branch sales offices, advertising, salaries and expenses of agents and officials engaged solely in the sales end of the business.

General expenses should represent the general expenses of conducting the business, which are not properly chargeable to the other expense accounts. To it should be charged insurance, taxes, legal expenses and salaries and expenses of the general officers not devoted entirely to one department.

Expenditures made for additions and betterments to the properties which do not represent renewals of existing structures or machinery should be charged to an additions and betterments account. The total of this account should be cleared at the end of each fiscal year by charging the amount to capital accounts. In this manner, the capital accounts would represent all the expenditures made for the properties when acquired and also all the improvements put thereon. The depreciation and the depletion of the properties will be taken care of in appropriate reserve accounts which I will explain hereafter.

Detail Expenses

Under maintenances, there should be entered in details expenses made for: Maintenance of tipples and outside structures, maintenance of power plants, motors and machines, tracks, ventilation, timbering, removal of slate, depreciation of the various classes of machinery, and such other primary accounts as may be necessary.

Under production expenses, there should be entered the details of expenses made for: Mining, hauling, ventilation (operation), lubricants for machines, barn expenses, removal of water, operation of power plants, and such other items as properly belong to the actual expenses of producing the coal.

Under sales expenses, the charges made for salaries of sales agents, expenses of sales offices, proportion of general office expense, expenses of yards, freight on coal sold delivered at destination, advertising and other actual sales expenses should be entered in the details of these expenses.

Under general expenses, there should be charged taxes, insurance, royalties, salaries and expenses of officers, depletion of coal measures, interest and discount, and such other expenses not included in maintenance, production or sales expenses.

Under additions and betterments, there should be charged all expenditures made for additions to the properties which are not renewals of existing structures.

Method of Handling

It is intended under this system of accounts that all payments are to be made on vouchers which are properly approved by the proper officer authorized to do so. As shown by Figs. 1 and 2, the vouchers should consist of two parts, the pay part and the file part. Vouchers should be made each month in favor of each party rendering services of furnishing material, showing the dates and amounts of the invoices with a brief description of each, the totals of the invoices entered and written in words in the receipt portion of the voucher. All supporting papers should be fastened to the file part of the voucher and passed to the auditor, who should enter thereon the month and audit number. By using the number of the month for which vouchers are made, with three additional numbers, provision is made for the issue of 999 vouchers in any one month.

Vouchers should be arranged alphabetically, as nearly as possible, before numbering. They should then be entered in the voucher register, the first columns of which should show the numbers, parties in whose favor drawn, purpose (briefly) for which drawn, and the amount. The debit columns of the voucher register should be headed for each of the general accounts and such other accounts as would be affected by the issue of vouchers and for which an accumulative total would be desired for book entries; also a special column should be provided for such accounts as might come up and for which no special columns had been provided. The credit side of the voucher register should show the net credit to be posted to the voucher liability account, a special discount column and such other credit columns as the nature of the business would require. Under this system it is proposed to dispense with numerous journal entries by handling accounts through vouchers, as well as payments. Only the totals of the general accounts would be entered in the columns for these accounts. A voucher-distribution form, Fig. 3, should be provided for the entries of the detail accounts, using one sheet each year for each detail account. This form, as will be observed, provides for 12 months' entries and shows the reference which should be the number of the voucher from which taken and the amount. Credits to the detail accounts should be entered in red ink and proper deduction made in totaling the same. If all details are properly entered, the totals of the detail accounts under each general account must agree with the register total of the general account; if not, the work has not been entered correctly. Under this system a voucher (for record only) should be drawn covering the payrolls, the liability account being payrolls, and all rolls handled through the voucher register in the same manner as any other payments. On this voucher, the various expense accounts would be charged, the corresponding credit being passed to payrolls, and then payrolls should be debited and a corresponding amount passed to the credit accounts affected.

Journalizing

Under this system, it would be better to make all the journal entries at one time, say, the last day of the month in which the accounts are handled and the journal entry should contain only the totals of the accounts affected. This would reduce the number of journal entries required to a minimum. A form like Fig. 4 should be used for journal entries, which should state "the debit account" the credit account and follow with the explanation of why the entry is made. The total of the debits and credits should be shown on each entry and its correctness should be certified or approved by the head of the accounting department before being entered; or, it could be certified to as being correct by the auditor, or chief accountant, and approved by the general manager of the business before being entered. In this way, the head of the business would have knowledge of every entry affecting the books before being entered thereon. Entry into the journal then becomes a matter of straight copying, and all papers supporting the entry can also be attached to the loose entry form, making a nice file for it.

COAL AGE

Fig. 3. Detailed Distribution Sheet

Miscellaneous Expenses

Payments which are made annually; such as taxes, insurance, etc., would, if charged direct to expenses in month the payments were made, burden the accounts for that month unnecessarily and cause the expense to be all out of proportion. The taxes should be accrued each month and charged to expenses direct or through an account that could be cleared into the income account, monthly on a basis of one-twelfth of the previous year's tax payments. Differences between the book amount and the actual amount due could be adjusted in the month of payment. Prepaid insurance premiums should be charged to an appropriate asset account and one-twelfth of this amount charged out monthly to the appropriate expense accounts. By this manner of handling, it will be seen that the credit side of the balance sheet will show the liability for taxes up to and including the month for which they are made, and will likewise show correctly as an asset the unexpired insurance premiums. Accounts of a similar nature should be handled in a like manner.

Depreciation and Reserve Funds

A fixed amount per ton of coal mined should be charged into the expense accounts each month and credited to an appropriate reserve fund to cover depletion of coal measures. All equipment should be depreciated each month on a basis of a fixed percentage of the value of the equipment, or on the purchase price, the monthly charge being one-twelfth of the annual percentage, which should be sufficient to recover the full amount of the value of the machinery or investment at the expiration of the depreciation period. This amount should likewise be credited to an appropriate reserve account. It would be well to charge to expenses and credit to an appropriate reserve account one-half of 1 per cent. monthly of the total investment, or the initial investment in the property. This should be done because, if money of others were employed in the business, legal interest would have to be paid thereon and if a business will not justify a night; at all mines employing less than one hundred (100) men underground, the fan shall be run at its usual speed for six (6) hours before men go into the mine to work. A recording pressure gauge shall be maintained in connection with each fan at all times: *Provided,* nothing in this clause shall apply to mines employing ten men or less.

§ 15. REFUGE PLACES—POWER HAULAGE ROADS. (*a*) On all single-track haulage roads, where hauling is done by machinery, which roads the persons employed in the mine must use while performing their work or travel on foot to and from their work, there shall be places of refuge on one side not less than 3 feet in depth from the side of the car, and not less than 4 feet long and 5 feet in height and not more than 60 feet apart. On rope-haulage roads, means of signalling shall be established between the haulage engineer and all points on the road.

ial shall be stored nor allowed to accumulate therein. They shall also be whitewashed not less than once in six months.

GOB ON HAULAGE ROADS. (*e*) One side of all haulage roads shall be kept clear of refuse or materials, except timbering, unless the rib or timbering on such side shall be 2½ feet or more from the rail. But in such case materials or refuse shall not be permitted within 2½ feet of the rail.

§ 16. CARS. (*a*) When there is an open hook coupling on either end of the car, the hook and links must be attached so that when hanging down, the coupling will be clear of the ties and rails.

Mine cars in use when this Act shall become in force and effect shall be made to comply with this provision within one year thereafter.

passage

charge of legal interest on the investment therein, it is not profitable to have the money so invested. The funds thus set up should be in terms of cash, not book values, and it would be well to invest the amounts in bonds or other securities, so that when the mine has been exhausted the stockholders can be returned their investment and the dividends paid them will truly represent the profits. Additional lands purchased should be charged to the depletion reserve account and not the property account. A charge to property account for additional lands purchased from funds secured from the profits of the business would swell the property account out of proportion. It must be remembered that in coal mining, every ton of coal removed from a property reduces its value to that extent.

The balance sheet of a coal company should show first the property assets, such as lands, equipment, etc.; second, bills and accounts receivable; and, last, liquid assets. The liability sheet should show the capital liabilities, funded liabilities, notes or bills payable, current liabilities for labor and materials, reserve-fund liabilities and last the profit and loss, which, of course, in an efficiently managed coal business should appear on the credit side.

A system of this kind can be applied to a concern operating any number of mines, is very flexible, and at the same time very effective. Its purpose would be to accurately record the history of a coal business.

⁂

Mining Show and Annual Convention of the American Mining Congress

That the manufacturers of mining machinery and appliances and the makers of safety and rescue devices have been awaiting just such an opportunity as will be presented in Philadelphia, Oct. 17-25, when the American Mining Congress will hold its first national Mining Show or Exposition, became pleasingly apparent to the officers of the congress a few days after the project was launched. There has already been such a response from manufacturers that it is feared there will not be space for all who may apply.

It is already regretted by the congress that Horticultural Hall, in which the exposition is to be held, is not larger, and, while it may prove inadequate to the demands to be made upon it, nevertheless, it is large enough to stage a great industrial show.

There is already some talk among the officers of the congress of cutting down the amount of space being asked for by the larger corporations in order that there may be a greater diversity of exhibits. Provisional contracts are being made to meet this contingency.

"The manufacturers have been quick to appreciate that this will not merely be an industrial show to satisfy the curiosity of the public," said Richard L. Humphrey, the director of the exposition. "They realize that the convention of the American Mining Congress, which is to be held during the week of the exposition, will bring to Philadelphia a great gathering of practical mining men who are directly interested in the exhibits and men who will either be purchasers then and there, or who will make their purchases after returning home and weighing the efficiency and need of the devices.

"The exposition will be the first general national clearing house between the men who make mining machinery and the men who use such machinery. Mining men, in need of new equipment, understand fully what a tremendous task they have on hand when they start out to find the machinery that is best adapted to the conditions of their mines. They see their opportunity in the mining exposition. The indications are that the American Mining Congress will have the greatest and most representative convention in its history.

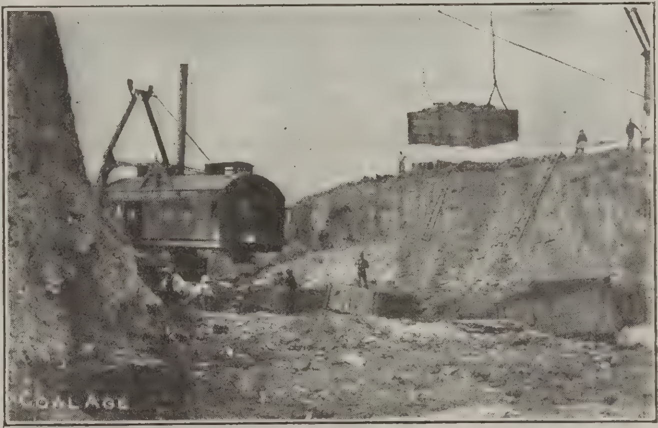
"It is proposed to bring together at the exposition a variety of exhibits affording instructive object lessons of greatest value to the future of the mining industry. The American Mining Congress and the first mining exposition will afford an unusual opportunity for the interchange of views, and is by far the most comprehensive attempt that has been made in the history of the mining industry to demonstrate its needs and the efficient utilization of the mineral resources of the country."

⁂

A Trackless Mine

A muleless, trackless, motorless coal mine is one of the latest and most novel improvements in open-cut or strip-pit mining in the Pittsburg, Kansas, coal field. The style of mining itself, where steam shovels are used, is comparatively new.

In two or three of the 25 strip pits in this country lifting cranes on the banks of the cuts are used to elevate 5-ton skips of coal to the surface, there depositing them on the running-gear of a tram. These cars, filled with coal, are hauled by a dinky engine to a derrick which picks the skips up and dumps them in railway cars. It is claimed that nowhere else in the country is such a method used in coal mining.



An Open Trackless Mine

The lifting crane travels by its own power and keeps on the bank of the cut abreast of the coal diggers in the bottom of the pit, which usually is from 24 to 30 ft. deep. Ladders are used by the workmen in entering and leaving the workings.

Other pits have been employing tracks and trams in the bottom of the huge trenches, as is done in underground mines, and most of them use mules for motive power. In such pits the coal is hauled to the surface on inclines.

The coal vein is about three feet thick and is uncovered by steam shovels, some of which are the largest ever constructed. The yield is somewhat over 5000 tons per acre

POWER DEPARTMENT

Does Bituminous Mining Pay?

By A. E. Rickards*

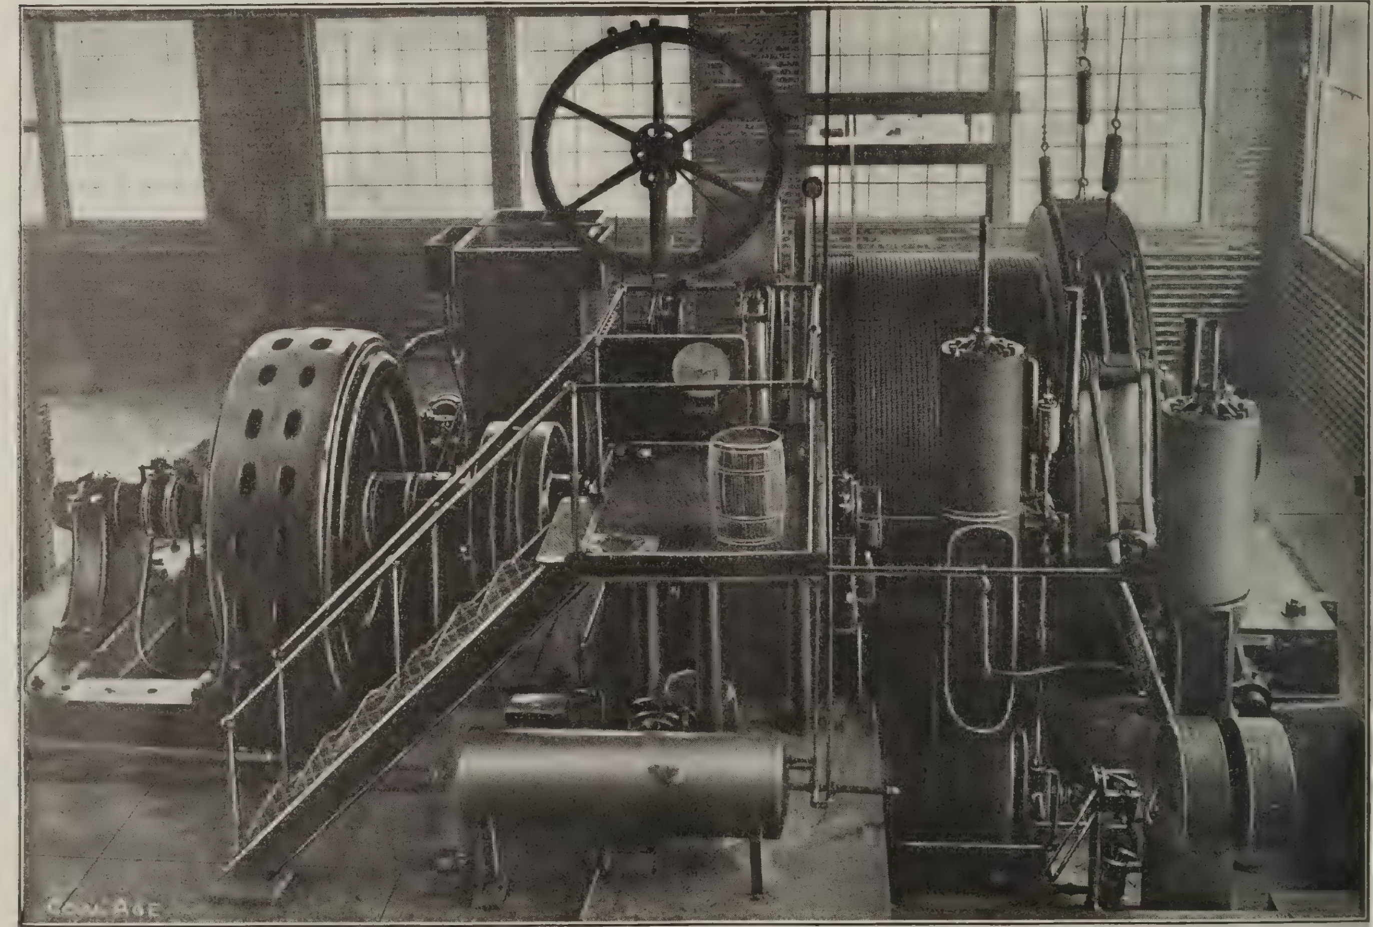
SYNOPSIS—Some interesting facts and figures are here presented, covering the coal production of the country during the past, and showing the steadily increasing amount mined per capita of population and its rising cost per ton. The principal opportunity for economy in mining cost is then discussed.

⁂

In the year 1920, there will be 835,000,000 tons of bituminous coal mined in the United States. This amount is over twice the quantity produced in 1909. With this great increase in the demand for bituminous coal, at first glance, one would consider its production a very profitable business. However, to earn a legitimate profit becomes a more difficult problem each year. These statements can be verified by referring to the United States census reports and those of the Geological Survey.

The data given in this paper are compiled from these reports and indicate that the operators have a big problem before them. The first table is most interesting—it shows that this country is changing rapidly from an agricultural to a manufacturing one. It also shows that there are two other factors which have a material bearing upon this great increase in the demand for coal. These factors are the rapid growth in population and the remarkable increase in the demand for fuel per capita.

For the past 50 years the population increased at an average rate of 23.5% per decade. The demand for coal per capita has increased from 0.26 tons in 1860 to 4.54 tons in 1910. Or, in other words, in 1910 there was 4.54 tons of coal mined for every man, woman and child living in United States at that time. During the past two decades the coal mined has increased at an average rate of 62% per capita per decade.



A 750-Hp. Alternating-Current Motor Driving a Mine Hoist

If these averages hold true until 1920 the coal mined per capita will be 7.36 tons. If the population increases at the same rate as during the past 50 years, there will be 113,475,000 inhabitants in the United States in the year 1920. On this basis the coal mined in that year will amount to 835,176,000 tons. This is an increase of 100% over that mined in 1910. By comparing this increase with the per cent. increase in the quantity of coal mined during the past 50 years, the amount predicted for 1920 seems entirely probable.

---

*General manager, Industrial Engineering Co., Pittsburgh, Penn.

TABLE No. 1. COMPARATIVE ANALYSIS OF BITUMINOUS COAL MINED IN PROPORTION TO THE POPULATION.

	Population		Quantity of Coal Mined		Per Capita	
Year	In Numbers	Percent Increase in 10 yrs.	Tons per year	Per cent. Increase in 10 yrs.	Quantity Mined in Tons	Per cent. Increase in 10 yrs.
1860	31,443,000	....	6,494,000	....	0.262	....
1870	38,558,000	22	17,371,000	167	0.45	73
1880	50,155,000	29	42,831,000	147	0.855	89
1890	62,947,000	25	111,302,000	159	1.77	108
1900	75,994,000	20	212,316,000	91	2.8	64
1910	91,972,000	21	417,111,000	96	4.54	60

Coal was first discovered in this country in the year 1670 by Father Hennepin, a French missionary. It was found close to the Illinois River near the site of the present city of Ottawa. The first actual mining of coal was about 1744 in the Richmond Basin, Virginia. The first records of production were in 1822, which shows that about 54,000 tons were mined.

Remarkable Progress Has Been Made

In 1890, this country was the second coal-producing nation of the world. At that time Great Britain's production exceeded ours by about 30%. However, by 1900, the United States had overtaken Great Britain and has since maintained the advantage with an increasing lead each year. In 1911, the coal production of this country exceeded that of Great Britain by 60%. Today the United States is by far the greatest coal-producing country in the world.

Chart 1 shows graphically the quantity of bituminous coal mined each year from 1890 to 1912.

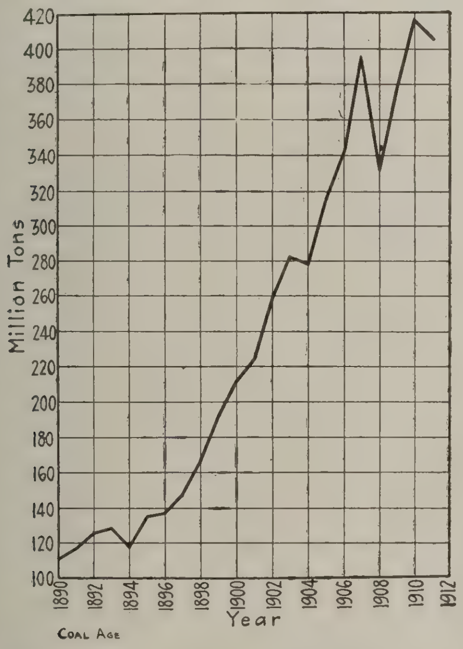


Chart 1. Amount of Coal Mined Yearly

In almost any other industry such a growth in the demand for its product would have caused a considerable increase in the price of its commodity. However, this did not take place in the case of coal production. In fact, at times the selling price was so low that it was a difficult task for the operators to earn a legitimate profit. This condition of affairs is caused by a constantly increasing competition. As the demand increases, new workings are continually opening up.

This makes a capacity in excess of the demand. This condition has existed for the past 25 years. The owners of coal lands are always looking for an opportunity to develop them. The railroads also encourage competition by continually extending their lines into new fields. This gives them additional tonnage and at the same time secures a low-priced fuel for their own consumption.

Chart No. 2 shows the effect of keen competition upon the selling price of coal. This chart shows the average selling price per ton per year at the mines.

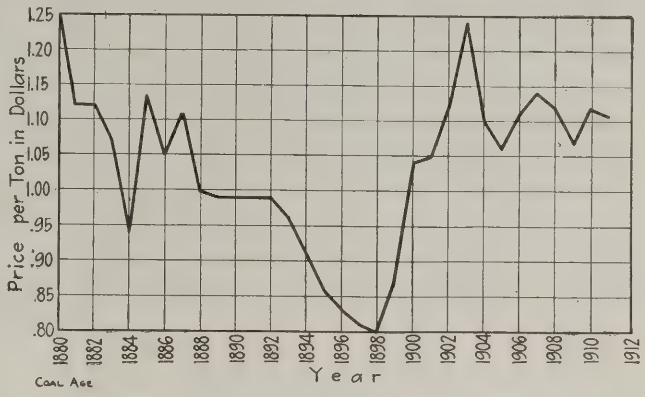

Chart 2. Selling Price of Coal per Ton at the Mines

To make a profit with the low selling price and the continual increase in the cost of production, is indeed a problem. One way to solve this is to increase the output. Mr. Edward W. Parker states "that the present bituminous mines in the United States are capable of producing 600,000,000 to 700,000,000 tons per year." He claims that this is possible without opening up another new working. To do this, of course, requires ample transportation facilities and plentiful labor supply.

The Present Status of the Industry

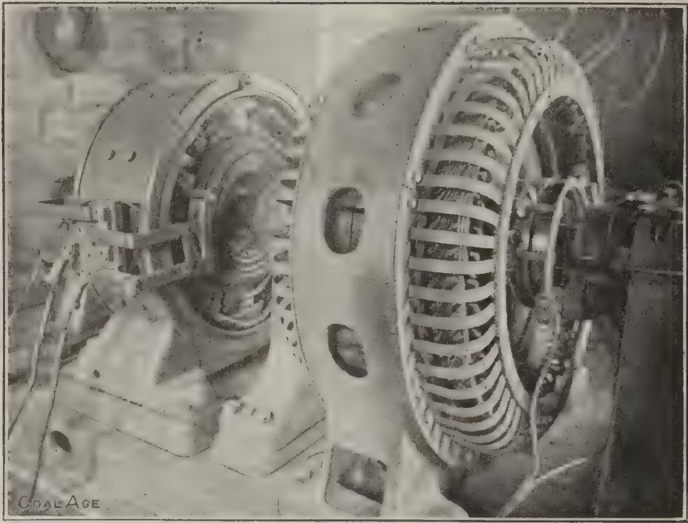
Table 2 shows the condition of the bituminous industry in 1909. Per cents. shown in the last column would apply to the conditions of today. These figures indicate the increase in seven years dating from 1902 to 1909.

TABLE No. 2. CENSUS ANALYSIS OF THE BITUMINOUS COAL INDUSTRY—ALL COAL COMPANIES

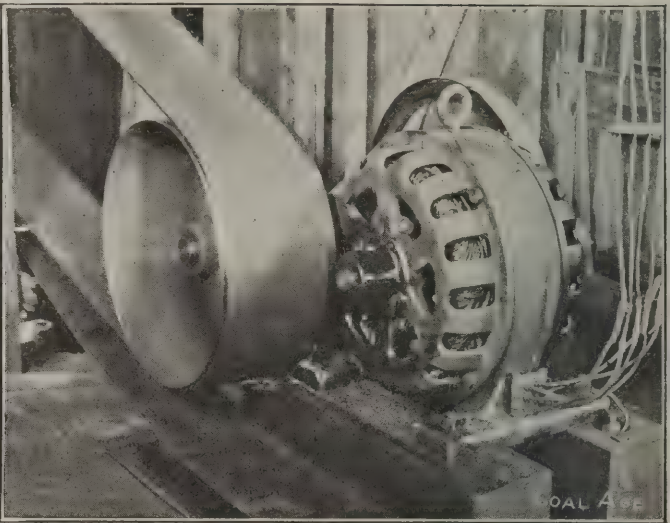
No.	Item	1902	1909	Per cent. Increase in 7 years
1	Number of companies..........	4,409	3,503	—20.3
2	Number of mines..............	5,652	6,013	6.4
3	Total capital................	$440,800,000	$1,062,197,083	141.
4	Primary horsepower...........	521,165	1,227,401	135
5	Number of wage earners.......	280,638	569,789	103
6	Wages........................	$181,482,288	$294,196,488	62
7	Number salaried employees....	19,871	22,800	14.7
8	Salaries.....................	$14,511,924	$21,800,895	50
*9	Miscellaneous expenses.......	$16,774,459	$29,691,324	77
10	Cost of supplies.............	$24,798,922	$48,000,000	94
11	Contract work................	$1,244,114	$2,207,672	77
12	Quantity coal mined (tons).....	260,216,844	379,744,257	45
13	Value of product.............	$290,858,483	$405,486,777	39

* Note—Includes royalties and rent of mines, taxes, office rent and sundry expenses.

Table 2 shows that the number of companies (item 1) decreased 20.3%. This does not mean that competition decreased. The next item (2) shows that the number of mines increased 6.4%. These figures indicate that the companies become larger and stronger. This is borne out by the next item (3) which shows that the total capital increased 141%. Some readers may consider that a large portion of the increased capitalization was water. However, the next item (4), Primary Horsepower, shows that this is not the case. For instance, the primary horsepower increased 135%. This means that the capacity of the power plants had to be increased this



100-Kw. Synchronous Motor-Generator Set



A 15-Hp. Alternating-Current Motor Driving a Fan

amount, due to the installation of new and heavier equipment in and around the mine. The new machinery must have required the expenditure of a considerable portion of the new capital. All the remaining items in this table show a material increase.

Table 3 shows more clearly how the cost to mine coal has increased. It is an analysis of the preceding one and contains the same items worked out upon a per ton basis.

TABLE No. 3. ANALYSIS SHOWING AVERAGES UPON PER TON BASIS

No.	Item	1902	1909	Per cent. Increase in 7 Years
1	Number of tons coal mined....	260,216,844	379,744,257	45
2	Capital....................	$1.695	$2.80	65.3
3	Contract work..............	$0.00478	$0.00583	21.9
4	Number of wage earners.......	0.00107	0.0015	40.3
5	Number of salaried employees.	0.0000764	0.0000602	—21.2
6	Primary horsepower...........	0.002	0.00324	62
7	Wages......................	$0.697	$0.775	11.2
8	Salaries....................	$0.0558	$0.0575	3.4
9	Cost of supplies...............	$0.095	$0.126	32.6
10	Miscellaneous Expenses*.......	$0.0643	$0.0785	22
11	Value of Product.............	$1.115	$1.07	—3.9

* Item No. 10 includes royalties, rent of mines, taxes, office rent and sundry expenses.

Table No. 3 shows most conclusively that the cost per ton of coal mined has increased and that the profits have decreased. For instance, in 1902, the average selling price per ton was $1.115 and the average operating cost to mine coal was $0.912, leaving a profit of 20.3c. In 1909, the average selling price was $1.07 and the average cost $1.037, leaving a profit of only 3.3c. per ton.

These operating costs do not include all the fixed charges. They include only the cost of wages, salaries, supplies and miscellaneous expenses. The item, miscellaneous expenses, includes royalties, rent of mines, taxes, office rent and sundry expenses.

Contract Work (item 3) is given to show the amount of new development work done.

The increase in capital (item 2) per ton of coal mined is interesting. This shows an increase of 65.3% in seven years. It shows that the mine operators are continually spending money for equipment and improvements which they anticipate will reduce the cost of mining. In 1902, there was $1.695 capital invested for every ton of coal mined per year. In 1909, this had increased to a sum of $2.80 for every ton of coal mined per year. If the economies anticipated by the operators, had worked out, the other items of expense in the column under 1909, would have been reduced, instead, each item of expense shows an increase.

From the foregoing it is seen that the capital account has reached such proportions, that the future profits must be obtained through greater output and greater economies in the operation of the workings, and the investment must be kept down to a minimum.

A Rapid Evolution Is in Progress

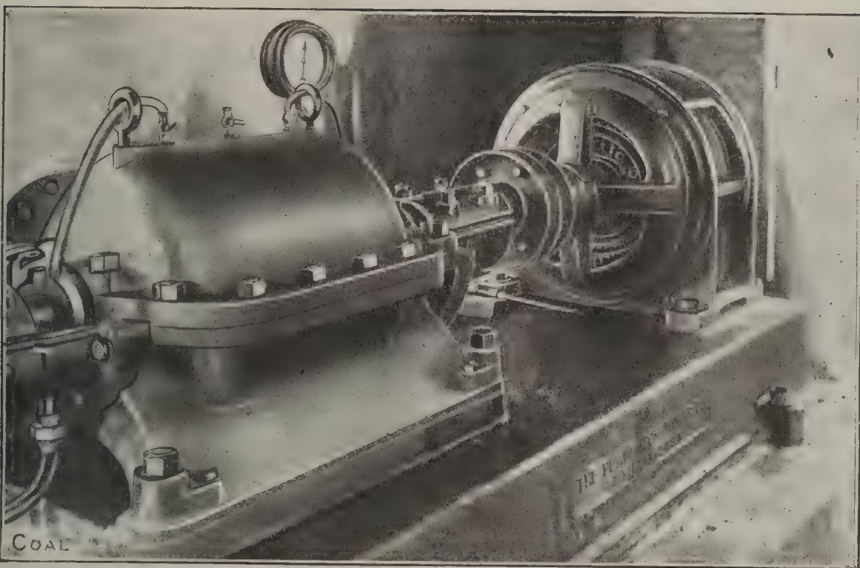
The coal-mining industry is undergoing a rapid evolution. It was only a few years ago when mining coal was strictly a mining proposition. Coal was dug entirely by manual labor and hauled by mules. Today almost 50% of the entire production is mined by machinery and hauled by locomotives. The industry is now becoming a combination of both a mining and a power proposition.

After the mine operators had gone to the expense for mining machinery, etc., the cost to produce coal should have been reduced. However, the new order of things brought about conditions of its own, which, in most cases, increased the cost of production.

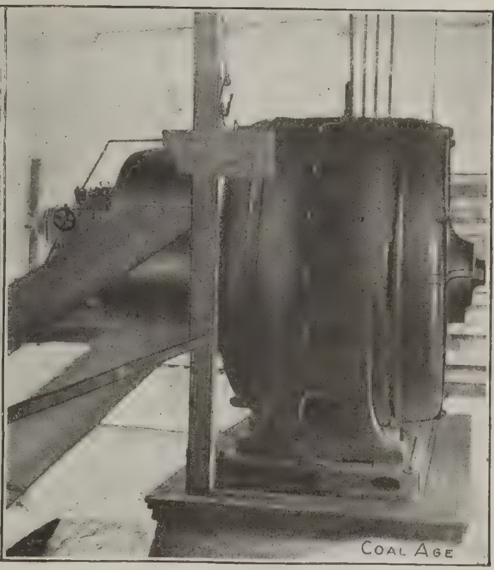
The profits in the future depend in a great measure upon the solution of these new problems. They offer the greatest of opportunities to effect economies. These opportunities exist in almost every working. This does not indicate that the man in charge is negligent. A mine superintendent is essentially a miner. He has been selected by the management because of his practical knowledge on mining coal. Power is entirely out of his line. The production of power, its proper distribution and its use in a mine, requires the work of those who have made the subject a special study, in other words, specialists.

In the past, the operators have made it a general practice to install isolated power plants and generate their own current. However, today a large number of these plants have since been abandoned and the operators are now buying electricity from the nearest power company. Many of the new workings opened up during the past few years are operating entirely from purchased power.

It seems somewhat inconsistent to think that a central station can afford to buy coal, pay freight and then sell the current produced back to the coal mine. Nevertheless, this is the case; furthermore, the operators are in



A 35-Hp. Motor Driving a 330-Gal. Centrifugal Pump



A 200-Hp. Motor Driving a Mine Fan

many cases finding it cheaper than producing their own power.

One of the principal advantages of central-station service is that it allows extensions to be made and more mining machinery to be added without making expensive additions to a power plant.

This can best be explained by citing the case of a certain coal company. This experience will most undoubtedly be similar to that gone through by many readers. These men opened up their workings eight years ago and invested $18,000 in a power plant. They anticipated that this installation would meet their requirements for years to come. They increased their tonnage to such an amount that three years ago they found it necessary to increase the capacity of the power house. This required an additional investment of $14,000. They then had a total of $32,000 invested in the power plant and believed that this equipment would be ample for their needs for years.

They extended their workings such distances that it soon became a problem to deliver electricity at proper voltages. At times the quantity of coal mined was considerably less than it should have been, due to this one difficulty. Early this spring they decided to make further additions to the power plant to take care of the new conditions before them. The changes contemplated would cost $18,000—this would make a total of $50,000 invested in power-generating equipment.

After studying the matter thoroughly these men decided to purchase their power from the local central station. The necessary investment would be much less than that required for power-plant extentions; also since making the change they find it considerably cheaper than their former power costs.

How Conditions May Be Met

To meet the conditions arising due to an increase in the power requirements, is oftimes a most perplexing problem. The solution may lie in any one of the following three plans:

1. By increasing the capacity of the present installation.
2. By building an entirely new, modern power plant,
3. By purchasing central-station current.

To decide which plan to adopt requires considerable study. The operator should first determine the following details with the present plant.

1. The maximum demand for power per ton of coal mined.
2. The quantity of power required per ton of coal mined.
3. The cost for power per ton of coal mined.

There are always certain parts of the load that remain fairly constant irrespective of the quantity of coal produced, such as that required for ventilation, pumping, lighting, etc. The information on the first two details should be obtained separately so as to show the demand and the quantity of power required by this part of the load, and that required for mining, haulage, etc.

With this information as a working basis, the plan to adopt can be decided upon by determining which alternative offers the most economical operation with a minimum investment and at the same time allows for future growth.

Purchased Power Is Usually Cheaper

When an analysis is made, such as outlined in the foregoing, it will, in almost every instance, result in favor of purchased power. This, of course, is assuming that the rates are such as usually quoted by the power companies. Table 4 is given to support this statement. The information in this table was obtained from actual tests in 40 mines located in Pennsylvania, West Virginia and Ohio. Each case, excepting mines Nos. 24, 36, 37 and 40, shows that purchased power is cheaper.

The table is divided into groups according to the size of units and contains data on both steam and gas engines. The groups are arranged as follows:

Group (A) Steam Engines—50 hp. and under.
" (B) " " from 51 to 100 hp.
" (C) " " " 101 to 200 hp.
" (D) Gas " " 101 to 200 hp.
" (E) Steam " " 201 to 500 hp.
" (F) Gas " " 201 to 500 hp.
" (G) Steam " " 501 to 1000 hp.
" (H) Gas " " 1001 hp. and over
" (I) Steam " " 1001 hp. and over

Columns 8, 9 and 10 show the cost per horsepower-hour and the savings effected if power were purchased at a given rate. The savings are shown in cents and also upon a percentage basis. The rate used for central-station power is figured at $15 per kilowatt per year for the maximum demand and 1c. per kilowatt-hour for the current consumed. On a horsepower basis this rate would be $11.20 per horsepower maximum demand plus 0.746c. per horsepower-hour. All the details in the table are worked out upon a horsepower-hour basis.

37	$0.05-g	1500	1500	24	3,160,000	1.10	1.27	0.17	*15
38	0.05-g	1500	1500	24	3,160,000	1.40	1.27	0.13	9.2
39	0.05-g	1700	1500	24	3,680,000	1.40	1.20	0.20	14.3
	Average cost					1.30	1.24	0.06	4.6
	Group I. Steam Engines over 1000 Hp.								
40	$0.75-c	1800	2000	18	2,840,000	1.20	1.53	0.33	*27.5
	Average for all mines					2.13	1.32	0.81	38

*Note—These quantities are negative and show an increase of cost by the purchase of power.

Column 2 shows the price the operators charged themselves for fuel; 75-c. indicates the price charged was 75c. per ton for coal; 4-g. indicates that the company used natural gas at 4c. per 1000 cu.ft.

It seems to be common practice among many operators to charge themselves at the rate of 75c. per ton for the coal used for power purposes. As a matter of fact it costs them whatever price it would bring in the market. Again, many operators insist that they use slack and refuse from the mine, fuel which for the most part, is unsalable. A visit to many of the boiler rooms shows that by far the greater number of them are using run of mine.

Four Per Cent. of Output Is Burned

Very few operators appreciate the quantity of coal they consume for power purposes in proportion to their total output. Table 5 gives these details. The last column shows the percentage of coal used for this purpose in proportion to the total production. It also shows that this is steadily increasing. For instance, in 1911 the operators used 3.9% of their total output to generate power. Can an operator afford to consume practically 4% of his total production for power purposes?

TABLE No. 5. COAL CONSUMED AT THE MINES FOR POWER PURPOSES.

			Quantity Consumed at Mine for Power	
Item	Year	Total Quantity Mined	No. Tons	Per cent. of Total Quantity
1	1890	111,302,322	3,580,214	3.2
2	1895	135,118,193	4,673,577	3.46
3	1900	212,316,112	7,260,899	3.42
4	1905	315,062,785	11,275,864	3.56
5	1910	417,111,142	15,362,518	3.66
6	1911	405,757,101	15,935,564	3.90

It will be but a matter of a few years when the greater number of coal mines will be operated from central stations. To illustrate the trend of the times—the Virginia Power Co., a $10,000,000 incorporation in the New River District was developed because of the opportunities existing there in the coal field.

The West Penn Electric Co. connected the first coal mine on their lines in 1896—a load of 120 hp. Today it has contracts with the mine operators aggregating over 20,000 hp., and anticipates that this will exceed 30,000 hp. before the closing of the year.

Another point worth mentioning is that the total capital of all the power companies exceeds $2,500,000,000. This amount is 2.35 times greater than the total capital of all coal companies. Again, the central station companies' income from the sale of electricity for power purposes increased 746% during the last 10 years. This shows how power users are adopting purchased current.

EDITORIALS

Power for Coal Mining

We print, upon another page, an article by A. E. Rickards, entitled, "Does Bituminous Mining Pay?" Aside from the facts, figures and comparisons brought out in this paper, all of which are well worthy of careful consideration by mining men, there are others which are perhaps equally potent, although less lucidly revealed.

In speaking of the increased amount of power employed to secure coal, the author says in part:

> The industry is now becoming a combination of both a mining and a power proposition. . . . The profits in the future depend in a great measure upon the solution of these new problems. They offer the greatest of opportunities to effect economies. These opportunities exist at almost every working. This does not indicate that the man in charge is negligent. A mine superintendent is essentially a miner. He has been selected by the management because of his practical knowledge on mining coal. Power is entirely out of his line. The production of power, its proper distribution and its use in a mine requires the work of those who have made the subject a special study, in other words, specialists. . . . It seems inconsistent to think that a central station can afford to buy coal, pay freight, and then sell the current produced back to the coal mine.

This is an age of economic production. So far as power is concerned, this involves large units, carefully planned power plants and scientific operation.

Few, indeed, are the men who thoroughly master two professions. As pointed out by Mr. Rickards, in most cases the successful mine superintendent is a "practical" man. He has probably grown up in the mines and knows from alpha to omega the ins and outs to be observed in the removal of coal from the earth. In short, he is a thorough specialist in his line.

It is nearly as rare to find a man who can economically produce coal and at the same time efficiently produce power therefrom as it is to meet a farmer who can successfully raise large crops of grain and cheaply and safely navigate the vessel that transports them over sea. Yet it is no more of a discredit to the practical mining man that he does not understand the theory of combustion, or the thermodynamics of heat engines, than it is to the farmer that he may not be versed in spherical trigonometry, or the science of navigation.

There are mining companies, and not a few of them, who are today generating energy in their own plants cheaper than any power company can supply current to them. Immediately beside these mines, however, may be located others that find it decidedly to their advantage to purchase current from an outside source. Whence, then, comes this difference in economic policy under identical conditions of mining?

As has been stated above, economic production of power requires large units, advantageously placed and carefully handled. This not only means a demand for a heavy power output but requires the services of one or more specialists, either mechanical or electrical or both. The small user of power cannot, in the nature of things, produce current as cheaply as either the large consumer or the central power company.

Other things being equal, the one place on earth where power may be developed from coal with the least possible expense is at the mine's mouth. The only reason why the central station, making its current from the consumption of fuel, can furnish power cheaper than the mining company is able to do, is that the former makes economies in power generation which the latter either cannot or does not attempt.

As pointed out by Mr. Rickards, coal mining today is a dual business, requiring not only the production of fuel but the scientific generation, distribution and utilization of power. At the present time there is not only an opportunity but a positive need—not necessarily a demand—in the coal field for mechanical and electrical engineers who are as truly specialists in their line as a superintendent is in his. In many cases, such men, if given a free hand, would be able to effect vast economies in the power expense of coal production, even though they might be woefully ignorant or the minutiae of mining and be guilty of that cardinal sin, in the eyes of many a so called "practical" mining man, of never having hurled imprecations upon the head of a mine mule.

◆

An Interesting Question for Discussion

There is probably no element that lends itself more effectively to the development of safe and economic mining than that of the discussion of mining subjects. The experiences of intelligent mine workers, briefly narrated, not only make interesting reading, but are of untold value to readers who are themselves working in the same or other districts. The experiences of men working in gaseous mines and localities is often a revelation to those employed in districts where gas is not known.

We have received this week an important inquiry from a mine worker in the Northwest in reference to starting the fan after an explosion. This question presents a broad field for discussion; it considers the conflict and doubt that exist in the minds of those in charge, immediately after a great explosion, when all is uncertainty, and sentiment and duty run riot in the mind.

In this connection, we recall the words of Sir Thomas Holland, commenting on the tragic death of Mine Inspector W. H. Pickering and quoted in COAL AGE, Aug. 9, p. 203: "The deeds of men are worth more than lives; through their death the spirit of the race lives." The occasion was the explosion in the Cadeby Main colliery, July 9, 1912, in the report of which Chief Mine Inspector Redmayne described the conditions immediately after the explosion as "A race with death."

We hope this discussion will be treated in the broad spirit that it deserves by men who have experienced such moments of doubt and uncertainty when the lives of fellow mine workers were at stake, and all depended on the action of those left in charge. Let the best advice available be given to guide and control those who may be called to similar experiences in the future.

Star-Chamber Methods

The medical profession has been exposed from the earliest days to the criticism of a public unable as a whole to do justice to those whom it would judge. This is true also of other professions, but it must be conceded that the "medicos" have resented such outside criticism more fiercely that any other people, and we think with no greater reason.

This attitude, strange to say, is most obvious in the more competent medical men; the more marked their talents, the more anxious they seem to disguise what they do not know and the more they scheme to screen themselves from the protests of the laymen.

In some recent first-aid meets, the judges have published no demerit list, have announced no percentage markings, have made absolutely no criticisms. They have limited themselves solely to declaring the names of the winners of first and second places.

By this method they have in a way safeguarded their honor at the expense of their usefulness. But the credit of themselves and their order is nothing to the world at large. Their first duty is to care for human life and health and when self-sacrifice is required, to their credit be it said, they recognize the paramount call of humanity. A first-aid man recently stated to us that the doctors were neglecting their duty in not criticizing first-aid work at public meets, for the men who make mistakes in the field will repeat them in the mine. It may not be necessary for purposes of *examination* to reveal the mistakes of the examined, but it is essential to call attention to them if those men are going to perpetrate the same follies in a mine heading or room which they have committed on the drill field.

Let it not be thought that laying themselves open to criticism by an expression of opinion, will degrade the physicians in the eyes of the public. It is true that they will sometimes err, and sometimes criticism will be fierce and unjust, but on the whole, they will gain by coming into the open.

We could leave two blank pages, week by week, to represent the profundities of editorial thought. Many slips, erring judgments, half-lights, snap decisions would doubtless be saved to the public and many a time we should be spared the foolish attacks of people who had given less consideration to the matters at issue than we had expended ourselves. But every week we deliver our judgments, expose ourselves to the line of fire and accept the criticisms openly made or secretly uttered by our readers, and are not either provoked or injured thereby.

We were glad to see that at Gibson, N. M., where in true Western way, men are men and professional dignity is an unknown quality, the judges declared what mistakes were made, laid themselves open to charges of lax judgment and false conclusion and accordingly really did good work.

At other meets we have seen men unrebuked who tried to resuscitate a victim by forcing his arms into the sod, his friends apparently hoping to revive him not by reducing and dilating his chest cavity but by forcing in the insensate ribs of Mother Earth.

The first-aid men are learning fast; they will not patiently accept all that is taught them and discussion will be helpful to teacher and scholar. We believe that first-aid will make more rapid strides here than it has made in England or on the European continent, because the teaching of physiology in the public schools and the discussion of medical subjects in even nontechnical papers has prepared the American people for an intelligent consideration of first aid.

We have unlearned the false modesty of Europe and if our school training has been at times conducted in an incompetent manner and has become hazy with the passing years, there yet remains a nucleus from which great results may spring. The study of physiology in public schools in this country which already is 25 years old, has given the first-aid men of the United States a considerable advantage over the students of the St. John and St. Andrew Ambulance Associations of Great Britain, the illustrious prototypes of American first-aid organizations.

⁂

A Home-Made Expansion Joint

On long steam or air-pipe lines, especially if the work is of a temporary nature, the question of adequate expansion joints is sometimes puzzling. This is especially true where the line is continuous and has no bends or changes of grade.

If no provision is made in a pipe line for expansion and contraction, it is almost certain to do damage, either from breaking its connections, or, as is sometimes the case, actually moving or displacing the machinery to which it is attached.

A makeshift expansion joint can be easily made from three short nipples, two long nipples and six screwed elbows. As ordinarily constructed this puts an offset in the pipe equal to the length of the three short nipples and the six elbows.

Another similar contrivance can be made with two short nipples, one long nipple and four elbows. This, however, necessitates an offset in the pipe equal to the length of the long nipple plus two elbows.

Of course, such an arrangement as has been described is not to be compared with such an expansion joint as a double offset U-bend, but, on the other hand, it can be made easily and is much cheaper. It is also fairly satisfactory, even when considerable expansion must be accommodated.

⁂

Collapsible Stoppings

The question of the efficacy of collapsible stoppings has recently been brought forward, in a paper by Dr. J. J. Rutledge, mining engineer of the Bureau of Mines, now located in Oklahoma. It is argued that the building of light stoppings in entries will prove effective in localizing an explosion of gas or dust, by permitting the free expansion of the gases of the initial explosion, owing to the destruction of these light stoppings by the blast.

The question is a broad one in its bearing on mining practice and is open to argument, on both sides. We would like to ask, however: "Has the Bureau of Mines made sufficient experimentation along this line, and have the results of such experiments been sufficiently satisfactory to warrant advocating the practical application of this theory in coal mining. The question is a good one for discussion, as it admits of arguments on both sides; and we hope that mining men will give their experience and recommendation in regard to such practice.

LEGAL DEPARTMENT

When is Delivery to the Carrier, a Delivery to the Buyer?

By A. L. H. Street*

In instances when a contract to sell coal or other commodity, to be shipped to the buyer, does not fix a place for delivery, the law ordinarily regards delivery to a railway company, or other carrier, for transportation to the purchaser, as a delivery to him, especially if he has designated a particular carrier. The question as to when title passes to the buyer usually arises when the freight is lost or injured in transit, in determining to whom the carrier is liable, and whether the seller is entitled to recover the contract price, notwithstanding the loss or injury. Application of the legal principle above stated, with its important qualifications, is illustrated by the following summary of appellate court decisions, including holdings in cases which arose in the coal trade.

The general rule is that coal is "shipped" when it is put on board the car or vessel in which it is to be carried, and that an agreement to deliver coal f.o.b. is satisfied, and title passes to the purchaser, and the coal is at his risk, when fuel of the quality and quantity called for by the contract is loaded for shipment. (*Massachusetts Supreme Judicial Court, 84 Northeastern Reporter 1020*; *80 Northeastern Reporter 236.*) An important exception to this rule is that title to a shipment does not pass to the buyer until the price is paid, on delivery to the carrier designated by the buyer, where the contract calls for payment on delivery. (*70 Pacific Reporter 1080.*)

The ordinary effect of a purchase of coal "f.o.b. mines" is declared by the United States Circuit Court of Appeals to pass title on delivery of the coal to the carrier. (*172 Federal Reporter 113.*) In the last cited case, it was further held that the fact that sellers shipped coal in their own name did not necessarily show an intent to retain title after delivery to the carrier. Under a contract by a mining company to sell coal to a customer to be delivered on cars at the mines each month, carload lots, which the company loaded and directed a railway company to carry to the purchaser, must be regarded as having been delivered to the customer, as between him and the mining company, though the railway company refused to transport the coal, appropriating it to its own use (*United States Circuit Court of Appeals, 141 Federal Reporter 617*); the buyer's remedy being against the railway company.

It is not necessary that the bill of lading be sent the buyer, in order that delivery to the carrier be constructive delivery to him. (*96 Southwestern Reporter 188.*)

The Seller Is Not Liable for Delay in Delivery

The seller is not liable, of course, for any delay in actual delivery by the carrier to the buyer, in a case where delivery to the carrier is constructive delivery to the buyer. (Case last cited.) Though, in such cases, a theory of agency of the carrier for the buyer arises, there is no such agency as makes the buyer liable to the seller for a misdelivery made by the carrier. (*43 Southeastern Reporter 715.*)

When coal was sold for delivery on board a vessel provided by the buyer, it was held that the seller's right to recover the price was not affected by a proceeding brought by the master of the vessel for demurrage. (*Maryland Court of Appeals, 24 Atlantic Reporter 420.*)

Fuel was sold for delivery at Burlington, N. J., and was carried there in a barge selected by the seller. The shipment arrived at the buyer's wharf too late in the day for unloading, and, during the following night, the barge sank. On these facts, the New Jersey Supreme Court of Errors and Appeals held that, unless the loss was caused by a defective condition of the wharf, it must fall on the seller, who was responsible for the condition of the barge and the manner in which it was handled, until the buyer had reasonable time in which to inspect and remove the coal. (*23 Atlantic Reporter 686.*)

Under a contract to ship coal from Belleville, Ill., mines via a certain railroad, the parties knowing that St. Louis was the nearest point to which that line extended, delivery to the only carrier to which delivery could be made was held by the Kansas City Court of Appeals to constitute delivery to the buyer. (*120 Southwestern Reporter 658.*)

When a buyer agreed to furnish vessels to carry coal to be delivered thereon by the seller in monthly installments of 2500 tons each, it was decided that there was no delivery of any part of an installment until the whole was loaded; and, in another case, it was held that under a contract to sell a full boatload of coal slack, title to the fuel did not pass to the buyer as fast as the slack was put in the boat in the course of filling it. (*33 Federal Reporter 552.*)

When Shipment Is Consigned in Name of Seller

If the seller consigns the shipment in his own name, he is presumed to have intended to retain title in himself, and, on loss of the freight in transit, will not be heard to say that delivery to the carrier was delivery to the buyer; and, according to a decision of the Nebraska Supreme Court, prepayment of freight charges warrants an inference that the seller intended to reserve title pending transportation, though it was also held, in the same case, that the mere fact that the seller agreed to see the shipment f.o.b. at the buyer's place of business did not retain title in the seller after delivery to the carrier; that agreement being treated only as a promise to pay the freight charges to the destination. (*74 Northwestern Reporter 670.*)

Under shipments to the shipper's order, delivery to the carrier is not delivery to the buyer, unless the bill of lading is delivered to the latter. (*39 Southern Reporter 722.*)

SOCIOLOGICAL DEPARTMENT

Lehigh Valley Coal Co. Meet

Special Correspondence

The second annual first-aid contest among the champion teams of the six divisions of the Lehigh Valley Coal Co. was held at Hazle Park, Hazleton, on Saturday, Sept. 13. Over five hundred employees of the company were in attendance. The principal prize was a large, handsome gold-lined loving cup, which was awarded to the Packer No. 5 Inside Corps last year. This cup is to be awarded year by year until some corps has won it three times, when it will become the permanent property of that team. In addition to this prize, the company will send the winning team and the two men who made the best scores in the one-man event, to the American Mining Congress, in Philadelphia, in October, the men to be the guests of the company and to represent it in the contests.

The divisions were represented by the following teams, all of which had demonstrated their fitness for the honor in a series of preliminary contests: Lackawanna division, Westmoreland colliery; Wyoming division, Franklin colliery; Lehigh & Coxe division, Deringer No. 1 slope; Mahanoy & Shamokin division, Packer No. 5 colliery; Delano division, Primrose colliery; Pottsville division, Blackwood tunnel. Doctor Lathrop, of the Hazleton State Hospital, and Doctor Shafer, of Kingston, were judges, with Atherton Bowen, of Wilkes-Barre, as field chief.

Captains of First-Aid Teams

Doctors Judging Franklin Team

The events were as follows:

Two-man contest. Compound fracture of right arm midway between shoulder and elbow; severe laceration of back of left hand and fingers.

Three-man contest. Simple fracture of nose, punctured wound of left eye, and simple fracture of left collarbone.

Four-man contest. Severe burns of face, neck and shoulders: patient suffering from shock; left hand and forearm slightly burned. Full-team event. After a fall of rock, the patient is found with the following injuries: Simple fracture of right forearm, both bones; severe cut in palm of right hand, bleeding in jets; simple fracture of left thigh just below the hips.

One-man event. Patient is found with a severe cut on the right temple, unconscious in bad air. The air 50 ft. away is good. Use contents of first-aid package only.

The Deringer team won the cup and the trip, with a percentage of 97½, but the closeness of the competition can be judged from the scores made by the other teams; Franklin, 97⅜; Packer No. 5, 97⅛; Westmoreland, 96⅞; Primrose, 96¾; Blackwood tunnel, 96½. The one-man event was won also by the captain of the Deringer team, Simon Fellin, with a score of 99. Captains Morris, of Westmoreland, and O'Neill, of Franklin, tied for second in this contest with a score of 98. Since the captain of the winning team was also the winner in the one-man event, and the two other men were tied for second place, Mr. Bowen, in behalf of General Manager Chase, of the Lehigh Valley Coal Co., announced that Messrs. Morris and O'Neill would both accompany the Deringer team to the Philadelphia meeting.

First-Aid Team from Deringer No. 1 Slope. Winners of the Contest

After the second contest, an excellent dinner was served by J. J. Becker, of Wilkes-Barre. Among the prominent men present at the meet were General Manager F. M. Chase, mining superintendent Thomas Thomas, general manager A. B. Jessup, of the Markle Coal Co., division superintendents W. D. Owens, J. H. Haertter, W. H. Davies, Thomas R. Jones and G. P. Troutman.

The competing corps were composed of the following men: Westmoreland, James H. Morris, captain, Edward Reap, Thomas Ridgely, Walter Jacoby, Joseph Johnson, Fred Halpin, subject.

Franklin, John O'Neill, captain, Edgar Boston, William Morgan, Harry Thomas, Hugh Owens.

Deringer No. 1 Slope, Simon Fellin, captain, Joseph Fellin, Henry Poncari, Isaac Morgan, Leon Poncari, Thomas Gibson, subject.

Primrose, Anthony Gluding, captain, Henry O'Donnell, Joseph Maher, Daniel Lewis, Joseph Blum, Daniel Jenkins, subject.

Blackwood Tunnel, Williams Adams, captain, Ray Clemens, Ralph Parr, Henry Krise, John Rhoads, John Lipsback, subject.

Packer No. 5 Shaft, John McLain, captain, Charles Calvert, Joseph Kerwin, Henry Carey, John Sheridan, Thomas Brown, subject.

The penalties enforced in the contest were those recommended by the American Mine Safety Association at its first meeting with an additional count entailing 5 demerits for improper bandaging.

The penalties enforced in the contest were those recommended by the American Mine Safety Association at its first meeting, with an additional count entailing 5 demerits for improper bandaging.

⁂

Gibson First-Aid Contest

By Tracy Garrett*

Only three points separated, the four teams in the second annual first-aid contest of the Victor-American Fuel Co.'s New Mexico division. The meet was held Aug. 17, and was probably one of the most successful ever held in New Mexico. The amphitheater of the company's athletic park, where the contest was held, was crowded, not only with the employees of the company and their families, but with the Atchinson, Topeka & Sante Fé Ry. Co.'s men, brought by Agent Purdy, of Gallup, to witness the events.

Weaver Mine Team Which Received Cup
(Team lifting injured man over props representing a fall. Ropes mark roof of entry.)

The judges were C. S. Stevenson and A. A. Flynn, from the U. S. Bureau of Mines mine-safety car, which happened to be at Gibson at the time. State Mine Inspector Beddow served as time keeper. The government men were enthusiastic in praise of the work done by al of the competing teams and, in making the award of a handsome silver loving cup, presented by the Victor American Fuel Co., Mr. Stevenson called attention to th closeness of the score and to the difficulty in making th decision.

Four teams competed, representing the Weaver, Hea ton, Navajo and Bartlett mines. The final standing o the teams was: Weaver, 93; Navajo and Heaton tie with 92, and Bartlett 91. Each of the mines was repre sented by a team captain and four men. An interesting feature was the Navajo team, composed entirely of Jap anese miners, with the mine boss as captain. Severa

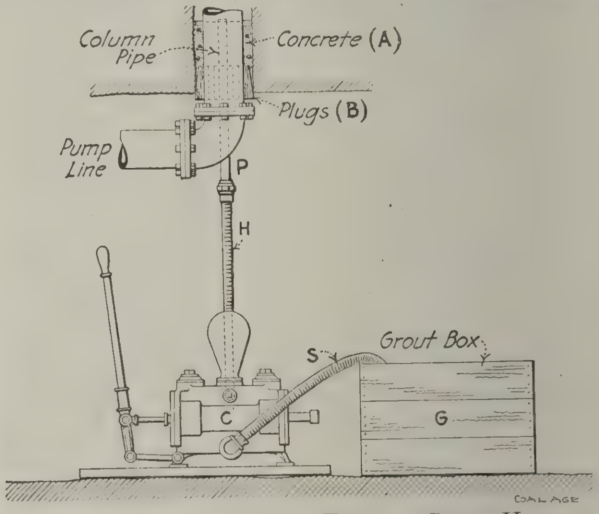
Y READERS

to pour cement grouting into the space surrounding the pipe, from the surface above. This method has generally proved unsatisfactory, owing to the air entrapped in the hole preventing the grouting from filling the space.

I want to suggest a method that I believe is simple and effective, for grouting the lower end of the pipe. By its use, a practically air-tight joint can be secured between the casing and the strata. Referring to the accompanying figure, the space around the casing, at the



Grouting the Lower End of Bore Hole

bottom of the hole, is plugged with wooden plugs, i the usual manner. The grouting is made by mixing several sacks of good hydraulic cement with sufficient water so that it will flow readily through the handpump show in the figure. The grouting is mixed in the box (*G*) which is also shown, at the bottom of the drill hole. short pipe (*P*), 1 or 1½ in. in diameter, connected t the discharge of the pump cylinder (*C*) by a flexibl hose (*H*), is run up through the plugs (*B*) surroundin the casing. This pipe is extended from 18 in. to 2 f above the top of the plugs. Another short section o wire-wound suction hose (*S*) leads from the box to th pump and forms the avenue by which the grouting i drawn into the pump.

By this arrangement, the grouting is readily pumpe from the box into the annular space (*A*), above th plugs and surrounding the pipe. When sufficient grouting has been pumped into this space, and while the pum is still in operation, the pipe is gradually withdraw from the hole and a wooden plug quickly inserted in it place to prevent the grout from flowing out of the hol before it has set. After giving the grouting sufficien time to set, the borehole should be thoroughly groute from the surface. If the best portland cement is use in preparing the grouting, there will be no trouble experienced by reason of leaky joints. I have seen severa holes grouted, in a manner similar to that describe and none of these holes have given any trouble.

Pennsylvania Engineer.

Stockdale, Penn.

Cleaning the Coal

I was interested in reading the article on "Cleaning Coal," by Josiah Keely, COAL AGE, Aug. 30, p. 296. In some districts, when the mines are running at full capacity, neither the operators nor customers are as particular about having the coal thoroughly cleaned by the miners, as when orders are scarce and the work is slack.

Since miners as well as operators are always anxious for steady work and like to have the mines run regularly, it seems to me it would be of advantage for the miner, sometimes, to see and to know the complaints that are made to the company by their customers. This might induce the miner to take more pains to clean his coal properly when loading his cars. If miners could see some of the letters that are received from customers, complaining of dirty coal, they might not be so anxious or ready to "slip one over" on the company, by the many practices known to them, such as breaking up and wetting the bone coal. In some mines this has been quite a common practice among a certain class of miners who do not seem to know or realize that, by so doing, they injure themselves and the company who employs them.

I have never seen such letters of complaint posted, but think the suggestion would be worth trying.

GEORGE N. LANTZ.

New Straitsville, Ohio.

Save the Timbers

I have noticed numerous references to the drawing of mine timbers, as the working faces advance; and was much interested in the letter by Charles Waine, on "Shooting Mine Timber," COAL AGE, Aug. 2, p. 171. The practice of shooting mine timber is a bad one, and should never be used where it is possible to draw the timbers and use them again.

My experience in buying the timber supply for mines has taught me how much can be saved by using the old timbers, many of which can be used two or three times, with proper care. The amount of timber ordinarily used in a mine employing, say 150 or 200 men, is very large. Now, if two-thirds of the timber used in such a mine can be used a second time and another portion a third time, it is easy to see that an immense saving can be effected. In some mines the timber bill is a large item, and if this can be reduced one-third or one-half by using the mine posts two or more times, it means a large reduction in the operating expense of the mine.

Every miner should be as much interested in saving the timber, which the company brings to his place free of charge and which enables him to protect himself while at work, as though its loss was his own.

JOHN SUTTON.

Terre Haute, Ind.

⁂

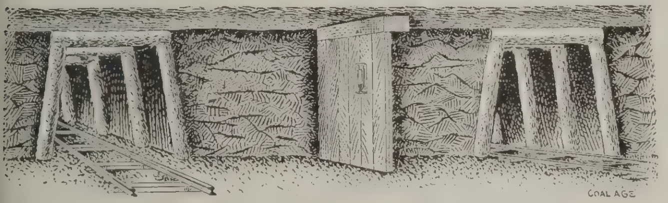
Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

The Water Gage in the Mine—As used in the mine, the reading of the water gage shows the difference of pressure between the intake and return airways, at the point where the reading is taken. The intake pressure is always greater than the return pressure and this excess or difference of pressure is what moves the air or creates the current.

The use of the instrument is clearly shown in the accompanying figure, which shows two parallel airways going into the mine, one of these being the intake and the other the return airway of that section of the mine. It makes no difference on which side of the brattice the instrument is placed; the water will always be depressed in that arm of the gage which is open to the intake, because the pressure on the intake is always greater than that on the return airway.



SHOWING POSITION OF WATER GAGE BETWEEN INTAKE AND RETURN AIRWAYS

What the Water Gage Shows—The water-gage reading indicates the ventilating pressure required to circulate the air, and is therefore equal to the resistance of the airways between the two points on the intake and the return; or, in other words, the resistance inby from the point of observation. The nearer this reading is taken to the head of a pair of entries, the closer it will approach zero, while at the next to the last crosscut it would be practically zero.

The use of the water gage in mining practice is of great importance. In connection with the observed velocity of the air, it shows the "power on the air" or the power producing the circulation. What is required in the practical ventilation of a mine is the production of the necessary velocity and volume of air, with the smallest expenditure of power. The most economical circulation is obtained when the required air volume is circulated by the least power, which means a comparatively low water gage.

The circulation of a comparatively large quantity of air under a low gage indicates ideal economic conditions, as far as the circulation is concerned. On the other hand, a small air volume and a comparatively high water gage shows a needless waste of power. In practice, an unusual reduction of the quantity of air passing in a mine or entry, accompanied by a similarly uncommon rise of gage pressure would indicate an obstruction of the airways.

The Coal Age Pocket Book

VELOCITY

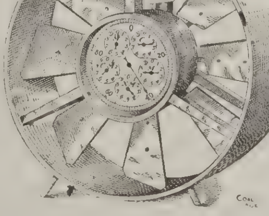
The velocity of the air current is one of the most important factors in the practice of mine ventilation. If the velocity of the air current is too low the ventilation of the mine is inefficient, as the air will not sweep away the accumulating gases from their lurking places in the mine. On the other hand, if the air moves with too great a velocity, not only do the workmen suffer inconvenience; but the high velocity of the current is often dangerous.

Danger of High Velocity—A rapid air current carries a great quantity of dust, and, by supplying large quantities of oxygen, maintains an unnecessarily active condition of the mine atmosphere that favors the ignition of the gas and dust. The high wind creates a draft that greatly intensifies the flame of lamps or of a blast of powder and increases the possibility of ignition.

How Velocity is Estimated—In mine ventilation the velocity of the ventilating current is commonly estimated in feet per minute, or feet per second.

How Velocity is Measured—A simple method of ascertaining, with more or less accuracy, the average velocity of the air current passing in an airway is to measure off a distance of, say 300 ft. along a straight portion of the airway; and note the exact time between the observed flash of powder at one end and the smell of smoke at the other end of this distance. The distance (300 ft.) divided by the time will give the velocity of the air in the center of the entry. The average velocity of the current may then be taken as $^4/_5$ of this observed velocity. For example, if the observed time is 30 sec., the center velocity is $300 \div 30 = 10$ ft. per sec.; and the average velocity $^4/_5 \times 10 = 8$ ft per sec. or $8 \times 60 = 480$ ft. per min.

The Anemometer—The common method of measuring the velocity of the air in airways is by the use of the anemometer, which is shown in the accompanying figure. The dial hands record the number of revolutions of the vane. The instrument is so calibrated that each revolution of the vane corresponds to 1 ft. of air travel. The reading of the dial, therefore, shows the distance the air traveled during the time that the instrument was exposed to the current. Hence, this reading divided by the time of exposure, in minutes, will give the velocity of the current in feet per minute. A single revolution of the large hand corresponds to 100 revolutions of the vane. The small dials register the total reading.



THE ANEMOMETER

INQUIRIES OF GENERAL INTEREST

Starting Fan after Explosion

Assume that an explosion occurs in a mine generating large quantities of methane. The coal is highly inflammable and the mine dry and dusty. From the dry condition of the timber and the inflammability of the coal, it is highly probable that numerous small fires have been started by the explosion, in different parts of the mine. Suppose, moreover, that the ventilating fan is so badly damaged by the force of the blast, that it is necessary to make extensive repairs before it can be again started.

Under ordinary circumstances, dangerous quantities of gas will accumulate in different parts of the mine, during the time the fan is idle. There is, besides, now, the probability that carbon monoxide has been produced by the explosion. The amount of damage done in the mine and the condition of the stoppings, brattices, etc., are unknown and can only be surmised.

Under these conditions, would it be advisable to start the fan, after making the necessary repairs, without first ascertaining, as far as it may be possible, the condition of affairs underground? Would not the starting of the fan, without making a preliminary examination of the mine, incur the risk of a second and more disastrous explosion?

RALPH W. MAYER.

Roslyn, Wash.

While the question proposed by correspondent is practical, it assumes the worst condition that could possibly exist. No one familiar with the assumed conditions in this mine will deny for a moment that a second and more disastrous explosion is liable to occur, whether the fan is or is not started. It may be admitted, however, that the danger will be somewhat greater when the fan is first started. The question calls for the exercise of the best judgment by those in charge. If men are in the mine, the hope and possibility of rescue demand that a reasonable risk be assumed. On the other hand, the uncertainty of rescue as compared with the strong probability of further disaster may make any attempt to enter the mine at once, a foolhardy sacrifice of life. On such occasions, sentiment is strong, but good judgment aided by experience should rule.

In answer to the question asked, we would say if rescue work is to be attempted at once, it would be safer not to start the fan, but to organize a rescue party of experienced men equipped for entering a gaseous atmosphere. This would require the use of breathing apparatus and safety lamps. If it is found on investigation that further attempts at rescue are impracticable, all should withdraw from the mine and the fan should then be started, very slowly at first, so that the result can be closely watched. It would not probably be advisable, in that case, to make any attempt to enter the mine for several hours after starting the fan; but this can only be determined by the observed results. In any case, we would not advise a strong circulation of air. It must be remembered that the air current, for the most part, is probably only traversing the entries, and the volume of the air should be gaged accordingly. The upcast current should be watched closely for any indication of fire below.

This question presents many phases worthy of discussion; and we hope to hear further from a large number of practical mining men who have had experience in rescue work and in the later investigation of mine explosions. Anyone of any heart realizes that it is a difficult matter to lay aside sentiment and to turn a deaf ear to the pleadings and demands of those whose only hope for the rescue of dear ones lies in the efforts of brave heroic souls who are willing to sacrifice even their own lives in a possibly forlorn hope of saving others. Let this question be thoroughly discussed.

⁂

Fire on Intake

Some time ago a fire broke out in one of the old rooms, in the mine where I am employed. It was decided to seal off this fire and, to do this, it was necessary to build air-tight stoppings in the necks or mouths of five rooms.

When this work had progressed a few days, the company wanted coal for local trade and were desirous to have the miners go in and load this coal. In the meantime, the fire boss had reported fires on the third southeast entry as "giving off fumes;" but signed the book "O.K." The miners went into the mine, but had to come out again in less than an hour, because of the gas from the fire. Some of the men were sick and went to the doctor at once.

The mine committee, with the mine manager, mine examiner and superintendent then went into the mine to examine the firewalls that were built to seal off the fire and confine the gases. The committee were composed of old, practical miners, one of them an experienced gas man. They found stoppings that were built of concrete leaking badly at the top. The first of these showed a crack 2 in. wide and 8 ft. long, while the second showed a crack 1 in. wide and 10 ft. long. Smoke and gases were coming from both of these cracks.

The examiner's report showed a current of 2400 cu.ft. in the intake of this section, and 3000 cu.ft. in the return, an increase of 600 cu.ft. They still tried to get the miners to go in to work, claiming that the mine was safe and the gas given off would not hurt anyone. Normally, this mine registers about 30,000 cu.ft. of air at the foot of the downcast; but the air courses were, in places in such shape that the miners had to crawl on their hands and knees to get through them. It was estimated by those working on the stoppings, that the top coal, 18 in. thick, was burning over a space 20 ft. wide and 20 ft. long.

Kindly state if this mine was operated in compliance with the mine law.

A MINER.

Farmersville, Ill.

The Illinois state mining law would not allow the operation of a mine under the conditions named above.

N QUESTIONS

[redacted]

Ques.—In mines where undercutting is done, would you adopt the same method of blasting the tight side of rooms and entries, in all thicknesses of coal seams? Explain fully.

Ans.—In mining a thick seam where the coal is undercut, it is common practice to put in what is called a "rib shot," to cut the tight side. The thickness of the seam gives such a shot greater opportunity to work and break the coal. In the mining of a thin seam, it is safer practice to blow down the center coal first, as a rib shot, in this case, would probably prove a very tight shot and might cause trouble by blowing the tamping. In any case, much will depend on the shooting quality of the coal.

Ques.—How should props be placed if the top is soft and the bottom hard?

Ans.—With a soft top and a hard bottom, a systematic method of timbering should be adopted, the props being stood in rows and long cap pieces used against the roof. The distance between the rows and the distance of the posts apart will be determined by the character of the roof.

Ques.—In what position should a prop be stood in a flat seam in order to best resist the roof pressure?

Ans.—Post timbers, in a flat seam, should be set perpendicular to the roof and floor, unless some slip or other peculiarity of the roof formation makes it advisable to give the post a slight inclination to enable it better to support the tendency of the roof to slide or creep.

Ques.—How should a post be set in a moderately inclined seam?

Ans.—The post should be "upset" or given a slight inclination up the pitch, the amount the post is thus inclined to depend on the degree of the pitch of the seam. In this position, the tendency of the roof to slip downhill will act to tighten the post.

Ques.—How many gallons of water will a pump discharge that has a 14-in. cylinder, a 4-ft. stroke, and makes 200 strokes per minute? Find the discharge in gallons per minute.

Ans.—The sectional area of the pump cylinder is $0.7854 \times 14^2 = 153.96$, say, 154 sq.in. The piston travel is $200 \times 4 = 800$ ft. per min. The cylinder displacement, in this case, is $154 \times 800 \div 144 = 855+$ cu.ft. per min. In practice, the water end of a pump is commonly assumed to have an efficiency of 85 per cent., making the actual discharge 85 per cent. of the cylinder displacement, or, in this case, $0.85 \times 855 \times 7.48 = 5436$ gal. per min.*

Ques.—How many mine cars would be required to operate a mine having an output of 1500 tons of mine-run coal, per day of eight hours; the cars having a capacity of 2 tons mine-run coal per car; and allowing a period of 2 hours' time for each car to be loaded, hauled to the tipple, emptied and returned to the working face?

Ans.—Allowing 2 hr. as the time required for a car to be hauled to the tipple, emptied and returned to the face, assumes that each car in the mine can make four trips daily, provided the coal is loaded promptly. This would then represent a tonnage of $1500 \div 4 = 375$ tons, carried to the tipple by the cars in 2 hr., each car making a single trip. The capacity of the mine cars being 2 tons each of mine-run coal, the number of cars required would be $375 \div 2 = 187.5$. Since there are always a certain number of cars laid up for repairs and otherwise idle, there should not be less than 200 cars provided for the operation of this mine.

Ques.—Name the different conditions under which you would advise the single-, in preference to the double-entry, system.

Ans.—The single-entry system should never be used, in the development of a mine of any size or importance. In case of a fall of roof in the rooms, which is liable to occur at any time, the circulation of air would be entirely blocked, in the use of the single-entry system.

---

*Note—The speed given for this pump is from six to eight times its normal speed. A pump of this size would ordinarily make from 30 to 40 strokes per minute, and probably discharge from 800 to 1000 gal. per min.

COAL AND

Washington, D. C.

In amending the House draft of the tariff bill the Senate sitting in committee of the whole has inserted in that measure an important provision relating to coal. The provision consists of language including coal under certain conditions in the list of articles upon which the President is authorized to impose special duties for the purpose of retaliating against any country which may not accord to the products of the United States the equal and reciprocal treatment to which he believes they are entitled. A part of the general language preceding the coal paragraph and applicable to it which is now included in the draft of the bill is as follows:

That whenever the President shall ascertain as a fact that any country, dependency, colony, province, or other political subdivision of government imposes any restrictions, either in the way of tariff rates or provisions, trade or other regulations, charges or exactions, or in any other manner, directly or indirectly, upon the importations into or sale in such foreign country of any agricultural, manufactured, or other product of the United States, which unduly or unfairly discriminates against the United States or the products thereof; or whenever he shall ascertain as a fact that any such country, dependency, colony, province, or other political subdivision of government imposes any restriction or prohibition upon the exportation of any article to the United States which unduly or unfairly discriminates against the United States; or whenever he shall ascertain as a fact that any such country, dependency, colony, province, or other political subdivision of government does not accord to the products of the United Statse reciprocal and equal or equivalent treatment, he shall have the power and it shall be his duty to suspend by proclamation the operation of the provisions of this Act relative to the rates of duty to be assessed upon the importation of the following specified articles, or such of them as he may deem just and applicable, and to substitute therefor the rates of duty hereinafter prescribed upon such articles when imported directly or indirectly from such country, dependency, colony, province, or other political subdivision of government.

Following this comes the list of articles with reference to which retaliatory powers are given to the President. Coal is provided for in the following terms:

On coal, bituminous and shale, 45c. per ton of 28 bushels, 80 lb. to the bushel; coal slack or culm, such as will pass through a half-inch screen, and briquets of which coal and coal dust is the component part of chief value, 15c. per ton of 28 bushels, 80 lb. to the bushel.

And the President may provide for drawbacks for the refunding of the duty paid upon any such coal, culm or slack imported for the purpose of being used for fuel upon vessels propelled by steam and engaged in trade with foreign countries or between Atlantic and Pacific ports of the United States and which vessels are registered under the laws of the United States.

That whenever the President shall ascertain as a fact that such restriction or prohibition or lack of accord of reciprocal and equivalent treatment has ceased, he shall have the power and it shall be his duty to revoke such proclamation, whereupon the articles covered thereby, when imported from the place mentioned therein, shall pay the rates of duty otherwise provided by law. But this provision shall not be applicable beyond the period of three years after the date of the passage of this Act unless Congress shall otherwise prescribe.

West Virginia Hearings Are Concluded

The hearings have been concluded before the senate committee investigating the West Virginia coal strike situation at Paint Creek, but without developing much real additional information. The hearings held some time ago in the West Virginia district itself appear to have developed about all that the committee was able to bring out, and the recent testimony has been chiefly concerned with sustaining or rebutting the statements which were brought forward at that time.

It would seem that the materials in the hands of the committee three weeks ago have been but little added to, although there have been some interesting exhibits filed which may shortly be published. It is believed that a report on the situation may before long be made public, and this, it is supposed, will sharply take sides in regard to the matter. The exact content, of course, is not yet even tentatively known, but the prediction is strongly made in well informed quarters that there will be a sharp drift toward the side of the miners owing to the fact that several members of the committee have already indicated a strong bias in that direction.

That there will be any disposition in the Senate to take action of a definite kind based upon the findings of the committee is not generally believed, it being the view of most

companies is upheld by the courts.

At the meeting to be held shortly at Shenandoah the ques tion of docking and the "check-off" will be thrashed out wit President White. All those affected by the docking bill ar standing behind the efforts of the union officials.

The Question of Railroad Passes

The Public Service Commission of Pennsylvania has de cided that, for the present it will not require public-servic companies to file tariffs or schedules with the commissio but will be satisfied with the posting of them in their of ficies and stations in the form required by the Interstat Commerce Commission. Companies not subject to the Inte state Commerce Commission will adopt similar forms of ta iffs and schedules and publish and post them in their office All companies are required to keep a copy of each tariff schedule in their principal office.

With respect to the applications now pending for the a proval of contracts, the Public Service Commission will ho hearings in all cases on Oct. 8, of which due notice will given by publication in the localities affected. General rul and regulations governing the making of applications, t publication of the time and place of hearing and the di position of the applications are being promulgated by t commission.

The commission will not before Jan. 1, pass upon t question as to the right of railroad companies granting fr passes to their employees. The act creating the commission does not become effective until that time, and prior to the new year the commission has authority only to dispose of the unfinished business of the old Railroad Commission and to determine questions relating to contracts between utilities and municipalities.

The question of railroad passes has caused a stir throughout the state since the passage of the new Public Service law, as many who have studied the act are of the opinion that under its provisions railroad employees cannot be granted the courtesies which are now extended to them. This is of importance to the coal industry especially since many of the officials of the larger coal companies now receive railroad passes.

PENNSYLVANIA

Anthracite

Scranton—Subsidence of the surface, due to mining operations under the city still continues to be evident and in at least one instance, concrete piling has been resorted to, to prevent damage to buildings.

Mt. Carmel—Philip Hughes and Felix Crusinsky, assistant fire bosses at the Pennsylvania Colliery, were badly if not fatally burned Sept. 10 by an explosion of gas in a tunnel they were examining. The men were alone in the mine at the time. Hughes managed to find his way to the surface and summoned a rescuing party.

Pittston—At a recent fire drill at the Pennsylvania No. 6 Colliery, at Pittston, the 187 men and boys employed about the breaker and washery were out of the buildings and in the yard in one minute and ten seconds after the sounding of the alarm, and in two minutes and four seconds there were five lines of hose in active play, with a pressure of 140 lb. per sq.in. This was more than sufficient to carry the streams from the lower yard to the top of the breaker.

Shamokin—During the past week the Susquehanna Coal Co. opened the bath houses in the Shamokin district for the first time and the miners on coming out of the mines went under the showers and proceeded home looking like bank clerks.

Plymouth—The proposed proceedings of the Borough of plymouth against the Plymouth Coal Co. to restrain the mining of coal was postponed by agreement, pending an investigation by mine inspectors, and 60 days was allowed for a thorough inspection of mining conditions in the borough.

Bituminous

Uniontown—Through a deal just completed, L. B. Hawkins, of New Castle, has sold to J. V. Thompson 100 acres of land in Greene County which is underlaid with coal. The land was sold at $600 per acre. For several years past efforts have been made by the coal people to purchase the land, but it was not until this week that the deal was finally completed and the land disposed of.

Cresson—A number of coal operators have approached state authorities in an effort to purchase valuable coal holdings that underlie the new Tuberculosis Hospital at Cresson. The coal was formerly owned by Andrew Carnegie who deeded it to the state when he gave the large tract of land to the State of Pennsylvania for the erection of the new sanatarium.

Beaverdale—More than 200 miners employed by the Pennsylvania Coal and Coke Corporation struck recently because they allege the mine foreman discharged several men that he might employ others to do contract work. President Watkins is expected from New York to confer on the matter.

Boswell—A new mine opening said to be one of the largest shaft openings ever planned in the western part of the state is about to be started near here by the Consolidation Coal Mining Co.

Latrobe—Phillip Stump aged 65 years, night fire boss at the Atlantic mine of the Atlantic Crushed Coke Co. was found dead in the mine. The man was resting on a bench when death, due to heart failure, overtook him.

WEST VIRGINIA

Charleston—Alleging that the Paint Creek Colliery Co. had failed in its promise to dismiss a company physician employed during the recent labor trouble, 500 miners employed in and around Mucklow struck Sept. 12.

A unique and valuable feature of the first Fayette County fair, which will be held at Oak Hill, West Virginia, during the week of Oct. 6 to 11, will be one of the United States Government mine rescue cars equipped with all modern life-saving and rescuing apparatus for use in coal mines.

The differences between the miners and their employees at the works of the Seng Creek Coal Co. in the Coal River field were settled Sept. 10 by a conference between a committee of miners and the president of the company. By this settlement, the price for mining coal in the low veins is advanced from 26c. to 30c.

Bluefield—It is estimated that there are jobs for 2500 men in the Pocahontas region. It is impossible to get miners to perform the work necessary in filling the increased demand. Throughout this region, able-bodied men can earn from $90 to $125 a month or even more.

TENNESSEE

Isoline—The Clear Creek Coal & Lumber Co., of Isoline, Cumberland County, Tenn., recently filed a voluntary petition in bankruptcy, scheduling liabilities of $70,000, with assets of the alleged value of $212,000. The principal creditor is L. A. Pugh, who is trustee under a bond issue of $50,000, secured by property listed at $200,000. The company controls 6500 acres of coal and timber land in Cumberland County, encumbered by the trust deed referred to, as well as other property.

KENTUCKY

Jenkins—A survey of the Baltimore & Ohio is nearing completion from the Elkhorn Fuel Co.'s workings on Beaver creek to Jenkins, Ky., a distance of 35 miles, and it is said that a contract is to be let at once for the construction of the line. This road will be one of the heaviest pieces of railroad work in Eastern Kentucky.

Somerset—A recent fire at Somerset, Ky., did considerable damage to the town, the total loss amounting to $20,000. The office of the Crain Coal Co. was among the business houses destroyed.

Hindman—The interests known as the Litts Syndicate are said to have bought up recently several thousand acres of rich coal and timber land lying along Carr's Fork, in Knott county, immediately beyond the Letcher county line, completing a tract of about 10,000 acres in that section under control of these interests. It is said that a branch of the Lexington & Eastern will be built up Carr's Fork a distance of 15 miles in order to reach the tract.

Middlesboro—The long-continued drouth in Bell County and southeastern Kentucky generally is reported to have forced a number of mines to cut down their operations to half-time, on account of their inability to secure sufficient water for their boilers. At one mine in the county it requires two days of pumping to secure sufficient water for half a day's operation. Recent rains have helped somewhat, and the season has now arrived when ample precipitation to relieve this condition may be expected.

OHIO

Columbus—Judge E. B. Kinkade, of the Court of Common Pleas in a decision handed down recently declined to interfere with the rates established by the Ohio Utilities Commission a year ago on Hocking Valley coal between Nelsonville and Toledo. The rate was cut by the Utilities Commission and the Hocking Valley R.R. Co. tried to have it rescinded. The railroad company contended that the rates established by the commission were unreasonable and unlawful as they did not allow the railroad company a fair profit.

The commission named by Governor Cox, of Ohio, to investigate conditions surrounding payment for coal mined, took a vacation during the past week. All of the members attended to their private affairs and have arranged to take up the work again next week. The commission spent a week investigating conditions in the Springfield district of Illinois and also met with a number of operators in Chicago. A day was spent at the docks of Milwaukee to see the condition of the coal as it comes off the freighters.

INDIANA

Terre Haute—Miners here have an understanding among themselves that if the train that takes them home each evening across the Wabash River is more than 20 minutes late they will not go to work next day. One day recently the crew was late. The railroad officials made satisfactory explanation to the miners, however, and they agreed to go back to work. Next morning 900 men filled the cars. The switching crew did not know of the arrangement and being delayed did not take the trouble to couple on to the waiting cars, believing that they were empty, and proceeded to the mines with a couple of cars the locomotive already had in tow. It will take the railroad commission to settle the trouble caused by the misunderstanding.

Seelyville—The Rosebud Mine of the Vandalia Coal Co. closed Sept. 10, throwing more than 250 men out of employment. Although all of the coal has not been removed, there is considerable danger in mining it.

ILLINOIS

Chicago—With only a few days remaining before they were expected to face trial on rebating charges, the O'Gara Coal Co., the Harrisburg Big Muddy Coal Co., and the Harrisburg Saline Collieries Co., filed a petition of insolvency and asked for receivers on Sept. 13. Judge Carpenter, to whom the application for a receiver was made, appointed Thos. J. O'Gara, president of the O'Gara Co., and Fred A. Busse, former mayor of Chicago, to take charge of the properties of the three companies.

Virden—Two miners were seriously burned and another less severely in a gas explosion Sept. 8, in the mine of the Glenridge Coal Co. Some time ago a fire broke out in one of the entries, which was subsequently walled up to smother the flames. An attempt was made to open up the entry and get out a mining machine which had been walled in and the explosion followed.

O'Fallon—The record for hoisting coal in the St. Clair County field the past year is held by the St. Louis & O'Fallon Coal Co.'s No. 2 mine, where 4056 tons were hoisted in 6¾ hours, which is at the rate of 601 tons an hour. Failure to complete the eight-hour run was on account of no cars. During the past year the Suburban Railway handled the greatest amount of St. Clair County coal into East St. Louis, and St. Louis, the account being 854,983 tons, the product of four mines. The St. Louis & O'Fallon R.R. hauled 848,704 tons from its two mines.

Taylorville—The miners employed in the No. 6 mine of the Springfield Coal Mining Co. went on strike Sept. 13, because of a dispute over the weighing of coal. The limit of 3500 lb. on each car was removed recently, since which time there has been more or less trouble over the weights. The difficulty is not regarded as serious, and it is expected that the men will soon return to work.

Springfield—At the present time the mines in this district are doing better than they have since early spring. Some of the coal companies are, however, advertising for more miners.

TEXAS

Bridgeport—The coal mines in this vicinity are now operating full time after two months of light running.

Slaton—A coal mine yielding lignite which was worked 33 years ago near Slaton, is to be opened up on a commercial scale, it is hoped, at an early date, by Colonel A. B. Robertson, owner of the famous "V" ranch, on whose land the mine is located.

COLORADO

Trinidad—John R. Loft has stated that the rumors of an immediate call for a strike in the southern Colorado coal fields were unfounded. He says the leaders of the union are optimistic and hope that the operators will meet the miners, and that a satisfactory agreement may be reached.

OREGON

Eugene—A bed of coal has been found in the hills three miles south of Eugene by H. A. Mitchell and E. G. Wilfert, who own a small tract of land there. Samples of the coal have been brought to Eugene and indicate a good quality. If investigations prove satisfactory, mining operations will follow.

Squaw Creek—Representatives of the U. S. Geological Survey have been in this field for the past six weeks, making an extensive examination of the coal in this section. This appears to be a promising coal field and awaits only transportation to make the fuel available. The field, which lies in the mountains 40 miles west of Grant Pass, is inaccessible at present, although a railroad has been surveyed through it. It is presumed that the promoters of the survey are the people who filed on the coal lands, as 9000 acres had been filed on before the lands were thrown into the national forest by former President Taft.

FOREIGN NEWS

Sydney, N. S.—The output of the Dominion Coal Co. for August amounted to 425,635 tons, as compared with 409,125 tons in the same period of 1912. The highest previous output was in October last, when 422,343 tons were mined. The output for the seven months previous to Sept. 1, 1913, was 2,720,765 tons, as compared with 2,533,283 tons last year, or an increase of 187,482 tons.

PERSONALS

Henry D. Jackson, consulting engineer, at 88 Broad St., Boston, sails Sept. 20 for Bermuda on a three months' trip for rest and recreation.

John Lynn has leased the Sherrill coal mine at Blanco Okla., and will engage in the coal business in a small way. He expects to work eight or ten men.

Morgan O. Morgans of Nesquehoning, for 12 years superintendent for the Lehigh Coal and Navigation Co. has resigned and accepted the superintendency of the Kaska William colliery at New Philadelphia.

Frank I. Pierce state mine inspector, of Indiana is delaying the completion of his investigation of the explosion in the mine of the Jackson Hill Coal Co. at Hymera where several men were injured, three of them since dying, until the survivors are able to testify.

Wayne Collier, manager of the Pan-American Coal Co., at Zanesville, Ohio, claims to be one of the luckiest men that ever lived. Recently he started out with two sacks containing $2800 each on his motorcycle to pay the men at the mines and when he arrived at his destination he found both sacks gone. Stanley Kern, a pumper at the tube works, found the sacks and returned them to him.

CONSTRUCTION NEWS

Elkins, W. Va.—The Davis Colliery Co. is making a number of improvements in its already modern mining and coking plant at Coalton.

Erie, Penn.—The Bury Compressor Co. is just starting the erection of an addition to its plant, extending the main building 100 ft. This is necessary on account of increase in its business.

Fredericktown, Penn.—The finishing touches are being put on the new temporary tipple being constructed by the Fredericktown Coal & Coke Co., and within a short time the plant will be running coal.

Sturgis, Ky.—Among the new buildings to be erected and used by the West Kentucky Coal Co., at Sturgis, is a complete department store, which will be used as the company's commissary. Other buildings to take the place of those destroyed in a recent fire are well under way, and all will be completed before cold weather.

Salt Lake City, Utah—Development of the newly established coalfield in Southern Utah is being pushed with great rapidity by the American Fuel Co., of Salt Lake City, and hundreds of thousands of dollars are going into the work. The above mentioned company has developed its property at Neslen quietly but thoroughly, and this mine will soon become one of the big shippers of the state.

Bluefield, W. Va.—The Norfolk & Western R.R. is planning a branch line into Wyoming County to open up some valuable coal lands, which have already been leased. Several lines have been surveyed into Wyoming County, by the Norfolk & Western, the Chesapeake & Ohio and the Virginian, but it is expected the first mentioned will build a branch line leaving the main track at Davy, which will extend for about 20 miles or more into a comparative wilderness, thus giving access to a large area of coal and timber land.

Cabin Creek, W. Va.—The two-million-dollar power plant of the New River Development Co., now under construction upon Cabin Creek, is approximately two-thirds completed, and it is believed it will be finished within a month or two. While no transmission wires have yet been strung, the steel towers to which they will be attached are being erected, and this phase of the work is well under way. It is also contemplated to build a dam near Hinton and develop power from the waters of New River.

Harlan, Ky.—Mine operators and business men of Harlan, Ky., are said to be preparing to organize an independent telephone company, with a direct line connecting Middlesboro, Harlan and Pineville, unless the Cumberland Telephone & Telegraph Co. will extend its lines to the town shortly, as there is some prospect of its doing. The growth of the business interests of Harlan make adequate telephone service imperative, and a line will be built, either by the company or by the business men of the town.

Hazard, Ky.—The new Kentucky Block Coal Co. proposes to lease the property of the Henry Coal & Coke Co., about two miles from Hazard, and to begin operations there at once. A 1000-ton plant will be built. J. B. Allen will have the active management of the operation, having resigned recently as chief engineer of the Slemp Coal Co. He expects to have coal moving shortly after the first of the year, with houses for the miners and other buildings completed. A sawmill will start work on the property at once, getting out lumber for various purposes in connection with the mine.

Sandusky, Ohio—Dock improvements are to be made at Sandusky, O., and the work is announced to begin shortly. The Lower Lakes Dock Co., is planning an expenditure of $1,000,000, which will include additional railroad sidings and an additional coal loading plant. The announcement of the improvements were made following the visit of Otto Schroll, Supt. of the Toledo division of the Pennsylvania R.R. Co., to Sandusky. The proposed improvements are designed to give the Pennsylvania better facilities for handling coal shipped from southern Ohio and West Virginia mines. The contract for the improvement has been awarded to the Great Lakes Dredge & Dock Co.

Panther, W. Va.—The Lathrop Coal Co. has let a contract to the Pittsburgh Coal Washer Co. for a large coal washer, the work of erection to be started at once. This washer will be used to remove all foreign substance from the slack. A contract has also been closed with John W. Doss, of Welch, to build 10 new houses for the miners, all to be thoroughly uptodate; also to operate new sawmills for cutting timber upon the lease.

The Panther Coal Co., a new corporation that will be managed by the same officers as the Lathrop Coal Co., has applied for a charter and will operate a lease one-half mile east of the Panther Station. This company will be in operation in a short time, producing the same quality of coal as that mined by the Lathrop company. Work will be commenced at once on 50 houses, all of which will be thoroughly uptodate.

NEW INCORPORATIONS

Idamay, Ky.—The Congleton Coal Co. has been incorporated with a capital of $1500, and the incorporators are Lee, Hill and Tryce Congleton.

Hazard, Ky.—The Kentucky Bullock Coal Co., has been organized with a capital stock of $30,000. The incorporators are J. B. Allen, M. M. Bullock and J. A. Roan.

Morgantown, Ky.—The Independent Coal Co., has been organized with a capital of $1500. The incorporators are C. M. Sullivan, James W. Cook, and James F. Hope.

Coalton, Okla.—The Herron Coal Mining Co., has been organized at Coalton with a capital stock of $20,000. The incorporators are W. F. Herron, W. P. Russell and George Arbaugh, all of Coalton.

Greencastle, Ind.—The Silver Ash Block Coal Co., has been organized to buy, sell and mine coal. The capital stock is $25,000 and the incorporators are George W. Hanna, James E. Houck and John W. Stoner.

Nashville, Tenn.—The Royal-Ten Coal Co., of Knox County has been organized with a capital stock of $25,000. The incorporators are H. M. Johnson, H. S. Pless, Ben. A. Morton, Ralph W. Brew and Joseph P. Grant.

Peru, Ind.—The Island Creek Lumber Co., of Island Creek, W. Va., has filed articles of incorporation here naming as directors J. O. Cole, Chas. C. Crane and E. C. Bears. The company has $10,000 capital stock, and will open coal mines on land owned by Mr. Cole.

Philadelphia, Penn.—The L. P. S. Extraction Co. has been organized with a capital stock of $120,000 to acquire, own and lease mines and mining rights of all kinds. The incorporators are George A. Perry, of Philadelphia, Penn. W. M. Hope, of Dover, Del., and others.

Des Moines, Ia.—Articles incorporating the McKay Coal Co. were filed Sept. 5 with the county recorder. The company is incorporated for $4000 and will engage in a general fuel business in Des Moines. The incorporators are A. G. McKay, E. M. Gray, and Earnest C. Pond.

Elkins, W. Va.—The Limestone Railroad Co. is to mine and transport coal, limestone and other mineral. Capital stock $15,000. Incorporators are R. B. Cody, E. M. Cody and E. A. Cody, of Buckhannon, W. Va., J. A. Isherwood, of Elkins, W. Va. and Robert Connell, of Washington, D. C.

Charleston, W. Va.—The Economy Splint Coal Co., of Charleston, W. Va., has been organized with a capital stock of $15,000 to produce coal. The incorporators are N. R. Hoge, of Sanderson, W. Va., T. G. Bush, of Quick, W. Va., Joseph Moore, J. M. Harris and Fred Burdett, of Charleston, W. Va.

INDUSTRIAL NEWS

Charleroi, Penn.—Improvements being made at Lock No. 4 on the Monongahela River are not interfering with the coal trade. During the month of August 16,807,000 bushels of coal were locked through. This is somewhat above the average.

Scranton, Penn.—The total shipments of anthracite coal from Pennsylvania in the month of August were 1,206,691 tons less than for the corresponding month in 1912. Last month, these shipments amounted to 5,369,900 tons as against 6,576,591 tons for the corresponding month of last year.

Peoria, Ill.—The Peoria Coal Club has signed a contract with the Illinois Merchants' & Manufacturers' Protective Association to do all its investigating for the coming year. Short weight, the credit of customers, etc., will be the work of the detective agency and two men have been appointed for this purpose.

Charleston, W. Va.—Over a million and a half tons of coal were shipped on the Chesapeake & Ohio R.R. from the Kanawha, New River and Kentucky districts during the month of August. The tonnages are as follows for the three districts:

Kanawha district coal 892,540 tons, coke 1980 tons. New River district coal, 537,490 tons, coke, 12,810 tons. Kentucky district coal, 195,300 tons, coke, 11,940 tons. This makes a total shipment of coal and coke of 1,652,062 tons.

Washington, D. C.—That the coal operators of Pennsylvania and Ohio took a hand in fomenting trouble and promoting the big strike in West Virginia in 1912 in order to more advantageously compete with West Virginia operators, was the sworn testimony before the Senate Investigating Committee on Sept. 9. A former Burns detective who went into West Virginia during the strike to investigate testified he received this information from a prominent man identified with Pennsylvania mining interests. He steadfastly refused to give the name of his informant.

Monongahela, Penn.—Representatives of a Uniontown syndicate headed by J. V. Thompson, are rapidly buying up all the virgin coal land that lies along Ten Mile Creek and in the vicinity of Hackney in Greene and Washington Counties. Agents of the syndicate have been at work for several months acquiring the property which is said to aggregate over 7000 acres, the prevailing price being approximately $600 an acre. The same interests are also purchasing coal lands at Conger and Dunn Station. The farmers at these points, however, are holding out for higher prices and the likelihood is that they will get them.

Granite City, Ill.—A big increase in the output of coal in Madison County will be shown by the report of the county mine examiner to the board of supervisors. This will be the fourteenth annual report and each has shown a substantial gain over previous years. Twenty-seven mines are in operation and the output for the year was approximately four million tons. Practically all the coal was consumed by the industries of the county or sold to railroads for locomotives. Thirteen persons were killed in the mines during the year and approximately $85,000 was paid by the miners for powder to blast the coal.

St. Louis, Mo.—One of the most important coal and railroad transactions made in this vicinity in a long time came to light a few days ago when it became known that the Manufacturers Ry. had bought the St. Louis & O'Fallon Ry., and had secured trackage rights over the Alton & Southern lines.

This came in the face of the fact that the Manufacturers Ry. was at this time supposed to be completing a deal with the various roads entering St. Louis, and working as the St. Louis Terminal lines to allow the Manufacturers road a working basis for the freight moved over its rails. With the announcement of the O'Fallon purchase came a letter withdrawing the proposed arrangement with the Terminal Ry.

It is understood that the Manufacturers Ry. will have a close working arrangement with the road now building by the Aluminum of America, which has under way work for the approaches to ferry slips on the east side of the river. The railroad owns property on the west side and in this way the Manufacturers Ry. has broke the Terminal control of the river crossing facilities, and threatens to become an important coal carrier to at least the local market.

COAL TRADE REVIEWS

GENERAL REVIEW

Bituminous operators again out of the market and tonnage difficult to obtain. Occasional congestion reported but the season is now sufficiently advanced to look for a hard situation at any time. Wholesale anthracite continues dull and mining still restricted.

The retail anthracite trade received a slight impetus during the week, due to the first appearance of colder weather. Greater activity is noticeable among dealers and consumers, but the movement is not of sufficient proportion to effect the wholesale situation. Mines continue working under curtailed production, and some of the smaller sizes are still going into storage. The most interesting development during the week was the recent announcement of a proposed increase in the water freights out of New York Harbor. The companies claim that this business has been done at a loss in the past and they are determined to eliminate all such unprofitable features of the trade.

Bituminous operators who were in the market a few weeks ago, have again withdrawn and the situation is notably stiffer. The short car supply is having a steadying influence while the spot market is stronger and the outlook even more perplexing. There is a particular scarcity of West Virginia grades and quotations are showing a strong tendency to increase on what little prompt coal is offered. The season has advanced to a point where a firm situation may develop very rapidly.

On the other hand, an occasional congestion is being reported, notably at Boston where there is more coal on vessels than can be unloaded and some of this will probably be on demurrage shortly. Again, prompt loading cannot be obtained on short notice at Hampton Roads, as was recently demonstrated when an attempt was made to divert vessels there from Baltimore; apparently shipments to tide are well sold in advance of their arrival. A record production is being made in the Pittsburgh region. The demand continues close up to the supply and prices are firm with prompt tonnages difficult to negotiate. Dealers are beginning to buy in preparation for the fall trade. Cars continue in fair supply, the greatest difficulty at the moment being the shortage of labor.

The effect of the heavy movement in Ohio is noticeable on the car supply although the situation is by no means serious as yet. The September circular is well maintained, domestic grades being particularly strong and the lake movement limited only by the supply of cars; the latter business is also being somewhat delayed by the difficulty in obtaining return cargoes at the upper-lake ports. The railroad yards at Hampton Roads are practically cleaned up due to a heavy dumping, principally for shipment into the New England trade; spot tonnage is difficult to obtain. The car supply is the principal feature in the Southern market, many mines being forced to reduce operations to one-third or one-half capacity; both steam coal and lump are improving.

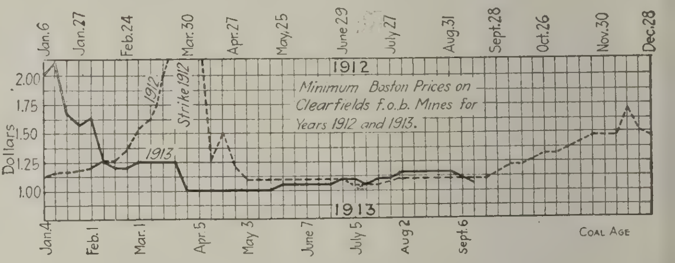
The cooler weather has caused a tightening in the car situation in the Middle West and free coal is generally difficult to obtain. Some activity has developed in the retail trade and there is a disposition among coal men to speculate heavily on the prospects of a rising market this winter. Industrial conditions are improving and prices are some stiffer.

BOSTON, MASS.

Hampton Roads coals firmer, and the outlook more perplexing; receipts still heavy. Georges Creek in short supply. Signs of increasing demand for Pennsylvania grades. Barge rates on anthracite from New York to advance Oct. 1.

Bituminous—There is no material change in Pocahontas and New River, except that the spot market is even stronger than a week ago and the outlook for the next 60 days is, if anything, more perplexing. Orders are still plentiful and it is at least worth noting that steamers it was sought to divert from Baltimore were finally obliged to await their turn at that port because no agency at Hampton Roads could undertake prompt loading on short notice. In other words, coal is still being sold well in advance of its arrival at tide and it may be that this condition will prevail into the cold weather. Shippers who were putting coal on the market here a fortnight ago now find themselves obliged to decline business that is offered, and as high as $2.95 f.o.b has been realized for the small orders that have lately come in.

Meanwhile Boston has more bituminous waiting discharging berths than has been the case for months and it is reported that some heavy demurrage will accrue before the harbor is clear of boats that have been held in the stream for two and three weeks. It is possible there will be a decided lull when these cargoes are added to the stocks already on hand but we cannot be so confident now that the market will ease off later. The season is at hand when a firm situation can develop very fast.



The shippers of the better grades from Pennsylvania have no difficulty keeping orders ahead of output. Prices fluctuate from day to day but there is a strong undertone. There are signs of an increasing demand for these coals, now that Pocahontas and New River seem so firmly established on a high-price level. For bunkering, in particular, the distributors here find a wider opening for reputable Pennsylvania coals on account of the demand from steamship owners for lower prices than can be made on coals from Hampton Roads. There is a better regard here for Pennsylvania coals of known origin than was formerly the case.

Water Freights are easy. Most of the coal moving this way is in steamers or in other tonnage that is under contract, so the current demand is rather light and at what are now considered minimum rates; 75c. is about the average from Norfolk on large vessels, with 10c. less to Providence.

Anthracite—It has been informally announced that effective, Oct. 1, certain anthracite carrying companies will advance barge freights, New York to Boston, from 50 and 55c. to 65 and 70c., making the circular price $5.90 alongside for stove and egg. In March, 1912, the price was $5.50 alongside, making a total advance of 40c. in less than two years, not counting the Pennsylvania state tax which some shippers are charging and others are not. Dealers are nevertheless taking supplies as fast as their storage will permit and the hard-coal trade is in excellent shape.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*................	$1.10@1.50	$1.35@1.65	$1.67@1.77	
Philadelphia*..........	2.35@2.75	2.60@2.90	2.92@3.02	
New York*............	2.65@3.00	2.90@3.20	3.22@3.32	
Baltimore*............	....	....	2.85@2.95	
Hampton Roads*........	....	....	....	$2.85@2.95
Boston†............	....	....	....	3.78@3.88
Providence†............	....	....	....	3.93@4.10

NEW YORK

Bituminous market steady and well supported in spite of the rumored withdrawal of the railroad buyers. Anthracite continues dull and production restricted. Retail trade somewhat stimulated by a fall in temperature.

Bituminous—The withdrawal of a number of Eastern railroads from the market as reported last week, has failed to have any effect on the situation which continues firm in every respect. It is clear that whatever results were anticipated from this action on the part of the roads, the effect of their withdrawal from the market has been entirely discounted and coal continues to move as freely as at any time during the prevailing activity. It is anticipated that they will again be buying by Oct. 1; a great deal of difficulty was experienced last year in obtaining sufficient railroad fuel and it is probable that the roads will endeavor to better prepare themselves this winter.

One of the best features in the market is the obvious care which operators are taking to keep the production down within the limits of the demand. Indications point to a consistently strong market throughout the winter, with the producers so thoroughly in control of the situation, that they will be able to eliminate the possibility of a runaway market. Such a condition is very desirable since any abnormal infallation is invariably followed by a subsequent depression, more harmful in its effects than any temporary period of high prices. Conjectures are already being heard as to what effect the closing of the lake trade will have upon the market; this of course, always results in a temporary embarrassment in certain districts specializing on this business but it seems to remote at the present time to be considered. The bituminous market continues firm at former quotations as follows:

West Virginia steam, $2.60@2.65; fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—The appearance of some moderately cool weather has had a slightly stimulating effect upon the retail demand for hard coal, but without changing the wholesale situation. There are no reports as yet of any increase in the production in the mining regions, and the collieries are still working on part time. The companies are also stocking as liberally as before, notably pea and buckwheat grades. Stove continues in strongest demand. However, the change in weather has caused renewed interest in the market on the part of both dealers and consumers; inquiries are more numerous and a continuance of the low temperatures will see the winter trade under way somewhat earlier than is usually the case.

There is a noticeable tendency on the part of local agencies to confine their business entirely to old customers and in some instances to even withdraw from some of the outlying local markets. An example of this is found in an advance in local water freights particularly to Boston which, it is rumored, will be put into effect by a number of companies either Oct. 1, or Nov. 1. This increase will be from 50@55c. up to 60@65c., the latter figure having been put into effect in the early part of this year by one of the big local shippers. It is claimed that the water movement of hard coal by the large companies, has long been carried on at a loss. There are also other instances where unprofitable business is being dropped.

The local market has recorded some further advances during the week, and is now quotable on about the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	....
Egg	5.25	$5.15@5.25	5.20	$5.10@5.20
Stove	5.25	5.25	5.20	5.20
Chestnut	5.50	5.40@5.50	5.45	5.35@5.45
Pea	3.50	3.50@3.50	3.45	3.35@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.35@2.70
Rice	2.25	2.25	1.95@2.20	1.80@2.20
Barley	1.75	1.75	1.70	1.40@1.70

PHILADELPHIA, PENN.

Anthracite trade is slowly becoming more active. Curtailed operations still continue but there are indications that full mining is likely to be resumed shortly. Bituminous market continues strong with demand good, and prices on about a parity with the week previous.

The first real cool snap of the season made its appearance early this week, and anxious eyes were turned toward the coal bin. The change, while temporary, at the same time it is likely to be the opening wedge for the fall business. It is rumored that most of the dealers, are not carrying such very heavy stocks of coal. Then again, it is not believed that the householders have much coal, carried over from last winter. It will be recalled that the winter of 1912 and 1913 was, comparatively speaking, a very mild one; and it is safe to assume that few consumers were compelled to renew their supplies, the early winter purchases carrying them over until spring. This is an unusual condition, as there is generally more or less coal carried over. This bears out the assertion made by many, that when the demand actually starts up, it will come with rush. Curtailed mining still continues although operators declare that full operations are likely to commence at any time. Dealers state that they are receiving numerous orders for deferred shipment, and when deliveries start, there will be more activity with the wholesalers.

In bituminous one hears of occasional orders being turned down, more on account of lack of ability to deliver, rather than because the prices were not acceptable. Some coals are even selling at slightly higher prices than was the case a week or two ago, but that again resolves itself into a question of how bad the customer is pressed for tonnage. Tidewater deliveries are fairly heavy at the present time, with good prices prevailing. Quotations vary from $1.25 to $1.60 and better, at the mines.

PITTSBURGH, PENN.

Production at full capacity and prompt coal still difficult to obtain. Dealers buying more freely in preparation for the fall demand. Odd tonnages of coke being offered at concessions but the market generally firm.

Bituminous—More is heard of shortage of men than formerly, particularly from West Virginia fields, while car supply in the Pittsburgh district is fairly satisfactory, though short on a few divisions. Production and shipments are practically up to record rate. The approaching end of the lake shipping season has not produced any weakness in the market, regular prices being firmly maintained, while free coal is somewhat hard to find, although the demand is quite limited except from retail dealers. Many of the dealers failed to make contracts and are now increasing their purchases in the open market, providing for the fall demand from consumers. We continue to quote: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The market has been very inactive since there were fair sized sales of furnace coke for September delivery. These sales were at $2.50 with two or three possible exceptions. In the past week small lots of spot coke have been offered at concessions, down to $2.35 or $2.25, but there is question about the quality, and in any event no ordinary tonnages are offered below $2.50, which the leading operators regard as the market. We quote: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $2.90@3; contract foundry, $2.90@3. per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 6 at 369,459 tons, a decrease of 33,571 tons, and shipments at 371,270 tons, a decrease of 33,845 tons. The decrease was due probably to the holiday, and the previous week's figures had been correspondingly high, presumably in anticipation of same.

BALTIMORE, MD.

Growing car scarcity is tightening up the market again, although some low-grade coals are still comparatively cheap. Not a few mines are out of market, however, because they cannot get through more than enough to meet contracts.

The bituminous coal market is being again strengthened by a growing car scarcity. While the situation in Pennsylvania is not so bad, there have been days in West Virginia recently when the shortage has been acute. Some operating interests have reached a point where they refuse to sell any coal and are obliged to hustle to meet their contract obligations.

Where there was coal to offer in West Virginia, prices were as a rule a little better than the week previous. Unless the car situation improves rapidly the upward movement should continue. During the week run-of-mine was quotable in small lots at from 90 to 95c., and three-quarter sold around $1.05 to $1.10. Slack showed remarkable strength early in the week, because of the reduced screening and sold up to 95c.

There has been somewhat of an easing up in the movement to tide, although New England is still taking a fair quantity of coal. In the export business there should soon be a resumption of activity, as several important charters were announced for the week. Anthracite dealers are doing a fairly satisfactory business. There is no rush of fuel yet, as the yards are pretty well stocked. Many of the Pennsylvania coal cars that are ordinarily used in the anthracite trade are now in use in the soft coal districts.

Increased activity in shipping circles here recently is interesting the bunker supply trade. The port of Baltimore has shown a tremendous increase in its export and import business so far this year and many of the tramps that now come here are in the market for coal supply.

BUFFALO, N. Y.

Bituminous continues steady, but not quite so active. Car shortage becoming more and more noticeable. Demand close up to supply.

Bituminous—The most important change of front in the bituminous trade is in the car situation. It is not only agreed that they are growing scarcer, but the railroad officials state that the end is not very near. It is denied that the locomotive supply is short. At present the Pennsylvania, according to official statement, is delivering only about 75 per cent. of the required supply, though the Allegheny Valley mines appear to be faring somewhat better.

The fear that the closing of the lakes will develop a large amount of unsold coal is not so great as it was. The shipments in that trade are slowing down somewhat, but not on account of any natural falling off in demand or in any estimate that cuts down the apparent amount needed by the upper-lake consumers. Just as soon as the present cool weather becomes definitely established the former heavy shipments are expected to be resumed.

The fact is that the demand is so close up to the supply that there is no reason for predicting any great change in the situation. Not in the entire history of the bituminous trade has the summer demand been anything like what it has been this year, so that it is not to be expected that any decline will occur now just as the natural increase in consumption is at hand.

There is a steady growth in manufacturing in this vicinity, quite as much as has been the case at any former time and the domestic season is also now at hand. The iron consumption is good and business refuses to be disturbed by anything done or proposed by Congress.

Prices are therefore strong at $2.90 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run and $2.15 for slack, with Allegheny Valley about 20c. lower.

Coke—While high-grade coke is a little firmer there is a decided weakness in the lower grades of furnace, which are selling in place of stock. Quotations are $4.85 for best Connellsville foundry and $3.85 for high-sulphur furnace.

Anthracite—The weather now favors a return of the demand for anthracite and there is some call for the purely domestic sizes, but it is hard to sell egg in any quantity and shippers will not consider the fall trade definitely opened till all sizes will sell. Pea and buckwheat are not active. It will be a hardship to take out all the available chestnut and stove sizes before anything will sell at all steadily. Lake shipments are heavy, though not quite as large as they were last month. More storage room in the only requirement. The weekly shipment by lake was 148,000 tons.

TOLEDO, OHIO

Car situation showing effects of the large movement. Lake trade heavy but vessels delayed at the upper lakes waiting cargoes. Cooler weather stimulating the demand.

No car shortage of consequence has as yet been noted on this market although shipments are not as prompt as they were earlier in the season. Some of the railroads are sending out warnings of an impending shortage and are making an appeal to shippers to use every precaution to prevent a congestion of cars. Hocking operators are refusing many orders and other roads coming into Toledo are demanding that customers accept a certain proportion of hopper cars.

Lake business continues active and is being pushed as rapidly as possible. The ore shipments are not as rapid as was the case earlier in the season and vessels which have been waiting around for ore loaders have been offered to grain shippers. It is stated that ships have been waiting at the head of the lakes for ore from two days to a week.

The demand for coal is a little brisker than it was because of the cooler weather. Steam grades are fairly active and the domestic trade is beginning to pick up. A little more cold weather will bring about considerable activity in the market generally. Prices are very firm here and there are no indications of a weakening anywhere along the line. Fine coal continues scarce and high in price.

Prices as quoted at Toledo are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.75	$2.50	$2.00	$2.50	$1.35	$1.35
Egg	2.50	1.35	2.50	1.50	2.50	....	....
Nut	2.00	1.25	2.25	1.75	2.50	....	....
¾ lump	....	1.65	....	....	....	1.25	1.25
Mine-run	1.60	1.35	....	....	....	1.12	1.15
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

The principal feature is the car situation which is curtailing production. In Eastern Ohio and Pomeroy Bend the shortage is marked and trouble being experienced in other fields. Prices are stiff and the demand strong for all sizes. Lake trade is still active.

The question of car supply is the principal factor in the coal trade in Ohio. Inability to furnish sufficient equipment has caused a lessening in production in many of the fields. The demand for all grades is good and the circular at the new level of Sept. 1 is well maintained. The tone of the market is satisfactory in every way.

The domestic demand is one of the best features of the trade. Retailers in all sections are placing orders and asking for prompt delivery if possible. Dealers stocks are not large and they are endeavoring to increase them to guard against a famine when the rush comes. Larger householders have placed orders and retailers are busy making deliveries. Retail quotations are firm and inclined to advance. Pocahontas prices have increased because of a scarcity of labor in the mining district.

Lake trade is also active and the volume of fuel going to the Northwest is only limited by the car supply. The dock situation at the upper lake ports is satisfactory and little congestion is reported. Chartering of bottoms is still going on and the lake movement will be active to the close of navigation. The Toledo docks of the Hocking Valley have loaded 2,000,000 tons since the season started.

Eastern Ohio operators are probably the worst sufferers as a result of the shortage of cars. It is estimated that the output in that district is but 60 per cent. normal. In the Hocking Valley the production is estimated at 85%, in the domestic fields about 75% and in the Pomeroy Bend field, about 65% of the average.

Steam business is holding up well under the circumstances and is expected to continue active during the fall at least; manufacturing establishments are taking quite a good tonnage while railroad fuel is also in fair demand. Only a few steam contracts are expiring at this time and they are being renewed at higher figures generally.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.75 @ 1.70	....	$1.85 @ 1.75	$1.70 @ 1.65
3-4 inch	1.60 @ 1.55	$1.30 @ 1.25	1.55 @ 1.60	1.55 @ 1.50
Nut	1.30 @ 1.20	....	1.40 @ 1.25	1.25 @ 1.20
Mine-run	1.40 @ 1.35	1.20 @ 1.15	1.30 @ 1.25	1.25 @ 1.20
Nut, pea and slack	0.70 @ 0.65	....	0.75 @ 0.70	0.75 @ 0.70
Coarse slack	0.60 @ 0.55	0.85 @ 0.75	0.65 @ 0.60	0.65 @ 0.60

HAMPTON ROADS, VA.

Heavy dumpings during the week, principally for shipment into New England. Railroad yards well cleaned up and suppliers pressed for tonnage. Domestic trade opening up.

Coal dumpings over the tidewater piers during the past week have been heavy, a large fleet of schooners, as well as cargo steamers, having been loaded for ports in New England. There has also been a good movement in the foreign trade of both cargo and bunker coal. On account of the heavy dumpings and the light movement to tidewater, there is little accumulation in any of the railroad yards. A large number of the suppliers are short of coal, with a considerable number of vessels waiting in the stream.

There is practically no spot coal offering as the agencies are using all available on contract business. Prices for Pocahontas and New River grades have remained about the same as during the last two weeks.

Dealers in domestic coal, who have been doing practically nothing during the summer months, are now being rushed with orders as householders are beginning to get in their winter supply. Prices for domestic coal range from $4 for New River and Pocahontas to $7.50 for anthracite nut, stove and egg.

There have been foreign shipments to Dakar, Rio, Coronel, La Plata, Panama, Georgetown and Puerto Gallegos, Patagonia.

LOUISVILLE, KY.

Slack coal experienced a sharp reversal in form and is now heavy. Car supply becoming tighter and the new hopper bottoms are again a factor in the situation. Indications point to high prices for October delivery.

The local market for screenings has experienced an abrupt and unexpected change from almost famine conditions to an exceeding heaviness, certain grades being almost impossible to move. Some of the high-grade eastern Kentucky coals are only in moderately excessive supply, but of the western Kentucky, and other cheaper coals, the production is far in excess of the demand. The increased movement of western Kentucky domestic coal to the South and into the Kentucky market has resulted in an excessive production of screenings; as a result there has been a heavy movement of this grade into Louisville, its natural market. Large orders from the railroads have also resulted in an excessive production of pea and slack.

The lack of sufficient cars in the eastern Kentucky field has kept the supply of high-grade screenings from that district down to a comfortable margin. It is stated on reliable authority that a great deal of western Kentucky coal is being applied on contracts calling for Straight Creek and Jellico screenings, the market being flooded with the former and the latter in moderately short supply.

Eastern Kentucky operators are again experiencing a great deal of difficulty with the big hopper cars, which they are now being forced to load in the absence of an adequate supply of gondolas. Consignees north of the Ohio River refuse flatly to accept shipments in this class of equipment.

so that they are confined almost entirely in the state. While they are being accepted there, a great deal of dissatisfaction and complaint is heard regarding them. Where shipments have been made in the hopper cars, contrary to instructions specified in orders, an allowance of 15c. per ton is usually made for unloading.

In view of the prospective labor troubles next month, operators are making no contracts for deliveries beyond September, and $2.25 is expected to be the minimum on block for October deliveries. At the moment this grade is quotable at $2.10 with round at $1.60 to $1.65, and screenings 85c. to 90c. The over-supply of western Kentucky screenings has created a heaviness in that market, which is now quotable at about 50c. or 60c., and even less for nut and slack, and 30c. to 40c. for pea and slack.

BIRMINGHAM, ALA.

Demand continues good for steam and domestic coal. Coke shows improvement. Car shortage still serious. Pig iron firm with large sales. Cast-iron pipe very quiet, both in amount of business and price.

The demand for steam coal is very good in this district, and lump coal is picking up after about ten days of rather a quiet market. The market on both furnace and foundry coke is good, with prices from $3.25 to $3.50 on furnace coke, and $3.50 to $4.25 on foundry. The pig-iron market is booming. One producer has sold since July 4 over 120,000 tons for delivery during the balance of this year. Some iron is being sold for the first quarter of next year, at prices from 25 to 50c. above this year's deliveries.

The car supply is still serious, many of the mines running from one-third to one-half time on account of the shortage. The railroads are making every effort to get their cars back from all foreign lines, but it is quite evident that this winter will show them far short of the necessary equipment to move the product. Manufacturers of cast-iron pipe state that there is very little doing in that line and that prices are far from being satisfactory.

NEW ORLEANS

Spirited competition on between the agencies. Heavy shipping stimulates bunker trade. Coal men do not expect to see early conversion of Southern Pacific ships to oil burners, despite company's announcement.

The placing of the contract for the school board's annual coal supply developed some of the most spirited competition between the different agencies that has been seen in the city for years. The Tennessee, Coal, Iron & Railway Co. secured the bituminous and the C. A. Andrews Coal Co., Ltd., the anthracite contract.

Car shortage is becoming more pronounced but large quantities of Alabama coal continue to arrive daily.

An oil-tank steamer, the "Topila," has been put in service by the Southern Pacific Co. between here and Tampico, and fuel oil is being stored with the announced intention of beginning the use of oil as soon as the vessels of the company can be converted. While coal men are inclined to doubt that a change to oil will be made while same is at the present price, the loss of this business, even if it comes this winter, will be more than replaced by the new lines.

Exports for the week were confined to the regular shipments to Bluefields and Cape Gracias, Nicaragua; Port Barries, Guatemala; Belize and Stann Creek, British Honduras.

DETROIT, MICH.

Prompt coals steady at a relatively high level. Car shortage becoming more serious and free tonnage scarcer. Anthracite improving.

Bituminous—The local steam market continues to show a steady improvement from day to day, and it is difficult to anticipate what the future will bring forth. However, all indications point to a still further advance. There is very little spot coal to be had, and a pronounced scarcity of cars has developed in the West Virginia field. Contracts figures continue as strong as ever and many enticing offers are being rejected by operators, indicating that they desire as much free tonnage as possible for use in the open market this fall. There seems to be a general disposition among all classes of coal men to speculate on the probabilities of a rising market this winter.

The domestic situation is also beginning to attract attention locally. Inquiries are becoming steadily more numerous and large distributors are showing a disposition to get into the market. Prices are advanced over last year and some of the local agencies who have neglected to lay in their winter supply, are now finding themselves in a precarious position. Very little Pocahontas coal is coming in and it commands a ready premium, all sizes having advanced 10c. per ton within the last week. Spot coal is selling for 25c. above circular.

The local market is now quotable on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.75	....	$1.75	....	....	$2.60	$2.50
Egg	1.75	....	1.75	....	....	2.60	2.20
Steam lump	1.45	....	....	....	....	....	....
¾-in. lump	1.20	$1.25	1.15	$1.15	$1.20	....	....
Mine-run	1.10	1.10	1.10	1.10	1.10	1.60	....
Slack	0.90	1.00	0.75	0.80	0.85	....	....

Anthracite—The hard-coal market has failed to show any change during the week. The domestic sizes seem to be moving about as usual, stove and egg being the most active at the present time. Pea coal is moving a little more freely and expectations are that it will continue to improve as the cool weather advances.

INDIANAPOLIS

Cooler weather resulted in a further tightening in the car situation. Some activity in the retail trade. General industrial conditions improving.

There is some complaint of a shortage of cars at the mines, now that there has been a few days of cool weather that has stirred up the trade somewhat. In the Terre Haute district it is stated that mines could put in full time, if the Big Four, Chicago and Eastern Illinois and Vandalia roads would supply enough cars. The Chicago and Eastern Illinois reports that it has 1500 men at work getting coal cars in good condition. This road is the heaviest coal carrier in the state. Since it has been separated from the 'Frisco system, some of the old directors are back on the board and they at one time gave the coal traffic good attention. Operators are therefore hopeful.

In the retail trade consumers of domestic are hurrying to get in a supply before an expected advance in prices, Oct. 1. This activity reflects back to the mines. Prices hold steady, with some slight improvement in the inquiry for screenings, and a gentle pushing of industrial activities to their usual fall schedule. Mine-run, too, is in somewhat better demand.

ST. LOUIS, MO.

Cool weather locally has developed some demand. Country trade improving. Franklin County and Carterville particularly strong. Standard grades the weak department.

The local market did not hold out as was anticipated last week practically every grade breaking from 5 to 20c. a ton. However, with the beginning of this week things looked different, and it is likely that prices will be maintained from now on. The main cause of the weakness was the extreme warm weather; with the first of this week conditions changed, and there is a general demand for coal. Country business is also picking up, and everything indicates that the balance of the month will be good.

Franklin County is unusually strong and Carterville is creeping along fairly well; the end of the month should see both these coals commanding a good figure on account of the car shortage and other minor troubles that are besetting the operators. Standard coal is still being sold at cost of production. The operators in the 5th and 9th Districts seem unable to get out of the rut they have been in for several months.

There is little anthracite and smokeless moving, but there is an abundance of coke coming in for which there is no demand. A fairly good tonnage of Arkansas is moving in this season, which is taking the place, to some extent, of West Virginia smokeless.

The prevailing circular is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	$1.40	$1.05@1.15
3-in. lump	....	....	1.50	....
6-in. lump	$1.60 @ 1.70	....	1.60	1.25@1.35
Lump and egg	1.50 @ 1.60	$2.15	1.60	....
No. 1 nut	1.30 @ 1.40	....	1.05	....
Screenings	0.55	....	0.40	0.30@0.35
Mine-run	1.50	....	....	....
No. 1 washed nut	1.60	....	1.60	....
No. 2 washed nut	1.30	....	1.50	....
No. 3 washed nut	1.20	....	....	....
No. 4 washed nut	1.15	....	....	....
No. 5 washed nut	0.40	....	....	....

PORTLAND, ORE.

The announcement of an advance in wholesale coal prices at the Wyoming and Utah mines here last week was followed this week by an increase in the price on standard coals to the extent of 25c. per ton. The opinion prevails that there will be no oversupply of coal in the market the coming winter, but rather a shortage, unless shippers are fortunate in getting rolling stock promptly.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

The following is comparative statement of the anthracite shipments for August and the first eight months, of the years 1912-13, in long tons:

	August		8 Months			
	1913	1912	1913	%	1912	%
Phila. & Reading.	855,343	1,286,651	8,616,490	18.91	7,765,878	19.93
Lehigh Valley....	1,035,934	1,261,814	8,640,052	18.90	7,119,159	18.27
Cent. R.R. N. J...	656,154	901,870	6,007,368	13.14	5,139,578	13.19
Del. Lack. & West	862,602	918,734	6,523,639	14.27	5,519,630	14.17

*Bold face type indicates a surplus.

FOREIGN MARKETS

GREAT BRITAIN

Sept. 5—The market is quiet and irregular. With the exception of two or three leading descriptions, supplies of large and small coal are more than ample, colliery outputs being much increased.

Best Welsh steam......	$4.90@4.92	Best Monmouthshires..	$4.08@4.14
Best seconds..........	4.50@4.68	Seconds..............	3.96@4.02
Seconds...............	4.26@4.44	Best Cardiff smalls....	2.46@2.58
Best dry coals........	4.32@4.56	Seconds..............	2.28@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while these for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

COAL FREIGHT DECISIONS

I. C. C. No. 4631—In the matter of alleged irregularities and discrepancies in the weighing of freight by carriers subject to the act to regulate commerce.

1. Inaccuracies in weighing result in the imposition of unreasonable charges and in discrimination between shippers just as effectually as do differences in the freight rate itself.

2. The record herein discloses that a majority of the track scales now in use should be at once rebuilt in order to obtain reasonably accurate results. It is also apparent that many additional scales should be installed.

3. A modern scale, properly installed and kept in proper condition, should be accurate within at least 100 pounds, and when under test it shows a variation of 100 pounds or more it should be considered out of order. All scales should be tested by the test car at least once in two months; in many cases every month.

4. Cars should never be weighed in motion coupled at both ends. They may properly be weighed in motion when uncoupled upon scales especially designed for that purpose and in charge of thoroughly competent men. Cars should not ordinarily be weighed when coupled at one end, and never unless at points where the greatest attention is paid to the condition of the scale and the competency of the weighmaster.

5. A prolific source of error is the wrong stenciling of the tare weight of cars; when the car weighs more than the stenciled tare the shipper loses, while when the car weighs less than the stenciled tare the shipper gains. Correction of an erroneous stenciled weight is by a proper reweighing of the car at stated times.

6. Inaccuracies in weighing particular commodities, such as grain, coal, and lumber, discussed and various remedies considered; and criticism of certain team-track weighing made.

7. General rules and practices of carriers whereby large amounts of carload freight are exempted from all weighing whatsoever considered and various criticisms and recommendations thereon made.

8. Remedies for the defects in weighing revealed by this investigation discussed at length, and the opinion advanced that some federal tribunal, perhaps this Commission, should be given authority in the following respects: (a) To fix the points at which track scales shall be installed; (b) to prescribe the standard of such scales and their installation; (c) to test or supervise the testing of such scales; and (d) supervise the operation. **Opinion No. 2399.**

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending Sept. 13:

DIVIDENDS

Ashland Coal & Iron Ry.—Dividend of 1% payable Sept. 25 to holders of record Sept. 20.

Lackawanna R.R. of N. J.—Regular quarterly of 1% payable Oct. 1 to holders of record Sept. 9.

St. Louis, Rocky Mtn. & Pac.—Regular quarterly No. 5 on the preferred of 1¼% payable Sept. 30 to holders of record Sept. 21-29.

American Coal Products Co.—Regular quarterly of 1¾% on both the common and preferred, the former payable Oct. 1 to holders of record Sept. 25 and the latter payable Oct. 15 to holders of record Oct. 10.

⁂

Coal and Coke Ry. (West Virginia)—This company owns in round numbers 100,000 acres of coal land and coal-mining rights and practically a perpetual lease on all the properties of the Davis Colliery Co., which latter concern owns about 25,000 acres of coal land and is one of the principal operating companies in West Virginia. The tonnage handled by the road has shown a steady increase from about 700,000 tons in 1907 to 1,300,000 in 1912.

Hickory Swamp Colliery Outside First Aid Team at Cameron Colliery of Mineral Railroad & Mining Company, Shamokin, Penn.

An Actual Record
of the service rendered by
Baldwin-Westinghouse
Electric Mine Locomotives

Standard Westinghouse bron armature bearing with oil a waste lubrication as suppli on these locomotives.

At the mines of the Ray Consolidated Copper Company, Ray, Arizona, there are eleven ten-ton Baldwin-Westinghouse Electric Mine Locomotives in operation. The following information is proof of the phenomenal record of **low repair and maintenance** cost made by these locomotives:

Brushes and Commutators

The first shipment of locomotives was put into operation May, 1911, and additions have been made from time to time until now a total of 11 locomotives are in use. In this time not a single brush has been changed, nor a single commutator turned down.

Bearings

In the spring of the present year, one of the motors was removed from the first locomotive installed to ascertain the general condition and amount of wear in the bearings. General condition of the motor was A-1. The armature, commutator and brushes were in perfect shape. A careful test of the armature bearings showed that in practically two years of operation the wear was only .003.

Controllers and Resistors

A careful system of inspection is carried out at Ray, and when it is found that contact fingers become badly worn or burred, they are either smoothed u or replaced. Up to date not a single segment ha been replaced on any of the controllers.

No trouble has been experienced with the gri resistors; only three grids having been replaced i three years time, and this was due solely to a collisio in which the grid was damaged.

Mechanical Parts

The foregoing does not cover repairs to wearin parts, such as brake shoes, trolley poles, etc., which c necessity must be replaced from time to time. Wit regard to wheels, however, only one pair of wheel has been changed in two years.

Two of these locomotives are used for genera purposes, such as hauling mine timbers, etc. Th remainder are used for hauling ore. The output o the mine is 6000 tons in 16 hours, at the present time The average train consists of 20 to 25 cars holding tons of ore each, and weighing approximately 2 ton each.

The above statement emphasizes the reliability o Baldwin-Westinghouse Mine Locomotives. Th newer cast steel bar frame design has many feature that are far superior to the earlier types, used by th Ray Company.

Full information about Baldwin-Westinghouse Electric Mine Locomotives can be obtained by addressing either company.

A Tale From Texas

The Weekly Ad-Talk Page

One morning a few years ago a peculiarly interesting story came out in the New York newspapers. It stated that the town of Brownsville, Texas, had involuntarily seceded from the Union—

That during the recent heavy rains the Rio Grande River had swelled, overflowed its banks and pursued a new and original course across the country—

That by this change of route the Rio Grande, instead of flowing in its time-honored bed *south* of Brownsville, now ran in a new course fifteen miles *north* of that growing town—

And that, as the Rio Grande River was the boundary between the United States and Mexico, Brownsville was now thrown south of the river and was, therefore, in Mexico!

After reading this article, the writer, being of a more or less skeptical nature, dropped a line to the postmaster of Brownsville asking him how much truth there was in the startling report.

About three weeks later he received a lengthy, wrathful letter from the Texas P.M.

It said, in effect: "There is no truth at all in the story.

"The Rio Grande hasn't changed its course an inch and even if it did this foolish dream couldn't happen—the boundary line is absolutely fixed by the treaty between the United States and Mexico.

"If the Rio Grande turned and ran up to Oregon the boundary would remain unchanged and Brownsville would still be an American town.

"The story was sent out by a promoter who thought any kind of publicity would pay—and nothing has done us more harm than the circulation of this ridiculous report.

"What we want to advertise to prospective settlers from the North is that, by coming to Brownsville, they can become prosperous *Americans*—not Greasers."

The point at once struck us that it was the promoter, and not the Rio Grande, that had overstepped the boundary.

He was attracting attention to his product, Brownsville, by making false statements about it. He thought he was an advertising man when really he was only a press agent.

He told a lie to incite curiosity instead of telling the truth to inspire confidence. His fanciful story had to be authoritatively denied broadcast before the tide of homeseekers again turned toward the Texas town.

That this principle of profitable advertising has become gospel today you can see by reading the ads in your paper.

It would be business suicide for an advertiser in Coal Age to print a "Brownsville" story over his name.

The modern manufacturer works on a different method.

He spends his time, his brains and his money to make his product so good and so reliable that, when it comes to advertising it, the *strongest* things he can say about it are the *true* ones.

This is why the advertising pages of your technical paper are so informative. It's why many a man today reads the advertising section before he does the reading matter.

COAL AGE

Vol. 4 NEW YORK, SEPTEMBER 27, 1913 No. 13

Has it ever occurred to you that in these days of dawning in efficiency organization and safety first, many coal officials fail to scrutinize the warp and woof in the fabric of their mining operations? These same individuals regale themselves in wordy talks on economy, hold up their hands in holy horror at the semblance of an excessive "first cost" when purchasing, yet fail to extract efficient service from the material they buy.

Should we classify this personal quality as a human frailty? Perhaps, but let us look still farther.

"Safety first" flashes across your mental vision by instinct as the first and last care of operation. The efficiency of the workman holds, logically, the next place in your thought. On the heels of this comes the necessary balancing of cautious purchases with the careful attention to the service rendered by the material. Yes, *careful attention* is right.

Can you, Messrs. Manager and Superintendent, be candid with yourselves in answering the next two questions?

Have you steel rail, compressed-air or water pipe, electric wire or anything else in your abandoned workings which is still available for use in some other part of your mine? Have you thought of that, or are you merely putting off the utilization of this second-hand material until "tomorrow"?

Without casting reflections, grant that you have these materials in accessible but worked-out rooms. Still further, for the sake of discussion, admit that these materials (partly used) have not been reclaimed because of the oversight of an inside boss. Again, since neither you nor the engineers ever wander through these abandoned workings, you know nothing of the conditions there and hence cannot order an adjustment.

Is this consistent with the extreme caution you exercised in purchasing this rail, pipe or what not? *Decidedly not.*

To bring out more clearly the inconsistency of this pseudo-economy, which saves at the spigot and wastes at the bunghole, let us review the following instance, which by the way is not an hypothesis.

A coal-mining company whose annual output is over two million tons, installed an electric power plant, to operate on the exhaust steam from noncondensing engines. The newly installed plant, which cost $70,000, enabled the operators to abandon the former electric plant whose annual operating cost was $15,000. This was consistent with efficient management and operation.

On the other hand, this same company has one 1000-ton mine with 3000 ft. of 3-in. compressed-air pipe, with half its use still available, lying in an old heading. In a second mine there are 30 idle-room switches and two miles of steel rail that has not outlived its usefulness. In yet another mine, electric cable and lighting wire hang on the timbers in old workings.

A rough estimate shows that the company loses between $500 and $1000 annually at each of ten mines. The reason is self evident.

It would cost this corporation five dollars per day to have one of its competent engineers make the rounds, and report possible economies to his general manager. Such a report, made once in 60 days, taking 10 days to cover 10 mines would cost $300 per year. The total resultant saving would vary between five and ten thousand dollars annually—a nice return on the $300 invested.

There are, of course, mines where the cost of labor in reclaiming material from old workings makes such a scheme impracticable; however, these instances are isolated exceptions to the general rule.

Nothing is more rare than consistency. Most of us practice economy upside down. In such matters we are generally ambidextrous, easily and heedlessly spending with our left hand what we save with our right. Sit a moment and think—

Are *you* saving at the spigot and wasting at the bunghole?

—Outlined by Newell G. Alford

Working Thick Highly Inclined Seams

By John E. Ambrose*

SYNOPSIS—Description of the general methods employed for working thick seams of coal on steep pitches, in Colorado and British Columbia.

⁂

The following description of the general method employed in working semibituminous and lignite coals in Colorado and used, also, extensively in British Columbia, is of particular interest in connection with all deep-pitching seams.

In most cases where this method is in use, the seam of coal pitches from 50 to 85 deg., or is practically vertical. If the location is favorable, a shaft or slope is sunk on the outcrop of the seam. This shaft or slope has generally three compartments; namely, two hoistways and a pumpway, which is used also for installing the electric wires supplying light and power to the mine. The shaft is sunk in the seam until it reaches a point where the latter dips away at a greater angle from the vertical. From this point the shaft is continued downward in the rock, until a certain required distance is attained for a lift of, say from 300 to 350 ft. Here, a tunnel is driven wide enough to afford ample room for the handling of the coal, at the landing.

This tunnel is driven over to strike the seam of coal and will vary in length, according to the depth of the shaft and the pitch of the seam. Gangways are then turned to the right and left, on the strike of the seam, and should be of sufficient size to handle a good car with ease and safety. These gangways are pushed ahead to insure a quick development of the mine. They should be given a grade of one-half of 1 per cent., or about 6 in. per hundred feet, in favor of the loaded cars.

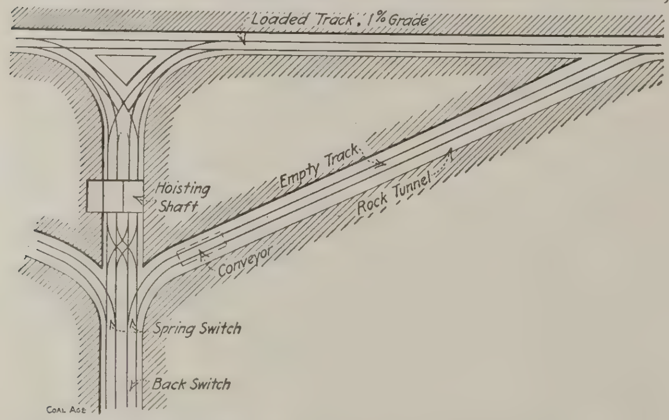

Fig. 1. Proposed Plan for Loaded and Empty Tracks at Landings Underground

Another force of men can be put to work, at the mouth of the tunnel, where it strikes the seam, to widen out the gangway, to accommodate two tracks. These sidings built at the mouth of each gangway should be long enough to hold about 100 loaded cars, on each side of the tunnel. Long collars should be used of sufficient size and strength to withstand the top pressure, so that there will be no necessity for center posts, as these are always a source of danger both to drivers and others who are handling the coal, on the sidings or making up trips. Unless the conditions prevent it, steel I-beams should be used instead of timber, for the collars. These should be supported on concrete walls. This arrangement would give more room, look 50 per cent. better, cause less risk from fire, and possess greater strength and durability.

As shown in Fig. 1, the empty cars are run off the cage to the back switch and then to a point on the cutoff marked "conveyor." This conveyor, which is kept constantly running, picks up the empty cars and carries them through the cutoff, or tunnel, shown driven through the rock on each side of the shaft. Where this cutoff meets the gangway, the cars are picked up by the motors and hauled to the face of the workings.

At the end of each siding, a sufficient barrier pillar should be left to protect the shaft in emergency. This pillar should vary in width according to the depth from the surface and the thickness of the seam of coal. Beyond this pillar the rooms should be turned on 80-ft. centers. Chutes *BB* are first driven up the pitch from the gangway to the air course above, a distance of about 50 ft., as illustrated in Fig. 2. The chutes are continued above the air course, a distance of about 20 ft., at which point the rooms *CC* are widened out on a 45-deg. angle, as shown in the figure, to a width of from 40 to 50 ft., depending on the condition of the roof and floor of the seam. In many cases a separate manway *AA* is driven the same distance, up the center of each pillar and branched to meet the manways in the rooms.

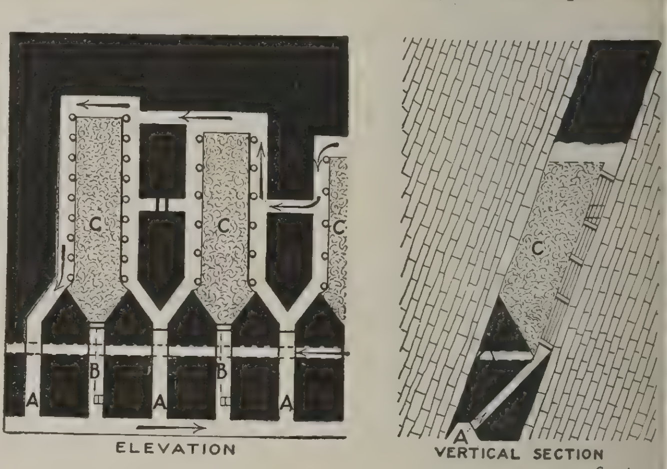

Fig. 2. Vertical Elevation and Cross-Section of Chambers and Chutes

The rooms are driven up the pitch of the seam, and a manway constructed on each side of the room. Crosscuts are driven in the pillars, at regular intervals, as shown in the figure, to conduct the air current from room to room, and cause it to sweep the working face better. The length of the rooms will depend upon the distance to the gangway above; but a chain pillar or barrier should be left, of sufficient strength to protect the upper gangway. This chain pillar will vary from 100 to 150 ft. in thickness.

It is common practice to drive the rooms up on a yardage basis, since the coal is stored in the chute in each room and is only drawn as required. The pillar separating the gangway and the air course above is about 50 ft. in width. The size of the air course is slightly less than that of the gangway, being 7 ft. collar, 10 ft. spread and 7 ft. clear headroom. The timber sets on both the gangway and the air course, are spaced 6 ft. centers and wedged or spragged at the top to prevent swinging. Good stout round lagging is used above the timbers.

---

*Mining Engineer, New Durham, N. J.

It is common, in deep-pitching seams, to drive the gangway and air course, as shown in the vertical section on the right, in Fig. 2, next to the top slate. This enables the loading chutes to be driven across the seam at a suitable angle for loading. By reducing the angle of the chute, in this manner, the coal is more easily controlled as it slides down the chutes to the cars. The manways on each side of the chute are from 7 to 8 ft. wide and furnish the means of ingress and egress to the working face. The system of ventilation generally adopted makes the hoisting shaft a downcast. Where the tunnel meets the gangway, the air current is divided, part going to the right and part to the left. The air follows the gangway to the face and returns through the rooms. In case of accident or fall of roof in one or more rooms, the air is conducted across the trouble, by means of the short "monkey airway" or crosscut connecting the room with the airway above the gangway.

⁂

Cost of Small Frame Buildings

The bills of material and costs of three frame buildings erected for a construction camp are of interest to the mining industry, since the buildings are of the type and description frequently found installed in small camps and remote properties. The buildings are described by Clark A. Bryan (*Eng. & Cont.*, July 2, 1913) as follows:

One building was used as a store and dining-room combined. It was 36x16 ft. in plan, built with a gabled roof 7 ft. 3 in. from the top of the floor to the top of the plates, with a total height of 11 ft. 9 in. There were two rooms, 11 ft. 6 in. and 24 ft. 6 in., respectively, the former used as the store. The sills were made of 4x6-in. lumber, the four corner posts and the intermediate posts, of which there were two on each of the long sides, of 3x4-in. material. These upright posts were all mortised into the plate, which was of 4x4-in. material. As an additional brace a piece of 2x4-in. was run completely around the building between the uprights, 3 ft. above the floor. The building was braced in the direction of its short dimension by running a piece of 2x4-in. material from the top of one of the intermediate posts to the top of the opposite post, these braces set flush with the top of the plate. The 2x4-in. rafters were nailed to the plate. There were 19 rafters on each side, 10 ft. long, overhanging the sides by about 8 in. A piece of 1x5-in. material was nailed over their ends as a sort of trim.

The 1x3-in. purlins were laid at right angles to the rafters and nailed to them; they were spaced 1 ft. 6 in. on centers. Corrugated-iron roofing, weighing 115 lb. per square, was nailed directly to the purlins. This provided plenty of ventilation, inasmuch as at the sides the building was not tightly sheathed. The 2x8-in. joists were 16 ft. long, notched 3 in. on the sills; they were spaced 1 ft. 6 in. A 1-in. floor was laid. The sides were of 1-in. rabbeted barn boards, 10 in. wide. The partition was of this same material. There were five windows, each 2 ft. 6 in. x 2 ft., with six lights. There were three doors, each 2 ft. 9 in. x 7 ft. Table I gives the bill of materials and cost of construction.

The building used for a bunk house was 14x50 ft. in plan, built with a shed roof. It was 9 ft. 6 in. high on the high side and 6 ft. 6 in. on the low side, divided into five compartments, each of which was designed to accommodate eight men. The sills were of 4x6-in. material; the corner post and the eight intermediate posts on the long side, of x4-in. material. The 2x4-in. plate was spiked to the top of the posts; the 3x4-in. by 16 ft. rafters were spaced 2 ft. and overhung the plate about 8 in., being spiked to the latter. The roofing and purlins were the same as in the other house. The bracing also was similar to that of the first house. The partitions were of barn boards, 6 ft. high. Each room had one door and two windows; against each side were two tiers of bunks ft. wide and 7 ft. long, the lower being 1 ft. above the floor, and the upper resting on the 2x4-in. brace which extended around the building. The bunks were supported at the center by means of a trestle built of 2x4-in. material, braced on the sides. Table II shows the material consumed and the cost of the building. The cooking shed consisted of four upright posts about 7 ft. high, supporting a corrugated-iron roof 12 ft. square. In Table III are given the material and cost of the shed.

TABLE I. COST OF DINING ROOM AND STORE

Items and Size	Rate	Cost
114 lin.ft. sills, 4x6 in.	$0.05	$5.70
100 lin.ft. posts, 3x4 in.	0.0275	2.75
16 lin.ft. frames for doors, etc., 3x4 in.	0.0275	0.56
104 lin.ft. plates, 4x4 in.	0.03	3.12
104 lin.ft. braces, 2x4 in.	0.015	1.56
32 lin.ft. braces at plate, 2x4 in.	0.015	0.48
380 lin.ft. rafters, 2x4 in.	0.015	5.70
432 lin.ft. purlins, 1x3 in.	0.005	2.16
144 lin.ft. ridge, 1x3 in.	0.005	0.72
36 lin.ft. ridge pole, 3x4 in.	0.0275	1.00
416 lin.ft. joists (26 pieces 16-ft.) 2x8 in.	0.028	11.70
576 sq.ft. flooring, 1-in.	0.025	14.40
782 sq.ft. barn boards in sides, 1x10 in.	0.025	19.55
72 sq.ft. barn boards in gables, 1x10 in.	0.03	2.16
150 sq.ft. barn boards in partition, 1x10 in.	0.025	3.75
40 lin.ft. tin ridge	0.06	2.40
5 windows (six 8x10-in. lights), 2 ft. 6 in. by 2 ft.	1.25	6.25
3 doors, 2 ft. 9 in. by 7 ft.	0.90	2.70
2 mess tables, 16 ft. by 3 ft.	2.50	5.00
4 benches, 18 ft	0.40	1.60
720 sq.ft. corrugated iron roof	0.046	33.12
90 lb. wire nails	0.035	3.15
7 lb. galvanized nails	0.06	0.42
3 pairs hinges (10-in. strap)	0.25	0.75
3 hooks and staples	0.05	0.15
2 hasps and staples	0.10	0.20
1 padlock	0.28	0.28
112 lin.ft. trim, 1x5 in.	0.035	3.92
Total cost of materials		$135.28
Labor—		
14 hr. foreman carpenter	$0.275	$3.85
66 hr. carpenter	0.22	14.52
41.5 hr. carpenter's helper	0.17	7.06
Total cost of labor		$ 25.45
Total cost of building		160.73

TABLE II. COST OF BUNK HOUSE

Items and Size	Rate	Cost
128 lin.ft. sills, 4x6 in.	$0.05	$6.40
93 lin.ft. posts, 3x4 in.	0.0275	2.56
65 lin.ft. frames for doors, etc., 3x4 in.	0.0275	1.78
132 lin.ft. plates, 2x4 in.	0.015	1.98
128 lin.ft. braces, 2x4 in.	0.015	1.92
224 lin.ft. braces at plate, 2x4 in.	0.015	3.36
416 lin.ft. rafters, 3x4 in.	0.0275	11.44
650 lin.ft. purlins, 1x3 in.	0.005	3.25
405 lin.ft. joists (27 pieces 16-ft.), 2x8 in.	0.028	11.34
75 lin.ft. braces foot of posts, 3x4 in.	0.0275	2.07
800 sq.ft. flooring, 1-in.	0.025	20.00
1000 sq.ft. barn boards in sides, 1x10 in.	0.025	25.00
336 sq.ft. barn boards in partitions, 1x10 in.	0.025	8.40
500 sq.ft. barn boards in bunks proper, 1x10 in.	0.025	12.50
60 lin.ft. 2x4-in. supports for bunks	0.015	0.90
50 lin.ft. braces, 2x4 in., for bunks	0.015	0.75
132 lin.ft. trim, 1x5 in.	0.035	4.62
10 windows (six 8x10-in. lights), 2 ft. 6 in. by 2 ft.	1.25	12.50
5 doors (2 ft. 9 ins. by 6 ft.)	0.54	2.70
800 sq.ft. corrugated iron roof	0.046	36.80
128 lb. wire nails	0.035	4.48
7 lb. galvanized nails	0.06	0.42
6 pairs hinges (8-in. strap)	0.18	1.08
6 pairs hooks and staples	0.05	0.30
6 pairs hasps and staples	0.10	0.60
Total cost of materials		$177.28
Labor—		
24 hours foreman carpenter	$0.275	$6.60
95 hours carpenter	0.22	20.90
34 hours carpenter helper	0.17	5.95
Total cost of labor		$33.45
Total cost of building		$210.73

TABLE III. COST OF COOK SHED

Items and Size	Rate	Cost
40 lin.ft. corner posts, 4x6 in.	$0.05	$2.00
Other lumber		1.00
144 sq.ft. corrugated iron roofing	0.046	6.63
Total cost of materials		$9.63
Labor—		
7 hr. carpenter	0.22	$1.54
Total cost of shed		$11.17

⁂

No Pennsylvania Report before 1914

The Annual Report of the Pennsylvania Department of Mines for 1912 will not be printed before some time in 1914. The reason for this is that they have a new state printer in Harrisburg and he is snowed under at present getting out this year's laws.

Submarine Coal Mining

By John E. Spicer*

SYNOPSIS—The necessary thickness of cover an important factor. The nature and thickness of the strata overlying the seam are determined by soundings and test holes put up in the roof of the mine. Faults and washouts a menace. Submarine mining in Nova Scotia, British Columbia and Great Britain.

⁂

The interest in the submarine mining of coal has greatly increased within the last few years. There is little doubt but that large areas of coal now lying under the sea will be worked in the near future. If these attempts are successful, the life of the coal industry will be greatly extended.

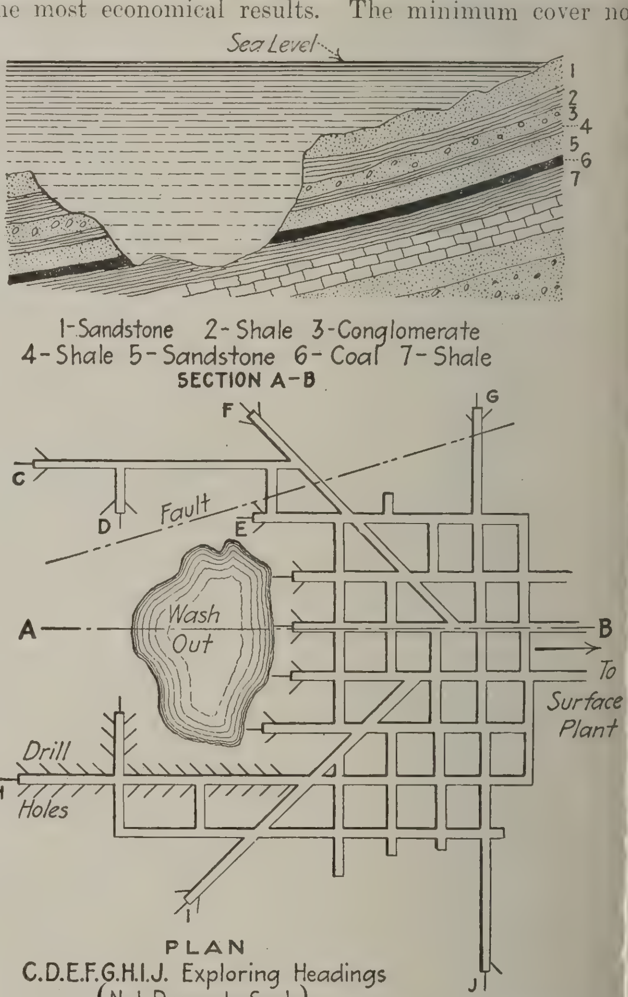
The opinions of mining men vary considerably on the question of the minimum cover that may be allowed with safety. This question assumes a very grave importance where it is desired to rob the pillars, or where the longwall method of working is adopted. A considerable loss of life and property has resulted, in the past, by the error of allowing an insufficient cover for the support of the ocean bed.

The sizes of pillars and openings that may be considered safe, in submarine mining, depend primarily on the character and thickness of the overlying strata which form the bed of the sea. The nature of the strata is of the greatest importance. The presence of beds of clay intervening between the water and the mine workings permits the work to be done with greater confidence under less cover than would be permissible in the case of alluvial or sandy deposits. A thick deposit of alluvium, forming the bed of the sea, often makes it difficult to ascertain the true thickness of solid cover overlying the coal. Beds of shale are better than sandrock but by no means as good as those of clay. The experience, in many collieries in Durham, England, where the coal has been worked under beds of magnesium limestone and other Permian strata, proves that the danger of working under these beds is practically as great as that arising from an insufficient cover, owing to the numerous washouts and solvent action of the water on these rocks.

It is customary, in submarine workings, to ascertain the thickness and character of the rocks overlying the seam, by means of soundings taken in the sea above, and by putting up drill holes in the roof strata below. The precaution is always taken, in submarine mining, of keeping a prospect or exploring heading well in advance of the other work. This heading is driven as narrow work, and a drill hole not less than 15 ft. in depth is kept in advance of the face of the heading. The purpose of this heading is not only to prospect the seam but to determine beforehand the possible presence of any faults in the strata, which are always a present danger in submarine mining. The heading also guards against the possible outcrop of the seam at the sea bed. The thickness of cover is carefully watched, in this heading, by test holes in the roof. The heading also affords protection against large washouts, or the filled-in beds of ancient lakes, rivers, etc.

The presence of faults is a continual menace to safety, in submarine mining; because the fault line affords a natural channel along which the water finds its way into the workings below. This is a common source of trouble in ordinary mining, but the danger is greatly increased when mining under the sea. The most common method to guard against danger from this source is to leave a barrier pillar of sufficient size on each side of the fault.

In Nova Scotia, there are important submarine workings, and this class of mining was made a subject of special legislation. The restrictions laid down were considered, a few years ago, too severe for accomplishing the most economical results. The minimum cover now allowed by law over all submarine workings is 180 ft., except for prospect headings, which cannot be driven under a cover less than 100 ft. The law provides that where the cover is less than 500 ft., these workings must be laid out in panels not greater than one-half mile on each side, the panels to be separated by a barrier of at least 90 ft. of solid coal, pierced by not more than three openings not exceeding 6x6 ft., each.



Ideal Plan and Vertical Section of Submarine Workings

Practically, the same restrictions are in force in British Columbia, where a minimum of 180 ft. of solid cover is required above the seam in all submarine workings, except for prospect headings driven in the solid coal, where the cover must not be less than 100 ft. unless expressly permitted by the chief mine inspector. The proposed stem of working must also be submitted to the chief spector for his approval, and cannot be altered without s permission. The mine plan must show the depth of lid cover at specified distances along all main roads and ound the working faces; and soundings must be taken reasonable distances and recorded on the plan; and hen required (if reasonably practicable) the depth of arine or alluvial deposits overlying the solid cover must so be determined.

---

*Cumberland, B. C., Canada.

The question of minimum cover allowable when drawg pillars or working longwall is not easily determinble, even where the character of the strata is known; but uch valuable information may be obtained from workgs that lie under water-bearing strata.

There are many interesting instances of submarine orkings in Great Britain. Among these may be menioned the Whitehaven colliery, Cumberland, where the orkings of a 10-ft. seam have extended three miles nder the sea. In this colliery, the pillars are 60 ft. ide and the bords or chambers, are driven 18 ft. wide. n this case, the minimum cover under which the total xtraction of the pillars was allowed was 360 ft. Where he cover was less than this amount, only 50 per cent. f the coal was taken out, the remainder being left for he support of the roof.

The complete extraction of the coal by the longwall nethod, with well packed wastes, seems to be more reiable and afford greater protection than is possible when he pillars are drawn in bord-and-pillar work. The subidence of the roof is more gradual in the former case han in the latter; and, as a result, heavy fractures of the verlying strata are largely avoided. In any case, the nethod of working adopted must be determined by the revailing conditions; and the success of the operation vill depend largely on the care, foresight and good judgnent exercised by the management.

A Tape-Repair Outfit for Field Use

A recent issue of the *Engineering and Mining Journal* gives the following illuminating description of an old, out none the less reliable and prompt method of repairng ribbon tapes:

> It seems not generally known among engineers that a teel tape can be mended quickly in the field by solderng the two ends together, and this repair is more permannt than the usual method of riveting. A riveted joint always as a lap which has a tendency to catch on every little proection over which the tape passes, and is usually soon ipped off. A much better joint can be made by soldering, specially on the narrow 300- and 500-ft. tapes, which are specially difficult to rivet. Directions for making a soldered oint are here given:
>
> First straighten out the rough ends of the break with pair of pliers and clean the ends of any rust or mud. A ittle rubbing with a piece of paper or a small stone will suffice. Then cut a sleeve of soft tin plate, the kind used or the inner seal of some coffee cans is handiest to work with, as it can be easily cut with ordinary scissors and ent into shape with the fingers. The sleeve should be bout an inch long and fitted to the tape, so that when olded down snugly the edges just come together. It is hen folded around one end of the broken tape. The other nd is then slipped into the sleeve just far enough to make he tape the proper length. This is determined with some ther part of the same tape. The sleeve is then clamped lown with the pliers to an almost snug fit, leaving just a ery small crack still open. The joint is now ready to be oldered. First run in some soldering compound, holding the oint with the pliers. Now hold the joint in the flame of a andle and drop a little solder on the crack in the sleeve. t will run around in the sleeve covering all the joint. The sleeve is now squeezed down tight with the pliers and the job is done. The tape may break again but rarely at one of these repaired joints.
>
> A repair outfit, consisting of a small piece of candle, a few inches of soft wire solder, which can be easily melted in the flame of the candle, an inch or so of stick soldering compound, such as electricians use, or a piece of resin, a piece of a tin can, a small pair of scissors and pliers to match, weighs less than a pound and can be carried in a 6-in. canvas sack, along with the regular field outfit. A broken tape can then be repaired in a few minutes right on the job.
>
> The writer once lost two days' time going to town to get a jeweler to rivet a tape, because he didn't know this simple scheme. He had been told "solder wouldn't hold" and believed it.

◆

A Coal-Buying Syndicate in the Philippines

According to the *Daily Consular and Trade Reports*, a coöperative coal-purchasing organization has been perfected in the Philippines for the purpose of reducing costs, both in buying and handling, and to assure an adequate supply of good-grade fuels being always on hand. We quote from the report, in part, as follows:

> The organization includes the Government of the Philippines, the Philippine Railway Co., which operates various railways in the archipelago, the Manila Railway Co., which operates railways in the vicinity of Manila, and the Manila Electric Railway & Light Co. At present they use, respectively, 36,000 tons, 10,000 tons, 35,000 tons, and 40,000 tons, while the Compania General de Tobaccos uses 16,000 tons. The association is controlled by a board of five directors, of which two are chosen by the Governor General and the other three by other members of the association.
>
> The association has employed a coal expert, E. Randolph Hix, who is now making an investigation of the coal mines of China and Japan and who is also collecting data as to coal tests and coal consumption from the larger industrial concerns in Hongkong, Shanghai and Japanese cities. It is thought that the entire enterprise can be managed upon an expenditure of not over 15 centavos (7.5 cents gold) per ton. The concerns, already in the organization, including the government of the islands, but not the Navy Department, which is likely to be directly concerned in it, import about one-third of the total imports of coal into the archipelago. The imports of coal into the islands from all countries have increased from 295,648 metric tons in 1907 to 322,928 in 1908, 342,047 in 1909, 375,518 in 1910, 413,735 in 1911, and 436,687 in 1912—an average annual increase of about 8.5 per cent., representing steady industrial growth in the Philippines. The purchases of the Navy average about 82,000 tons additional.
>
> It is planned to purchase coal for the association as far as possible in a single contract for the purposes of securing the lowest possible price per unit for the fuel, regulating the arrival of colliers so that no two will be in the harbor at the same time, thus saving lighterage and stevedoring costs; and especially to purchase the coal only after exhaustive tests as to ash and calorific power and on the basis of a bonus for increased fuel efficiency in the fuel bought. The value of the combustible material in most coals purchased in the Philippines from China, Japan and Australia runs about the same, allowing for a variation of about 5 per cent., ranging from 7500 to 7900 heat units per kilo (2.2 lb.); but the amount of ash and moisture carried varies so greatly as to materially affect fuel costs. In a recent purchase by a large consumer in the islands it was found that coal in one pile averaged 10 per cent. more efficiency than that in another pile bought of the same parties from the same locality and for the same price. The association expects to buy its coal on the basis of a contract price for a standard number of heat units and percentage of ash, the price to be increased for an increased proportion of heat units and a reduced proportion of ash. or decreased with decreased units of heat and increased proportion of ash. It is to ascertain the best and most economical proportion of combustible material and ash for the best price among the coals reasonably available in this field that investigations are now being made.

◆

The original supply of coal in the states of Iowa and Missouri is estimated to have been respectively 29,160,000,000 short tons and 40,000,000,000 short tons. Of this amount 0.4 per cent. has been mined or wasted.

Coal Development in Nagasaki

According to U. S. consular reports, the mining industry in the Nagasaki district of Japan was extremely prosperous during the season of 1912. Coal operators, especially, had a busy year, and at times had difficulty in getting sufficient tonnage to make their foreign shipments, which go to Vladivostok, Siberia, and Bombay, India.

One of the largest coal companies here contracted for the delivery of 55,000 tons of coal to the Great India Peninsula Ry., at Bombay, and it is expected that a contract will be made to supply coal to the Central India Ry. This invasion of Indian markets by Japanese fuel in competition with the best Bengal coal has aroused much interest. The competition will probably be keen. It is reported that the Kiushu coal is as good as the best Bengal fuel, and as there is plenty of it, and freight rates are low, it is likely that it will continue to go to Indian markets. There is now a large and increasing demand for Japanese coal in Singapore, Penang, Colombo and Manila, and prices have advanced in consequence from 30 to 50 sen (15c. to 25c.) per ton.

As a consequence of the increased demand for Kiushu coal, many of the smaller mining concerns are being consolidated with the larger companies, and new machinery is being installed and the output increased. One of the largest of these companies to amalgamate with the Mitsui Bussan Kaisha, the largest coal operators in Japan, is the Matsushima Colliery, a new company being formed with a capital of $1,000,000, of which 60 per cent. was taken by the Mitsui Bussan Kaisha, and 40 per cent. retained by the former owners, the Koga family. The present output of this mine is 300,000 tons, but this is soon to be increased to 500,000 tons.

Another mine near Nagasaki called the Sakito Colliers Co., and owned by the Kiushu Coal & Steamship Co., has an annual output of 250,000 tons, which is to be increased shortly. All the output of this mine is contracted for by the Imperial Government Railways Board. This mine gives employment to 1223 miners and 454 artisans and other laborers, while the Matsushima mine employs 1675 miners. Both of these properties have modern American machinery, which was installed in 1912.

The island of Amakusa, off the southwest coast of Kiushu, and some 20 to 25 miles distant from Nagasaki, has a fair-sized area of anthracite, which hitherto has been worked only in a primitive way. The Daito Kogyo Kaisha, a Tokyo mining company, has a plan for the development of the Shiki collieries of this field, and claims that, by the introduction of modern machinery, the daily capacity of 250 tons can be increased to 1000 tons, as the field is extensive. The coal seams run under the sea some distance, and the pits are only three miles from the port of Tomioka, Amakusa Island, with a light railway making connection between the mines and the port. It is proposed to increase the capital stock to $500,000 in the reorganization and development scheme.

The coke plant of the Mitsui Bussan Kaisha, at its coal mines at Miike, has been very successful, and it is planned to establish similar plants at other mines to make use of the coal dust for coke and byproducts. The capacity of the Miike coke plant is 300 tons of coal dust at each charge, and the time of coking is 26 hours.

Kentucky's Coal Production

The State of Kentucky in 1912, according to E. W Parker, of the U. S. Geological Survey, produced 16,490,521 short tons of coal. This was an increase of 2,440,818 tons over the figures for 1911 and nearly 2,000,000 tons over the former maximum output of 1910 There was also an increase in value in 1912 of $2,845,749 over the figures for 1911.

The number of men employed in the mines in 1912 was 24,304, and the average production per man was 678 tons. In 1912, 66 per cent. of the coal produced was machine mined. There were during the year 51 fatalities in and about the mines, 41 underground, 2 in shafts and 8 on the surface.

Kentucky is the only coal-producing state which has within its borders areas belonging to any two of the distinctly separate great coal fields. The eastern counties are underlain by the coal beds of the great Appalachian Mountain system, extending entirely across the state in a northeast-southwest direction, while the southern limits of the central or eastern interior coal fields, are found in the more northern counties of the western section.

The total area underlain by coal in the eastern counties of Kentucky is estimated at 10,270 square miles, and the coal-bearing areas in the western part of the state are estimated to contain 6400 square miles. Up to the close of 1911, the larger part of the production has been from the western district, but as a result of extensive developments in Harlan, Johnson, Letcher and Pike Counties, the larger part of the coal production in 1912 was from the eastern part of the state. The eastern Kentucky coals are mostly of the high-grade gas or coking varieties, with some cannel coal.

⁂

Track Work in Mines

The *Engineering and Mining Journal* recently published the following interesting notes on track work in mines:

The illustrations on next page show some details of underground track work and one of the motor turns used in the mines of the Republic Iron & Steel Co., on the Mesabi range. Figs. 1 and 2 show a right and left turn. As a rule, the location of a turn is determined before the drift is driven and the necessary sets are put in place to make the turn when required. Props are placed under the ends of the two caps resting on the opening set until that turn is to be driven. A 9-ft. by 6-in. post is used under both of these caps and on either side the posts of each set are shortened six inches until an 8-ft. post is reached, which is the length of post used in motor drifts. When the opening set is placed in position, a point is placed on the set and on the 10-ft. by 9-in. set and with this line the rest of the turn is put in with the aid of the other dimensions shown. Figs. 3, 4 and 5 show the track layout and frog details used in connection with a 25-ft. radius timber turn. The frog is designed so that it can be used for either a right or left turn. The stub switch has given better satisfaction for underground work than the point switch. The latter caused considerable trouble by dirt getting between the wing rail and track, which interfered with its closing. Figs. 6 to 10, inclusive, showing details of switch stand and tie-rod connections, are self-explanatory.

Turnouts Used in a Minnesota Mine

Record Coal Output of Pennsylvania

The output of bituminous coal in Pennsylvania, according to E. W. Parker of the U. S. Geological Survey, established a new record in 1912 and exceeded the previous maximum of 1910 by 11,343,964 short tons in quantity and by $16,340,987 in value.

The production decreased from 150,521,526 short tons valued at $153,029,510 in 1910 to 144,561,257 tons valued at $146,154,952 in 1911, the smaller production being accompanied by a slight decline in price. In 1912 prices were somewhat improved and the production increased to 161,865,488 short tons valued at $169,370,497. The gain in quantity in 1912 over 1911 was 17,304,231 tons, or nearly 12 per cent. The increase in value was $23,215,545, or 16 per cent.

Production increased generally throughout the state, eighteen of the twenty-three counties showing gain, but, as previously stated, by far the greatest increases were in the two counties named. Fayette County showed a gain of 5,756,405 tons and Westmoreland a gain of 6,487,354 tons. The combined production of these two counties in 1912 was 62,956,116 short tons, which exceeded the entire production of Illinois, the third coal-producing state, and was equal to 94 per cent. of the production of West Virginia.

No less notable than the increase in production in 1912 was the extension of the use of mining machinery and a larger tonnage of machine-mined coal. In 1911, the quantity of coal mined by machines was 69,131,923 short tons, or 47.78 per cent. of the total. In 1912, the quantity so mined was 82,192,042 tons or 50.8 per cent. of the total. The number of machines in use in 1912 was 6176 against 5719 in 1911.

Pennsylvania, like West Virginia, presents a commendable record in the small percentage of bituminous coal improperly mined. Of the total production in 1912 only 4,801,784 short tons, or approximately 3 per cent., were reported as being shot off the solid. The quantity reported as mined by hand was 54,545,218 tons, which added to the machine-mined tonnage makes a total of 136,737,260 tons, or 84½ per cent. of the entire production that was undercut, sheared or otherwise mined before being shot or wedged down. The quantity produced in 1912 for which the methods of mining were not reported was 20,326,444, or 12½ per cent. of the total.

Very little of the bituminous coal produced in Pennsylvania is washed before being sold or used in the manufacture of coke. The quantity washed in 1912 was 4,819,330 tons, or 3 per cent. of the total. It yielded 4,326,162 tons of clean coal and 493,168 tons of refuse.

The statistics, compiled by the U. S. Bureau of Mines, show that 437 men were killed in and about the bituminous coal mines of Pennsylvania in 1912, a decrease of 92 from 1911 when there were 529 fatalities.

⁂

A New Mammoth Breaker

Not content with the largest and most uptodate breaker in the anthracite field, the Truesdale, the Lackawanna Coal Co. have begun excavations for the foundations of the Loomis breaker, which will surpass all previous attempts in breaker building. The structure, which will be a mammoth affair, will be built entirely of concrete, steel and glass. There will be no lumber used except in making the falsework necessary in the course of construction. The breaker is to be erected within 1000 ft. of the old Dundee shaft, which was abandoned about 50 years ago because of the inability to cope with the danger surrounding mining at that time. The fact that a new breaker is to be built in this location shows plainly the advance in coal-mining methods in a half century.

The contract was recently awarded to the Walter F. Gahagan Co., of New York. The breaker and washery from surface level to the top of the pocket line will be of reinforced concrete, and from the pockets to the roof structural steel inclosed by metal and glass. The work of excavation has already begun, and about a year will be required to complete the two buildings. Like the other Lackawanna collieries in the Nanticoke district the new plant will be operated by electricity furnished by the big Nanticoke power plant. When completed and in operation, the Loomis will give employment to about 2500 men, and will have a capacity of about 6000 tons of coal in nine hours.

Two shafts have already been sunk to the Hillman bed, a depth of 930 ft. below the surface. At the present time the Hillman and Mills seams are being worked. Plans for the sinking of an additional shaft 14x53 ft. 4 in., and about 900 ft. deep, are now under consideration. This shaft will be sunk approximately 800 ft. east of the power plant and will open up virgin territory. The coal will be handled on the surface by 15-ton electric motors.

The old Dundee, which was sunk in 1851, and which for many years has been abandoned on account of the gas will soon be widened. Its present dimensions are 10x16 ft., with a depth of 810 ft. When the Dundee shaft was in operation there was no such machinery in the anthracite field as a ventilating fan. The shaft is to be extended to the Ross bed, which is about 1500 ft. below the surface, and will be increased in size to 14x43 ft. 3 in.

The steel headframes for Loomis shafts Nos. 1 and 2 are already on the ground, and preliminary work for their erection has been begun. A number of substantial buildings for the housing of engines, etc., erected of concrete and pressed brick are now completed. Two 34x48-in. Corliss-valve hoisting engines have been installed at these openings. They are the products of the Vulcan Iron Works, of Wilkes-Barre, and are equipped with all modern safety devices, such as steam brakes, steam reverse, Welsh overwind device, three throttle valves, one on the main steam line and one on each cylinder. In addition to the above, each cylinder has two relief valves under control of the engineer in case of emergency.

Coal Shipping on the Great Lakes

YNOPSIS—A description of the harbors at Toledo and ilwaukee. Toledo is already an important shipping int for bituminous coal and now has improvements unr way that will give it the largest capacity of any of e loading ports. Milwaukee is the second largest reiving point and also has important reconstruction of its rbor facilities under consideration.

Toledo Harbor*

Following the completion of the new docks of the ocking Valley Railroad Co., in East Toledo, this city ill rank among the first ports on the lakes in the shipent of coal. Toledo is a natural distributing point for al coming from the South or Southeast for reshipent. It has an aggregate of 12 miles of dockage alady developed with an additional 35 miles of available cking sites. During the year of 1912, two million tons coal were shipped by vessel to up-lake ports, while six d a half million passed through Toledo by water and il together. All coal destined for Detroit vessels reshipped at this port.

Car Dump on the Hocking Docks at Toledo

Steamer "Champlin," 8500 Tons Capacity

Toledo has three large docks, the Hocking Valley, T. O. C., and the C. H. & D. The largest ore dock is that the C. H. & D.; it is built of concrete and is 1700 ft. ng and 433 ft. deep. It is equipped with two 15-ton ulett fast ore unloaders with a capacity for discharging 10,000-ton steamer in 10 hr. The C. H. & D. coal docks rank third in Toledo and have yard space for 3500 cars. These docks carry a stock of about 80,000 tons of coal and are among the most modern on the lakes.

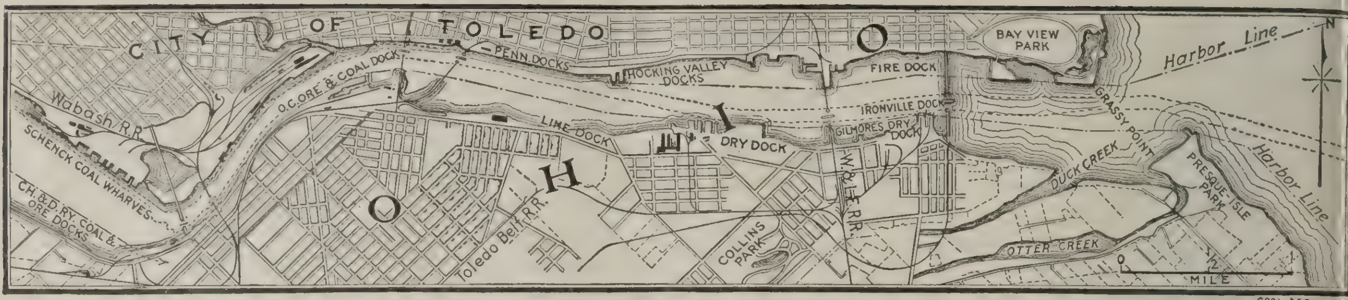
Bituminous coal alone is handled at the Hocking Valley and T. & O. C. docks, which are splendidly equipped and have a 2500-car capacity. These docks have loading machinery with a capacity of 20,000 tons every 20 hours. The new Hocking Valley docks, now in course of construction, will be open for use, about June of next season, and will be equipped with more loading machinery than any port on the lakes. With the completion of these docks, which will be of concrete and equipped with every modern improvement known, Toledo will take precedence over all other ports as a coal center. All the Hocking Valley and Chesapeake & Ohio coal, which is now going to Sandusky and other points, will be diverted to Toledo, more than doubling the present tonnage. During last year, 1497 vessels arrived at Toledo and 1477 cleared.

Railroad Facilities at Toledo

The railroad shipping facilities here will also be further increased next season by the immense improvements being made at Air Line Junction by the New York Central lines. The yard capacity at that point is being increased to five times and additional shops will also add to the efficiency of the service. The value of this movement to the coal interests will be more apparent when it is understood that Detroit is extremely short of yard space and is in no position to increase its capacity, ow-

---

*By E. F. Baker, Nicholas Bldg., Toledo, Ohio.



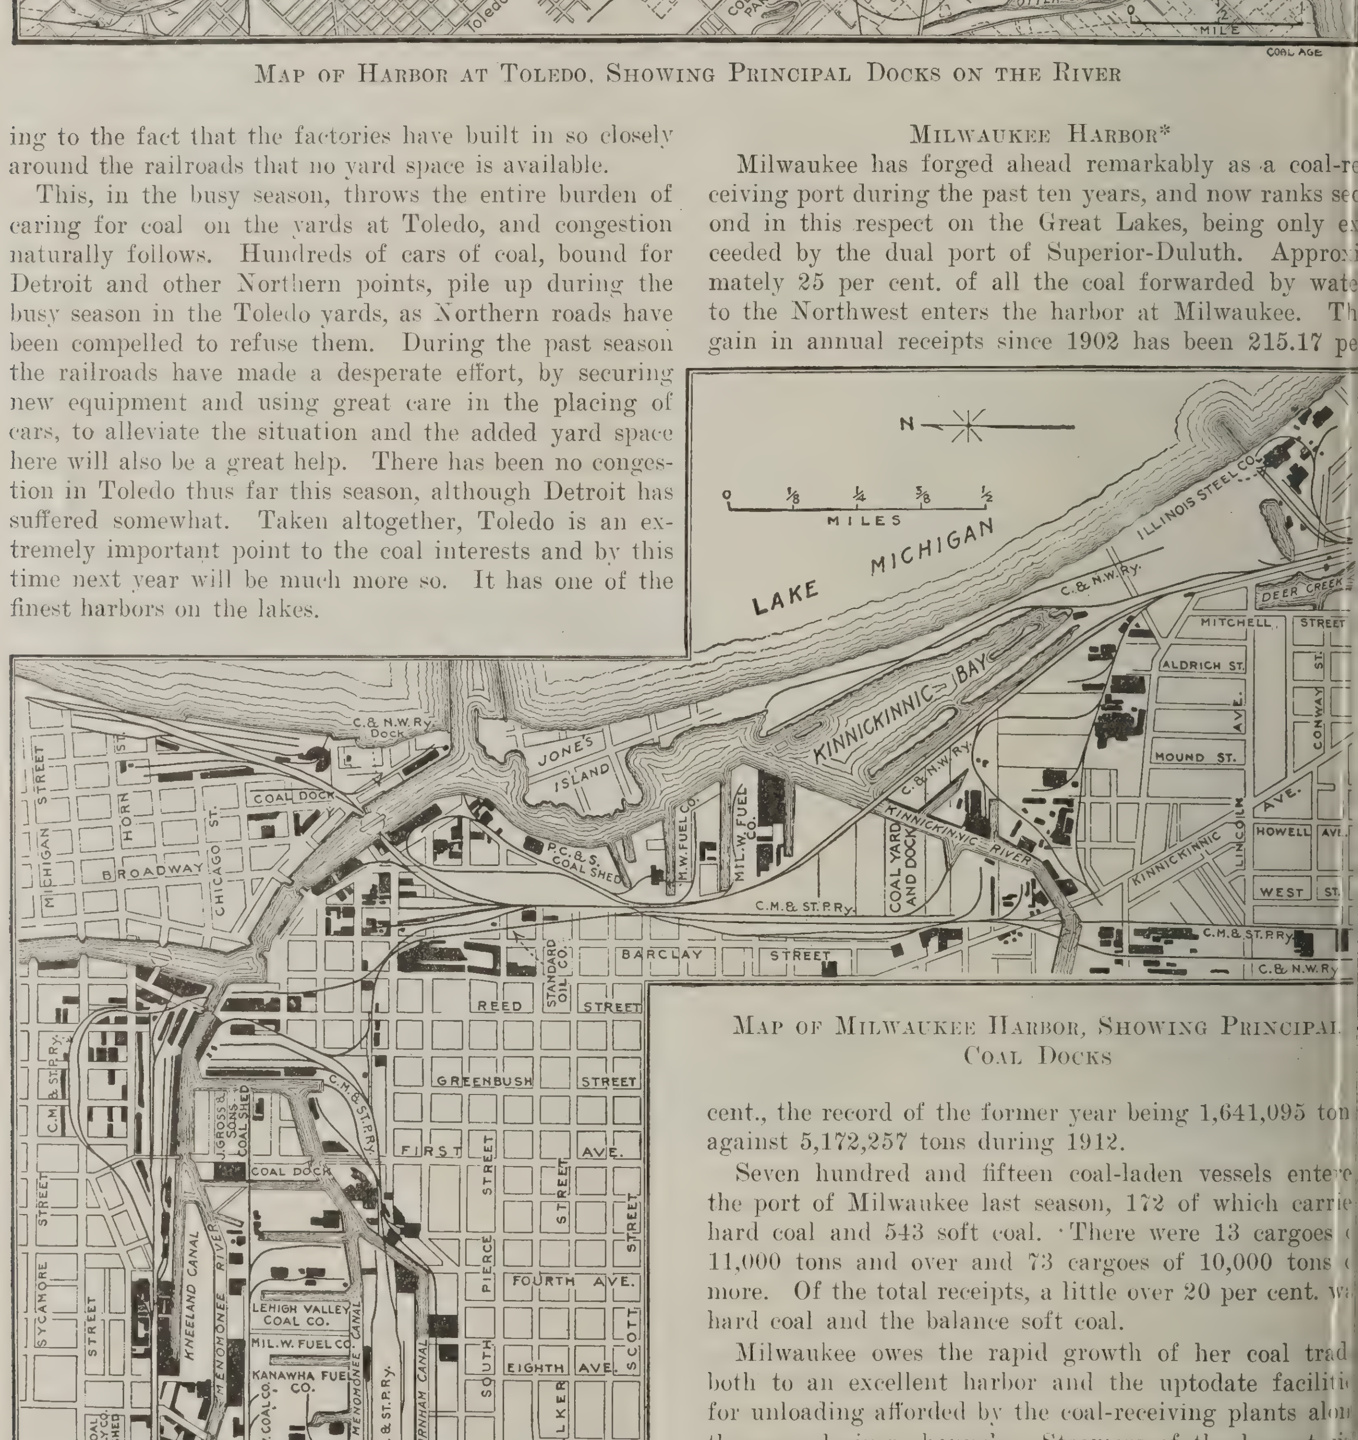
Map of Harbor at Toledo, Showing Principal Docks on the River

ing to the fact that the factories have built in so closely around the railroads that no yard space is available.

This, in the busy season, throws the entire burden of caring for coal on the yards at Toledo, and congestion naturally follows. Hundreds of cars of coal, bound for Detroit and other Northern points, pile up during the busy season in the Toledo yards, as Northern roads have been compelled to refuse them. During the past season the railroads have made a desperate effort, by securing new equipment and using great care in the placing of cars, to alleviate the situation and the added yard space here will also be a great help. There has been no congestion in Toledo thus far this season, although Detroit has suffered somewhat. Taken altogether, Toledo is an extremely important point to the coal interests and by this time next year will be much more so. It has one of the finest harbors on the lakes.

Milwaukee Harbor*

Milwaukee has forged ahead remarkably as a coal-r ceiving port during the past ten years, and now ranks se ond in this respect on the Great Lakes, being only e ceeded by the dual port of Superior-Duluth. Appro mately 25 per cent. of all the coal forwarded by wate to the Northwest enters the harbor at Milwaukee. Th gain in annual receipts since 1902 has been 215.17 pe cent., the record of the former year being 1,641,095 ton against 5,172,257 tons during 1912.



Map of Milwaukee Harbor, Showing Principal Coal Docks

Seven hundred and fifteen coal-laden vessels ente the port of Milwaukee last season, 172 of which carri hard coal and 543 soft coal. There were 13 cargoes 11,000 tons and over and 73 cargoes of 10,000 tons more. Of the total receipts, a little over 20 per cent. w hard coal and the balance soft coal.

Milwaukee owes the rapid growth of her coal trad both to an excellent harbor and the uptodate faciliti for unloading afforded by the coal-receiving plants alo the several river channels. Steamers of the largest si are able to deliver cargoes at docks fully two miles fro the harbor entrance, and, as a rule, these docks a equipped with coal-handling machinery of the most mo ern type, one dock having an unloading capacity of 10,5 tons in ten hours.

---

*By Herman Bleyer, Milwaukee Press Club, Milwauke Wis.

Proposed New Docks at Toledo

There are 27 coal-receiving plants along the three rivrs and tributary canals which comprise Milwaukee's ommercial harbor, with a combined storage capacity of lose to 3,000,000 tons. Four of these are private plants onnected with local industries. The others do a local nd trans-shipping trade. Of the private plants, the argest receives 60,000 tons per season. The fact that everal of the leading yards are enlarging and improving heir facilities indicates that those engaged in the trade ave confidence in its stability and future growth.

The matter of providing more river territory, to accommodate the increasing coal trade, is now receiving the ttention of the Harbor Commission, which has recommended that the city proceed at once with the development of the Kinnickinnic Basin and Kinnickinnic River. With the completion of a proposed inner basin behind what is known as "Jones Island," near the harbor entrance, Milwaukee will be able to accommodate from 50 to 60 loaded vessels of the largest class with mooring places for the winter; it will thus add to the coal-storage capacity of the port and make it an object for vessel-owners to send their craft to Milwaukee with coal cargoes on the last run of the season. The absence of mooring room has been detrimental to Milwaukee's receipts at the close of navigation, but the proposed improvement will remove this objection and enable shippers to order coal in quantities far beyond the maximum storage capacity of their yards.

Pittsburgh Coal Co.'s Loader at Fairport, Ohio

Milwaukee is an extensive manufacturing center and consequently is a heavy consumer of steam fuel, while several surburban industrial points also draw heavily upon the coal supply. These facts, together with a large coke- and coal-product plant, which requires about 1,000,000 tons of soft coal annually, makes Milwaukee a consumer of coal to the extent of about 50 per cent. of the total receipts. The remainder is forwarded to points in the interior. The plant alluded to is now erecting an auxiliary establishment at Mayville, Wis., the raw product for which will have to be received at Milwaukee and transferred by rail. This will increase the receipts at that particular dock in the course of a season to nearly half a million tons.

Shippers and dealers report a satisfactory condition of trade, especially in the shipping territory. The consuming area is steadily increasing and orders indicate that buyers intend to be well supplied for the winter.

Freighter "Ontario" in the Canadian "Soo"

The movement is good for the season of the year and it promises to outstrip all previous records by a million tons or more. Between the first of January and the first of September, the gain in receipts over last year aggregates something like 850,000 tons. Even if this high rate of increase is not fully maintained during the balance of the season, it is reasonable to expect that Milwaukee's coal receipts by lake during 1913 will reach the 6,000,000-ton mark.

COLLIERY NOTES

To clean badly rusted steel tapes, use a mixture of lubricating oil and cement. Do not rub too hard.

⁂

An open light should not be taken by the fireboss on his rounds; and to avoid suspicion, the fireboss should wear a cap or hat on which it is impossible to hang the ordinary open miner's lamp.

⁂

As far as possible, the use of continuous currents in mines employing over 50 men should be avoided, as not only are the men compelled to breathe impure air by this system, but any fire occuring on the intake would send its smoke all over the mine.

⁂

Generally speaking, it is advisable to ventilate the old and abandoned workings. When it is not done, the only proper alternative is to surround the old workings with solid fireproof dams, that is, heavy permanent stoppings of masonry, brick, concrete or other fireproof construction.

⁂

The practice of having other engines, such as electric pumping, haulage, etc., in the same engine house with the hoisting engine is responsible for many hoisting accidents, as the noise of the other engines make it exceedingly difficult, if not impossible, for the engineer to hear and attend to the signals properly.

An Analysis of the Coal-Car Situation

Compiled by A. T. Shurick

SYNOPSIS—The beginning of the crop movement and the opening up of the winter coal trade throws the maximum load of the season on the railroads at about this time. Car supply, therefore, becomes an item of serious moment to the producers. A review of the outlook is presented here, together with comments from officials of the leading coal roads. Indications point to a relatively easy situation this year.

⁂

With the nearer approach of the customary car-shortage season, coal operators are naturally interested in what the indications are for this year. It might be well to state here that any prophecies in this connection are subject to impending developments, and furthermore that all the information available in regard to this subject is of a more or less contradictory nature. The most reliable information is, of course, obtained from a study of railroad statistics with special reference to expenditures for additional equipment and motive power, as well as grade elimination, improvement in terminal facilities, etc.

A comparative statement of such data with previous years forms the best available index to the position of the road. The only remaining unknown quantities in the equation are the weather conditions and the increase or decrease in tonnage to be handled.

The Situation in General

The latest accurate statistics regarding equipment and motive power for the entire country are those of the Interstate Commerce Commission recently made public. Unfortunately these are more than a year behind as of June 30, 1912; however, a review of the situation on that date presents some interesting features.

At that time there were a total of 2,368,658 cars on all the roads of the country, this being an increase of only about 25,000 over the statement for the previous year. It is thus obvious that buying new equipment was rigidly curtailed over that period, but such has not been the case during the past year, as will be noted when the statistics become available. Of this gross number of cars in service on June 30, 1912, 2,203,108 were freight cars, 852,720 of these being coal cars. The gross number of locomotives in service on this date was 61,250, of which 36,600 were freight and 9465 switch engines.

The opinion of the average railroad man on the situation appears to be that the deficiency in equipment will be no worse this season than last. The reason most generally advanced for this belief is the broad campaign which manufacturers' associations and civic bodies have conducted and by which shippers and consignees have been impressed with the necessity of rapid loading and unloading of cars. It is interesting to note in this connection that the average trip of freight cars is 14.9 days, during which time the shipper has the use of the car 5.74 days, or about 37 per cent. of the time. This, of course, involves a tremendous loss, which may be materially reduced by coöperation on the part of the shippers.

The Sunset-Central lines, of the Southern Pacific Co., issued an instructive circular offering suggestions for facilitating the movement of freight, which we quote as follows:

> **1.** By giving as much advance notice as possible of your requirements. If there is no suitable car on hand, opportunity should be given to secure it from another point.
>
> **2.** By calling on the agent for his approval before reloading cars made empty on your tracks. Such cars may or may not properly be used in the direction you desire, and their misuse may necessitate transfer of freight, with consequent delay to your shipment.
>
> **3.** By loading cars to the greatest possible percentage of their capacity, and by using your efforts with your customers to induce them to place orders for full car loads. If you use two cars to handle the load of one, you reduce the supply 50 per cent.
>
> **4.** By regulating, so far as possible, your inbound shipments so as to avoid receipt of cars in excess of your ability to promptly unload. Congestions which delay your freight and hurt your business are almost always caused by over-shipments. The effect on the car supply is also obvious.
>
> **5.** By calling the agent's personal attention at once to any condition which retards the loading or release of cars and which it may be in the power of these lines to correct. Our own deficiencies in facilities or service may be chargeable with a detention for which you are being held responsible.

Orders placed by railroads for new freight equipment during the year have exceeded those for any previous year. The number of new freight cars ordered in this country, Canada and Mexico during the year 1912 aggregated 226,195, or nearly twice that of the previous year. Only in two past years has this been exceeded, that is in 1905 and 1906, when the equipment orders were 341,315 and 310,315, respectively. The following table shows the number of freight cars ordered during each year since 1901:

Year	Cars	Year	Cars	Year	Cars
1901	193,439	1905	341,315	1909	189,360
1902	195,248	1906	310,315	1910	141,204
1903	108,936	1907	151,711	1911	133,117
1904	136,561	1908	52,669	1912	226,195

Statement of the American Railway Association

In a review of the situation by the general agent of this association, in *The Railway Age Gazette,* he says:

> First, let us ask: What is a car shortage? Is it necessarily a lack of cars? The answer to this, of course, is "No." We have enough cars if we can move them faster. To avoid a car shortage, then, we need either more cars or more movement, and it will be better if we can have both more cars and more movement.
>
> As to the cars, the answer is easy. Last year the roads built 150,000 new freight cars, and this year they are nearly 10,000 cars ahead of their last year's record. Something is being done in this line. What do we mean when we say the movement can be improved? Do we mean that our freight trains ought to be run faster? Any railroad man will tell you no—that to run freight trains faster is not the best way to secure a better movement. He will explain that the freight car is in motion only a small fraction of the time, and that what is needed is more movement of the kind we have now, and not faster movement.
>
> The usual arrangement with train employees is that they are to be paid overtime when the freight train makes less than ten miles an hour. This ten miles an hour is generally accepted as a proper movement for a freight car. At this rate our freight cars in the fiscal year 1910 were in motion one-tenth of the time, and in our record months they were in motion about one-ninth of the time. Certainly there is a chance for more movement of a vehicle which stands still eight hours for every hour it is in motion.
>
> Let us consider who is responsible for car delay. This responsibility is divided between the public and the railroad. Delay by shipper and receiver should be adequately taken care of by demurrage rules, and there is a general impression that on the whole there is less delay by the public than there used to be. Unfortunately, there are no statistics by which this can be proved. The only information which covers the whole of the country is a figure given by the Interstate Commerce Commission of $7,764,964 demurrage collected by the railways in the fiscal year 1911.

We cannot, therefore, tell how much the shippers and re-ivers should help us, but we shall know more on this point the future. Certainly, some of the shippers and receivers ade great efforts to secure prompt handling of cars during e car shortage last fall and winter, and we trust they will ntinue these efforts even more successfully this year.

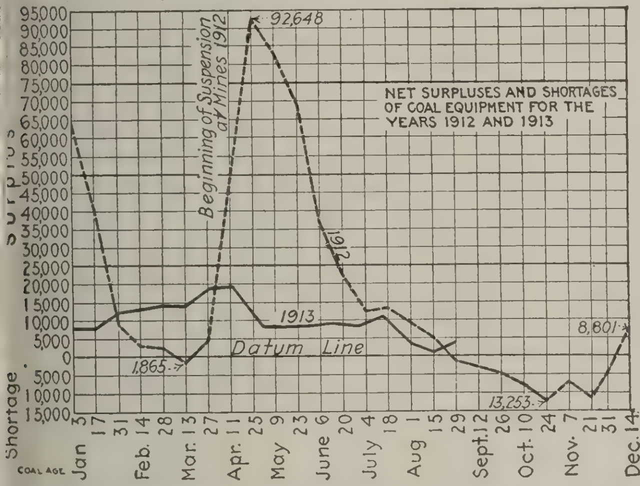
Now, as to delay by railroads, and in this delay I will in-ude shifting movements. As stated above, the railways do t credit themselves with any mileage on account of these ifting movements, and usually the time occupied in a switch ovement is much less than the time in which a car stands vaiting such a movement. Delays by railroads appear to be vided into four kinds—delays enroute, delays in yards, de-ys in shops, and delays in storage, and by this last word torage" I mean the holding of all available cars for which ere is no immediate prospective loading.

The bulk of delay in periods of shortage is to cars stand-g in yards awaiting movement. This includes both loaded id empty cars. There are cars delayed in this way waiting go into shops and coming out of shops; cars awaiting de-very to connections, and awaiting movement from inter-iange tracks, and lastly, and this is probably the most im-ortant item, there is a great total of cars, loaded and empty, vaiting road movement, some in terminals and others in irds where engines are changed.

Chesapeake & Ohio Railway

Vice-President M. J. Caples, of the Chesapeake & Ohio 'stem, sums up the car situation on his line as follows:

Considering the financial conditions prevailing through-ıt the country during the past year, this company has nade liberal appropriations for the purchase of coal quipment, motive power, passing and yard tracks and for ın additional coaling pier at Newport News, Va. There ıas been put into service 37 Mallet locomotives, having ı tractive power of 82,000 lb. each, and 26 Mikado loco-notives having a tractive power of 60,800 lb. each. The 'ollowing is a comparative statement of our coal equip-nent and motive power for this year and last year:



ᴾʀᴏꜰɪʟᴇ Showing Fluctuations in Car Supply for the Last Two Years

	1913	1912	Increase
Number of coal cars............	34,068	32,827	1,241 (3.8%)
Capacity of coal cars (tons).......	1,661,755	1,545,540	116,215 (7.5%)
Number of freight and switching locomotives..................	690	667	23 (3.4%)
Tractive power of freight and switching locomotives (lb.)	28,695,804	24,730,894	3,964,910(16.0%)

The condition of our equipment compares favorably with that of a year ago, and with the new cars received and others still coming, we should be able to take care of the shippers on our line. In addition to this, an expenditure of about three-quarters of a million dollars has been authorized for additional passing and yard tracks which will also tend to facilitate the movement.

At Newport News we are constructing a coal pier which, when completed, will be one of the largest and most modern on the Atlantic Coast. It will be 1200 ft. in length, 70 ft. in width at the water line, and 90 ft. high above high water. There will be 33 pockets on each side of the pier, each having a capacity of 100 tons, and the pier will be capable of handling 72,000 tons per 24 hr. continuous running. This pier is to be completed early in 1914.

The Norfolk & Western Railroad

D. E. Spangler, superintendent of transportation of this road, has furnished us with the folowing information regarding the situation on his line:

It is difficult to forecast the probable future car supply much beyond the immediate present. With us much of the coal produced on our lines is marketed at different points on other roads. While we have a very large coal equipment, which has been materially increased during the past summer, and to which further substantial additions will be made before the end of the year, we are nevertheless dependent for a full working supply upon the rapidity with which cars are released and returned.

In the fall there is always an appreciable slowing up in the movement of both loaded and empty cars on the Western lines, to which territory the greater portion of our coal goes; the promptness with which the cars are returned depends largely upon weather conditions.

Generally speaking, the Norfolk & Western is well equipped to render prompt service, and with reasonably quick handling on the part of the shipping public and connecting lines, it is felt that this road can provide a good working supply of cars throughout the fall. However, in view of the interruptions to service which the several roads are liable to be subjected to during the winter, and which cannot be avoided, coal consumers should, for their own protection, stock a reasonable tonnage during the summer and fall months. As compared with the increase in coal production, it will be seen that the additions to equipment have been quite liberal, particularly when it is considered that during some of the years practically a full supply of cars was furnished throughout the 12 months.

The increase in the tractive power of our freight engines during the past year has been 14.2 per cent., as compared with 1912, and 36.2 per cent. as compared with 1909. The additions to the coal-car equipment during the current year show an increase of 16.3 per cent. as compared with 1912, and 70 per cent. as compared with 1909. The increase in motive power and car equipment is in direct proportion, it being the policy of the management to do this in order to provide ample power to dispatch promptly all available equipment.

The following improvements and additions have been made or will be completed during the current year: 78 miles of second track; 19 miles of passing track; 25 miles of yard track; a new coal pier at Lambert Point, and numerous shop additions.

The condition of car equipment and motive power is as good as heretofore. The percentage of cars out of service, owing to being out of order, rarely exceeds 5 per cent., and the number of locomotives out of service on that account seldom exceed 10 per cent.

COMPARISON OF LOCOMOTIVE AND COAL-CAR EQUIPMENTS

Year	Freight Engines		Coal Cars	
	Number	Tractive Power	Number	Capacity
1909..................	844	27,538,674	21,996	993,080
1912..................	890	32,840,725	29,175	1,451,690
1913..................	951	37,506,784	a34,914	1,688,254

(a) Includes new equipment to be delivered to Jan. 1, 1914.

It will be noted that the gross tractive power of the freight engines has been increased 36.2 per cent. since 1909, 14.2 per cent. of which has been added in the past year. The coal-car equipment has been increased 70 per cent. since 1909, the increase in the past year being 16.3 per cent.

STATEMENT OF COAL SHIPMENTS*

Year	Tonnage	Increase
1909	12,428,385	....
1910	15,783,219	27%
1911	17,424,434	10%
1912	22,028,726	26%
1913†	23,008,258	4%
1913 *vs.* 1909		85%

* For fiscal years ended June 30.
† Ohio flood curtailed output.

Baltimore & Ohio*

Officials of the Baltimore & Ohio R.R. report that the car-supply outlook for the fall is encouraging and that unless there are extraordinary increases in the volume of business, the requirements will be met more satisfactorily this year than for several seasons.

It is explained in this connection, that with the large purchases of equipment made during the last two or three years, the rolling stock of the company is in good shape to move the fall traffic. The equipment purchased by the road during the last three years includes 25,000 freight cars and 600 locomotives. Most of the motive power bought was for freight service.

Liberal allowances for maintenance of equipment were made during the last fiscal year, the expenditures having amounted to $18,400,000. During the closing months of the fiscal year, the shops were kept on full time repairing the equipment and it was not until recently that the scale was put back to normal.

The most serious shortages in freight equipment occurs in coal cars and box cars, but no unusual concern is felt in respect to this. It is possible, however, that for a period the coal cars may be supplied on a percentage basis, but it is not expected that such practice will be necessary for an extended time.

New regulations covering the distribution of coal cars were recently issued to shippers by the transportation department and became effective Aug. 1. During extended periods of full car supply, all mines are given up to their orders as far as possible to do so, provided such cars are promptly loaded and consigned. Mine ratings for each operator are based upon the calendar month showing the highest average daily shipments of all mines of such operator during twelve consecutive months ending with the last month for which shipment figures are available. Ratings are revised each month. If the average daily shipments of any subsequent month exceed those of the highest month for which shipment figures are available, shipments of such subsequent month are the rating. Established rating of a mine is the basis for car distribution. Cars are pro-rated on a tonnage basis with a 50-ton car as a unit. One 50-ton car is counted as one car; one 40-ton car, one 30-ton car and one 25-ton car are counted as eight-tenths, six-tenths and five-tenths of a car, respectively.

For several months past, the transportation department, under the direction of C. C. Riley, general superintendent of transportation, has made a scientific study of the car-supply situation. A corps of transportation experts have studied the road's problems with effectual results, and the expectations are that there will be a saving of several thousand cars during the present season. The studies embrace a careful examination of the method of loading freight, selection of proper cars, packing shipments to prevent loss and damage and the expediting of cars through classification terminals and in the yards.

New York Central Lines

H. J. Merrick, general superintendent of freight transportation, says under date of Aug. 19, 1913: It is a hard matter to anticipate the car supply, months ahead, as so many conditions enter into the problem. It is my thought, however, that the New York Central Lines will have a better supply of equipment than last fall. Everything points to that end, owing to increased equipment and more of our cars on home lines, which was largely brought about by an agreement between the lines in the West, not to misuse open-car equipment, but return them home empty or loaded. So far this year, our mines have had practically 100 per cent. supply of cars, with largely increased production.

There will, without question, be some shortage the last three months of the Lake season, as in previous years. It is my opinion, however, that under normal conditions our coal-car supply will be better than last or previous years.

Illinois Central R.R.*

There has been a steady movement of coal from the Illinois fields throughout the summer and some sections have shown a fair increase in the tonnage as compared with last year. The indications for the coming fall and winter are for a volume of business equal, at least, to last year, with some signs pointing to increased demand for certain grades, on account of the diversion of some Eastern coals to other markets, creating advanced prices in the West and perhaps for other reasons.

The amount of domestic coal stored by dealers during July and August has been no greater than in former years, and as compared with some, is actually less. Warnings were sent out by the mine operators and railroads and suggestions made to the retail trade and others during the spring and early summer to store as much as possible, but the effect has not been very noticeable. One reason for this may rest in the scarcity and high cost of labor for unloading.

Consumers of steam coal, as a class, do not seem to have grown any more provident, in the direction of insuring against irregularity in the operation of their plants, due interruptions to, and difficulties of transportation as a result of winter weather. It is the same in all localities, including even public service corporations and institutions and buildings that must keep up a steady and continuous fire, or run the risk of financial loss and bodily discomfort for many people. It is rather surprising but none the less true that there are numberless plants that expect the carriers to deliver the daily requirement of fuel with the same regularity with which the dairyman each morning deposits the bottle of milk on the kitchen doorstep, and this regardless of weather conditions, or other difficulties.

Many of the principal coal-originating roads have made material increases during the year, in their power, equip-ent and facilities for the handling of this traffic and nder the most unfavorable financial conditions that have btained in years. Notwithstanding this fact, however, real car shortage is not unexpected, and persons unamiliar with all the facts, may be inclined to blame the nitial carriers. It is also possible that under certain onditions a coal-car shortage may appear to exist, which s, to a large extent, fictitious.

---

*By Hampton Baumgartner.

*By C. C. Cameron, Coal Traffic Manager, Illinois Central R.R.

The rating of mines for the purpose of car distribuion is based upon the hourly performance, which multilied by the number of hours in the working day, fixes he car capacity for which the mine may daily order quipment from the railroad. Mines served by two or nore roads are permitted to add 50 per cent. to this ratng, in ordering cars. It results, then, the potential ratng of the mines in a given field for a single day often xceeds the productive capacity for two days, or, in other vords, is beyond the real working capacity of the mines, y perhaps as much as 30 or 40 per cent. In case of evere weather, causing increased demand and higher rices, the mines will order their full rating, including hose which may have been shut down, or working part ime. When this occurs the railroad, while furnishing within, say 15 or 20 per cent. of the actual productive apacity of the field, will be charged with having only 45 r 50 per cent. car supply and blamed accordingly. This, of course, is not fair nor justified by the conditions.

Another difficulty, which the initial roads in Illinois have to contend with, and which amounts to a severe disadvantage at times, is the fact that a very large percentage of the coal mined along their rails, is delivered to the consignees, on other lines. The connecting roads receiving this traffic, furnish practically none of the equipment for its transportation, and on this account a considerable proportion of the initial roads' cars, are on foreign lines at the time when they are most needed at home.

While there has been some improvement along that line, it may be said that generally speaking, very little has been done by consumers in the way of providing for prompt unloading and release of cars; although the proportion of self-dumping cars is constantly increasing, many consignees continue to take advantage of the full time for ordering, placement and unloading.

Some Difficulties of the Carriers

The function performed by established and reliable jobbers in finding markets for the operator, and coal for the consumer, is a perfectly legitimate one, and a commercial necessity. In times of stress, however, there appears a class known to the trade as "snowbirds," who are able to do a certain amount of business by making use of the reconsignment privilege. But they greatly abuse this privilege by "kiting" cars from point to point, which adds immeasurably to the carriers' expense and causes congestion and delay. The spectacle is both familiar and discouraging, of cars wanted at a particular mine for shipping to anxious dealers and consumers, while others loaded at this same operation are being jockeyed from station to station by speculative brokers for as long as 30 days before they are unloaded.

It is evidently not generally appreciated that the carriers have not the same ability to move trains and tonnage in severe winter weather that they have at other seasons. When the temperature is low, the snow falling and drifting, and sleet covers the rails and breaks down the telegraph wires, neither the plant nor the men can work up to normal capacity. It thus frequently happens that for days at a time no more than half the usual tonnage can be handled and double the number of trains is required. These conditions in themselves have a considerable bearing on the movement of both loaded and empty cars and yet it is usually at this time that the heaviest demands are made upon the carriers.

It is true that some coals have better storing qualities than others; but it is also true that practically all the standard grades can be stored for a reasonable time without serious deterioration, if handled with care and properly protected from the sun and rain. But, of course, this involves some expense which the dealer will avoid so long as he can.

As to conditions immediately confronting the coal shipper, receiver and the carriers, coöperation along the following lines will undoubtedly do much toward preventing and ameliorating the severity of a car shortage during the next six months:

1. Ordering no more cars at the mines from day to day than can and will be fully loaded and shipped on the day placed.
2. Loading each car to its full safe carrying capacity.
3. Billing through from the mines to the final consignee and destination, and avoiding reconsignment in transit, so far as may be practicable.
4. Omitting, so far as possible, all unnecessary routing instructions on billing, and leaving it to the carriers to utilize the most available routes, and avoiding points of possible congestion and delay; also avoiding unnecessary roundabout routes.
5. Limiting the amount of coal forwarded on consignment.
6. Unloading and releasing cars immediately upon arrival at destination.

⁂

The Coal Output of South Wales

A general strike lasting six weeks reduced the output of the South Wales coal field in 1912 by some two million tons, says the *Daily Consular and Trade Reports*, and together with war and other factors produced erratic fluctuations in prices and freight. The quantity produced during the year exceeded 50,000,000 tons, of which 36,000,000 tons were shipped by water. The general average of prices was high, the range for the year being $4.06 to $6.57 per long ton, f.o.b. Cardiff, for best admiralty large; and $2.20 to $4.24 for best bunker smalls.

The nearly 3000 ovens in the South Wales coal field produce not far from 2,000,000 tons of coke per annum. A growing number of mines producing bituminous coal convert the slack into coke. New ovens are constantly being erected, and there is continuous replacement of the old ones by modern plants, most of which are Coppées. The bulk of the output goes into domestic consumption, the local iron works being the chief consumers.

The surplus for export is increasing, the principal non-British buyers being Spain and the South American countries. Buenos Ayres takes 10,000 to 15,000 tons each year from the ports of South Wales. Montevideo about the same quantity. Rio de Janeiro about half as much. All the ports from Venezuela south take small quantities, totaling more than 100,000 tons per annum. High freights in the last few months of 1912 checked shipments, but under normal conditions coke may be shipped from South Wales to South American ports at $3.50 to $4.50 per long ton.

The Situation in Colorado

Colorado is at present facing an industrial crisis. The state convention of miners recently convened in Trinidad, and after listening to impassioned speeches by such notorious union workers as "Mother" Jones, unanimously adopted a resolution to strike on Tuesday, Sept. 23, unless an agreement with the operators could be reached prior thereto.

The demands made by the miners are seven in number, namely: (1) A 10 per cent. advance in wages on tonnage rates and a daily wage scale on the same basis as that of the State of Wyoming; (2) a 10 per cent. advance on wages paid coke-oven workers; (3) an eight-hour day for all classes of labor in the coal mines and at coke ovens; (4) pay for all narrow work and dead work, including brushing, timbering, removing falls, handling impurities, etc.; (5) check weighmen at all mines to be elected by the miners without any interference by company officials; (6) right to trade in any store that mine workers please, and the right to choose their own boarding place and their own physician; (7) enforcement of the Colorado mining laws and abolition of the guard system, which has prevailed in Colorado for many years.

The strike-call will affect about 9000 men, and 60 mines in Las Animas and Huerfano Counties. It is claimed by the mine workers that they have a fund of $1,000,000 with which to carry on the strike, and that a monthly assessment amounting to $350,000 can be levied throughout the country. They also aver that they are ready to shelter miners and their families in tents at the mines, and have leased land for this purpose and the establishment of a commissary.

The operators, on the other hand, allege that probably not more than 10 per cent. of their men will leave the mines for any length of time. They admit, however, that miners as a class are somewhat timid and readily yield to intimidation. They have given their employees every assurance, however, that those who are loyal and remain at their places will be given ample and adequate protection. In substantiation of their belief, they affirm that the delegates who willingly voted the strike order did not adequately represent the miners of southern Colorado, but were, in many cases at least, imported from other districts, or from outside the state in order to further the ends of professional, and to a certain extent, disinterested agitators.

Anticipating serious trouble or rather as a precaution thereagainst, Governor Ammons has instructed Adjutant General Chase to hold the National Guard of the state in readiness for immediate mobilization. The Governor, however, entertains strong hopes that the employment of the militia will be unnecessary, and that an agreement between the opposing factions may be arrived at without disorder.

What the outcome of this difficulty may be, time alone can disclose. Both parties to the strike affirm that the struggle will not end indecisively, but will be carried to the finish, one way or the other. The indications appear to be that the men in the mines themselves do not have any serious grievance against the management, but seem to have been led into the controversy by "missionaries" sent from other states by the United Mine Workers of America.

King Coal

By Berton Braley

Written expressly for Coal Age

Kings rule full many a state,
Armies and ships they command,
Glory have they that is great,
Splendor and pomp that are grand,
Wealth that the universe brings
Pays to the purple its toll.
Yet, in the roster of kings,
Greatest of all is King Coal.

King Coal!
And whose kingdom is vaster?
King Coal!
And the modern world's master,
Through triumph or blackest disaster—
King Coal!

Gold rules the markets of men,
How they have bartered and sold,
Risen and fallen again,
All for the glamor of gold!
Gold is the prize of the game,
Gold is the ultimate goal,
Yet—on the roster of fame
Greatest of all is King Coal.

King Coal!
He's the miracle maker,
King Coal!
He's the wilderness breaker!
The dreamer—the universe waker,
King Coal!

Steel has its empire of might,
Coal is the maker of steel,
Shaping it, daytime and night,
Into the sword—or the keel,
Rousing the magic of steam,
Driving the world to its goal,
Making a fact of the dream,
Greatest of all is King Coal!

King Coal!
And whose kingdom is vaster?
King Coal!
And the modern world's master,
Through triumph or blackest disaster—
King Coal!

Exports of Fushun Coal

The exports of Fushun coal now reach about 1,000,000 tons per year, says the *Daily Consular and Trade Reports*. The particulars of shipments and consumption are as follows: To Shanghai, 150,000 tons; Hong Kong and Canton, 150,000 tons; Singapore and Penang, 100,000 tons; Manila, 100,000 tons; Tientsin, 30,000 tons; Government Railways of Japan, 200,000 tons; Corean Railways, 200,000 tons, and North Manchuria, 70,000 tons. The South Manchuria Ry. has now 14 colliers under charter, which are all kept busy carrying Fushun coal to the different ports of consumption.

POWER DEPARTMENT

Notes on Rail Bonding

By Vincent Rhea*

YNOPSIS—The comparative costs in power expended ith two types of rail bonds are here discussed and the esults compared upon the basis of a one-mile track of 0-lb. rails per year.

⁂

An important phase of electric haulage systems in ining work is more or less neglected by many mine anagers and foremen, namely, the proper bonding of e rails. Apparently the great importance of a well onded return is not realized by mining men, other than ectrical engineers, and until recently there has been ttle tendency to use anything but the channel-pin and ire method that was in vogue when electric haulage sysems were first installed. It is the purpose of this article o show how defective bonding affects the electrical quipment of a colliery and how good bonding may be ecured.

The familiar channel-pin method of bonding has but ne good feature, the initial cost is low. The solid wire has o flexibility and the constant vibration of the joints ither causes the wire to break or the pins to work out rom the rails. As it is impossible to obtain an intimate ontact between the rail and the channel-pin, corrosion oon takes place and a high resistance in the joint is the esult.

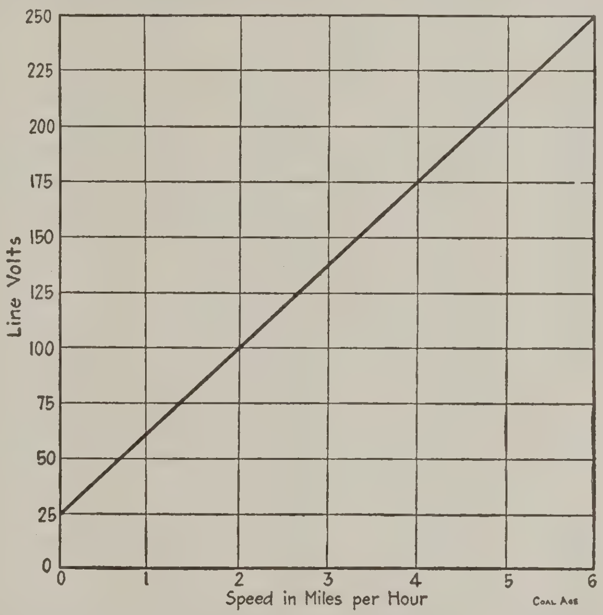
Tests made of channel-pin bonds at their installation nd three months later showed that out of 40 joints five ad a resistance greater than that of a 30-ft. length of ail and the resistance of the balance had increased 100 er cent. Numerous tests have shown that this increase characteristic of this method of bonding. The effect f this increase in resistance in the return path of the urrent is to materially lower the voltage.

As the performance of standard mine locomotives is ased on a certain voltage the effect of a reduction is imediately apparent in the work done by the machine. ssume that a certain locomotive takes 300 amperes at 50 volts to haul a given load at the rate of 6 miles per our and takes 10 min., actual running time, to haul e trip from the gathering point to the foot of the shaft. ow, if, owing to defective bonding, the line voltage drops 125 volts, which is not a rare occurrence by any means, e speed of the locomotive decreases from 6 miles per our to 2.6 miles per hour, and the time to haul the trip om the gathering point to the foot is 22.5 min. instead 10 min.

The current consumption of the motors is practically e same, 300 amperes. As the thermal condition of the otors is based on the time and the current, it is not surising that excessive field- and armature-coil "burn outs" e found where the bonding is defective. The period of ll-load current is too long, and the motors become so ot that they do not cool sufficiently during the light-load trip and the insulation is soon damaged and breaks down.

The relation, then, of defective bonding to the output of a colliery and the maintenance of the locomotives is apparent. The motor does not make the number of trips per day that it should. Armature and field repairs are expensive, as every operator knows, to say nothing of the locomotive being out of service at times, due to these troubles.

The generating plant is directly affected by poor bonds. It requires a certain amount of power to overcome the resistance in any transmission system, and the high resistance made by channel-pin bonds in each joint in the return side of the circuit means that a certain amount of power is being generated to overcome this resistance instead of being applied to the transportation of coal.



Curve Showing Variation of Speed with Voltage

In many cases the power required means a heavy overload on the generating plant. With power at 1c. per kilowatt-hour, the cost of overcoming the resistance of one mile of two 40-lb. rails in parallel for a year of 240 working days is $15.78 per 100 amperes, assuming that there are no joints. If the 350 or more joints in this mile of rail are bonded with channel-pins the resistance is increased from 75 to 200 per cent. As the power required to overcome resistance is the square of the load times the resistance it can be readily seen that an excessive cost in the power house is a result of defective bonds.

The maintenance of a channel-pin return is high as the bonds have a short life and must be replaced frequently. Motormen will complain of "poor power" and a section of the road will be re-bonded, only to be in bad condition again in a few months. A colliery using this method of bonding has its output limited by the low efficiency of the locomotives and the unnecessary load on the generating plant, and maintenance and operating costs are considerably higher than they should be.

---

*Scranton, Penn.

Experience has shown that the best method of securing a return of low resistance for mining work is the use of a flexible cable bond with compressed terminals. This bond is installed outside the splice bar, on the inside of the rail, thus minimizing chances of the bonds being injured by derailment of cars. A small compressor having a power of 25 to 30 tons is used to upset the terminals in the rails.

The result is an almost homogeneous and molecular union between the rail and copper terminal. Moisture cannot enter and the low resistance thus obtained does not vary during the life of the bond. The flexible cable, composed of many fine wires, takes care of vibration caused by trips passing over the joints and relieves the terminals from such stresses. The bond is readily inspected for mechanical injury.

The initial cost of a good bond installation is considerably higher than that for channel-pins, but this expense is offset by the low resistance secured and the long life of the bonds, without any increase in resistance.

Some interesting data, showing what can be accomplished by the use of this type of bonding, have been secured. Tests made at a colliery in Pennsylvania showed that the bonding was so bad that the return current was leaving the rails and finding its way to the generating plant by way of the ditches and water pipes, which, of course, had a high resistance.

The locomotives with a rated speed of 6.3 miles per hour were found to be traveling at about 2.5 miles and making an average of 12 trips per day. The actual load on the generator was 30 per cent. over the rated load on the line. The main haulage roads were bonded with compressed terminal bonds of sufficient capacity to equal the size of trolley and feeders.

The first month following this installation the production was the largest in the history of the mine. The locomotives instead of making 12 trips per day were averaging 18 trips. Later another locomotive was added and the whole load on the generator was less than that carried before the bonding was changed.

At another colliery the bonding resistance of the main haulage road was reduced 80 per cent. by the use of compressed terminal bonds. During the last six months of the channel-pin installation the track bonder had averaged three days per week on this road replacing broken and defective bonds.

During the first seven months of the new installation the bonder spent two hours on the road replacing some bonds broken by a wrecked trip. Numerous other cases could be cited where the output was increased and maintenance and operating costs decreased by the replacing of channel-pin bonds by those of compressed-terminal, flexible cable type.

Any mine manager or foreman who recognizes his own conditions in those mentioned in this article and wan to get better results from his electric haulage system c rest assured that this is possible by the use of good bond

TABLE SHOWING COST OF ENERGY-LOSS IN RETURN CIRCUIT PER 100 AMPERES LOAD, PER YEAR OF 240 9-HOUR DAYS, POWER COSTING ONE CENT PER KILOWATT-HOUR.

One Mile. Two forty-pound rails in parallel, assuming continuous joints	$15.78
One Mile. Two forty-pound rails in parallel, bonded with channel-pin bonds, resistance found by actual test	37.80
One Mile. Two forty-pound rails in parallel, bonded with compressed terminal bonds, resistance found by actual test	17.99
Fixed cost of rail resistance	15.78
Increased cost with compressed bonds	2.21
Increased cost with channel-pin bonds	22.02
Saving per year with compressed bonds for power alone per 100 amperes	19.81

⁂

Mine-Safety Meeting in Pittsburgh

The second meeting of the American Mine Safet Association was held at Arsenal Park, and the Fort Pi Hotel in Pittsburgh, Monday, Tuesday and Wednesda of this week. About forty first-aid teams from coal com panies located in various parts of the United States pa ticipated in the contest.

Many valuable prizes were distributed in the evenin after speeches delivered by notable men. Several the most celebrated mine surgeons in the country we present and took part in the discussion relative to firs aid methods. James Roderick, chief of the Departme of Mines, in Pennsylvania, and Earl Henry, chief of th Department of Mines, in West Virginia, were in atten ance with a number of their deputies.

One of the interesting exhibits was the mine-rescu automobile truck belonging to the Birmingham statio of the Federal Bureau of Mines. This car is sai to be capable of traveling 35 miles an hour in respon ing to a call for help, in case of a mine disaster. Th new truck is believed to be an improvement over th rescue cars, now in use by the Federal Bureau.

A full account of this meeting, as well as the Miner Field Day Meet, held at Knoxville, Tenn., Sept. 20, wi be printed in our special "mine-safety" number nex Saturday, Oct. 4.

EDITORIALS

Strikes and Their Cause

When we analyze labor conditions the world over and en compare wages abroad with those that American rkmen receive, we are forced to the conclusion that ssatisfaction and strikes are not alone due to the pay a an gets for his labor.

That great majority of humans who work with their nds are fast coming into their own, if they have not ready arrived there. The danger is, will they stick to e highway of reason and right, or be piloted to a distrous finish by some of their unscrupulous leaders ose chosen profession is the exploitation of their felw men.

Time was when capital believed it best to hold worken in a state of ignorance for fear that the acquisition knowledge might shed a light on the injustice being ne them; but that day has passed, and the safety of e future lies in a campaign of enlightenment, whereby e workingman is taught to think for himself. Such en will recognize *only* proper leaders and will not atmpt to change conditions of a century in the lapse of night.

American coal owners have naught of which to be hamed. Our miners are the best paid in the world. It not at all unusual for a good worker to draw from 100 to $125 for four weeks' labor. Even negro miners West Virginia at the present time are earning as high $140 in a month. We know of one "darky" who earned 148 in July; a Greek, 68 years old, earned $86 in 18 ays; two Italian youths, 19 years old, made $90 each 17 days; and a Hungarian earned $121 in 18 days.

Compare such conditions with those that exist in reat Britain, which is again on the verge of a national bor war. Think of 480,000 British railroad employees ceiving an average wage of only $6.42 per week. Last ear in the United Kingdom there were 900,000 paupers spite of the old-age pensions. Nearly a million men nd women over 70 years of age are on the pension roll r $1.25 a week apiece.

In such a country, where national success is only atined by forcing a scale of wages so low as to menace he freedom and citizenship of the people, we are not urprised that a great and serious industrial adjustment hould take place through ever-recurring strikes. 'Tis etter so, than that millions of deserving people should ace a hopeless future of hardship and suffering.

But in this country things are diffierent, and still we ave equally as much labor trouble as our British cousins. e may continue to add increase after increase to the ages of workingmen, and still we will have strikes plenty. There is but one solution—education. We talk f "safety first" and our great corporations are spending housands of dollars in this praiseworthy work, but merican industry, mining and otherwise, will not be laced on a proper efficiency basis until the boss and his en understand each other.

The menace of business today is the dishonest professional agitator. It is these parasites that must be eliminated. Unionism properly conducted is all right, and no employer who is just and fair wants such confederations abolished. However, it is essential to stable progress that the men have leaders who will fight their battles honorably and not betray them.

Any business that must be conducted on lines of secrecy is unfit to exist. Any company that cannot confide in its employees and survive their scrutinizing gaze deserves no consideration in the final accounting. If all the miners in this country were encouraged to take a greater personal interest in the affairs of their employers, they would not be so ready to respond to the appeals of agitators who harangue them from street corners.

⁂

First-Aid Judging

It is well known that the judging at first-aid meets may be divided into two classes: Inadequate judging by competent judges, and adequate judging by incompetent judges. In the anthracite regions, the former prevails, and in the bituminous-coal fields the latter.

Both forms of judgment are so unfortunate, undesirable, provocative of wrath, and subversive of discipline that we are not going to decide between them. We propose only to state the issue, and gracefully "dodge the bricks."

Of course, it is easy to say that every meet should have such a large number of competent judges present, that every event may be umpired completely from start to finish. But unfortunately doctors are busy men, and often when not actively engaged are detained by prospective cases. Moreover it is hard to secure enough of these who have made a sufficing study of first-aid. So it is difficult to secure enough medical men to act as umpires.

Of lay judges, little can usually be expected. Managers of coal mines rarely spare sufficient time to learn the many details of first-aid to such a degree that they are more proficient than the men they judge.

In the anthracite region, it is the custom for a few judges to go round after the maneuvering and bandaging are all done. There is no attempt to find out *how* the work has been performed; the result is all that is sought. A rapid declaration of the manner of execution on the part of the captain informs the judges in general of what has transpired and reveals principally whether the team took the most important step first.

But every physician and every layman knows that unless a moving picture were taken of the team in action, no body of men, however skilled in first-aid science, could hope to judge of the work by any such method. No pretense is made of supervising resuscitatory work or the loading of stretchers. A hasty action which the position or tightness of no bandage can exhibit or a false movement which the report of the captain fails to reveal might give more agony and do more harm to an injured man than the action of the team might remove and yet those faulty pieces of technique would not offend the judgment of the surgeon who made the final examination.

True, the doctors are watching and see perhaps more than is supposed, but very many errors in practice are committed which they never see. How can a mere quarter dozen of men watch effectively about 50 teams of six men each, all in action at one and the same time, three hundred possible offenders violating any one of perhaps twenty different rules. Thus the means is sacrificed to the end so that the team and even the training physician learn to belittle a knowledge of those details which do not have to be stated to the examining physicians.

But what, on the other hand, can be said as to the line up of laymen in the bituminous meets, who frequently award one hundred marks in every event, whose liberality is only exceeded by their lack of knowledge of the science of physiology and of the art of healing.

If any solution of the vexed problem of judging at first-aid meets is possible, it is this: Competent laymen should be appointed to watch the manner of execution, there being perhaps one to each team. Medical men should be the critics of the condition of the victim after the event is completed.

Certain mistakes should be left to the laymen for penalization; demerits for other faults should only be imposed by the examining physicians. The doctors could help the laymen decide whether any actions they have observed are deserving of penalties.

Neither the practice of the hard-coal nor the methods of the soft-coal regions are to be commended. There would be merit, however, in a skillful blend.

⁂

Oil in the Boiler

In many plants, especially those which operate condensing or where open feed-water heaters are used, drawing their steam supply from reciprocating engines or pumps, oil in more or less quantity finds its way into the boilers along with the feed water. This introduces an element of danger which is worthy of no light consideration and which may take two forms of manifestation.

Oil in a boiler, particularly if it be of animal or vegetable origin, is apt to cause foaming or priming to a more or less marked degree. This, however, is seldom detrimental to the boiler itself unless it becomes so violent and prolonged as to lower the waterline below the point of direct heat from the furnace. It is, however, usually cylinder oils that find their way into the boilers, and these are almost always of mineral origin.

It is this type of oil that is a source of real danger to the boiler itself. As is well known, oil has a marked tendency to adhere to and thinly coat the boiler surfaces. This film of oil effectually prevents the water from coming in direct contact with the metal of tubes or sheets. Small particles of scale-forming matter are attracted by this oil and with it from eventually a coating which is thoroughly impervious to the water. The latter is thus prevented from rapidly abstracting heat from the shell or tube, as the case may be.

The heat of a boiler furnace may be and frequently is well up around 2,000 deg. F. and unless the boiler tube or shell is effectually cooled from the inside when subjected to this high temperature from without, the result is obvious—the material will stretch, due to internal pressure, and eventually give way.

In water-tube boilers the presence of oil not infrequently causes a tube failure, which although decidedly less dangerous than the rupture through bagging of the shell of a multitubular boiler, is nevertheless not infrequently accompanied with disastrous results.

When for purposes of scale softening, we intentionally introduce crude oil into our boilers, we at least know of its presence and its approximate amount; in other words, we are forewarned not only of its existence in the boiler, but of its quantity, and can act accordingly. When, on the other hand, oil finds its way through inefficient or defective separating apparatus, into the boiler along with the feed water, the danger which its presence entails is doubly perilous, because it is unsuspected.

⁂

Supervision of Miners

Under this title, in another column, in the discussion of means and methods for producing greater safety in mines, a correspondent has suggested among other things a closer supervision of miners by deputy foremen. He suggests that each deputy foreman have charge of a prescribed district of the mine, for which he be held responsible in respect to the safety of the men, the methods they employ and their behavior in the mine. The suggestion is drawn from the practice in vogue in the north of England.

We are glad to note in this connection that the Lehigh Valley Coal Co., one of the largest coal-producing companies in the northern anthracite valley of Pennsylvania, has practically adopted this method of a closer supervision of miners during working hours. In common with other companies, it has been the practice in the Lehigh Valley mines, for the assistant mine foreman to make a thorough inspection of the mine each morning, and having warned the men of any existing dangers and recorded same, to leave the mine to the general supervision of the inside foreman.

Under the system recently adopted by the Lehigh Valley Coal Co., there has been a redistribution of responsibility. The fireboss makes his usual examination in the morning, while a number of assistant foremen are authorized to supervise the work of the miners and inspect their working places closely throughout the day. Each assistant foreman is held responsible for the safety of the men in his district, which is small enough to enable him to give the necessary attention to every detail. We are glad to say that the system has proved a success. It is patterned along lines similar to that described in COAL AGE, Apr. 5, p. 539. Chief Mine Inspector J. B. McDermott, of Montana, there drew attention to the systematic division of labor recently put in operation in the mines of the second-largest-coal-producing company in that state. By the system described, each class of work is in charge of men especially authorized and instructed in its performance. All shots are prepared and fired by shotfirers; trackmen lay all tracks and switches, the timbermen set all timbers. The system is reported to have produced an increased efficiency and economy in working. We believe there is no question but that greater attention will be given to such systematic arrangements in mining work, in the future, than ever before.

e Value of Study to Mining Men

By Samuel M. McMahon*

ave been much impressed recently with the need of
study on the part of mining men and, particu-
mine officials. Much of our work is performed in
tine, matter-of-fact manner; and to most of us the
task becomes quite ordinary because we fail to think
y and appreciate the great laws and principles in-
d.

a brief illustration, I may ask how many of us stop
nsider what a wonderful thing it is to breathe, see,
taste, smell and move from place to place. The
performs unconsciously the various functions in-
d in each separate act. We are not impressed with
wonders because they are continually with us, per-
ing their regular tasks with ease and requiring no
tion.

ut the most perfect physical health and strength are
ned only by a thorough knowledge of the laws of
re that control the physical life. It is the same in
rofessions: the doctor must be familiar with the
n body, its composition and the effect of drugs; a
r must be intimate with Blackstone and have a
ugh knowledge of technical law; the clergyman
study and know bible history; the merchant must
ate himself along commercial lines. Likewise, in
walk of life, success depends on an intimate knowl-
of the laws and principles that govern one's work or
. Men who possess such a knowledge are the mas-
of the situation.

ut, admitting the need of knowledge, the question
rmost in the mind of the practical man and, par-
arly, the mine foreman, is how this is to be attained.
l with the day's work, the idea of study or mental
t at night is irksome; unless a thorough-going in-
t in the daily work in the mine serves to make a
ter from a book on mining or a few pages in a min-
journal as much desired as the newspaper. The
le is that we submit too much to the routine and
tony of life; we get in a rut; we read the daily
paper as a habit; but we fail to devote a proper por-
of our spare time to secure the advancement that is
tial to success. The well balanced successful man
e one who mixes work and enjoyment in their proper
ortion.

hat study did for Lincoln, Hugh Miller and others,
n do for our mine superintendents, foremen and fire-
s. The great Scotch geologist, Hugh Miller, left
in life with the care of his mother, was the son of
ilor. Fortune made him a stonemason; but study
application developed the famous geologist who later
ne the author of many books. Miller said: "The
schools I have attended are the schools that are open
l; the best teachers I have had are easy of access to
hough severe in their discipline. My success as a
was my inclination to learn; and there are few of
natural sciences that do not lie as open to the work-
nen of America and Great Britain as geology did to

the same study and application, coupled with an
nation to learn, men of all classes can fit themselves
igher positions. I have quoted the words of Miller, because he had few advantages and received his education in the woods, under the earth, studying the trees and brooks and observing natural laws. In closing, let me say that mine foremen, because of their responsibility, have greater need to study than most other men. Theoretical, as well as practical mine foremen, are in demand. Try the plan of reading for self improvement and the habit will grow.

⁂

Coal Production in Illinois

The following summary shows the relative figures for the years ended June 30, 1912 and 1913, respectively. The figures include the local mines and show that coal was mined in two less counties, and that the total number of mines has decreased from 879, in 1912, to 840 mines, in 1913; the shipping mines show a decrease of nine. The tonnage for 1913, however, shows an increase over 1912 of 4,331,964 tons, or about 7.5 per cent. The total tons mined for the year ended June 30, 1913, is 61,846,204.

The number of persons employed in and around the mines has increased slightly; the increase being only 86 above that in 1912. The number of fatal accidents for 1913 is 177, or three less than for 1912, while the nonfatal accidents have increased from 800, in 1912, to 1030, in 1913.

There are a number of reasons that can be advanced for this increase in nonfatal accidents, which will be explained fully in the Annual Coal Report.

ILLINOIS COAL STATISTICS

Summary for the years ended June 30, 1912 and 1913.

	1913	1912
Number of counties producing coal	50	52
Number of mines and openings of all kinds	840	879
New mines or old mines reopened during the year	85	176
Mines closed or abandoned since last report	124	142
Total output of all mines, in tons of 2,000 pounds	61,846,204	57,514,240
Number of shipping or commercial mines	371	380
Total output of shipping mines, tons	60,515,416	56,096,695
Number of mines in local trade only	469	499
Output of local mines, tons	1,330,788	1,417,545
Total tons of mine-run coal	14,979,990	13,336,509
Total tons of lump coal	20,850,125	21,795,527
Total tons of egg coal	6,819,980	4,940,431
Total tons of nut coal	3,130,065	3,193,956
Total tons of pea coal	13,734,537	11,109,191
Total tons of slack coal	2,331,507	3,108,626
Total tons shipped	55,972,374	51,502,382
Tons supplied to locomotives at the mines	904,570	924,854
Tons sold to local trade	2,345,233	2,615,678
Tons consumed (or wasted) at the plant	2,624,027	2,471,326
Average days of active operation for shipping mines	179	172
Average days of active operation for all mines	170	160
Number of motors in use	466	381
Number of mines in which mining machines are used	139	139
Number of mining machines in use	1,661	1,581
Number of tons undercut by machines	30,228,520	25,550,019
Number of tons mined by hand	31,617,684	31,964,221
Average number of miners employed during the year	35,401	39,149
Average number of other employees underground	35,662	31,687
Average number of boys employed underground	1,430	1,526
Average number of employees above ground	7,004	7,049
Total number of employees	79,497	79,411
Average price paid per gross ton for hand mining	$0.664	$0.636
Shipping mines		
Average price paid per gross ton for machine mining	$0.521	$0.496
Number of kegs of powder used for blasting coal	1,308,381	1,313,448
Number of kegs of powder used for other purposes	3,685	3,040
Number of pounds of permissible explosive used	603,420	328,075
Number of men accidently killed	177	180
Number of men injured so as to lose a month or more time	1,030	800
Number of gross tons mined to each life lost	349,414	319,524
Number of employees to each life lost	449	441
Number of deaths per 1,000 employed	2.23	2.26
Number of gross tons mined to each man injured	59,922	71,893
Number of employees to each man injured	77	99

⁂

Legal Department

In this section of our paper next week we will print a discussion relative to "Removal of Coal through Adjoining Land." It will be shown that *the proper basis for valuation of a right-of-way is damage to landowner and not benefit to operator.* A number of recent coal-mining decisions will also be published next week.

SOCIOLOGICAL DEPARTMENT

Gardens in the Arid West

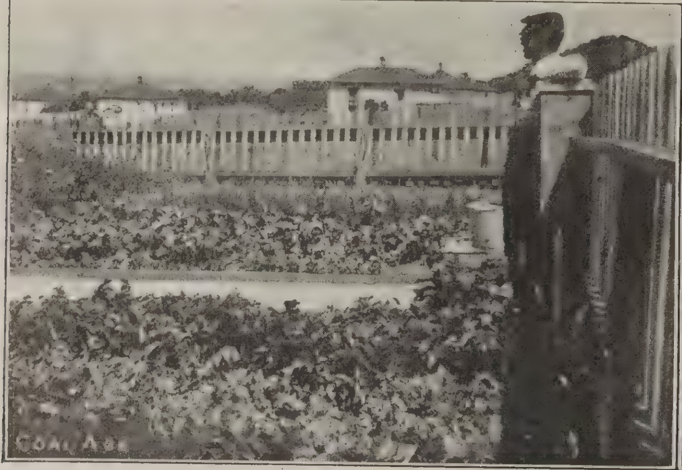
By F. W. Whiteside*

When visiting many of our coal-mine towns, especially in the western portion of the United States, the visitor is unfavorably impressed by the prevailing absence of neatness. The great American tin can is strikingly in evidence while ash heaps, rubbish, scrap iron and broken-down or cast-off machinery are scattered promiscuously about the village.

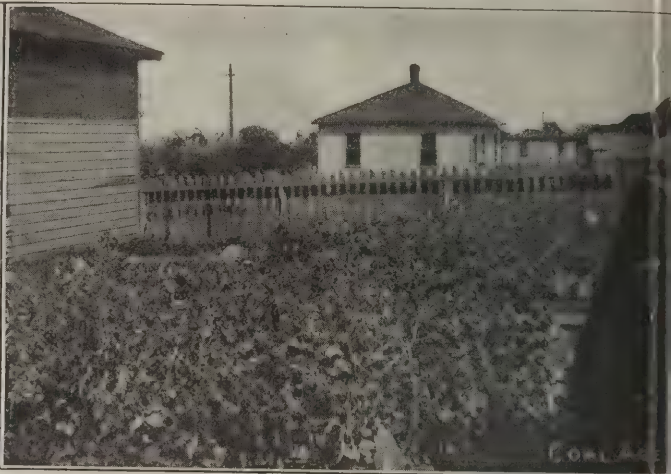
With few exceptions, the yards and roads about the dwelling of the miner are without tree or shrub. An occasional weed alone relieves the craving of the eye for something green and flowering. The fences about the cottages are either entirely wanting or in a sad state of repair. Taken altogether the picture presented is not alluring and the impression left upon the mind is not of so pleasant a cast that the visitor is tempted to tarry lon in the place.

In localities where water is scarce, where it must b hauled from some distant source by car or wagon tank, landscape of vines and flowers is not to be considere In such a place the closest approximation is a yard neatl fenced and all traces of weeds and rubbish eliminate It might be asked if it is worth while to go to the expense of building a fence to inclose a barren and unproductive yard. It appears, however, that unless a lot has some definite boundary line, the matter of up-keep is left to Mother Nature and the gentle breezes.

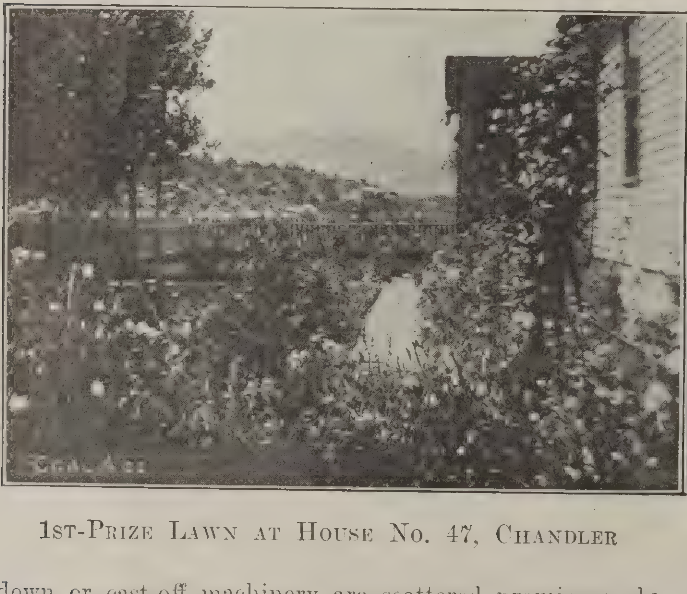
I well realize that, in many mining towns, especially in the long-established districts of the Eastern and Central States, neatly fenced yards are the rule rather than the exception. These remarks are directed toward those localities where the miner lives in a "coal camp." The term camp here being used in its original and primitive sense.



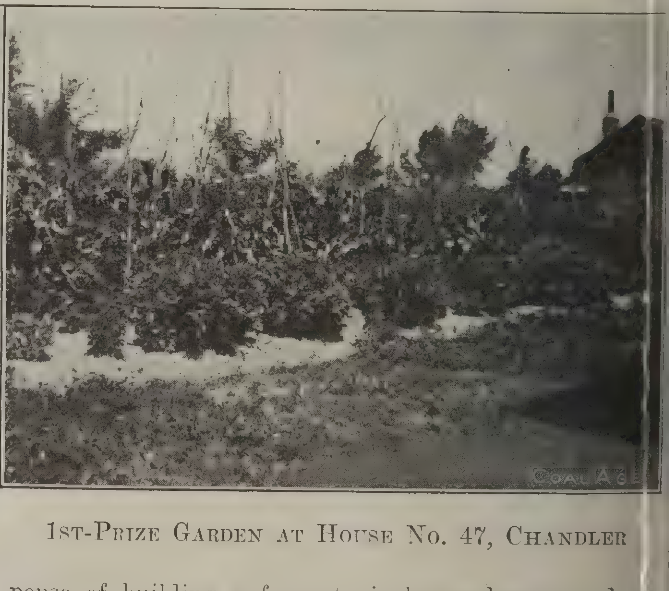
1st-Prize Garden at House No. 52, Ravenwood



2nd-Prize Garden at House No. 56, Ravenwood



1st-Prize Lawn at House No. 47, Chandler



1st-Prize Garden at House No. 47, Chandler n is greatly influenced by his environment. If ysically and morally good, it so casts a refining inence upon him. All the great corporations have come realize this fact. Their employees are provided with ygrounds, swimming pools, rest rooms, amusements, raries, theaters and schools. If the workman is eduted and entertained he will become more efficient and ntented. This is axiomatic.

---

*Chief engineer, the Victor-American Fuel Co., Denver, Colo.

Chandler School House
Note Neatness

2nd-Prize Lawn, House
No. 74, Chandler

Superintendent's House,
Chandler

It now follows that the miner, being provided with ll or many of these good things, will devote more interest and labor toward improving the condition of his ome and its surroundings. The first step is a neat house nd a well kept yard. The next is a tiny garden with a ower or two. The last step is to cover all the available ard space with flowers, lawn and garden.

In order to stimulate a healthy interest in this direcion, J. C. Osgood, chairman of the board of the Victor-American Fuel Co., of Denver, personally offered three ash prizes of $25, $15 and $10 for the prettiest yard in ach of the company's mining towns, where irrigation vas possible.

At Chandler, near Cañon City, the subject of lawns nd gardens has been given attention for several years, o that much was to be expected from it. At Ravenwood, near Walsenburg, a more modest start had to be made, as some of the soil had never before been broken for cultivation and it was an interesting and somewhat amusing spectacle to see some of the contestants attacking the hard-packed earth, with a pick, in the endeavor to soften it sufficiently so that they could dig it with a spade.

3rd-Prize Garden, House No. 53, Ravenwood

3rd-Prize Garden, House No. 26, Chandler

In order to secure fair and impartial judgment, when the yards were ready for the awards to be made, a judge, having knowledge and experience in gardening, was selected from one of the larger towns nearby. As he was unacquainted with the occupant of the house on whose yard he was passing judgment, it is fair to assume that the decision was just and impartial.

Only two of the company towns had sufficient water this summer to participate in the contest, the season being exceptionally dry, irrigation water was not available in sufficient quantity at the balance of the company's properties. Next year it is hoped that with perhaps two exceptions, all the Colorado division mines will be represented.

The awards were as follows:

	Chandler	Ravenwood
First prize, $25.	August Hudder.	John Happs.
Second prize, $15.	R. F. Perrine.	Frank Nodeck.
Third prize, $10.	James Rampone.	W. S. Smith.

⁂

The Tenderfoot

That accidents are largely due to inexperience is illustrated by the story of John Karpi, a Finnish miner, who recently commenced his first shift at the International Coal Co.'s mine at Bearcreek, Montana.

Instead of carrying his powder under his arm he placed the keg on his shoulder when he started up the slope. His keg touched the electric-transmission wire and a flash resulted followed by an explosion.

Karpi was not killed and managed to walk to the mouth of the slope, but an anæsthetic, a stiff brush and some sterile bicarbonate of soda will be necessary to make Karpi a good looking Finn again. A mule which stood by was burned even worse than the miner.

With all the stolidity of his countrymen Karpi thought his experience a good joke and appeared at the drift mouth with a broad grin over his blackened countenance.

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 16—I have had some experience with mixed lights in coal mining and was greatly interested in the discussion on this subject. I would advocate the use of mixed lights in any mine where gas is only found in certain districts, or at the head of an entry, or at the face of a room, or in some old workings, providing the fireboss or mine examiner knows his business thoroughly and is a conscientious man and one who can be depended on to put up the necessary fences and danger signs.

Suppose, for example, gas makes its appearance at the head of an entry; this entry should be put on safety lamps at once. It should then be fenced off a sufficient distance back from the gas, to prevent any person from approaching the face with an open light. In such a case, the fireboss must keep a close watch over the place and examine it often, as well as all adjoining places.

It is well known that safety lamps are only safe in the hands of experienced persons. It may happen that 50 per cent. of the persons working in a certain mine have never used a safety lamp before and do not know how to handle such a lamp even after being instructed. After letting a lamp fall, an inexperienced person will often try to light the lamp before it has been examined to see that it is safe. Many have a habit of tilting the lamp on one side, or raising the wick too high, in order to get a better light. On these accounts, the danger is often increased by the use of the safety lamp.

A number of explosions have occurred in mines where safety lamps are used exclusively and I venture the remark that such explosions have been more frequent than where mixed lights are in use in a well regulated mine. If a miner is so ignorant as to cross a fence or a dead line, with an open light, he is liable to prove a dangerous man with any kind of light and should be sent out of the mine.

The law in Alberta requires that the ventilation in mines shall be sufficient to dilute and render harmless noxious gases to an extent that all working places in the mine shall be fit to work in and travel through with safety. The law specifies that where safety lamps are used in any part of a mine, no naked light shall be used in any other part of that mine situated between the place where the safety lamps are in use and the return airway. If these laws are enforced the volume of air in circulation will be sufficient to permit of the use of open lights even in some places generating a little gas.

I agree with John Rose and would use mixed lights under the conditions stated in the last part of his letter (No. 14, COAL AGE, Sept. 6, p. 354.) In Letter No. 15, on the same page, John A. McDonald, in speaking of the use of mixed lights, states: "There will always be fear of some careless or reckless person, with an open light on his head, setting off some gas and causing a violent explosion; whereas, if safety lamps were used exclusively, this could not occur." I want to say that the same careless, reckless person would be just as liable to cause an explosion if required or permitted to a safety lamp. If he would risk going into gas with open light he would no doubt take greater chances a safety lamp; and if the lamp was not properly han or was defective a disaster would result.

GEO. WM. HALLIDA

Commerce, Alberta, Canada.

Letter No. 17—The several letters published rece in COAL AGE, relating to the use of mixed lights mining, have been both interesting and instructive. have been surprised, however, to see how many of writers whose duty it is and should be to guard the li of miners, seem to consider the use of mixed lights gaseous territory, as not a serious matter.

It has frequently happened that the antipathy miners in respect to safety lamps, together with a l of moral force on the part of mine officials in this gard, has brought disaster to both. The knowledge t the miners are opposed to the use of the safety la has deterred many mine officials from adopting th when their better judgment has dictated otherwise.

I regret to say that on the part of many miners th is an uncanny idea associated with the use of the saf lamp, the repugnance possibly arising from the dan the presence of the lamp in the mine suggests. some cases, a safety lamp in the hands of a mine offic creates uneasiness and a feeling of alarm, which is ma fested by remarks passed from one to another, such "A body of gas has been found somewhere; somethi has gone wrong, etc."

To a large class of miners, the safety lamp sugge danger, just as would the presence of an open light, the mind of an intelligent mine official. This is pa ticularly true in respect to the foreign element. Whe a change from the use of the open light to that of t safety lamp is made necessary, instead of this being garded as a wise precaution, it suggests to many a pre ent danger. The dread of an explosion, on the part many, causes an exodus from the mine.

In addition to the danger the presence of the lan suggests, the antipathy of the miner is due largely to t dim light it affords and the inconvenience of handli the lamp owing to its size and shape. There is al the fear of losing the light and not being able to relig the lamp, besides the prohibition of smoking where th lamp is used. For these reasons, many miners, pe haps a majority, prefer to run a considerable risk rath than be compelled to use a safety lamp.

After all that has been taught and demonstrated, reference to the ignition of gas and dust, there aris the question, in the thoughtful mind: Why should risk be run that is unwarranted? Why should there hesitation in the adoption and use of safety lamps whe conditions demand that they be introduced? Ever practical miner realizes, if he will admit the fact, tha in a territory producing an almost undetectable amou of gas, there is always the possibility of an outburst gas from the strata, that cannot be foreseen but whic would suddenly transform the mine from a safe to an alarmingly dangerous condition. Also, an unexpectedly dangerous condition may result from a breakdown of the ventilating apparatus, a heavy fall of roof in the air course, the setting open of a door, or a sudden fall of barometer, or any one of a number of other causes known and unknown.

In most cases, the mining law draws a narrow enough margin of safety, which should not be reduced but rather expanded, for the greater protection of life and security of property. While, in many cases, there has been a disposition to encroach on the requirements of the law (and this goes without saying), I am glad to say that many of the larger companies have established high standards of safety by widening the law's margin in respect to all possible danger. Where the law winked at the practice of mixed lights, these companies have become a law unto themselves and abolished the practice. Where the law was satisfied with a stipulated amount of ventilation, they have doubled and trebled that amount, in order to increase the security of the mine.

A brief review of recent catastrophes in mines operating in gaseous territory and under the mixed-light system, cannot but convince any unprejudiced mind that immunity from disaster is impossible under such conditions. The purchase of a few score of safety lamps of an approved type is not a matter of financial embarrassment; but the neglect to do this and thereby avoid a possible danger may cause ruin, besides producing untold misery.

Where entries develop gas, there should be no temporizing, but an approved type of safety lamp should be adopted at once; or, if preferred, an approved form of electric light should be used throughout the mine. The electric lamp does away with the miner's chief objection to the safety lamp; namely, the dim light it affords. In regard to the electric lamp, I feel safe in predicting that, not in the remote future, miners will demand its general adoption, in gaseous mines and in all mines. The use of this lamp will practically eliminate the question of fire in stables and other parts of the mine where timbers, brattices and other inflammable materials are exposed. In my opinion, the passage of laws in every mining state, that would make compulsory the use of the electric lamp in mines, would be a benefit and a blessing. This suggestion may seem radical, but it has the redeeming quality of being made in all sincerity.

CHARLTON DIXON.

Pittsburgh, Penn.

⁂

The Safety Lamp and the Eyesight

I have seen numerous references to this subject, in previous issues of COAL AGE, but the question as to whether or not the continued use of the safety lamp impairs the miner's eyesight and finally curtails his producing power appears to be unsettled. While the opinions of miners who have had the same number of years' experience in the use of the safety lamp differ widely, the preponderance of sentiment so far expressed seems to strongly favor the negative side of the controversy.

While acting in the capacity of mine foreman and fireboss, I was compelled to use the safety lamp constantly for several years and am forced to agree with Messrs. Sutton (Vol. 3, p. 1008), Virgin (Vol. 4, p. 244), Hogarth (p. 278) and Fireboss (p. 170), who have stated that, in their opinion, the constant use of the safety lamp has no ill effect on the eyesight of the miner.

My experience of eight years, in a mine operated with open lights, followed by an experience of 13 years in the same mine operated exclusively with safety lamps, has given me the opportunity to observe closely what effect, if any, is produced by the constant use of the lamp. As a result, I am convinced that the eyesight of miners is not impaired by the constant use of safety lamps. I believe there is greater danger of injury to the eyesight, by the use of large lamps burning inferior oil. The heat and smoke from an open light produced by the burning of an impure oil together with the unsteady nature of the light is, in my opinion, more harmful to the eye than the small steady light of the safety lamp.

I frankly admit that the safety lamp is not as convenient as the open light, which the miner carries on his head, and that it is, to some extent, a burden to the miner, in the performance of his work. However, my experience and observation convince me that the use of the lamp does not perceptibly reduce the man's producing power. It may require a little more effort on the part of the miner to work with a safety lamp; but miners have loaded as many cars of coal and timbered their working places as well when using the safety lamp as when the open light is employed. While this statement may seem a little unreasonable to one with but a limited experience in the use of the safety lamp, it will not appear so to the man who has been long accustomed to its use. This, however, is the result of my observation and experience with both lamps.

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

⁂

Supervision of Miners

I was much interested in the foreword of July 12, which described a method of checking off every man as he enters or departs from the mine. The system is good as far as it goes and is in force, at present, in most of the mines in this state. It is open to the objection, however, that much time may elapse before it is considered necessary to look up a man whose check is still out. There may be no particular alarm felt at the man's home or boarding place, perhaps, until he is an hour behind his usual time of returning from work. In some cases, even then, it is necessary to send for the foreman or one of his assistants, if no one is stationed at the mine entrance charged with the duty of checking off each man as he goes out of the mine.

In my opinion, a far better system is that which has been employed for many years in two of the northern counties of England; namely, Northumberland and Durham. It is my belief that, for efficiency, economy and safety, that system cannot be surpassed. The mine is divided into districts and a deputy in charge of each district, is held responsible for the safety of the men in that portion of the mine. He must examine each working place before shifts and meet his men at the foot of the shaft when they go to work. If they are working in gas, he must examine their lamps and instruct them in reference to any danger that may exist in their several places.

It is the duty of each deputy, during working hours, to supply all timber and tracking needed in his district. He must see that each place is timbered securely and that this timber is recovered, as far as possible, when the place is finished. The deputies practically work the mine; they start and stop all working places. At the end of each shift he must see that every man and boy, in his district, have left the mine and gone home. If any fail to appear on time, he looks them up at once.

In this connection, the article on the Prevention of Accidents in Coal Mines, by John McNeil, in the same issue, p. 42, is interesting. It contains many wholesome truths and good suggestions; but, after all, the method of supervision that I have described as in use in England is a better plan. The deputy is there to instruct and supervise the miner and better results are obtained both in respect to safety and the output of coal, while the cost of timber and other supplies is much reduced.

I wish now to refer to a feature of mining work that is quite common in the North of England and to which Mine Inspector J. B. McDermott has referred as having been adopted by the second largest producing mine in Montana, in his excellent letter, No. 12, Vol. 3, p. 539, when discussing the question of post timbering at the working face. I have reference to the division of labor in mines, whereby all shots are prepared and fired by shotfirers; trackmen lay all tracks and switches; and timbermen are employed to set all timbers. In the North of England a miner is not allowed to touch a car, but the driver takes it out of the room and puts another car in its place. This method has the advantage that a miner is not obliged to leave his room, at a time when he should attend to setting a post or sprag to prevent a fall of roof or coal. A miner may have a bad piece of top that needs a post set at once; but just at that time the driver comes in for his car and the miner must go out and bring in his empty. Other things may delay him and, perhaps, on his return in a half hour or less, the roof has fallen and must be removed, which means much extra work on the part of the miner. Then, probably, the timber he was about to place when called away by the driver, will be too short and he must hunt a longer stick.

It is the lack of systematic arrangement, in the work of mining, that brings poor results and increases the number of complaints that appear so often, to the effect that the returns from capital invested are small. The question of the division of labor should receive careful attention at the hands of all mine operators and superintendents; and every effort should be made to systematize and regulate the work so as to obtain the highest degree of efficiency from the workmen. This is being done in all industries to a greater extent than in coal mining.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

HYGROMETRY

Hygrometry is the measurement of the amount of vapor in the air, at any given time The capacity of the air for holding moisture varies with the temperature. For example, at 32 deg. F., a cubic foot of air will hold or has a capacity of only 2.13 grains of water; while at 60 deg. the capacity is 5.77 gr. per cu.ft.; at 100 deg., 19.84 gr. per cu.ft.; and at 212 deg. F., air fully saturated with moisture holds about 258 gr. per cu.ft.

Hygrometric State of Air—Air absorbs moisture from bodies in contact with it, and thus exerts a drying action, which is of great importance in mining The absorptive power of the air varies with its degree of saturation. For example, air at 60 deg. F., containing, say 2.9 gr. per cu.ft., is only about half saturated and is then said to contain 50 per cent. of moisture. In this condition, the air will readily absorb more moisture. The degree of saturation of air is called its "hygrometric state."

Air is said to be "dry" or "wet," according to the degree of its saturation. It is important to observe that these terms have no reference to the actual amount of vapor present in a given volume of air; but only express how nearly the air is saturated. For example, air fully saturated at 32 deg. F. contains 2.13 gr. of moisture per cubic foot and is "wet" because it is full of water vapor; but if the temperature now rises to, say 60 deg., the vapor capacity of the air is thereby increased to 5.77 gr. per cu.ft., and its degree of saturation or "humidity" is then 2.13/5.77 × 100 = 36.9 per cent. In other words, the air at this temperature contains only 36.9 per cent. of its capacity, and is therefore comparatively speaking, "dry" air. Owing to the rise of temperature, from 32 to 60 deg., the air is capable of absorbing 5.77 — 2.13 = 3.64 gr. of moisture per cubic foot.

Calculation of Weight of Moisture In Air—In order to calculate the weight (w), in pounds, of moisture contained in one cubic foot of air, it is necessary to know the degree of saturation of the air (c), its temperature (t), and the vapor tension (t_v) corresponding to that temperature. This last must be taken from tables known as psychrometric tables. Calling the absolute temperature T = 460 + t, the formula is

$$w = 0.6235 \frac{c\, t_v}{0.37\, T}$$

The constant 0.6235 is the specific gravity of water vapor, and the constant 0.37 is the reciprocal of the weight of one cubic foot of dry air, at a temperature of 1 deg. F. (absolute) and a pressure of 1 lb. per sq.in.

Example—Calculate the weight of water vapor carried in an air current of 100,000 cu.ft. when the saturation is 80 per cent. and the temperature 70 deg. F., if the vapor tension at the given temperature is $t_v = 0.3602$.

Solution—The absolute temperature, in this case, is T = 460 + 70 = 530; and the total weight of vapor is

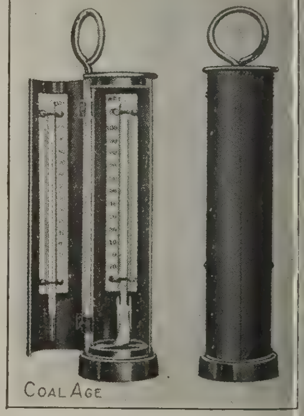
$$100{,}000 \times 0.6235 \frac{0.80 \times 0.3602}{0.37 \times 530} = 91.62 \text{ lb.}$$

The Coal Age Pocket Book

How Humidity Is Measured—The humidity of the air is commonly measured by an instrument called the "hygrometer" or "psychrometer." This is the "wet-and-dry-bulb hygrometer,"

Other forms of hygrometer have been employed depending on the absorption of the moisture from the air by certain hygroscopic substances, and dew-point hygrometers; but these are less simple and not as portable as the wet-and-dry-bulb hygrometer, which indicates the humidity by the difference in the reading of the wet-and-dry-bulb thermometers.

The Hygrometer or Psychrometer—A neat and portable form of the wet-and-dry-bulb hygrometer, designed by the Davis Instrument Manufacturing Co., is shown in the figure. Two delicate thermometers are mounted on springs on the inside of a light cylindrical folding metallic case, the dry bulb on the door and the wet bulb in the case. To the latter bulb is attached a fine silk or muslin sack, which forms a wick that extends downward to the small vessel which holds the water that keps this bulb wet.



A Pocket Hygrometer

Principle of Hygrometer—Unsaturated vapors, like gases, obey Boyle's law; and, for any given temperature, the ratio of the quantity or volume of vapor is equal to the pressure ratio, or the relative humidity (H), as expressed by the formula

$$H = \frac{\textit{Actual vapor pressure}}{\textit{Saturated vapor pressure}}$$

The saturated vapor pressure (dry-bulb temp.) is given in the tables. The actual vapor pressure, at the time of observation, is equal to the saturated vapor pressure of the tables, for the dew-point temperature, which, if known, would make the calculation easy by the use of the above formula. In the use of the wet-and-dry-bulb hygrometer, however, the relative humidity is calculated by the formula

$$H = \frac{P_w - \frac{B}{30}\left(\frac{t_d - t_w}{88}\right)}{P_d}$$

in which H = relative humidity; P_w and P_d the respective saturated vapor pressures of the tables, for the corresponding wet-and-dry-bulb temperatures t_w and t_d; and B the barometric pressure, in inches.

EXAMINATION QUESTIONS

Miscellaneous Questions

Answered by Request.

Ques.—What is the least amount of cover you would ow in the extraction of pillars in a 7-ft. seam of coal, under-sea areas? Show proof that your answer is proximately correct.

Ans.—The question appears to be incomplete, since does not give sufficient data in regard to the characr of the overlying strata or the depth of the water ove the solid formation. Without accurate informan in this regard and a knowledge or acquaintance th the action of the roof in the particular locality, it ould be difficult to give an intelligent answer to the estion and to name the minimum amount of cover, r any assumed thickness of strata; much less to give oof that such minimum thickness is even approxiately correct. The allowable thickness of cover must judged largely by the careful observation of working nditions and experience in the district.

While it is possible to assume that the strata overlyg the coal seam consist largely of shales and sandones, with a total thickness of not less than 60 ft. of ale, which is more dependable than sandstone, and to x the total minimum cover or thickness of overlying rata at, say 300 ft., it might happen that other unvorable conditions not mentioned in the question, exted, which would make the proposed thickness of strata nsafe. The question is not, therefore, one that should e asked in an examination, but must be left to be seted by the practical judgment and experience of the en in charge.

Ques.—What horsepower will it take to raise 60,000 al. of water up a shaft 250 ft. deep, in 1 hr., allowing 5 per cent. for resistance in the pump and the pipes?

Ans.—The weight of 60,000 gal. of water, allowing ight and one-third pounds per gal., is $60{,}000 \times 8\frac{1}{3} =$ 00,000 lb. Assuming a loss of 25 per cent. in friction, he power effective for lifting the water is $100 - 25 =$ 5 per cent. of the total power required. Therefore, the orsepower necessary, in this case, is

$$\frac{500{,}000 \times 250}{60 \times 33{,}000 \times 0.75} = 84+ \ hp.$$

Ques.—Assuming a volume of 25 cu. ft. of gas in the ace of an entry when the reading of the barometer is 0.7 in., how will this volume be affected if the baromter falls to 29.9 in.?

Ans.—Assuming that the temperature remains unhanged, the volume of gas or air expands in inverse roportion to the pressure; in other words, the volume atio is equal to the inverse pressure ratio. Calling the equired volume of the expanded gas *x*, we have:

$$\frac{x}{25} = \frac{30.7}{29.9}$$

nd

$$x = \frac{25 \times 30.7}{29.9} = 25.66 \ cu.ft.$$

Ques.—(a) Disregarding friction, what is the theoretical velocity of air corresponding to a water gage of 1.75 in.? (b) What is the pressure corresponding to this water gage?

Ans.—Since water is practically 815 times as heavy as air, the head-of-air column corresponding to a 1.75-in. water gage is $1.75 \times 815 \div 12 = 118.8$ ft. The theoretical velocity of air corresponding to this head-of-air column is:

$$v = \sqrt{2gh} = \sqrt{2 \times 32.16 \times 118.8} = 87.4 \ ft. \ per \ sec.$$

Ques.—In case a squeeze occurred in a mine of which you had charge endangering a heading and threatening to shut off a part of the work, how would you proceed to stop its progress?

Ans.—Much will depend on the conditions existing in the mine. The principal cause of a squeeze occurring in mine workings is the maintaining of too large a standing area, especially when the pillars are too small for the support of the overlying strata. When the pillars are insufficient or the open area is too large, the weight thrown on the pillars crushes the coal and starts a squeeze.

It is much easier to prevent a squeeze from starting than to stop one already in progress. To prevent such an occurrence, it is necessary to leave large pillars that will be sufficient to support the increased weight thrown on them by the extraction of the coal from the rooms. Also, in drawing pillars it is important to pull all timbers so that the roof will fall and thus relieve the pressure on the pillars.

In case a squeeze has started, the best way to arrest its progress is to rush work on the pillars and draw all timbers in abandoned places so as to start heavy falls of roof, in the path of the squeeze. Where possible, an attempt should be made to break the roof over the entry pillars, by placing shots in the roof, just inside of the mouth of each room. At important points on roadways, it may often be possible to build substantial "cogs," so as to reinforce the pillars at such points. This is also done in rooms to protect them from closing. The most effective method, however, is to relieve the pressure on the pillars by causing heavy falls of roof in all abandoned places adjacent to the squeeze.

Ques.—What must be carefully considered before the work of drawing the pillars is commenced?

Ans.—Before starting the work of drawing back pillars in a section of the mine, it is necessary to consider the effect this work will produce both on the surface and in the mine. Regard must be had to the future work and whether or not the drawing of the pillars will endanger the roads leading to other sections of the mine, or the work in those sections. It is also possible that the drawing of pillars may cause an inflow of water or gas into the workings that would prove a menace to the safety of the mine and this must, therefore, be taken into consideration before attempting to draw the pillars in any particular section of the mine.

COAL AND COKE NEWS

Washington D. C.

Within a short time probably a strong effort will be made to get Congress to adopt legislation giving the Interstate Commerce Commission power to completely control the physical equipment of railroads as well as to prescribe the condition in which they should keep their roadbed, trackage, stations, etc. Representative Stevens of Minnesota, an influential member of the House Committee on interstate commerce is behind the plan and it is understood that the scheme is supported by a number of Democratic members of influence.

The idea would be to enable the Commission to add this branch of labor to the powers it now exercises not only with the purpose of increasing the safety of passengers but also for the purpose of enabling it to end the socalled car shortage abuse.

As is well known, the Commission has conducted elaborate inquiry into car shortage during the past year, and it is claimed that the car shortage has been found to be due not only to actual scarcity of cars, as is frequently the case, but also to bad distribution or rolling stock, due in part it is alleged, to a disposition to favor given shippers. Particularly is this thought to be the case with regard to coal cars as to a shortage in which complaints have been numerous and constant for some time past.

The Commission has not had much success in enforcing its various orders with regard to the distribution of cars, various mines being said to have failed to get the quota to which they were entitled, or at all events to which they thought they were entitled.

A good many bills are now pending before the House Committee on interstate commerce with regard to the equipment question, many of them extreme and absurd in their nature, and some intended to deal directly with the alleged shortage of freight cars, including coal cars. The Committee is already making preparations to deal with the question of railway legislation at the approaching winter session, it being stated that the demand for further restrictive and repressive legislation has become irresistible, so that the legislative managers cannot afford to oppose it but must assent to the demand for doing something.

It is stated that the Stevens bill transferring the jurisdiction over the equipment question to the Commission would be more conservative by far than the adoption of measures prescribing in absolute terms what the railroads must do. In speaking on this point, Mr. Stevens says:

> Congress is too slow-moving a body to handle this question adequately. We are always ten years behind the times. The railroad problem should be solved by a small body of experts who are making a life study of it, rather than by 435 members of Congress who know nothing about the subject technically. Fifty bills are now pending in Congress on this subject. The way to deal with the problem is to turn the whole question over to the commission with power to act when occasion demands.

In spite of the relative conservatism which is thought to characterize Mr. Steven's proposal, it seems to find no favor whatever with the railroads but the information coming to hand is that they intend to oppose the scheme. Full hearings will be granted on the subject and it is believed that they may be undertaken shortly, without waiting for the winter session to begin, as Congress has now largely reconciled itself to the idea of remaining in session until almost December.

If this plan is followed, the effect may be to finish the preliminary work before the winter session technically begins, and thereby to render it possible to start the actual discussion of what is to be done with the equipment problem at the opening of the session.

The equipment discussion is likely to be closely associated with a debate on the rate question in which, a considerable proportion of attention will be given by Massachusetts members and others closely affected, to the question of how far present prices for coal are due to existing freight rates and how far the situation can be remedied through the adoption of proper legislation.

Investigating Experts Report

The Committee of special investigating experts appointed by Census Director Harris some time ago has completed its preliminary investigation of conditions in the Census and has made recommendations to the director. A part of the recommendations deals specifically with conditions as to t statistics of mining.

The Committee found that the current understanding wi reference to bad conditions in the census was by no mea exaggerated but that the Bureau was practically in a state disorganization and ineffectiveness while it has violated t law by delaying census statistics far beyond the time wh they were to have made their appearance. After outlini the situation and detailing the circumstances now obstruc ing work, the committee says:

> We therefore advise the Director to begin no new tabul tions or analyses in connection with the unfinished branch of the Thirteenth Census, namely, population, mining a quarries and to readjust the work of these branches on t delayed annual reports so as to insure their publication n later than Dec. 31, 1913. Further on the investigato suggest "That the tables relating to mines and quarri now in the form of printed bulletins, proofs, or manuscript sent to the public printer at once, the same to constitute t fiinal report on mines and quarries, and that no furth tabulations or text be prepared in connection with th report."

If these recommendations are carried out, they will e the further development of the mining census which h been generally conceded to be nearly as worthless as such enterprise could well be, particularly in its relation to co mining. The general opinion appears to be that the c operation between the Census and the Geological Survey regard to mining figures, which had been expected to yie beneficial results has been of no service in improving t data finally secured.

Coal Trade Changes Due to New Tariff

As a result of the new tariff, now practically law. which is carried as paragraph 459 in the free list the fo lowing: "Coal anthracite, bituminous, culm, slack and shal coke; compositions used for fuel in which coal or coal du is the component material of chief value, whether in brique of other form," it is expected that coal trade with Canad will be greatly altered in direction.

Considerable importations are expected to cross the bord into the United States both from the eastern and weste mines while on the other hand our export trade in coal t Canada via the Great Lakes is expected to be considerabl enlarged, as well as probably in other parts of the countr The precise changes that will be produced in this way ar however, not yet known, and experts are still uncertain to the precise direction they will take.

HARRISBURG, PENN.

Actual returns compiled by field secretaries of the Min Workers Institutes demonstrate that the fast growing min schools of the anthracite region of Pennsylvania have full proved their worth. Of the 56 candidates who presente themselves for the state examinations for certificates i Nanticoke Borough and Newport Township this year 4 of th 7 successful candidates for mine foremen's and 24 of the 3 successful candidates for assistant mine foremen's certificate were students of the mine schools.

At Mt. Carmel where the schools have not been in existenc long none of the students were sufficiently advanced to present themselves for examinations. One mine foreman's certificate and 6 assistant mine foremen's certificates wer granted at this year's examintions.

Of the 27 candidates who presented themselves for the examination at Shamokin, 2 of the 8 successful candidates fo mine foremen and 4 of the 14 successful for assistant min foremen's certificates were students of the mine schools.

The foregoing proves conclusively that the mine schools which open again next month, are adequate to equip me for the examinations and for better paying positions. A summary of the above returns shows that students of the school were granted 6 mine foremen's and 28 assistant mine foremen's certificates, which is a good showing for the schools

Mining Institute to Open in October

At a meeting of the board of directors of the Wilkes Barre District Mining Institute it was decided that the institute be opened the second Saturday in October. Secretar Devendorf made a report of the institute dinner held in Ma and reported that at present there is a membership or 114

The arrangements for the meetings of the institute for the coming winter were left in the hands of Mr. Devendorf. The November meeting will be devoted to the foreign speaking members of the association.

Work of Public Service Commission

The Public Service Commission of Pennsylvania has announced that the experts engaged on the inquiry into the rates for hauling coal from the anthracite collieries to Philadelphia have found that the work is greater than expected, but that a report will be filed shortly. The detail work is well advanced and an outline will soon be submitted to the commission, showing the charges and hauls on each railroad running into the anthracite territory.

The Commission will hold a hearing on Friday, Sept. 26, on one of the complaints concerning the rate on shipments of bituminous coal from the Clearfield district to York and Lancaster. On the same day the commission will give hearing to the Bell Telephone Co. on the tentative schedule of rates as published by the old Railroad Commission.

Reorganization Helps

A redistribution of responsibility, together with some increase in the number of assistant foremen, has been effected in the mines of the Lehigh Valley Coal Co. in the anthracite region. The former system was for the "fire-bosses," now known as assistant foremen, to make a thorough inspection of the mines each morning, as prescribed by the Anthracite Mine Laws, to warn the men of all dangerous spots, and to take whatever precautions were necessary to render the mines safe during the day; and then to leave the mines under the general supervision of the inside foreman. The driver bosses in charge of transportation only had no authority over the men, and could only caution them and report to the foreman whatever they saw that looked dangerous or wrong.

At present the mines are divided into districts, each one small enough to be patrolled easily by an assistant foreman, with time enough for him to stop and see that his orders are thoroughly carried out. The morning inspection before the men enter the mines is carried on as carefully as ever, but now the assistant foremen with authority over the men continue the inspection each in his own district throughout the working day. Each one is responsible for safe conditions in his district, and reports to the inside foreman. There are no more driver bosses, each assistant foreman being held responsible for the transportation through his district.

This system has been found to be a success, according to officials of the Lehigh Valley Coal Co., and has added greatly to the safety of the men who were prone formerly to forget the instructions of the fire-bosses and take a chance, when left to their own devices in order to hurry through the work.

PENNSYLVANIA

Anthracite

Hazleton—Orders have been issued by Kehoe & Co. which brought about a suspension of two of their big stripping operations. The suspension is due to the scarcity of water which has been prevalent in the Mahanoy Valley for several weeks. The company operates two big strippings, one at Packer No. 5, Lost Creek, and the other at Sayre, near Mt. Carmel. For the past two weeks operations have been hampered by the diminished water supply, but as long as it lasted the men were kept employed in the hope that a heavy rainfall would occur, eliminating the necessity for suspension. However, the drought has become so pronounced that it was found compulsory to close down the operations. About 70 men are affected.

Fern Glen—The miners at Fern Glen, an operation owned by the Lehigh Valley Coal Co., are on strike. The breast miners claim that it is their desire to buy their dynamite by the box, but that they are allowed only 3 lb. a day by the company, while the company miners get theirs by the box.

Plymouth—The Lance No. 11 Colliery, of the Lehigh & Wilkes-Barre Coal Co., which closed down on Aug. 8 in order that necessary repairs might be made to the shaft, breaker and engines, will soon be ready to resume operations. A concrete lining has been built in the shaft, from the surface to the rock, about 13 ft. Iron doors are to be placed over the shaft mouth as a protection against fire, the breaker being directly over the shaft. In a short time compressed air locomotives are to be put in service inside, the compressor engines being already in place on the surface.

Pittston—A squeeze in the workings of the Butler Colliery, of the Pennsylvania Coal Co., caused the bank of the old Hughestown reservoir, owned by the Spring Brook Water Supply Co., to give way, and the water rushed down to Mill St. and other thoroughfares in that section, causing considerable damage. The water flowed out of the reservoir through an underground channel, the stone walls holding firmly against the pressure. Part of the water went down into the mine, while the stream that took the surface course was much smaller.

Bituminous

Indiana—A large field of coal lying on the Indiana County side of the Conemaugh River, east of Garfield, is being taken up by Westmoreland and Fayette County coal operators. The field is a large one and adjoins land recently taken up by the Frick interests, who are interestd in brick manufacturing concerns located at Bolivar. The extent of the operations have not been decided, but a large block of coal has been taken up. The output of new mines, which will be located some distance from Garfield will be shipped over the Pennsylvania R.R. The spur to the new mines is so located that it will be possible to ship either over the Penn or Conemaugh Division or over the main line to points East.

Johnstown—George Ringler, aged 53, was killed when a steam pipe exploded in the power room of the Brothers Valley Coal Co., Ringler was killed instantly and another workman was badly scalded. The boilers were being prepared for inspection when the accident occurred.

Uniontown—There has been a considerable awakening of interest of late and no little inquiry for good coal land, and prices are buoyant. Uniontown men have been taking options for some weeks on the Pittsburgh vein of coal underlying farms in the vicinity of Ten Mile and Hackney in Washington County. The prevailing option price is said to be $600 per acre. It is said also that blocks of land of considerable size will likely change hands under the options now being secured. Brokers claim, however, that practically all large areas of coal available for operating in Allegheny County are controlled by the big corporations, so that the marketable supply is small.

WEST VIRGINIA

Charleston—The petty strike fever which has long vexed the Anthracite region seems to have been transplanted into the West Virginia coal fields. The men employed at the mines of the Eureka Coal Co. on Morris Creek, near Montgomery recently went on strike because a motorman was discharged. Five hundred men have been on strike for a short time on Paint Creek. Miners who are employed by the Edward Marmet Co. on Lens Creek have also been on strike. All of these contentions have been of a somewhat trivial nature and at the present time all the miners have returned to work. In order to cope with this situation President Thomas Cairns of District 17 United Mine Workers of America, has issued an ultimatum stating that "no more strikes will be tolerated unless ordered by proper authority." Resorting to petty strikes, he affirms is ruinous to the miners' cause and to the interests of the operators.

Coal operators with mines along the Chesapeake & Ohio, Kanawha & Michigan, Virginian and Norfolk & Western R.R. met in Charleston, Sept. 19 and organized an Operators Protective Association. A fund of $1,000,000 is said to have been raised to protect the interests of the mines in this organization.

KENTUCKY

Frankfort—Suit has been filed in the United States District Court, by J. W., A. W. and Hattie Sewell asking for a receiver for the properties being operated for coal and oil on Caney Creek by the Kentucky Block Cannel Coal Co., S. R. Collier and several others, being made defendants. The receivership is asked pending the settlement of a controversy as to the title, which is claimed by both plaintiffs and defendants. The Collier interests are said to be taking 1000 barrels of oil a day out of the property, while the coal rights are equally valuable.

Pineville—Many of the mines in the vicinity of Pineville, have been operating on a half-time basis, on account of the drouth, while a few have been compelled to shut down completely. Several recent light rains have given hope that relief is in sight, however, as there is now ample moisture in most parts of the state. Heavy orders are on hand, and over-time operations will probably be the rule as soon as there is sufficient water available for the work.

Dekoven—President L. B. Walker, of District 23, United Mine Workers of America, has declared a strike at the Dekoven mines in Union County, the matter under dispute being the disposition of unclaimed cars of coal finding their way out of the mines to the check weighman. Under an agreement with the operators it is claimed by the men that such occasional unclaimed cars were to have gone toward paying the wages of the check weighman, but that this arrangement has been discontinued.

OHIO

Columbus—It is rumored in railroad and coal mining circles that the southern division of the Detroit, Toledo & Ironton may be abandoned. The property was recently sold at receiver's sale and a considerable amount was required from the contractor to bind the agreement. After investigation it was found that the road was losing practically $45,000 per month and the purchasers have been loath to consummate the deal. Operators on the road have filed many complaints with the Public Utilities Commission as to lack of equipment and motive power.

John C. Davies, chief deputy in the mine inspecting department of Ohio in his report made to Governor Cox predicts that the year 1913 will be the banner year in Ohio's coal production. The state mine department has been taken over by the new Industrial Commission and goes out of existence as a separate department. Mr. Davies says that the business of 1913 should show a substantial gain over that for 1912 when it was 34,400,000 short tons. He also says one of the needs of the mining industry of Ohio is more thorough supervision and greater precaution on the part of the operator. He calls attention to the increased number of fatalities.

Athens—The commission appointed by Governor Cox to investigate the conditions surrounding the payment for coal mined in Ohio spent last week inspecting Mine No. 9 of the Circle Hill Coal Co., near Athens. Governor Cox accompanied the commission on its investigation trip. Next week mines in the Indiana and Illinois district will be investigated. It is the plan to bring the operators and miners together to agree on a number of witnesses from each state to testify before the commission. Every effort is being made to have the report ready by Dec. 1.

Massillon—Massillon city firemen recently fought flames in an entry of the Smith-Beaver mine 150 ft. below the surface of the earth until they had them under control. All of the fighters were equipped with smoke helmets.

INDIANA

Princeton—John G. Wright, deputy inspector of mines in Indiana, recently closed down the plant of the Princeton Coal Mining Co., for failure to obey certain orders with reference to the manner of operating. Inspector Wright said that the mines would not be allowed to reopen until his orders were complied with.

ILLINOIS

Belleville—In the Circuit Court here, the suit of Sherman Grant against the Chicago, Burlington & Quincy R.R. and the Southern Coal & Coke Co., for the loss of his right leg under a coal car while working for the coal company, resulted in a judgment of $6000. He sued for $10,000. While running down cars at the coal company's mine, in some manner he fell in front of a coal car, claiming the railroad company and the coal company at fault.

The annual report of the County Mine Inspector for the past year shows a death toll of 9 lives lost in the production of coal, a decrease of 4 from the previous year. Forty-one were injured, which is 12 less than last year. The report shows that one man out of every 630 miners was killed and one out of every 39 injured each year. The total number of employees in the mines in the county is 5717. The total production of coal was 4,738,198 tons, an increase of 217,672 tons in the 73 mines in the county, of which 8 did not operate during the year on account of the low price of coal. During the summer months 24 mines suspended on account of no business. Two new mines were opened during the year and four old mines abandoned, two on account of mine fires.

Herrin—Mine B of the Chicago & Carterville Coal Co. employing 350 men resumed operations Sept. 16. The indications are that the coming fall will be the greatest season ever experienced for the production of coal in this region.

Bush—It will likely be many months before work is resumed at the mine of the Western Coal & Mining Co., at this point. Progress in cleaning out the squeezes and falls is slow.

Springfield—Inability to meet a bond issue of $2,500,000 will result in a public auction within the next 60 days of the mining properties of the Illinois Collieries Co., valued at $3,000,000. The decree has been entered in the Sangamon Circuit Court. The sale will be made at the Court House in Springfield, of the eight different mines, located as follows: Springfield, mine known as the Dickerson Coal Co.; Chatham, abandoned mine; Auburn, a leased mine; Virden, two mines; Girard, one mine; Litchfield, one mine; Sorento, one mine.

Several of these mines have been leased to other parties and are being operated, but the leases were subject to an action of the above nature.

Chicago—Three additional involuntary petitions in bankruptcy were filed Sept. 15 in the United States District Court against concerns affiliated with the O'Gara Coal Co. These companies were the Middle States Coal Co., the Imperial Mining Co. and the Vivian Collieries Co. Judge Carpenter appointed Thomas J. O'Gara and Fred A. Busse to act jointly as the receivers for the companies. He later issued injunctions forbidding the sale of various bonds and other property held as collateral against two of these companies.

MICHIGAN

Bay City—All coal mines in the Michigan district were closed Sept. 15 and the operators insist that they will not be re-opened until the differences between the union and the Handy Brothers Mining Co. in Bay County are adjusted. About 3000 men are affected by this suspension of work the cause of which is the alleged refusal of union officials to consent to an arbitration of differences. Seven hundred men recently struck at Handy Brothers Mine claiming that the operators had refused to pay what was due them under the working agreement made in April 1912.

COLORADO

Trinidad—A strike of most of the coal miners of District 15, United Mine Morkers of America was declared Sept. 15 to take effect Sept. 23. The resolution of the Executive Committee of the United Mine Workers endorsing the strike was adopted by a unanimous vote at a convention of the district.

Several cars of provisions are being distributed among union commisaries, and union leaders have rented ground presumably for concentration camps. The operators are also making preparations to protect their property in case of serious trouble.

PERSONALS

Isidor Wulfson, city weights and measures inspector for Indianapolis, has made a ruling that coal must be sold by small dealers by the standard weight or measure and not by the basket. If they sell by the bushel they must give 80 lb. to the bushel.

A. H. Von Bayer, of Detroit, Mich., has arrived at Ashland, Ky., to take up his duties as superintendent of the new plant of the Solvay Coal & Coke Co., at that place. H. M. Cole, superintendent of construction, who has been at work on the new plant, has left Ashland.

George E. Smith, auditor for the Utah Gas & Coke Co., Salt Lake City, has been appointed assistant auditor of the American Public Utilities Co., at Grand Rapids, Mich. The latter company is a parent organization of the Utah concern and controls 11 gas and electric street railway corporations in various cities.

A. W. Calloway was appointed vice-president of the Davis Coal & Coke Co., Sept. 18, by J. M. Fitzgerald, president of the coal company and of the Western Maryland Ry. Mr. Calloway is at present general manager of the Rochester & Pittsburgh Coal & Iron Co. with offices at Indiana, Penn. He will assume his new duties not later than Nov. 1.

Hywel Davies, of Louisville, Ky., the active head of the Kentucky Mine Owners' Association, recently moved his offices to Lexington, where he has business interests which demand his attention. That location is also more convenient as the headquarters of the Mine Owners' Association, on account of its proximity to the rapidly developing eastern Kentucky field, and by reason of the fact that the State Department of Mines is also located in that city.

Earl Henry, state mine inspector of West Virginia, has announced the appointment of two new inspectors. Enoch Carver, of Charleston has been appointed to succeed J. H. Jackson in the Sixth District. E. B. Lambert, of Williamson, succeeds H. H. Pinckney in the Twelfth District composed of Wayne, Mingo and part of McDowell counties. Mr. Lambert has lately been general manager of the Glen Alum Coal Co.

William Haven, manager of the Inland Fuel Co., of Chariton, Iowa, in announcing to the company's employees the firm's intention to cease operations, paid a high tribute to upt. George A. Verner, son of John Verner, and to Hoisting ngineer W. S. Lowe. He said in part: "During a period of iore than 11 years not a man has been killed or even seriusly injured, and there has been no friction over labor onditions and no call for arbitration." This excellent record e attributes to the care and diligence of the superintendent nd hoisting engineer above named.

OBITUARY

James Ross, ex-president of the Dominion Coal Co., died at Iontreal, Sept. 20, from heart disease at the age of 65 years. Ir. Ross was born at Cromarty, Scotland, and came to the Jnited States in 1870 where he became chief engineer of he Ulster & Delaware Ry., and held other important posiions.

Removing to Canada he was appointed chief engineer and ubsequently general manager of the Victoria Ry. He built he Credit Valley Ry. in 1878 and 1879 and in 1883 had harge of the construction of the Canadian Pacific Ry. west f Winnipeg.

He took up his residence in Montreal in 1888 and became dentified with many extensive industrial and electrical enerprises occupying the position of president of the Dominion oal Co. for many years. At the time of his death he was resident of the Dominion Bridge Co. and the St. John Ry. nd a director of numerous other companies.

Mr. Ross was a member of the American Society of Civil ngineers and a noted yachtsman, devoting much of his ime to this sport. He was a liberal contributor to hospitals nd other charitable institutions.

CONSTRUCTION NEWS

Connellsville, Penn.—Work on the 200 new ovens at Leisenring, No. 2, is being pushed as rapidly as possible. One undred new ovens are also to be added to the Clarissa lant.

Pocahontas, Va.—The Pocahontas Consolidated Collieries o. expects to build a steel tipple near Bluefield, W. V., at a cost of about $65,000 with a capacity of 3000 tons in eight hours.

Bellaire, Ohio—The Cambria Mining Co. which is developing coal near here has its shaft completed and has let a contract for the erection of a steel tipple 50 ft. high, and 200 ft. long.

Boswell, W. Va.—One of the biggest shaft mines in the state and one of the most complete and up to date in America, will be constructed for the Consolidation Coal Co. on the old Biesecker farm near Boswell.

Birmingham, Ala.—A plant to manufacture benzol is to be erected at the by-product coke ovens at Fairfield in the next few months by the Tennessee Coal, Iron & Railroad Co. It is estimated that this plant will cost $1,500,000.

Champaign, Ill.—After considerable deliberation John O'Neill has decided to sink a shaft on his farm where a coal bed was discovered several weeks ago. The vein is 7 ft. thick which is somewhat thicker than the average in this part of the state.

Fairmont, W. Va.—It is estimated that the Louisville & Nashville, Chesapeake & Ohio and Baltimore & Ohio railways, have expended, or are about to expend over $55,000,000 developing the Elkhorn coalfields in southeastern Kentucky. The coal is claimed to be of the highest grade for coking, gas production and by-products.

Norwood, W. Va.—It is reported that work is well under way on a new branch line of the Norfolk & Western R.R., from Norwood, W. Va., up Laurel Hollow, a distance of four miles, in order to reach the properties of the Houston Coal & Coke Co., upon which shafts are already being sunk. The property is said to be unusually promising.

Jenkins, Ky.—Three hundred and fifty carpenters who have finished their work at Jenkins, the newest town of the Consolidation Coal Co., have gone to Fleming, the center of the Mineral Fuel Co.'s operations, to push forward the work of completing the buildings proposed for that town, before cold weather begins. The Nicola Building Co., of Pittsburgh, Penn., has the contract for most of the work being done, and is employing in the neighborhood of 2000 men in Fleming.

Columbus, Ohio—Coal operators, shippers and especially dealers in Columbus, are much interested in the plans for flood prevention, which are now the chief topic of discussion. Recently expert engineer Alvord submitted 10 different plans for preventing future floods in the Buckeye capital. He recommended plan No. 7, which provides for digging a new channel 880 ft. wide, and capable of taking care of 150,000 cu.ft of water per second. The cost of this plan is $12,000,000. The city council has taken steps to have the question of issuing $8,500,000 bonds for the city's share of the cost, submitted to the voters at the November election.

NEW INCORPORATIONS

Oakland City, Ind.—The J. M. C. Coal Co. has been incorporated to mine and deal in coal. The incorporators are John A. Jones, Janral R. Jones and K. Jones.

Cleveland, Ohio—The Balkan Mining Co., of Cleveland, Ohio, has filed papers with the secretary of state, increasing its capital stock from $300,000 to $500,000.

Cleveland, Ohio—The Kea Coal Co. has been organized in Cleveland to mine and deal in coal. The capitalization is $10,000 and the incorporators are Quay H. Findley, A. E. Bowdler, F. B. Pease, M. F. Edwards and T. F. Burton.

Columbus, Ohio—The Hazel Ridge Coal Co. has been organized to mine and deal in coal. The capital stock is $10,000 and the incorporators are Louis G. Addison, John R. King, Thomas H. Clark, L. L. Schaeffing and Arlington O. Harvey.

Pomeroy, Ohio—The Martin-Ersbach Co., of Pomeroy, Ohio, has been incorporated with a capital stock of $250,000, to mine and deal in coal. The incorporators are H. C. Royal, R. F. Marburger, C. L. Leher, C. E. Herrman and F. A. Siebold.

Williamsburg, Ky.—The Southern Mining Co. was recently incorporated, with a capital stock of $30,000, for the purpose of taking over the business of the Southern Mining Co. of Kentucky. The incorporators were E. C. Mahan, A. M. Stewart, P. G. McElroy and others.

INDUSTRIAL NEWS

Charleston, W. Va.—During the month of August 1913, the Norfolk & Western Ry. transported the following tonnage of coal from the West Virginia mining district: Pocahontas Field 1,318,149 tons, Tug River Field, 232,865 tons, Thacker Field, 296,422 tons, Kenova Field 89,271 tons, total 1,936,707 tons.

Washington, D. C.—Freight rates on coal, both bituminous and anthracite, shipped over the Chicago, Milwaukee & St. Paul Ry. and other lines from upper lake ports to destinations in the Northwest, particularly in South Dakota, were attached Sept. 19 before the Interstate Commerce Commission by the State of South Dakota. It was alleged that existing rates were unreasonable, discriminatory and excessive, and the commission was asked to readjust them downward on a basis of equity.

Fairmont, W. Va.—A deal was completed Sept. 19 by which the Fairmont and Cleveland Coal Co. purchased the holdings of the Parker Run Coal Co., for a cash consideration of $200,000. The new company is composed mainly of Fairmont and Cleveland men, and the capitalization is $600,000. The company also owns several hundred acres of coal land so far undeveloped on Kiverbaugh Creek. The Parker Run Co.'s holdings were developed and shipment was being made by boat and rail for the past two years. The new company will continue the present method of shipping and will also ship over the Baltimore and Ohio R.R.

Richmond, Va.—People living along the Norfolk & Western R.R. are soon to have a hearing against that carrier before the State Corporation Commission. The handling of coal from Virginia mines is the basis of the complaint. These mines are along the line of the Virginia Southwestern, and in order to get to the parties along the line of the Norfolk & Western, it is necessary to use both roads. The tariff on coal would therefore be higher. The Norfolk & Western is understood to demand nearly as much for bringing the coal from Bristol to points along its line as it does for coal brought from Pocahontas. The case will probably come up in the course of the next few days.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite coal more active although lake shipments are slowing down. Abnormal tonnages of bituminous being diverted to the Eastern markets but prices continue firm. Operators finding it difficult to meet their obligations.

If the winter weather opens up early, as conditions seem to indicate, there will be a quick rush for hard coal. There is already a notable change for the better in the retail trade, while reports from the mining regions are to the effect that the big producers are beginning to tune up production. There is an insistent and almost urgent demand for certain grades. Lake business is slowing up because of a congestion at the upper end, but ports on the Atlantic Coast, which are closed to navigation in November, are buying aggressively.

The inquiries for bituminous are plentiful and indications are that prices will shortly move to still higher levels. The lower grades, and shipments all-rail are inclined to be dormant with a slight disposition to sag but this appears to be only temporary. If the demand holds firm, a flurry of greater or less proportions seems to be inevitable this fall. The appearance of some inclement weather has interfered with the coastwise movement to such an extent that the accumulation at Boston has already been cleaned up.

The Eastern railroads are not permitting their equipment to be consigned to Western points, with the result that there has been more than the normal tonnage diverted into the Eastern markets. There is a steady call at tidewater for all good grades, and some operators are experiencing difficulty in meeting their contract obligations. Practically all of the West Virginia coals are commanding premiums, whether for prompt or deferred delivery.

The car supply has been less plentiful in the Pittsburgh district, particularly on certain divisions, and the production is being maintained with difficulty. Domestic coal is the feature of the situation there, dealers who failed to contract earlier in the season now being forced into the open market. It has been pointed out that the Pittsburgh district may develop a very competitive trade this season because of the large tonnage which the operators have left uncovered, for use in the prompt market.

The lake business in Ohio has slowed down materially, due to the large accumulation at the head of the lakes, and the short supply of vessels. In the other markets, however, all grades continue to show increased strength, particularly domestic coal, which is in excellent demand; a big rush is anticipated when the cold weather opens up. There is even less coal at Hampton Roads than last week, but large shipments are en route from the mines, so that the situation will be improved shortly. A vigorous buying movement was precipitated in the Southern market by the advent of some unexpected cool weather.

Shipments in the Middle West have slowed up somewhat, but are generally good on the whole. Buyers who failed to contract are now inclined to disregard the higher prices in their anxiety to get under cover; operators, on the other hand, prefer to hold off. The prospects for the fall business are excellent. Steam grades are a little difficult to move, although a great many mines are well sold up ahead.

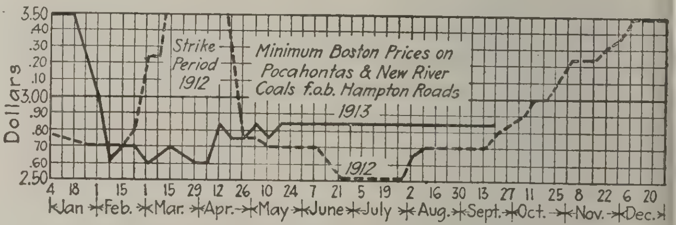
BOSTON, MASS.

There is an upward turn to Pocahontas and New River, and the demand is strong in every direction; orders being declined. Georges Creek receipts at tide very small. The Pennsylvania coals share the general firmness, and higher prices are looked for. The beginnings of a rush for anthracite.

Bituminous—Things are beginning to happen in the Southern coals. Practically every brand of Pocahontas and New River is now commanding a premium for shipment either spot or deferred, and some of the agencies are so far sold up in one direction or another that they are now declining business of any kind. The off-shore demand is notably strong, due largely to apprehensions abroad, and there are rumors, too, of labor agitation in the lower districts of West Virginia. Loading dispatch at Hampton Roads is still normal but only because shippers are rejecting tonnage except on old purchases. If the demand holds to the strength it is now assuming we shall have an active market in October; $3 f.o.b. Norfolk has been reached this week and no let-up is now in near prospect. All factors are growing shy of committing themselves and it may be we shall have an autumn "flurry."

The weather has been unfavorable to movement coastwise and the handling piers here are gradually working through the accumulation of the past fortnight. The situation in New England is therefore in comfortable shape.

Georges Creek receipts at tide continue very light, and it begins to look dubious for any heavy volume of this popular grade. The shippers are apparently confining their efforts to the clearance of large bottoms at Baltimore, to such extent, in fact, that Philadelphia and New York requisitions go begging.



The Pennsylvania coals are also showing renewed strength. Inquiries are plentiful and it is probably only a matter of days when prices will begin again to move to new levels. Contracts made last spring that have since remained dormant are now being revived and there is a steady call at tide water for all the good grades. All-rail the demand is moderate but with a strong outlook for the rest of the season.

Anthracite—All the companies are well supplied with orders. Broken and stove are getting increasingly short. From New York some of the shippers are declining orders that call for more than a third stove in the cargo. If the winter starts cold there will almost surely be a rush for hard coal of any kind. The Eastern ports that will close to navigation late in November are getting vitally interested in having cargoes come forward, and in every quarter the demand is active. The new advance in barge rates from New York will tend to throw an extra pressure on Philadelphia and developments are already being watched with more or less concern.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.10@1.50	$1.30@1.65	$1.67@1.77	
Philadelphia*	2.35@2.75	2 55@2.90	2.92@3.02	
New York*	2.65@3.00	2.85@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.90@3.00
Providence†				3.83@3.93
Boston†				2.98@4.08

NEW YORK

Soft coal tending to ease up slightly, but this is confined to the off grades. Supplies at tide rather low. Retail anthracite active and the wholesale trade is also beginning to feel the effects of the advancing season.

Bituminous—There appears to be a feeling in some quarters that the soft-coal market is a trifle easier this week. However, the good grades continue in as short supply as ever, what weakness there is being confined entirely to the off qualities or certain specialties, for which there does not happen to be any demand at the moment. The high-volatile railroad coals are particularly easy. On the other hand supplies at tidewater are generally low, so much so in some instances, as to cause some uneasiness. As a matter of fact it is noticeable that pessimistic opinions of the situation emanate principally from buyers.

The car supply is beginning to tighten up quite perceptibly, particularly on the Pennsylvania, where operations are often quite restricted at the close of the week; the situation is somewhat better on the New York Central. The heavy rains last week relieved the water famine, which was causing some restriction in operations in the Pennsylvania field. Quite a lot of labor trouble is cropping up in spots, which is making it difficult to maintain a heavy production; there are ations that the "button strikes," which have been so lent in the hard-coal region, may be spreading to the inous districts also.

will be entirely a weather market from now on. The in temperature must inevitably bring higher prices, eas if the weather continues mild quotations will remain y. At present the market has not experienced any ge and remains quotable on the following basis:

est Virginia steam, $2.60@2.65; fair grades of Pennsyl- , $2.70@2.75; good grades of Pennsylvania, $2.80@2.85; Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@

nthracite—The retail hard-coal trade is opening up ac- , orders coming in from all directions. The improve- has not extended to the wholesale branch as yet, how- and this continues to drag, particularly as regards in sizes. Stove coal is in short supply with orders far cess of the demand; nut is improving, the demand now ring to be about up to the production. The steam grades nue going into storage and are in quite easy supply, cularly pea and buckwheat; the advent of colder weather ause these to move more promptly.

e somewhat cooler weather already experienced is, no , having a psychological effect upon the consumers, who giving more consideration to their fuel supplies than l otherwise be the case. It is also noticeable that there endency to tune up the production in the mining regions. car supply is generally excellent, except when certain ment is specified, as, for instance, box cars. The heavy last week removed the possibility of a water famine, has been threatening for some time.

e quote the New York market as follows, with prices rately firm except on a few grades:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
t	$5.00	....	$4.95	....
	5.25	$5.15@5.25	5.20	$5.10@5.20
	5.25	5.25	5.20	5.20
ut	5.50	5.40@5.50	5.45	5.30@5.45
	3.50	3.40@3.50	3.45	3.35@3.45
heat	2.75	2.60@2.75	2.45@2.70	2.35@2.70
	2.25	2.25	1.95@2.20	1.80@2.20
	1.75	1.75	1.70	1.50@1.70

BALTIMORE, MD.

e market for the cheaper grades of soft coal showing derable weakness. Demand East and South very light. still continues best feature of market. Car supply much r.

hile the better grades of coal, which are now pretty covered by contract, are showing no signs of weakness, arket for the lower-class fuels was sagging during the The Great Lakes were still calling for large quanti- f three-quarter coal from West Virginia, but a number astern roads are refusing to allow their equipment ve westward and many operating interests were forced ip coals east that they could have obtained much bet- rices for in the West. The result was that the supply considerably in excess of the Eastern demand for spot nd sales were made of fair grade West Virginia coals d 85 and 95c. Westward these same grades were bring- bout 15c. to 20c. better.

e lower grade Pennsylvania coals were not in anything s liberal supply, and while demand was not very brisk, continued firm at $1 to $1.10. The better grades were uch in the market, and the few spot sales recorded were d $1.50. Gas slack proved the real sensation of the instead of moving backward it continued to advance. nd on every side was reported in excess of the supply, e result was that sales around $1 were recorded.

r supply was much better. Under the lightened demand uick movement the West Virginia field, which was so of cars the week before, reported plenty of equipment ovement East. The only shortage seemed to be in con- n with the heavy movement toward the lakes. Lack oor still continues a serious problem in many mining cts.

e announcement of the appointment of A. W. Calloway, Rochester & Pittsburgh Coal & Iron Co., as vice-presi- and general manager of the Davis Coal & Coke Co., is d on here as the first step on the part of the Western and Railroad to bring about a separation of its railroad oal interests.

PITTSBURGH, PENN.

oduction at full rate, with cars scarcer. Increased de- for domestic coal. Unsold capacity for delivery after shipments close. Connellsville coke prices maintained more difficulty. The production of furnace increased the merchant ovens decreased.

Bituminous—Market demand for domestic coal has materially increased. Many dealers failed to make their usual contracts last spring, with the result that there is more buying than usual at this time. Shipments are heavier on such contracts as were made. Car supply is not so good as it was, there being serious shortages now reported on some divisions. Labor supply is about the same as formerly. Production is approximately as heavy as at any time, but is maintained with more difficulty. There is not much demand for free coal outside of that for retailers. Prices are well maintained as lake shipments continue heavy, but it is understood that a number of operators curtailed their contracts in the hope of securing better prices late in the year and this may develop more active competition, putting prices to a test, which has been lacking in the past few months.

Regular prices are well maintained: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55 per ton at mine, Pittsburgh district.

Connellsville Coke—The market for prompt furnace coke has been somewhat irregular, there being moderate offerings, with very light demand. Prompt coke of slightly off grade has probably gone as low as $2.25, and standard grade at $2.40, but only in very limited tonnages, regular supplies being held at $2.50. No important demand is to be expected until furnaces covered for September, but not October, come into the market, when the $2.50 price maintained for several months may be under greater pressure than at any previous time. We quote: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $2.90@3; contract furnace, $2.90@3 per ton, at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending Sept. 13, at 374,810 tons, an increase of 5351 tons, the furnace-oven output having increased 14,097 tons, and the merchant-oven output decreased 8746 tons. Shipments are reported at 374,911 tons, an increase of 3641 tons.

BUFFALO, N. Y.

No slacking off in demand for bituminous. Slack continues firmer than sizes, which is a very good sign. Reports from Pittsburgh state that the trade is very confident. Anthracite beginning to move. Fall demand is here.

Bituminous—The trade is quiet and firm as ever. Nobody has any surplus and it is difficult to keep up a supply, especially for filling contracts. Operators would be glad if they had no contracts, hard as it is to refuse one when offered at current prices. A local jobber reports an offer of a large contract for slack, but he is not able to decide on a price; it is the very strong condition of the slack market that creates most of the confidence.

It is said by some of the jobbers that the demand for any sort of coal is not heavy, but the operators state that they could sell much more than they are able to mine. This is not a jobbers' market in any sense, so that all reports from them must differ quite widely from the views of operators. This is, in fact, about the first time in the history of bituminous coal when it would sell itself. Cars are steadily becoming scarcer and they will not be at all plenty again for some time. There has been much difficulty all through the Allegheny Valley to obtain water sufficient for either mining or locomotive supply. There has been considerable rain there, however, during the past week, so that the situation is now quite easy.

There is no change in the bituminous quotations, unless it is possible to make them still firmer than formerly. The figures continue at $2.90 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run and $2.25 for slack, with Allegheny Valley about 20c. lower.

Coke—It seems impossible to stiffen up the coke market, after the manner of bituminous coal, though it is so much lower than it used to be. The combined efforts of consumers to break down the price appears to be still exerted. Jobbers are at a loss to find any other reason for the weakness of prices, which are based on $4.85 for best Connellsville foundry, with some jobbers quoting 10c. lower.

Anthracite—The recent cool weather revived the anthracite market decidedly, and some shippers are reporting quite an insistent demand for stove, which is running away ahead of chestnut; indications are that it will be hard for the companies to hold the advance of 25c. over the price of chestnut, made sometime ago. The consumer as a rule now finds that he can use stove, not only in place of chestnut, but in furnaces also, and this is not favorable to the higher price.

The Western trade in anthracite is picking up fast on all rail lines, and it would also be active by lake if the upper docks could handle it. As they are badly congested, the amount shipped here in that trade has been reduced. Shipments by lake for the week were only 91,000 tons, which is about the first time for the season that the amount has fallen below 100,000 tons. It practically all goes to the head of Lake Superior, Chicago and Milwaukee. Shippers look for a revival of this trade with the more liberal buying from the districts west of Lake Michigan, which is now setting in.

TOLEDO, OHIO

Some slowing up in the Lake movement because of the short supply of vessels and signs of a congestion at the upper ports. Traffic situation moderately good. General demand about normal.

The Lake loading continues fairly active at the Toledo docks although there are not quite so many boats as were loaded earlier in the season. This is due to the fact that there is not enough ore to load the boats and many are being utilized for wheat shipments instead. An unusual quantity of coal has also accumulated at the uplake docks which has caused a slight slackening of the demand.

The traffic situation is not yet at all serious. An embargo was placed on Hocking Valley shipments by the C. & O. during the past week but it is believed this is only temporary. There continues some difficulties with Northern shipments out of Toledo but not enough to cause alarm or serious inconvenience. The general demand is normal for this season of the year. Domestic coal is not especially brisk but a few cold days would work wonders with this end of the market. Steam coal is in good demand. Prices here are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.75	$2.50	$2.00	$2.50	$1.35	$1.35
Egg	2.25	1.20	2.50	1.75	2.50	....	....
Nut	1.80	1.20	2.25	1.75	2.50	....	....
⅞ lump	....	1.35	....	....	....	1.20	1.20
Mine-run	1.60	1.35	....	....	....	1.10	1.15
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

Continued strength is the chief feature in the local trade. The demand for all grades is good and prices inclined to advance. Shortage of cars has been growing worse and production is curtailed to a certain degree. Lake trade active and domestic demand is strong.

The coal trade in Ohio has been active during the week and the only change is an increased strength all along the line. All grades are in demand and no weakness of any sort has been reported. The car shortage is growing worse and this has curtailed production to a certain degree. Operators, shippers and dealers say the market is in good condition and an active winter season is freely predicted.

The domestic demand is the feature of the trade. Dealers in all sections have been placing orders and asking for prompt shipment if possible. Because of the lack of cars, stocks in the hands of the dealers are not being replenished. The smaller users are placing their orders now and retailers are busy with deliveries. Steam business is also active, especially in the northern part of the state. Manufacturers are running along steadily and their requirements for fuel are about the same. Railroads are consuming a considerable tonnage trying to keep up with the freight movement. Contracts are being renewed at higher figures than last season. Many of the steam users are buying their supply in the open market

Production has been at the mercy of the car supply almost entirely. Eastern Ohio operators have been the greatest sufferers from a lack of cars and it is believed the output was only about 60 per cent. of normal in that district. In the Pomeroy Bend field the production was about 65 per cent. and the same figures prevail in other sections, excepting the Hocking Valley which reported the best car supply; the output there is estimated at 75 per cent. of the average.

Lake trade is strong and the tonnage moving to the Northwest is still large. Up to date the Toledo docks of the Hocking Valley Railroad have handled 2,095,000 tons since the opening of navigation. Docks at the upper lake ports have been kept free from congestion as the interior movement is good. Lake prices are strong in every way.

Small sizes are in good demand and prices for both nut, pea and slack and coarse slack are stronger.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.75 @ 1.70	....	$1.85 @ 1.75	$1.70 @ 1.65
3-4 inch	1.60 @ 1.55	$1.30 @ 1.25	1.55 @ 1.60	1.55 @ 1.50
Nut	1.30 @ 1.20	....	1.40 @ 1.25	1.25 @ 1.20
Mine-run	1.40 @ 1.25	1.20 @ 1.15	1.30 @ 1.25	1.25 @ 1.20
Nut, pea and slack	0.70 @ 0.65	....	0.75 @ 0.70	0.70 @ 0.65
Coarse slack	0.60 @ 0.55	0.85 @ 0.75	0.65 @ 0.60	0.60 @ 0.55

HAMPTON ROADS

Movement from Hampton Roads heavy. Shortage of co still continues but situation may be relieved in few days.

The coal movement from Hampton Roads piers for th week has been heavy and while all of the suppliers have bee short, the end of the week finds very little tonnage held u waiting for cargoes. The railroad yards are about clean out and while the amount on hand at the end of last we was considered small the number of cars here now is consid erably less. However, during the last few days some larg shipments have been started from the mines and with thi coal coming forward the situation should be much improved Owing to the heavy demand on contracts there has been lit tle spot coal and such sales as have been made were only fo small quantities and at prices which the suppliers have pre ferred to keep to themselves.

Shipments in the foreign trade have been fairly good The steamship "Finchley" recently took 1550 tons for Danzig this shipment from what can be ascertained, is a sample l sold with a view of introducing West Virginia coal to th manufacturers at that port.

LOUISVILLE, KY.

Screenings heavy due to the large demand for domesti grades. Car supply good except for certain classes of equip ment. Some further contracts closed.

The colder weather of last week has disappeared, bu has been followed by a raw, damp chilliness that has no been without its effect upon the consumers, and the de mand for domestic grades is excellent. With cars in moder ately good supply, dealers are having no difficulty in meet ing the demand, and there is a heavy movement; prices ar strong and show a perceptible rising tendency.

This large call for the domestic coals has naturally re sulted in a heavy production of screenings and there seem to be a surplus of these developing; while this has been th case with the western Kentucky product for some time, i only appeared in the eastern Kentucky field during the las week. The surplus of screening now available would be mor than sufficient to cover the demand in an active market, s that with requirements light as at present, prices are no very strong. The trouble is ascribed to the conservative at titude of the larger business interests and some uncertaint regarding the crop situation.

The Louisville & Nashville R.R. "battleship" cars are stil causing a great deal of trouble, particularly in the easter Kentucky field, where the operators are being compelled t load most of their production in this type of equipment A large tonnage of the better grade domestic coal was ne gotiated for Northern delivery at $2 f.o.b. mine for 2½-in block and lump. Block is now quotable at $2.10@2.25, whil block and lump is scarce and in good demand at $1.90@2 The better grade screenings are rather heavy at 75c. wit the off qualities almost impossible to move at any price western Kentucky nut and slack is plentiful at 50c. and pe and slack difficult to sell at 25c. A few more consumer who have delayed contracting in anticipation of lower price have recently signed up at advances of from 10 to 15c. highe than last year.

NEW ORLEANS

Unseasonable coolness starts retail rush earlier than usua Talk of making this point a big base for export shipments Bunker trade heavy. Interior demand vigorous. Hondura principal export buyer.

With the coming of a cold snap that made fires com fortable in northern Louisiana last week, retail trade picke up vigorously. This has started the buying season severa weeks ahead of the average time and will do much to re lieve the congestion of orders that comes usually in Octobe

Extension of an option held on a tract of river front lan has revived the talk of making this port the base for a extensive export trade in coal. While the local agencies o the companies bringing coal here by river are reticent ther is reason to believe that plans to this effect have not take definite form.

Shipments to interior points in Louisiana and easter Texas continue to move in considerable volume. Bunke trade is heavy. Ceiba and Tela, Honduras, are the best ex port customers at present; this is due to the activity of th United Fruit Co. at these points, where extensive railroa and constructional work is in progress.

BIRMINGHAM, ALA.

Market on coal fair. Furnace and foundry coke strong Slight improvement in car supply. Pig iron firm at $11.5 for last quarter and $12 for first quarter 1914.

The demand for steam coal is only fair, with prospects of an early improvement. The cool weather of the past few days, while not materially helping the lump market, as far as orders are concerned, has brought out a number of inquiries from the late buyers, and the next few days will see a decided change for the better in this line. Blacksmith coal has ben quiet for the past sixty days, but shows a decided improvement over last week. There is little furnace coke offered in this district, on account of local consumption, but one producer sold 5000 tons to a Western smelter at a very satisfactory price. Inquiries amounting to about 15,000 tons of coke for shipment over the next 60 days are on hand, and the business will probably be placed this coming week. Foundry coke is firm at $3.75 and $4, with fairly good business.

Pig iron is firm at $11.50 for the last quarter of this year. and the producers are holding for $12 for the first quarter of next year, several sales having been made on that basis. Very little iron has been booked for the first quarter, and large sales are predicted within the next 30 days.

INDIANAPOLIS

Shipments becoming slower but fairly good on the whole. Retail prices advanced. Eastern coals in good demand.

Conditions continue to improve steadily but slowly in both the operating and selling ends. Railroads are moving the coal with fair dispatch and there should be good supplies accumulated before the crops put a heavy burden on rail transportation. The movement is not satisfactory, however, in regard to Eastern coals; where shipments were formerly made within a week or ten days, it now takes three to four weeks. Some anticipate higher prices, as a result of a car shortage.

Owing to the fact that Indiana coal cannot be stored, except outdoors, it is only now beginning to move, into consumers' bins. There is a very brisk movement of Eastern coal from retailers' yards, some of the larger companies stating that they are practically running full capacity. The month's deliveries will apparently be much above the average. Screenings are not active, though better than some time ago. Mine prices in Indiana are unchanged.

The largest retailer in the city advanced prices 25c. to 50c. a ton on Sept. 22. His lead in the past has been generally followed, but other large retailers say they see no reason for an increase at present.

The new quotations given out (which include the advance) are:

Anthracite, chestnut..........	$8.50	Hocking Valley lump.........	$4.75
Anthracite, stove and egg.....	8.25	Luhrig lump..................	4.50
Anthracite, grate.............	8.00	Luhrig washed egg...........	5.00
Pocahontas, forked lump.....	6.50	Cannel........................	6.50
Pocahontas, shoveled lump....	6.00	Linton No. 4 lump...........	3.50
Pocahontas, mine run.........	5.00	Linton No. 4 egg.............	3.50
Pocahontas, nut and slack.....	3.50	Indiana washed egg...........	3.75
Blossburg.....................	5.50	Brazil block..................	4.25
Jackson (Ohio)...............	5.25	Indianapolis lump coke.......	6.50
Kanawha lump................	4.75	Indianapolis crushed coke.....	6.50
Kanawha egg, nut............	4.75	Connellsville lump...........	7.00
Pittsburgh lump..............	4.75	Citizens' egg coke...........	6.50
Raymond lump................	4.75	Citizens' nut coke...........	6.50
Winifred lump................	4.75		

DETROIT, MICH.

Higher prices and an active fall trade predicted. Pocahontas grades very scarce. Car shortage becoming more acute.

Bituminous—Both Ohio and West Virginia operators are agreed as to the prospects for an active business this fall. One large West Virginia producer recently advised his local representative here that no further contracts must be closed unless an advance of 10c. per ton could be obtained; this makes the price $1.05, so that it will be seen that the prophecies for a stiff market in October are being justified.

Buyers are showing a tendency to disregard high prices in their anxiety to get under cover, while operators, on the other hand, are inclined to hold off. Spot coal is rather scarce, nut and slack bringing 90 to 95c. per ton, while Hocking is quoted at 75 cents. The car shortage is becoming steadily worse, particularly in West Virginia where flats and gondolas are in very short supply. Domestic coal is easing up some, all dealers appearing to be well supplied, although it is noticeable that there is very little standing on tracks.

Pocahontas, egg and lump are in particularly short supply and the price has been advanced to $2.75, while it is freely predicted that $3 will be obtained by Oct. 1. The local market is now quotable on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	$1.50	....	....	$2.75	$2.50
Egg...........	1.65	....	1.50	....	....	2.75	2.20
Steam lump....	1.50	....	....	....	....	....	....
¾-in. lump......	1.25	$1.25	1.25	$1.25	$1.25	....	....
Mine-run.......	1.10	1.10	1.10	1.10	1.10	1.65	....
Slack..........	1.00	1.05	0.75	0.85	0.85	....	....

Anthracite—The cool spell has created some activity in hard coal, but prices are inclined to drag, the advance scheduled for the middle of the current month having failed to materialize.

Coke—Connellsville coke is in rather short supply at this point. There are rumors here to the effect that production is being restricted in order to advance the price which has been rather low for some time.

ST. LOUIS, MO.

Market continues to show improvement and the outlook is excellent. Many of the mines are well sold up ahead. Steam grades difficult to move.

The market is forging ahead slowly but steadily, and conditions in general are considerably better with prospects for an exceptionally good business beginning the last week in the month. Many of the Franklin and Williamson County operators have orders for one or two weeks ahead and are quoting higher prices than they expect, in order to get caught up. Standard operators, however, are still dragging along at the cost of production, and the same applies to many others in the intermediate fields.

The greatest trouble right now is the inability to move screenings and steam sizes, and this will likely continue until about the first of the year. There is more anthracite coming in than there is call for just now, but smokeless is away behind and is hard to get. There is an over-supply, at the present time, of coke and the prices have been cut to far below circular.

The market is now quotable on the following basis, f.o.b. mines:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump..............	....	....	....	$1.15
3-in. lump..............	....	....	$1.50	....
6-in. lump..............	$1.60 @ 1.85	....	1.60	1.35
Lump and egg..........	1.50 @ 1.60	$2.15	....	....
No. 1 nut..............	1.30 @ 1.60	....	....	....
Screenings..............	0.50 @ 0.60	....	....	0.25
Mine-run....	1.50	....	....	0.90
No. 1 washed nut.......	1.60 @ 1.70	....	....	....
No. 2 washed nut.......	1.20 @ 1.40	....	....	....
No. 3 washed nut.......	1.10 @ 1.15	....	....	....
No. 4 washed nut.......	1.00 @ 1.10	....	....	....
No. 5 washed nut.......	0.40 @ 0.45	....	....	....

Note—The Williamson and Franklin County Coals take a 67c. rate to St. Louis, Big Muddy 64½c., and all others 52c.

OGDEN, UTAH

Cooler weather prevailing throughout intermountain territory. Demand for lump coal increasing, causing a surplus of nut and slack. Strike of coal miners in Colorado stimulated demand for Wyoming coal in Nebraska. Utah mines suffering from severe car shortage.

The past week presented several conditions that stimulated the demand for coal, the principal one being cooler weather throughout the territory. Threshing has begun in several localities and the demand for coal in this trade has been brisk. The mines are receiving plenty of lump orders, sufficient to keep them running full time. As most of these have been placed late, the trade in general is demanding immediate shipment, and the operators are having some trouble to comply with all requests.

The increased demand for lump has increased the surplus of nut and slack coal, and at present quite a tonnage is drawing demurrage at the mines; however present indications are that the nut coal will all move before Oct. 1. The cool weather of the past ten days will delay beet harvesting and the sugar factories will not start their campaign until about Oct. 1. This will delay slack and steam coal shipments until Sept. 25, at which time the surplus of slack should be moved.

Negotiations between the Colorado operators and miners do not appear to be progressing satisfactorily and a suspension of mining operations in Colorado seems inevitable. This condition has caused large buyers in Nebraska to commence looking elsewhere for coal and the Wyoming mines are attractive prospects. In case of a strike, Rock Springs coal will be in demand to the East.

While the Wyoming producers are receiving plenty of cars, with an occassional shortage of box cars, the Utah mines are unable to work more than three days each week on account of the inability of the Denver & Rio Grande to supply equipment. The situation is very serious with no indication of relief. This is a good example of the rapid development of Utah; a plain case where the industries tributary to a railroad have advanced and developed faster than the road.

The increased demand for coal has not effected the price and quotations are as follows: Lump, $2.75; egg nut, $2.50; nut, $2.25; mine run, $1.85; slack, $1.

PORTLAND, ORE.

Owing to high freight rates there is practically no Australian coal in this market, and none likely to arrive now. Anthracite high priced and in little demand. Beaver Hill mine at Coos Bay again producing.

Australian coal has practically disappeared from the local market, owing to the fact that freight rates across the Pacific are too high to warrant importations. Not a cargo has arrived here since last spring and there are no vessels en route or loading at the Australian coal-shipping points for this port. Several cargoes are being shipped to San Francisco, however. All the Australian coal here in dealers' hands amounts to only about 1000 tons, and most of this has been contracted for.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a statement of the coal and coke tonnage over the road during July of the current year, in short tons:

	Coal				Coke

Total, 12 months	206,381,392	

[1] Includes coal from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note.—Southern Railway handled 329,730 short tons during May and 1,733,636 short tons during the 5 months ended May.

FOREIGN MARKETS

GREAT BRITAIN

Sept. 12—For anything approaching early shipment nearly all classes of large and small coals are in plentiful supply, and values rule on the easy side; but for forward, sellers are steadily holding to their ideas.

Quotations are approximately as follows:

Best Welsh steam	$4.80@4.92	Best Monmouthshires	$4.02@4.14
Best seconds	4.50@4.68	Seconds	3.90@3.96
Seconds	4.26@4.44	Best Cardiff smalls	2.40@2.52
Best dry coals	4.32@4.56	Seconds	2.28@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

British Exports—The following is a comparative statement of British exports for August and the first eight months of the last three years, in long tons:

	August		8 Months		
	1912	1913	1911	1912	1913
Anthracite	255,260	231,590	1,544,885	1,533,475	1,934,680
Steam	4,688,550	4,197,809	30,445,732	28,370,605	35,288,362
Gas	1,044,002	962,574	6,825,566	6,791,847	7,587,554
Household	189,420	137,375	974,102	991,688	1,160,811
Other sorts	280,443	289,814	2,040,755	1,985,249	2,349,201
Total	6,457,675	5,819,162	41,831,040	39,672,864	48,320,608
Coke	108,948	113,423	617,294	583,034	712,698
Manufactured fuel	163,030	140,278	1,117,783	990,258	1,363,324
Grand total	6,729,653	6,072,863	43,566,117	41,246,156	50,396,630
Bunker coal	1,850,346	1,749,847	....	11,608,744	13,720,560

BRITISH INDIA

The output of coal in British India during 1912 shows a total production last year of 14,044,368 tons, which is nearly 2,000,000 tons in excess of the production recorded in the previous output, namely, 12,048,726 in 1911 and 12,149,020 tons in 1908. The actual output by provinces during 1912 was, in tons, as follows: Bengal, 4,306,129; Bihar and Orissa, 9,123,437; Punjab, 38,409; Assam, 296,615; Baluchistan 45,732; Central Provinces, 233,996; Northwestern Provinces, 50.

CHINA

Vice Consul G. F. Bickford notes increasing coal exports from the Manchurian port of Newchwang. Shipments in July reached 49,648 tons, and bunker coals 5650 tons. The increase is mostly to the Japanese Government steel works at Wakamatsu, which took 15,875 tons, while 15,500 tons went to Shanghai.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending Sept. 20:

	Week's Range			Year's Range

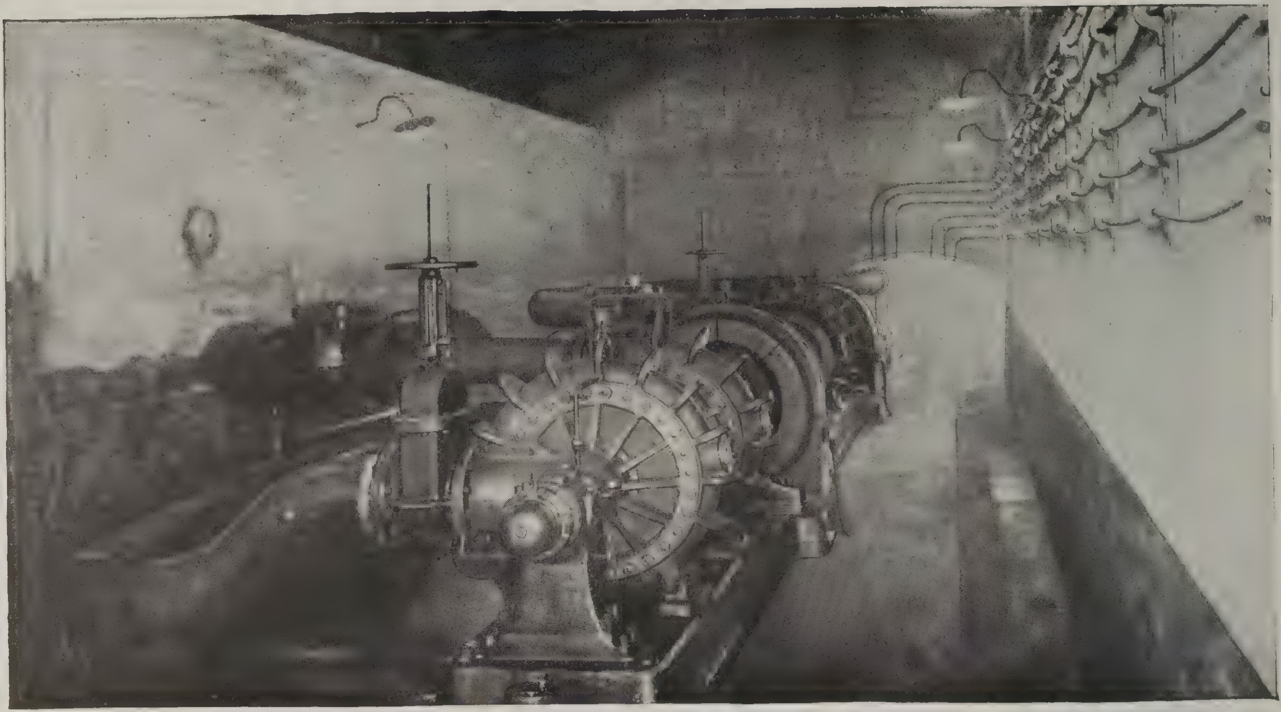
Users of Draeger Helmets and Pulmotors Are Their Best Testimonials

The appreciation which Draeger Helmets and Pulmotors have met with since their introduction into mine work is the clearest indication of their quality and practicability.

The photo shows a crew of Draeger Helmet men from the Oliver Iron Mining Co., Eveleth, Minn., who are enthusiastic Draeger users.

Write for full information.

Draeger Oxygen Apparatus Co., 421 First Ave., Pittsburgh, Pa.



Westinghouse Motors Driving Pumps in a Mine

Westinghouse Motors for Mine Pumps

are so designed that they will operate satisfactorily under the most exacting conditions of the service for which they are intended.

All parts subject to stress and wear are much stronger and more reliable than the needs of the service require and will last for years. They are extremely simple in construction and are easily inspected and renewed.

If the service requires, motors with moisture proof insulation can be furnished, or motors can be provided with splash proof covers to afford protection from the drip. They will operate successfully up to 190 degrees Fahrenheit, and will withstand rapid changes in temperature without injury.

Full information on request.

VOLUME 4 OCTOBER 4, 1913 NUMBER 14

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 477

Some verses dealing with the "safety first" movement in coal mining. Attention is called to the fact that the lives of men are worth far more than coal. It is suggested that we have paid a fearful toll for our carelessness and haste. Berton Braley. COAL AGE, Vol. 4.

IDEAS AND SUGGESTIONS: *Pages* 478-479

Payday Drinking—Quit Worrying.

*PREVENTING ACCIDENTS FROM MACHINES: *Pages* 480-483

Description and illustrations of some safety devices which have proved their merits in actual use at power plants, substations and shops. Frank H. Kneeland. COAL AGE, Vol. 4.

FATAL ACCIDENTS IN DORTMUND, GERMANY: *Page* 483

MINE-SAFETY PRECAUTIONS IN UTAH: *Page* 484

A. C. Watts. COAL AGE, Vol. 4.

*MINE-RESCUE WORK IN GREAT BRITAIN: *Pages* 484-485

FIRST-AID MEET AT KNOXVILLE, TENN.: *Pages* 485-486

The meet at Knoxville, Tenn., was well managed and shows how rapidly first-aid has spread in the Southern States, largely due to the exertions of the Bureau of Mines. Reference is made to the advance in technique and training which is now manifest everywhere. COAL AGE, Vol. 4.

*H. C. FRICK COKE CO. MEET: *Page* 488

*THE FIRST-AID MEET OF THE HILLSIDE AND PENN. COS.: *Pages* 489-490

*MINE RESCUE AUTOMOBILE: *Page* 490

*THE AMERICAN MINE SAFETY ASSOCIATION'S SESSION: *Pages* 491-496

The association held an interesting meet and created much sentiment in favor of safety. It also completed its organization, but did little toward fixing standards. The most notable event at the meet was Dr. Henry's method of splinting a broken back. The mine explosion established the return or inward draft in a most spectacular manner and proved the efficacy of stone-dust barriers in isolating explosions. COAL AGE, Vol. 4.

*THE MEET OF THE SUSQUEHANNA INTERESTS: *Pages* 497-499

At the Shamokin first-aid meet of the Susquehanna Coal Co., some instructive events illustrated how to rescue a man who has fallen into water in a low place full of noxious gases, and how to bandage and care for a victim who has had an arm torn from the socket. Notes are added on the prone-pressure method. R. Dawson Hall. COAL AGE, Vol. 4.

THE STRIKE SITUATION IN COLORADO: *Page* 499

*FIRST-AID MEET OF THE NAVIGATION CO.: *Pages* 499-501

The Lehigh Coal & Navigation Co. has inaugurated an annual First-Aid and Field Day, the initial meeting having been held recently. Under the stimulus of suitable prizes, a sharp rivalry has developed among the different first-aid teams, all of which are quite proficient. COAL AGE, Vol. 4.

*A NEW RESUSCITATION APPARATUS: *Page* 502

The Advertiser's Creed

By Berton Braley

I BELIEVE in the goods I am selling
Because I have tried them, and know;
I believe in the facts I am telling
Because I am certain they're so;
I believe in the faith of the buyer,
I believe in the honor of men,
I believe if I'm SQUARE, they'll desire
To deal with yours truly again!

I BELIEVE I am wise in proclaiming
The fact that I'm out for the trade,
I believe there is wisdom in naming
The merits of goods I have made.
I believe that vim, vigor and push'll
Pay mighty good profits to me
So my light isn't under a bushel
But up where the people can see!

I BELIEVE in good copy with "kick" in
For lifting my business ahead,
For making a buyer's pulse quicken
With proof I'm a live one—not dead!
I believe more in joy than in sorrow,
In sunshine much more than in gloom,
I believe in Today and Tomorrow,
For Yesterday's gone to the tomb!

I BELIEVE in the work I am doing,
I believe in the paper I use,
I believe in the end I'm pursuing,
I believe that the hustler can't lose,
I believe in the art of the printer,
The ads that are bringing me pelf,
And always, through summer and winter,
I stoutly believe in Myself!

Safety First

By Berton Braley

Written expressly for Coal Age

Too long we've dared the firedamp's breath
And chanced the dusty air,
Too long we've sent good men to death
Through lack of thought and care;
Too long our sense of caution slept,
We blindly drove ahead
While children wailed and women wept
In sorrow for their dead.

Master and Man must share the blame
For all those blunders past,
For many a holocaust of flame
And many a deadly blast;
But we have come, at last, to see
How carelessness was cursed,
And from old haste and greed set free
We think of "Safety first!"

For men are worth far more than coal,
And carelessness is waste,
And we have paid a fearful toll
For heedlessness and haste,
Where once we thought that life was cheap,
We know that life is dear,
And more and more we strive to keep
The way to safety clear.

So we have trained our rescue corps
To serve in time of need,
To help and save—but, what is more,
We're learning to take heed,
To face no risk we need not take
Lest death about us burst,
And always, everywhere, to make
Our motto "Safety first!"

IDEAS AND SUGGESTIONS

Payday Drinking

By a West Virginia Superintendent

"The fellow that drinks liquor is a damn fool." The speaker was a man of about fifty, and a glance at his condition showed that the declaration was a personal allusion. He was in his usual "pickled" state after payday, and, with a little thought, he continued, partly to himself, and partly to the payroll clerk who had refused credit, "I am a prohibitionist and have been for years; I vote against liquor and I talk against liquor, and I try to stop the making and exhaust the supply." All of which was literally true, especially his attempts to drink it all up. He was a hard worker and a hard drinker.

Another type was a small, mild man who worked every day and was good for a double shift any time he was needed. He seldom came about the office, but his wife was a constant visitor, taking up his wages in "scrip" as fast as his time could be turned in. She was one of that raw-boned, vixenish sort, every inch a shrew. About once a year Bill got drunk, not as any particular celebration, but he seemed to be able to stand his domestic life only about so long. On these rare occasions he did not land with a whoop, but usually picked up a barrel-stave and quietly walked in the back door, and the family came out the front, not stopping to look back but sailing up the street, bent on putting distance between themselves and Bill. Then Bill would sit on the front porch and tell the neighbors that it was "damn strange thing if a feller couldn't be boss of his house once in a while." That was all the harm there was in Bill, and after it was over he went back to work, submitting to the old order of things.

Carl the Carpenter

Carl was a carpenter, a silent man who chewed his "Mail Pouch" and served the company. He mended the tipple screens and fixed water lines and was general handy man. His drinking was of the periodic type, only he "saw things," and the neighbors usually had to come in and sit on his arms and legs for a day or so till the doctor could bring him around.

Fred's booze turned his mind to fistic triumphs. His payday drunk generally ended in "woes," "redness, or rather blackness of eyes," and "wounds without cause."

Frank became a millionaire, and his month's pay became largess to be scattered in small change to the birds. And so we might follow on through all the American types of payday drunks, singing, laughing, swearing, crying, fighting, preaching and soliloquizing. Passing on to the foreign quarter, we might dwell on the "sheep drunk," "monkey drunk," "lion drunk," "hog drunk," and not exhaust the possibilities of payday.

If we wished to go into historic drunkenness, Hebrew literature presents us with Noah, overcome by wine and exposing his nakedness; Lot, "made drunk" by his daughters to commit incest and rear up a race from destroyed Sodom; while pagan annals even invent a god to preside over Bacchanalian revels, and Christians sing, "We've reached the land of corn and wine." Our boasted Anglo-Saxon nation had its birth in the land of Beowulf where the "mead-hall" was the nation's council chamber, and laws were made at the great tables around which brute heroes drank from foaming horns and shouted their boasts amid the flow of strong drink.

Temperance an Issue in Ages Past

We have also the traditional temperance movements, the Jewish Nazarites, the Wise Man crying, "Vanity of vanities," and there is not so much difference after all in the solemn wail, "At last it biteth like a serpent and stingeth like an adder," and the blunt self-accusation of the old booze-hoister, "a man that drinks liquor is a damn fool"; yet modern civilization, seeking other worlds to conquer, has again tackled the problem. With our national and international figures turning to grape juice, lemonade and buttermilk, there may be possibilities, but when a mere mine superintendent begins to talk about cutting out the "wet," and running a Y. M. C. A. mine, he is bucking the game with a fair amount of nerve.

A great point has been made between the way a "gentleman" drinks and the manner in which a laborer takes it on. But is there a difference? When the various types around a mine take their spree, everyone knows it and their social standing is affected according to the current standards of their neighbors and, perhaps, the company. When those higher up, at their banquets, clubs and social sessions, become incapacitated, possibly the spectacle is less public, but we will venture that nearly every man on the job can tell you all about it, the only unfortunate part of it being that they are apt to exaggerate the facts rather than minimize the incident, and, if it is a question of drinking on duty, the higher up an official is, the more nearly he is on duty all the time.

The trouble is, the old doctrine of "the king can do no sin" exists just about as tenaciously as the racial custom of drink. It is all right for everyone to "slop it up" but the other fellow. However, the whole problem in the coal business is an industrial one, and we might as well face it in this way. We need not affirm or deny that it has a moral or an ethical side, the question is narrowed down to a glaring sin against industrial efficiency. The fact that our mines try to operate five or six days out of every month at a shameful loss, is a disgrace not to be lightly passed over.

Instead of wasting time devising petty schemes for harassing the men who lay off after payday, or of forcing them to work in a besotted condition, or of driving them out of town, it is a matter worthy of the best brains of the coal industry to see how they can begin to "revise downward." Public opinion can put out of the business any custom or practice. When drunkenness in the public eye becomes an offense against public opinion, as diciated by the best and most powerful forces of society, it will be indulged in only by the degenerates, as is the worst of our present-day drug habits.

See that Drinking Is Unpopular

Americans try to get things by short cuts. If everyone in West Virginia had wanted what they voted for, the vote would have been unnecessary, for each person could have disapproved of drinking in a way that would have abolished drunkenness. However, public opinion seems to be sometimes formed by a well enforced law. That is, the law breaker is unpopular for being found out. Now that both state and federal laws are pending to put West Virginia in an absolutely "dry condition" it is up to the powers that be to make drinking in that state exceedingly unpopular.

If the public, and the coal companies could unite in their campaign against booze, they could get rid of it, only it would hurry things up a bit if the movement started with those higher up. Of course, every effort helps get society ready for the change, but it must be shaped into an industrial policy if anything large is to come of it. The airship will not succeed Noah's ark in a day. When we are babbling temperance at the mines we are jabbing at something racial, nobody knows how old, but it is generally admitted that the liquor problem is the next important matter to be settled.

We will not deny that a recent writer for the Coal Age drove 15 families of drunkards away from his mine, for some of them, if not all, have come here to live. We are glad that he can report a complete change of life among what are left, and also that his conditions are such that he can afford to pick his men, but unfortunately most of us have to be contented with less success and endure what seems impossible to change.

The reason we are constrained to bear the ills we have rather than to fly to others we know not of, is that if 50 per cent. of our men lay off five days out of every month, the loss in output is only about one-tenth, while if we "fire" one-tenth of the population bodily on account of drunkenness, we have lost our tenth and have not made a clean sweep either.

Another difficulty in starting a campaign with the slogan, "Clean out the drunks," is that by the time these fellows are fired a few times they will perhaps get wise enough to make the next fellow a good bunch of men. Then who will be the loser?

Still, 10 per cent. is worth trying for. Let's see, Monday, Tuesday and Wednesday after payday are the drunks' holidays. Who will be the first to cut out Wednesday, or will we set Tuesday for the limit of a drunk and put the blocks to the fellow who is "too much sick" on Tuesday? Possibly, after all, the thing can be revised both upward and downward. How about all this highbrow stuff concerning labor efficiency when the operator is losing 10 and the miner 20 per cent. on account of the payday drunk?

Curing this ill is a man's size job if anyone wants to go to it, and it is not altogether a job for the W. C. T. U. Coal mining seems to be about the only industry in the world where a fellow is allowed to lose money for his employer two or three days every two weeks and then go back to work as if nothing had happened.

If the policy makers of the big coal syndicates are not sufficiently interested in this problem to take the initiative, the little reformer is placed in the light of Shakespeare's Iago, who, urging Roderigo to help himself to what the gods had prepared, said, "Zounds! Sir, you are one of those that will not serve God even if the Devil bid you."

⁂

Quit Worrying

By Arthur Feehan*

Worry digs more graves in a month than any sexton ever dug in a life time. Every time you worry, you are frittering away your health—you are spoiling your chances—you are making yourself a fidgety old duffer.

Worry never solved a problem. It has never yet helped a man up from the sick bed or smoothed out the cares of his business or the wrinkles on his brow. It has not soothed the pain of disappointment. If you don't kill that habit of worrying, it will kill you; and that's a poor finish to the grand adventure of life.

Whenever you start worrying, remember what it means to you—so much needless waste of nervous force, so much happiness thrown away, so much less faith in yourself.

There is only one cure for worrying. The cure is based on the following principle: What made you frown yesterday will make you smile tomorrow. All you have to do is to look at every trouble from the standpoint of the future. Smile at it today, instead of tomorrow.

If you look back at your worries, you will be amazed to find what silly little trifles can upset you. Think over your experience last week. Wasn't it something like this? Monday—Worried because Brown didn't seem the good old pal he used to be. You thought he was curt, snobbishly curt, with you. It worried you into thinking he wanted to drop you after all these years of comradeship; because, as you bitterly reflected, he was prospering a bit faster than you.

Worrying—yes, it was very disquieting, wasn't it? At any rate it was until Tuesday. Then you met Brown again. Dear old Brown—the same as ever—one of the very best! You saw at once what a fool you had made of yourself by worrying over nothing. How true the old saying—"Worry makes a mountain of misery out of a molehill of misfortune."

On Monday, too, you felt dreadfully down on your luck because you thought your work wasn't as good as it used to be. You felt sure you saw the sack coming. There was a rasp in the boss' voice that slashed at your nerves terribly. You saw yourself out of work, loafing You felt as if your skin didn't fit and as if everybody hated you. Sheer nonsense, wasn't it? Of course, it was. And yet you let it worry you for hours last Monday. Don't let yourself be fooled in that way again.

Look a worry fairly and squarely in the face, and it will slink from you like any other cowardly thing.

⁂

Experience has shown that the maintenance and effectiveness of a first-aid corps depend largely upon the superintendent and mine foreman, and that aside from the strictly humane features of the work, the effect of such an organization is to encourage a more friendly feeling between the employer and mployee, and a better understanding between the foreman and miners. The superintendents and foremen should be urged to give their best efforts to these organizations.

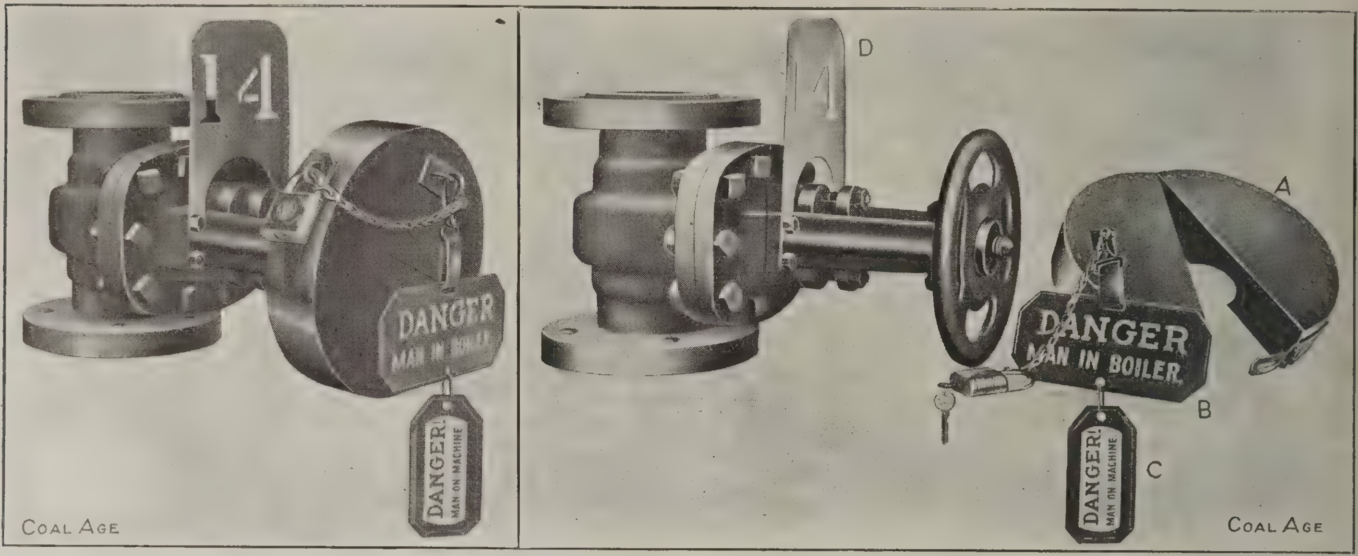
Preventing Accidents from Machines

By Frank H. Kneeland

SYNOPSIS—Descriptions and illustrations of some safety devices which have proved their merits in actual use at power plants, substations and shops.

⁂

About the mines the percentage of men who meet death through machinery or mechanical devices is small, compared with the number who are annually killed by falls of roof and slate. Men are nevertheless killed, crippled and injured in no inconsiderable number, through what might well be termed "mechanical accidents." Such occurrences should therefore be forestalled by every means that human foresight can devise.



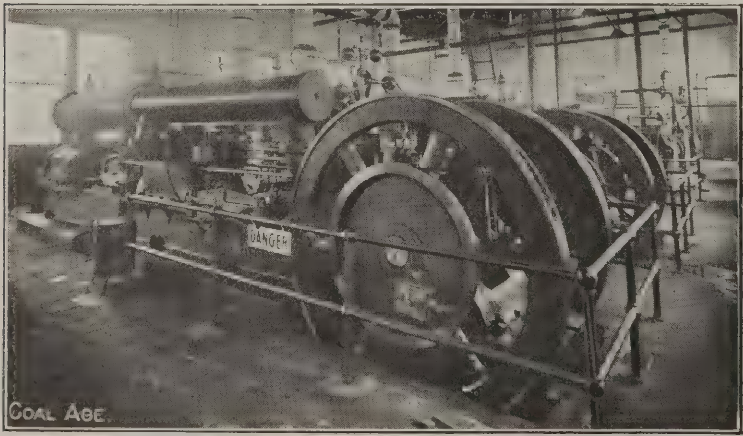
A Safety Device for Valve Handwheels

When one or more men repair or inspect a boiler one of these handwheel cases is placed and locked upon each of the valves connecting this boiler with others, with the feed line or the blow-off line, and the man entering the boiler pockets the keys. These cases are removed only upon the completion of the work and then by the man who has been within the drums or settings.

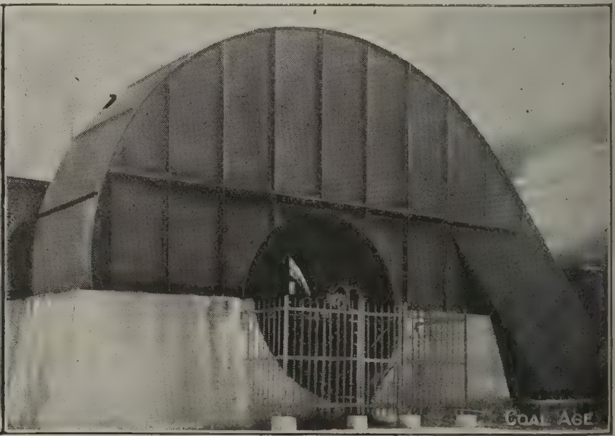
We illustrate upon this and succeeding pages some safety devices, the utility of which is at once manifest. These photographs have been kindly furnished us by the Bureau of Safety, Relief, Sanitation and Welfare of the United States Steel Corporation, Mr. C. L. Close, manager. All of the devices shown are not at present in use at coal mines. They are, however, without exception, applicable to coal-mining power plants, sub-stations and repair shops.

It will be readily understood that industrial safety does not necessarily mean that injury to life and limb shall be made impossible. There is a difference between making a machine safe and making it proof against suicidal carelessness. The fundamental object which the inventors of these various safety devices had in mind was to render accidents out of the question. This is not possible, however, as the human equation is always present and can not be depended upon.

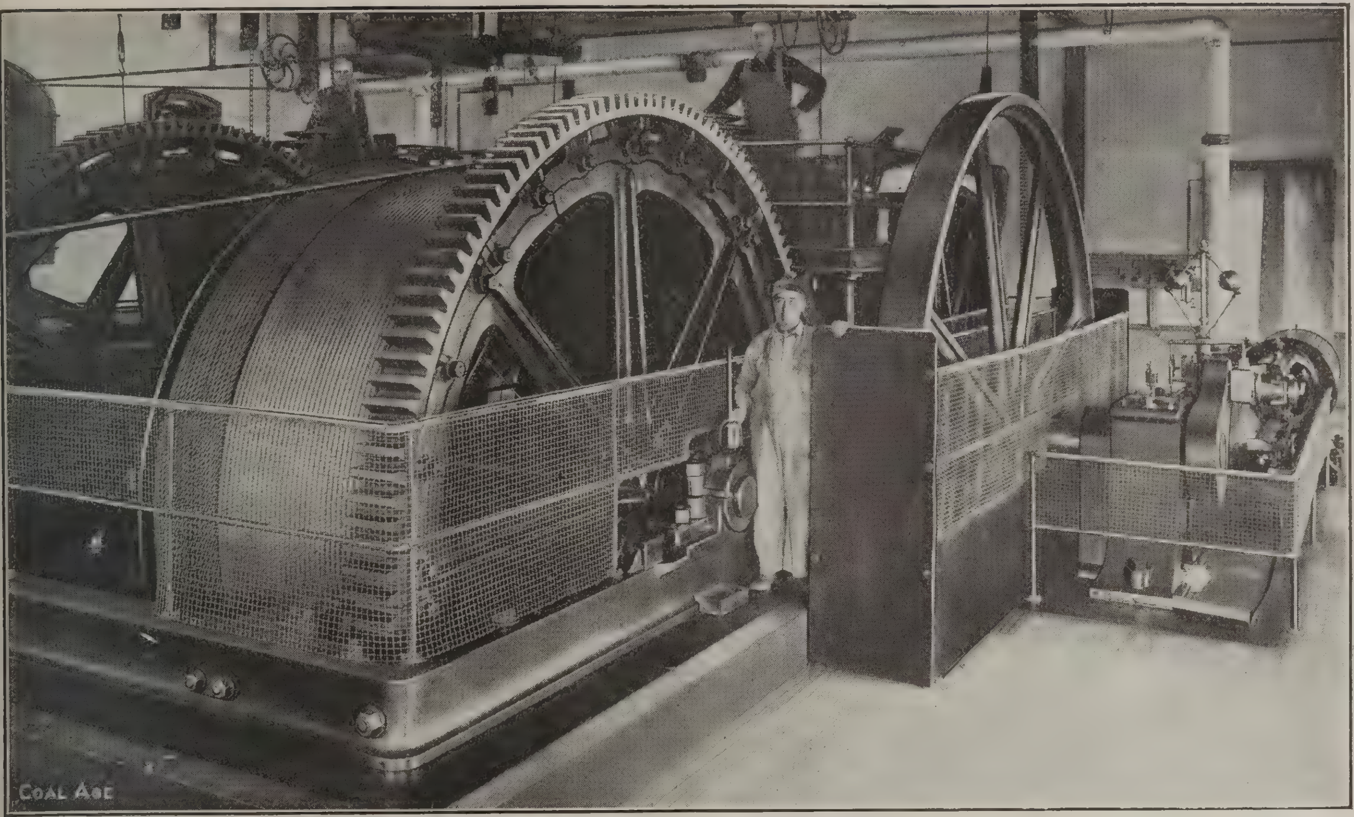
The accidents to which the workmen in power houses, sub-stations or repair shops are chiefly liable are varied, but in general will come under one or more of the following five headings: (A) Coming in contact with moving parts of machines or with live conductors. (B) Falling from platforms, ladders or other elevated positions. (C) Fire and spontaneous combustion. (D) Being struck by flying parts of broken machinery or material. (E) Mis-



In a Compressor Plant. Note Railing, Danger Sign and Waste Can



A Railing around the Eye of a Ventilating Fan



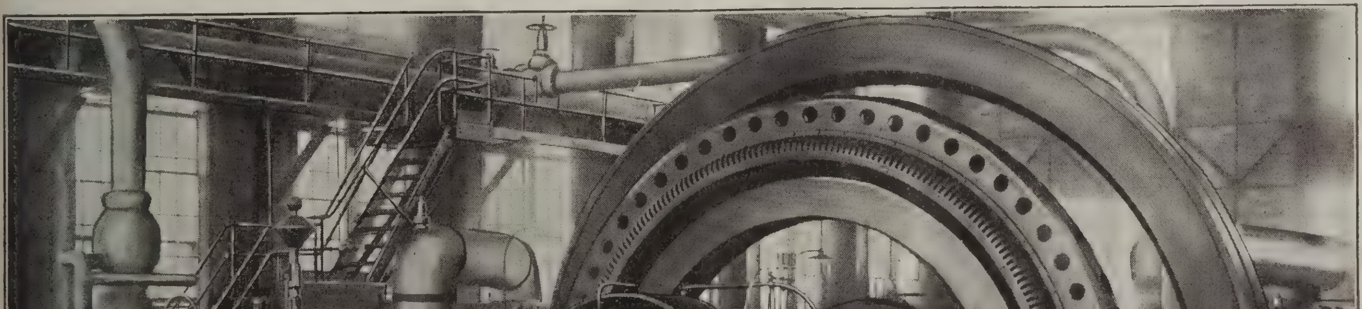
A Well Guarded Mine Hoist

Two men are here seen upon the operating platform. Under ordinary circumstances only one man is at the levers. When men are being hoisted or lowered, however, a supernumerary engineer is provided so that should any misfortune befall the regular hoistman the other engine driver may immediately gain control of the machine. Two sets of control levers are provided for this purpose.

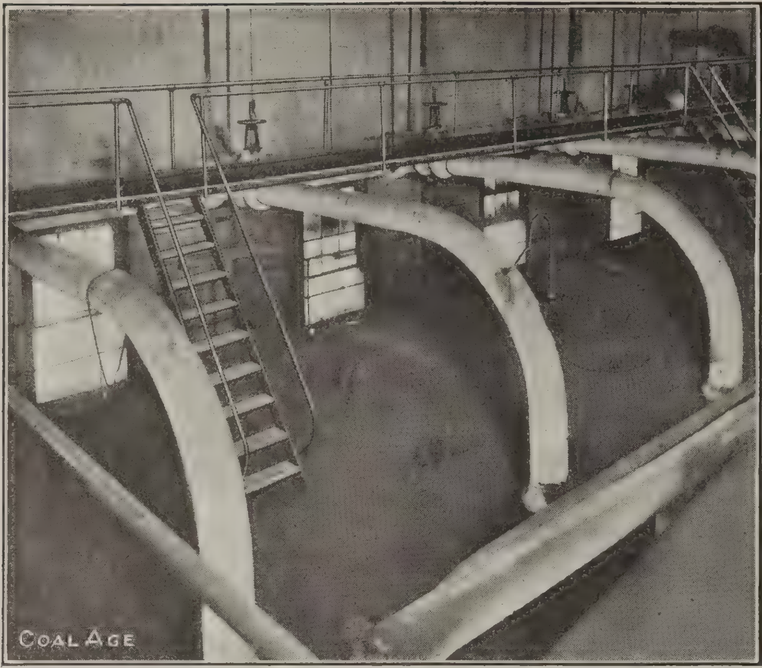
manipulation of levers, valves, switches, or other hand-operated controlling devices.

The means to be employed in guarding against accidents of the above kinds are as divers as the accidents themselves. Coming in contact with moving parts or live conductors is perhaps more fruitful of disastrous results than any other one source of danger. In general this can be avoided by suitably inclosing the moving parts or conductors or by isolating the machine with proper hand rails. Means of preventing falls and protection against fire are well known, while the most common devices for providing against injury from flying pieces of broken machinery are safety collars on emery wheels and gage-glass guards on boilers. Preventing mismanipulation of valves and switches has long been a difficult problem. We illustrate, however, two extremely simple and efficient devices to guard against this contingency.

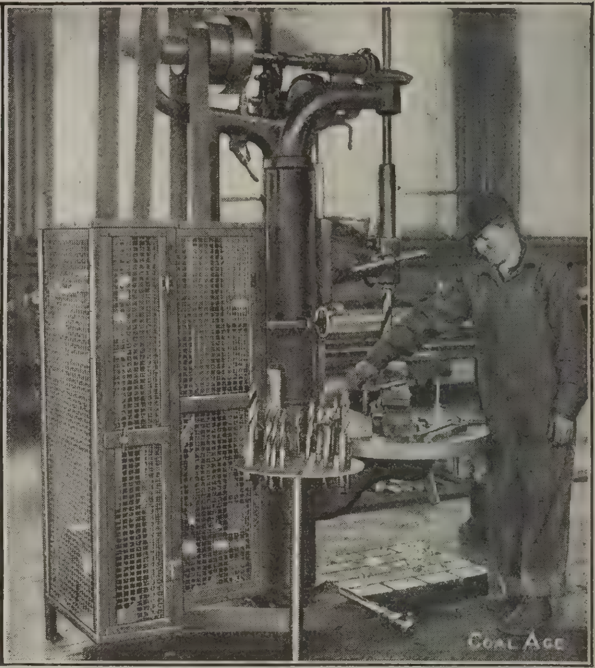
Many makers of mining machinery in order to lessen manufacturing expense as much as possible, have in the past habitually built engines, pumps, lathes, drill presses, etc., without any guarding whatever over gears, belts



Guards around a Generator. Note Platform along Steam Header and Stairway Leading to It



View above Boilers. Note Platform along Steam Header and Stairway Leading Thereto

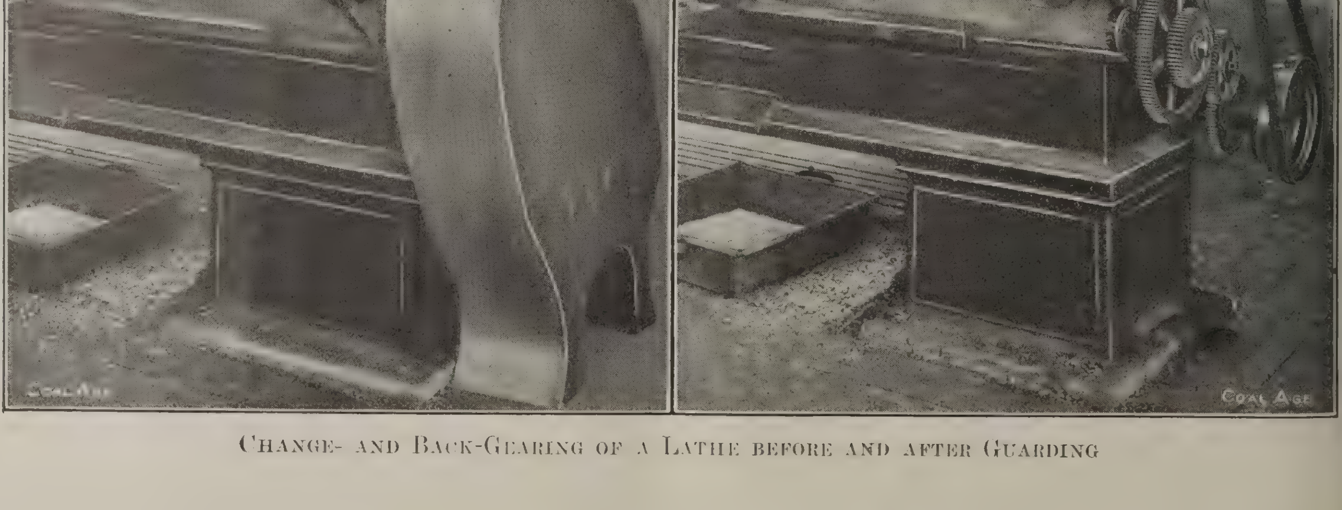


An Efficient Method of Inclosing the Belts of a Drill Press

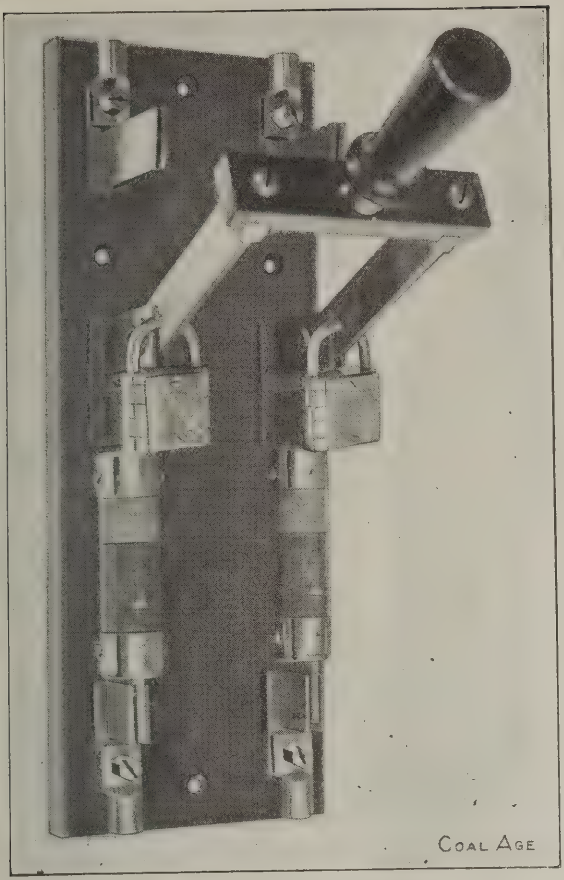
or other dangerous moving parts. Recently, however, many users of these machines have specified, when making purchases, something like the following; "No protruding keys or set screws are to be employed. All gears, cams, pulleys, belts, chains, sprockets, eccentrics, or other dangerous parts moved or operated by power shall be so guarded or otherwise inclosed as to effectively prevent accidents to an attendant or other person arising from contact, intentional or otherwise, with these parts, and at the same time allow easy and unobstruced access to all parts of the machine for inspection or renewal." The builder is perhaps of all men, the best fitted to guard the dangerous points in his machine. Such specifications as the above are therefore worthy of careful consideration by all purchasers of such equipment.

It is well also to provide a place in the regular printed title for drawings and tracings to show when and by whom that particular drawing has been checked for safety devices. This plan has been in use for some years by the various subsidiaries of the Steel Corporation, and has been found extremely fruitful of good results.

It is utterly futile to cover a machine with guards and expect them alone to afford immunity from accident. To be truly effective, safety devices of all kinds must be reinforced by discipline and morale. It is only



Change- and Back-Gearing of a Lathe before and after Guarding

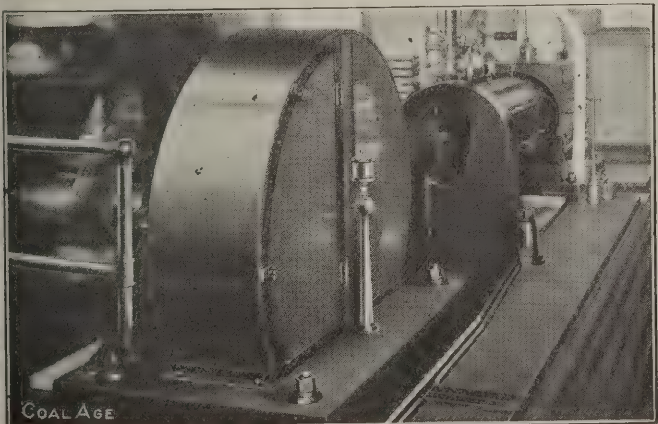


A SWITCH LOCKED OPEN

When work is to be done upon an electric line the switch is locked open. The above picture shows that two men are at work upon the circuit controlled by this switch. When their work is finished and each has removed the padlock bearing his name the switch can be closed, but not before.

when employed in conjunction with these moral qualities that any system of guarding, be it ever so perfect or elaborate, becomes in the highest sense effective. Proper education and habitual care among men whose employment carries them into dangerous places will do vastly more to eradicate accident than any number of handrails or danger signals.

In the last analysis, after all possible means of forestalling mishaps have been exhausted, the safety of the worker comes down to the worker himself. In the vast majority of cases, at least, his immunity from injury to life and limb depends upon his ability to *think* safety just as he thinks horsepower or tons of coal.



AN EFFECTIVE GUARD OVER AN ENGINE CRANK

Fatal Accidents in Dortmund District, Germany

The following table, showing the number of fatal accidents in the largest coal-mining district of Germany, is interesting for comparison with the records of the United States. In 1912, 3.15 men per thousand employed were killed at United States mines. The Dortmund record shows 2.91 It is interesting to see that the United States death rate per 1000 is 1.53 from falls of roof and coal whereas the Dortmund rate is 1.094. These are the causes of death which have shown themselves the most difficult to reduce by legislation or operating care and are those most largely dependent on the ability and prudence of the miners themselves, and above all on local conditions. So the American showing for more preventible causes is by no means bad, because all other accidents than falls of roof and coal give us a death rate of 1.62 and the Dortmund district a rate of 1.816.

FATAL ACCIDENTS IN THE DORTMUND DISTRICT OF GERMANY IN 1911 AND 1912*

Men Employed	1911	1912
Average daily force		
Underground	271,488	279,713
Above ground	81,067	81,438
Total average daily force	352,555	361,151

			Per 1000 men	
Accidents Underground	1911	1912	1911	1912
By breaking in of rock masses (falls of stone, coal, etc.)	277	306	1.020	1.094
In shafts leading underground				
During permitted hoisting	19	16	0.070	0.057
During forbidden hoisting	2	0	0.007	0.000
During passage otherwise	0	1	0.000	0.004
During work in or about the shaft	41	37	0.151	0.132
Otherwise	9	2	0.033	0.007
Total	71	56	0.262	0.200
In blind shafts and headings with haulage inclined upward or downward				
Due to wrecks, etc	76	81	0.280	0.290
Due to haulage or clutch mechanism or a car	68	86	0.250	0.307
Due to other causes	22	22	0.081	0.079
Total	166	189	0.611	0.676
In haulage through approximately level headings				
With mechanical haulage	16	28	0.059	0.100
With animal haulage	19	21	0.070	0.075
With hand haulage	12	12	0.044	0.043
Total	47	61	0.173	0.218
By explosions				
Of mine gases or dust	27	188	0.099	0.672
Of gases from mine fires	0	0	0.000	0.000
Total	27	188	0.099	0.672
By bad or dead air				
From gases from mine fires without explosion	4	2	0.015	0.007
From mine gases without explosion	3	2	0.011	0.007
From gases from blasting or otherwise	6	3	0.022	0.011
Total	13	7	0.048	0.025
In blasting	22	30	0.081	0.107
By machinery	3	5	0.011	0.018
In other ways	68	83	0.250	0.297
Total underground accidents	694	925	2.556	3.307
Accidents above Ground				
By machines or mechanical appliances	16	27	0.197	0.332
By railway cars or locomotives	24	35	0.296	0.430
In other ways	52	64	0.641	0.786
Total	92	126	1.135	1.547
Grand total	786	1051	2.229	2.910

There were 21 fatal hoisting accidents in shafts leading under ground in 1911 (or 0.077 per thousand employed) and 17 in 1912 (or 0.061 per thousand employed).

* From "Glückauf," July 12, 1913.

It will be noted that this German district has a large number of surface accidents: 1.547 per thousand employed. The figure for the United States is only 0.25. Looking over the figures, there is little reason for a citizen of this country to feel troubled that Germany shows us a trifling lead, when he duly considers the polyglot and inexperienced personnel with which our mines are filled and that to the accidents which our miners alone control should be ascribed our slightly higher death rate.

Mine-Safety Precautions in Utah

By A. C. Watts*

The "safety-first" idea in Utah is not the result of the agitation of recent years along these lines, but has been a subject foremost in the minds of the operators for many years.

The "first-aid" movements, the activity of the government along the lines of rescue cars and the improvement of various oxygen helmets and other rescuing devices, has lent impetus to the movement and stirred up all those interested in the welfare of the mine workers.

We now find several rescue cars in the West, while helmets with supplies of oxygen and first-aid appliances are in general use. There are also trained men in the use of oxygen helmets and rescuing machines in every camp, while "Safety-First" mottoes are placed in conspicuous places at all collieries. In fact, a more general spirit of care pervades the entire industry.

The government rescue car for this district was taken away some time ago. Owing to the scattered locations of our coal mines and the difficulty of getting together we do not have the frequent meetings and contests along first-aid lines that is possible in the thickly populated East, but the spirit is here just the same.

Shot and Roof Inspectors

"Prevention" is the motto of the operators here. The Utah Fuel Co., the oldest in the field, has had shot and roof inspectors in its mines, in addition to the regular gas inspectors, for years, and employs two general underground inspectors whose duty it is to continually travel through its properties and inspect them as to the safety.

For years, the Utah Fuel Co. has employed sprinkling (even before it became a state requirement) of the dust, and in two of the mines, of which the dust is especially explosive, the electric shot-firing system, by which all shooting down of the coal and rock is done from the outside after all men and animals are out of the mines, is used.

These extra precautions of safety are employed solely because of interest in the welfare of the mine worker, for they mean an additional cost to the operator.

A Simple Safety Measure

A simple precaution that is used, and one that entails but slight expense and no inconvenience, is the shutting off of electric current in trolley lines when men are getting into man trips. A sectional switch at the parting is all that is needed. When miners are getting into cars with their picks and drills, there is always danger of some one hitting the trolley wire and a serious accident may result if the wire is "alive."

The regulations as to use and care of explosives are strict, and the shot and roof inspectors continually instruct men in the proper placing of shots and care of their working places. On these men, in a large measure, is placed the responsibility of reducing the fatalities from falls of roof and coal, for it is from these causes that most accidents occur. We also try to protect men from machinery. The mines are electrically lighted and great care is taken to prevent accumulations of inflammable materials in mines.

Fire protection is had mainly from the sprinkling systems which permit water under pressure to be taken to all open places in the mines.

Altogether Utah has the better welfare of its mine workers close at heart, and expense is not spared to bring it about. "Safety first" seems to be the by-word on all sides in the coal mines of this state.

---

*Chief engineer, Utah Fuel Co., Salt Lake City, Utah.

⁂

Mine-Rescue Work in Great Britain

Special Correspondence

The recent disastrous explosions in Scotland and England have again brought before the British public the question of rescue work in mines. In this connection one of the most important problems confronting mining men is the immediate effect on an individual of the various gases constituting polluted mine atmospheres.

The standard of air purity set up by the Mines Act of 1911 is that the air must not contain less than 19 per cent. of oxygen, and not more than 1¼ per cent. of carbon dioxide. Under normal conditions it has been shown that the percentage of oxygen in mine air gradually falls, and the carbon dioxide gradually increases as the air circulates through the mine. This, of course, is due to the consumption of oxygen and the production of carbon dioxide by the breathing of men and horses and the burning of lamps. Another important cause is the partial oxidization of some of the carbon and hydrogen in the composition of the coal.

Investigation has shown that the mine air may vary considerably from that at the surface, even though no inflammable poisonous gases flow in from the coal or adjacent strata. The following is an average analysis of the mine air in the return at several British mines: Oxygen, 20.16; carbon dioxide, 0.37; firedamp, 0.42; nitrogen, 79.25.

When the Situation Underground Is Abnormal

When conditions in a mine are abnormal, that is, when combustion takes place on a fairly large scale, the pollution of the air goes on at an alarming rate. As an example of such a case, attention is called to the report of Dr. Haldane relating to the Snaefell mine in the Isle of Man, where 19 lives were lost by a comparatively small underground fire. The analysis of the air was as follows: Oxygen, 15.48; carbon dioxide, 4.22; carbon monoxide, 1.07; hydrogen, 0.48; nitrogen 78.75.

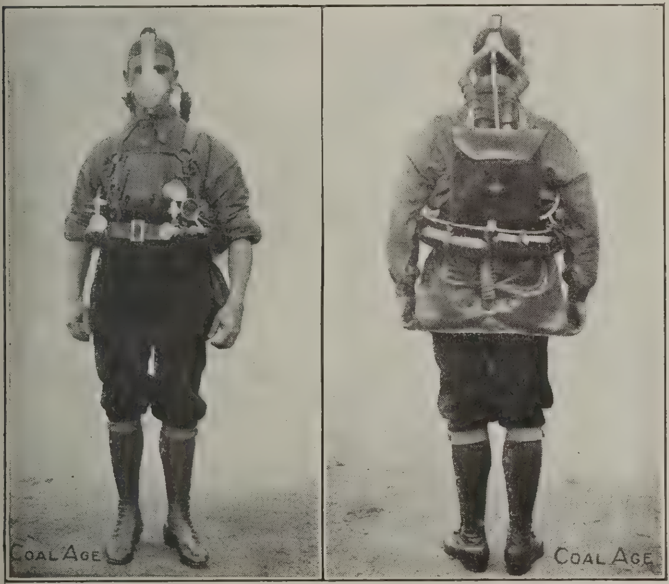
The total capacity of the workings in this case was about 1,000,000 cu.ft., and it was shown that the combustion of 125 cu.ft. of timber would have polluted the whole of the air in the mine to the extent shown by the foregoing analysis.

The effect of a reduction of oxygen percentage on an individual in mines near the sea level is similar to that produced by the reduction of atmospheric pressure on hill climbers at high altitudes. British authorities maintain that the oxygen may fall to 15 per cent. without producing any apparent effect on the individual. If no exertion is being undertaken, the individual may continue to breathe an atmosphere with only 10 per cent. of oxygen. The limit is reached at a little under 7 per cent., when unconsciousness takes place. A light is extinguished at 17 per cent. of oxygen, so that even although a flame will not burn, a man may exist for some time before the dangerous percentages are reached.

Effects of Carbon Monoxide

The effects of carbon monoxide are confined to closer limits. It combines with the haemoglobin in the blood three hundred times faster than oxygen does, and forms a comparatively stable compound. Thus the haemoglobin loses its capacity as an oxygen carrier to the tissues, and death occurs from lack of oxygen. The same British investigators above mentioned, claim that if 0.08 per cent. of carbon monoxide is present, the blood of an individual breathing such air for two or three hours becomes 50 per cent. saturated with the compound containing the carbon monoxide. They say that anything above 0.05 per cent. will produce unpleasant symptoms, and anything above 0.15 per cent. is distinctly dangerous.

Since carbon monoxide may arise from explosions of firedamp or coal dust and from underground fires, no mine can be regarded as free from risk. Hence, the necessity arises for providing a breathing apparatus to render the wearer independent of the mine air when undertaking rescue work or the recovery of the mine.



Views of Weg Apparatus Used in Recent Cadder Disaster

British practice tends towards the establishment of central rescue stations in preference to the idea of each company working as an independent unit. A number of stations have been established in Scotland and England, and recent mine acts have gone so far as to expressly stipulate the style and equipment of such central stations. One of the most modern rescue plants is the Fife Station in Scotland, which serves and is in direct telephonic communication with 91 collieries employing 26,000 men. The equipment consists of twenty sets of improved Weg apparatus; six sets of smoke helmets with bellows and pipe connection; two sets of pulmotor apparatus; twenty electric lamps of the Float type; twenty storage cylinders, each of 120 cu.ft. capacity; one recharging pump electrically driven; one motor car; a complete stock of ambulance apparatus, packed; a reserve of 1560 cu.ft. of oxygen, and small cylinders kept charged, and a minimum stock of 800 lb. of caustic.

The experimental gallery at the Fife Station is constructed to represent as closely as possible a wrecked roadway underground. It is formed around the three sides of a central drill hall, and has a total length of 134 ft. and a width of 8 ft. The gallery can be filled with flue gases from a furnace by means of a fan, so that the atmosphere can be made totally irrespirable. The training of the men proceeds by easy stages, until finally they are permitted to do heavy manual labor for two hours in the smoke gallery. This work consists of weight-lifting, building brick stoppings and generally doing work as closely as possible imitating underground operations. As high as 302,000 ft.lb. of measured work has been accomplished by one man in the gallery in 1 hr. and 26 minutes.

No Water Here

A West Virginia newspaper reports the formation of a new company with the following objects: "To acquire coal and mineral lands and develop all the substances and fluids therein, quarry stone, cut timber, manufacture earth, clay and other products, develop salt, natural gas, oil, etc., and refine same for heat, light and other purposes; construct and own pipelines; refine petroleum, and do a general mercantile business. The authorized capital stock is $500 all subscribed and $100 paid."

Contemplation of this firm's field of endeavor and its capitalization prompted the following effusion:

In this age of frenzied finance
It may cause no mental shock
When we read of high inflation
Or of irrigated stock.

But a firm in West Virginia
Puts inflation quick to rout
And the things they can't accomplish
Are a mystery, no doubt,

For the things they're organized for
And the things they aim to do
Far surpass the mean conceptions
Of such folks as me or you.

They will first acquire coal rights
Whereso'er such rights abound,
Use all substances and fluids
That within the earth are found,

Quarry stone and get out lumber,
Manufacture earth and clay,
And a thousand other products
That are needed every day;

And they're goin' to build some pipelines
And they'll own 'em, too, you bet,
And they'll force petroleum through 'em
Till they make their old pump sweat;

And the salt they will develop,
Gas and oil and maybe peat—
They will make these latter products
Furnish light as well as heat.

When it comes to refinition
They will do it up in style,
And they also think of starting
In a business mercantile.

And they'll mine the coal deposits
From the earth in mighty chunks
On a capitalization
Of a small five hundred plunks!

If the stocks of corporations
Through the country far and wide
Show remarkable resemblance
To the ocean's mighty tide,

If such stocks show irrigation
Unmistakable, alarming,
This new firm in West Virginia
Is assuredly "dry farming."

—By F. H. Kneeland.

First-Aid Meet at Knoxville, Tenn.

Editorial Correspondence

SYNOPSIS—The meet at Knoxville, Tenn., was well managed and shows how rapidly first-aid has spread in the Southern States, largely due to the exertions of the Bureau of Mines. Reference is made to the advance in technique and training which is now manifest everywhere.

⁂

The Society of Tennessee Mine Foremen, the U. S. Bureau of Mines, and the American Red Cross held a most successful first-aid meet at Knoxville, Tenn., Saturday, Sept. 20, the expenses of which were largely footed by the Appalachian Coal Operators' Association, a few powder companies and several merchandising concerns of the city in which the meet was held.

Size of Mats

The meeting was preceded by drizzling rain, and the prizes were presented in a somewhat heavy downpour. The men exercised on Johnson's race track, which has excellent draining qualities, otherwise the mats of brattice cloth would have been insufficient for the protection of the subjects. As it was, in event No. 2, where a man was supposed to have fallen with his abdomen over a wire, the mat proved too small, for he could only be placed where the wire had been laid or in the mud of the track. The mats should be at least 12 ft. long if such an event is to be exhibited.

The track was laid out with the lime lines in nine and three foot strips alternately, the teams being restricted to the larger spaces, and the judges using the three-foot lanes between competing teams. In all, 24 teams were entered and 21 actually attended.

The demerit list used at this meet, and which we printed in our issue of Sept. 6, was not as we then thought and tentatively suggested a product of the activity of the American Mine Safety Association, but was compiled by Jas. W. Paul, in charge of the mine-rescue work of the Bureau, and Major R. U. Patterson of the Medical corps of the U. S. Army, detailed to have charge of the first-aid industrial work of the United States, and others. It is to be found embodied in Miners' Circular 15, entitled "Rules of Mine Rescue and First-Aid Field Contests." The rules also will be found in our issue of Sept. 6 and in Circular 15.

A Bleeding Palm

After a parade, the first-aid events followed:

One-Man Event—Machine boy while running fell and cut vertical gash on knee cap; punctured palm of right hand with machine bit; bright red blood. Treat and carry 50 ft.

It was understood by most of the teams that the bright red blood was due to the puncturing of the palm of the hand, but some put a tourniquet on the leg, as if the gash of the knee-cap had severed an artery. Most of the contestants put that instrument on the upper part of the arm so as to compress the brachial artery and did not place it around the wrist as is to be preferred.

In early training most of the first-aid instructors were doubtful of the ability and willingness of the men to receive instruction. They questioned, whether they would give the requisite time and necessary care to the study of first-aid. They also doubted whether it was well to trespass too much on the province of the surgeon, both because such a course was in itself wrong and because it was likely to lead to a certain degree of professional resentment. Consequently they did not advocate the use of the tourniquet around the wrist because by a simple instruction they could show a first-aid man how to control the blood flow in the whole arm from finger-tip to biceps and restrain it effectually.

But they did invariably point out that extreme compression of the brachial artery might result in the loss of the arm if the victim's bleeding were prevented after this manner for two or three hours. On the other hand, when the constriction is made at the wrist, only the hand is liable to be lost.

More Skillful Instruction Needed

First-aid is in its transition stages, and it is perhaps as well to state here and now that judging is going to demand more perfect technique from the first-aid man than is to be found in the abridged text book on first-aid, published by the American Red Cross. The book still serves useful purposes as a guide for beginners and amateurs, but unfortunately the judges, even when appointed by the Red Cross, have not been ready to regard the suggestions of the text-book as the ultimate first-aid technique and the American Mine Safety Association has not declared other technique mandatory, so that first-aid men depending on textbooks or lay training, however official, are liable to lose the highest awards at present-day meets. It is much to be regretted that the A. M. S. A. has met twice, and done so little to declare what a first-aid man should know and should do.

We have frequently noted that the judges are disposed to demerit on what they believe to be correct principles, rather than on the question of the nearness with which the first-aid men have complied with instruction given them. The tests have ceased to be examinations of teams, and have become rather tests of the relative merits of the training doctors. It is discouraging to a working man, who has diligently absorbed the teaching of his master in the art to find that he is demerited for the misjudgments of his teacher, or because his instructor did not know that the judges had decided that the first-aid movement had made such advances that a more perfect technique was permissible. We trust that the A. M. S. A. will shortly grant to every contestant, a clear knowledge of the measure by which his attainments in first-aid will be meted.

Resuscitation Case

The second event was as follows:

Two-Men Event—Miner found lying face down, unconscious, on a live electric wire, abdomen badly burned. Rescue, and give treatment.

It is probable that this man after being rescued from the wire should have been resuscitated by the Sylvester method, because it is not well to use for the recovery of the patient a system which involves the parts burned. It is one of those rare cases in which the Schaefer method is perhaps inadvisable. One team did favor it, however, and administered it wrongly, the operator placing his hands on the under part of the subject in a position more suited to the lifting of the patient, than to the compression of his floating ribs. In this way the action was rendered largely ineffectual and most injurious to the burns of the patient.

In most cases the deflating or systole action in the lungs was obtained by pressure on the chest and not by pressing the doubled arms of the patient on the lower ribs and rubbing them down his sides. The chest-pressure method does not develop the full deflating powers of the Sylvester method and may be regarded as comparatively ineffective, but it serves to save the patient from injury to the abdomen, when that part of the body is burned.

In fact, the competing claims of the Sylvester and Schaefer methods in case of abdominal injury is, we think, a matter for the due consideration of the American Mine Safety Association and for the investigation of the Bureau of Mines. Almost the only merit of the Sylvester method, which it seems to us, is retained with mere chest pressures, is the inflating or diastole action caused by the lifting of the arms. Seeing that the Sylvester action is at its best, a less efficient method than the Schaefer, and granting further that the Schaefer method is not so much an action on the front as on the sides of the abdomen, would it not be better to risk doing some superficial injury to the patient than to run the greater risk of allowing him to die by an inefficient method of resuscitation?

There were a few men who adopted the plan of holding the victim by the wrists in the Sylvester treatment. No harm is done by this manner of grasping the patient, but it does not give any better results than are obtained when the victim is held below the elbows. The operative is saved much unnecessary motion and is drawn up closer to the abdomen of the patient, thus he himself is longer becoming exhausted and relief is not so often needed.

Shock From Burns

Three-Man Event—Head, face, neck, arms and hands badly burned from gas ignition. Treat same.

The victim was in nearly every case caused to sit up by the operating teams in this event. It is dangerous to raise a man into such a position for if he has not already received a shock from his burns; he is liable to receive a secondary shock. The effort of pumping blood to the head is increased when in a standing or sitting position and is minimum only when the patient is recumbent.

In nearly every case picric acid gauze or a simulated equivalent was used, but in some cases plain gauze was substituted. We understand, however, that by the agreement with the judges beforehand, this plain gauze was to be supposed to be impregnated with carron oil or other medicament.

The fourth and fifth events were:

Team Event—Injured spine or broken back; left hand cut on back and bleeding; carry 50 ft.

Team Event—Miner caught between loaded car and side of gangway, right shoulder blade broken; left arm broken 6 in. above elbow, left foot crushed; lacerated right cheek. Improvise a stretcher and carry 50 ft.

In these events nothing of particular interest was noted. The assumption was made as usual in such cases that the miner was lying on his back after the injury was received. We do not know how often this is true, but we suppose but rarely. We have a habit of staging these accidents as we will, without any regard to the true underground facts. Naturally men who are taught to treat spinal injuries with the subject lying on his back will turn the victim over when they find him lying otherwise. The thought of the effect of that roll almost makes the eyes close with horror.

The judges carefully examined the action of the teams, but were not so particular about the condition of the bandages. There were three teams or less to each judge so that reasonably accurate judgment of the manner of operation could be assured. Moreover, all the judges were medical men. Some judges asked several questions of the captains and some examined the bandaging with much care, but this was not so necessary as it is in meets where there are fewer judges as the manner of bandaging can be examined while under execution. None of the judges were acquainted with the teams they examined and the judges were rotated after each event, so that as far as possible, perfect fairness in judgment was secured.

The Demonstration of the Bureau of Mines

A charge of permissible explosive, equal in deflective force to one-half pound of 40 per cent. nitroglycerine dynamite and tamped with one pound of clay, was fired in the steel gallery in the presence of coal dust. There was a large outburst of dust but no flame.

D. T. Blakey, a mechanical engineer, with the Link-Belt Machinery Co., in a breathing apparatus, then entered a glasscase carrying a canary and a pigeon. The box was charged with carbon monoxide, supposed to comprise 0.1 per cent. of its whole content. The canary was a long time feeling the effects and probably died finally only because it was held in the entering current of gas. The pigeon was but little affected. Whether the box leaked or the gas not being prepared by a chemist, was insufficient, cannot be asserted. However, the minds of the visitors were concentrated on canaries and rescue work and the psychologic result was attained without any one experiencing undesirable after-effects.

A charge of F. F. F. black powder of equal disruptive effect to the permissible explosive, fired before in the explosion galley was then placed in the cannon and tamped with a pound of dry clay. It was fired in the presence of coal dust and made much flame and a considerable report.

Speeches were then made by T. A. Wright, President of the National Conservation Exposition, Miss Boardman of the American Red Cross, and W. B. Wilson, Secretary of Labor. Mr. Wilson has shown himself a man of integrity. His advance is due to that characteristic and not to his fund of information and nearly all the remarks he made needed truth to give them force. Seeing Mr. Wilson is a specialist in mining, we can scarcely see how he can form an accurate conception of other industries when he has not mastered the facts of the business in which he was only lately employed.

Prizes and Prize Winners

After the speech-making the prizes were distributed. It must be explained that no team receiving a prize for general average excellence in the meet could receive any further recognition for its merit in the one-, two- and three-men events or in those in which the full teams participated.

The grand prize was won by the Tennessee Coal Co. It consisted of a silver cup provided by the Provident Life & Accident Co., of Chattanooga, Tenn., $25 in cash presented by the Atlas Powder Co., Knoxville, Tenn., six gold medals from the American Mine Safety Association and five bronze medals from the American Red Cross.

The second grand prize was awarded to the Westbourne Coal Co., and consisted of a breathing apparatus presented by the Draeger Oxygen Equipment Co., $25 donated by the Ingersoll-Sargent Drill Co., six silver medals from the A. M. S. A. and first-aid certificates from the A. R. C.

The third grand prize went to the Jellico Coal Mining Co., of Mountain Ash, Ky., and consisted of an ambulance hamper donated by Siebe-Gorman Co., Chicago, Ill., $10 donated by the Pennsylvania Crusher Co., of Philadelphia, Penn., six bronze medals presented by the A. M. S. A. and first-aid certificates presented by the A. R. C.

The Tennessee Grand Prize was awarded to the best team from the state regardless of the receipt of any other prize. Hence, two teams which had already received the open grand prizes also gained the Tennessee awards. Thus the Tennessee Coal Co. as first prize was rewarded with a silver cup presented by the Southern Coal Operators' Association, and $25 donated by the A. S. Cameron Steam Pump Co., of New York City.

As the Roane Iron Co., the Knoxville Iron Co. and the Piedmont Coal Co. tied for first place in the team events with 94½ points, the prize intended for the winning team consisting of a complete mining course in the International Correspondence Schools, two years' subscription to the "Colliery Engineer" and a copy of the Coal and Metal Miners' Pocket Book were divided among the winners.

The second prize in team events was awarded to the Ducktown Copper Co. and consisted of a short mining course in the I. C. S., a year's subscription to the "Colliery Engineer" and a copy of the Pocket Book.

The third prize of $15 presented by the Miners' Field Day Committee, of Knoxville, Tenn., and six steel tapes donated by the Lufkin Rule Co., of Saginaw, Mich., was awarded to the Stonega Coal & Coke Co., of Big Stone Gap, Ky.

The first prize for the one-man event went to the Coal Creek Coal Co., Coal Creek, Tenn., the prize being a gold watch presented by Walsh & Weidner Boiler Co., Chatanooga, Tenn. The second prize of a gold chain, donated by the Link-Belt Co., of Chicago, was drawn by the Stonega Coal & Coke Co., there being three teams having equal percentages; the teams of Standard Jellico Coal Co., and the Continental Coal Corporation, William Taulber, captain, being the two which were defeated by the drawing of lots. The third prize went to the Wisconsin Steel Co., T. K. Johnson, captain. It consisted of $5 presented by the Miners' Field Day Committee.

The two-man event was won by the Wisconsin Steel Co., L. D. Smith, captain, with a perfect score. The team received $15 presented by the Ohio Brass Co., Mansfield, Ohio. The second prize went to Baker No. 2 team of the Continental Coal Corporation and consisted of $10 presented by Leschen Sons Rope Co., of St. Louis, Mo. Two teams were equally entitled to third place, the Wisconsin Steel Co., A. Patterson, captain, and the Stearns Coal Co.; on drawing lots the first team secured the prize.

The first prize for the three-men event was given to the Black Diamond Coal Co., and consisted of $10 donated by the Ohio Brass Co., of Mansfield, Ohio, and $5 presented by the Miners' Field Day Committee. The second prize for that event went to the Minersville Coal Co. and consisted of three Thermos bottles presented by the Milwaukee Locomotive Co. The third prize was awarded to the Roane Iron Co., W. T. Richards, captain, and consisted of three electric flash lights.

"Coal Age" gave five gold watches to the captains of the teams making the best scores in the five events. The men receiving the prizes were H. R. Smith, of the Tennessee Coal Co., R. Rigsby, Westbourne Coal Co., J. M. Wood, Knoxville Iron Co., L. R. Eager, Standard Jellico Coal Co. and S. Marsh, of the Jellico Coal Mining Co.

Much credit for the success of the meeting is due to H. M. Wilson, D. T. Blakey, E. F. Buffat, G. B. Sutton and H. M. Ashmore, who all gave much time and attention to the promotion of the meet.

⁂

H. C. Frick Coke Co. Meet

The meet of the H. C. Frick Coke Co. was held on Thursday at 2:30 p.m., Sept. 25, 1913, at the Trotter mine, near Connellsville, Penn.

The events were as follows:

One-man event: Compound fracture of jaw on the left side. Bleeding bright red blood in spurts and a small cut over right eye.

Two-men event: Treat a man unconscious from electric shock demonstrating both the Schaefer and Sylvester methods of artificial respiration, two minutes each.

Nine Teams of H. C. Frick Coke Co.

From left to right, Coalbrook, Davidson, Adelaide, Trotter, Leisenring No. 1, Leisenring No. 3, Juniata, Bitner and Broadford teams.

Leisenring No. 3 Team

Bandaging a fractured jaw. Dr. Parker, medical director of team, in foreground.

Three-men event: Dislocated left shoulder and right foot crushed half way to knee.

Full-team event: Fracture or dislocation of spine. Compound fracture of right forearm 4 in. above wrist. Attend, place on stretcher and carry 50 ft.

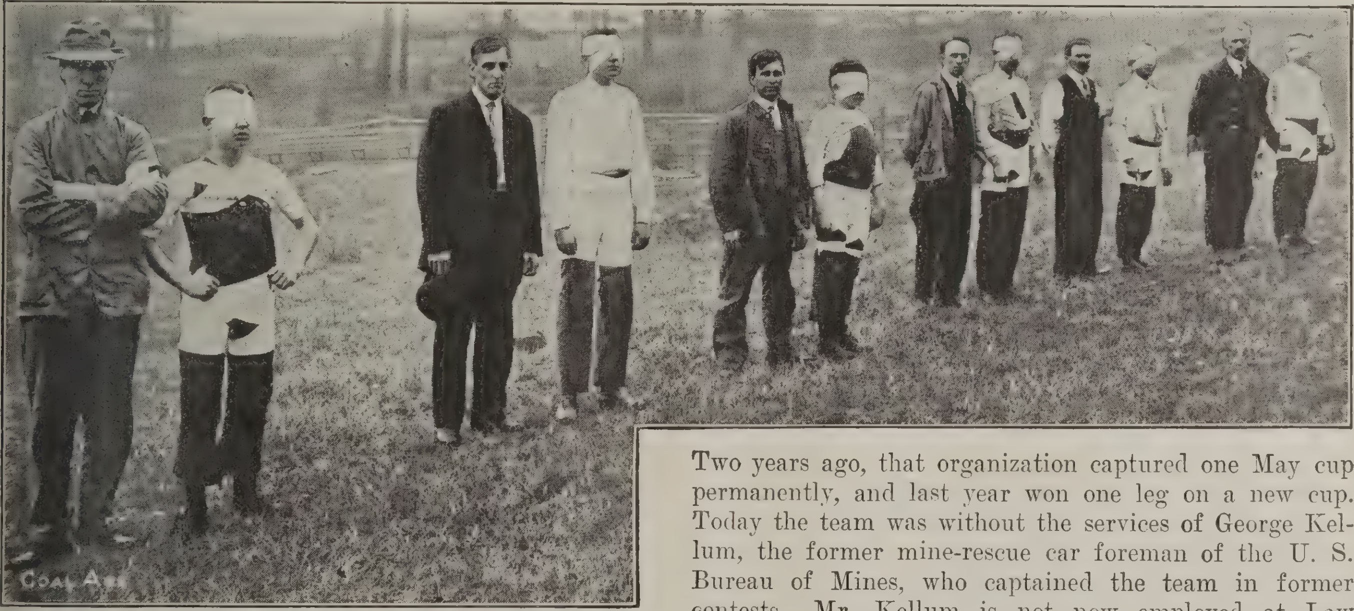
The following teams took part, receiving the stated percentages:

Coalbrook	97¾	Bitner	96½
Juniata	97½	No. 1 Leisenring	95½
Davison	97¼	Broadford & Valley	95¼
Adelaide	96¾	No. 3 Leisenring	93⅝
Trotter	96¾		

The First-Aid Meet of the Hillside and Pennsylvania Companies

Special Correspondence

Under threatening skies, which limited the attendance but in no way diminished the enthusiasm, the eighth annual first-aid contests of the Pennsylvania and Hillside Coal & Iron Co. were held Sept. 20 at Valley View Park, Inkerman, Penn. Twelve teams, two from each district of the Erie system, competed in the contest, which was for a year's possession of the handsome silver loving cup, donated by Captain W. A. May, president of the companies. The competition was keen, and the averages resulting, showed that the improvement in first-aid work in this region is bringing its devotees close to perfection. Seldom have better exhibitions of skill in caring for the injured, been seen at Valley View since the coal companies took an interest in the relief work.



Individual Contest

Bandaging both eyes, both shoulders and both groins.

Establishing a general average of $98\frac{3}{5}$, in a remarkable exhibition, the team from the Fernwood Slope, Butler Colliery, North Pittston District, captured the first prize. Old Forge Colliery, Avoca District, was second with 96 per cent. The other teams finished as follows:

No. 5 Shaft, No. 6 Colliery, $95\frac{1}{5}$.
Law Shaft, Avoca District, 95.
Erie Colliery Outside, Mayfield District, 92.
No. 1 Colliery, Dunmore District, $91\frac{1}{5}$.
No. 5 Shaft, Dunmore District, 90.
No. 6 Breaker, South Pittston District, 90.
Erie Shaft, Mayfield District, 89.
No. 1 shaft, No. 9 Colliery, $87\frac{1}{5}$.
No. 2 Shaft, Forest City District, $85\frac{1}{5}$.
Forest City Colliery, Forest City District, 82.

The Captain May contest consisted of five events, presenting hypothetical cases of injuries common to the miner, and calling for the services of from one man to five in treating the different cases. One of the interesting innovations of the day was the individual contest, instituted this year. As an incentive for individual effort, the companies offered three valuable prizes in this event, a Howard gold watch, gold cuff links, and a gold handled umbrella. The number of competitors was limited to one man from each district, the entrant being the man who had made the best showing in the district contests. The standing of the men in this individual contest was as follows:

Luther Heal, North Pittston District, 93.
John O'Malley, Mayfield District, 85.
William Creedon, Avoca District, 80.
William Davis, South Pittston District, 75.
William Bulger, Dunmore District, 65.
Del. Burdick, Forest City District, 65.

The May cup events were preliminary to the general contests, conducted under the auspices of the American Red Cross at Valley View, Sept. 27. The high teams in these events represented the companies on the following Saturday when teams from the Temple Coal & Iron Co., Scranton Coal Co., Jermyn Coal Co., and many other companies in this region, took part.

Two consecutive victories by the same team give permanent possession of the May cup. Law Shaft team, of the Avoca District, has had a monopoly on the trophy. Two years ago, that organization captured one May cup permanently, and last year won one leg on a new cup. Today the team was without the services of George Kellum, the former mine-rescue car foreman of the U. S. Bureau of Mines, who captained the team in former contests. Mr. Kellum is not now employed at Law Shaft.

The contest was in charge of Dr. F. F. Arndt, general director of the primary relief work of the Pennsylvania and Hillside companies, whose able systematizing of the contests greatly expedited the progress of the events. The other officers were: Judges, Drs. F. J. Bishop, Edgar Sturge, B. B. Wormser, of Scranton; director, F. H. Coughlin, secretary to Capt. May; H. T. McMillan, inspector of the North Pittston District; W. P. Jennings, superintendent of the South Pittston District; F. D. Conover, recorder; Edgar Weichel, timer.

The events were begun at about 10:30 a.m., and two took place before the noon recess, when lunch was served to the visitors and entrants. The events were as follows:

First event, 10 minutes—Two men working on separate subjects; one subject has an incised wound 3 in. long on back of head, running crosswise near bony prominence, and a wound on back of left shoulder near the summit. Second subject has a fractured right jaw, with an incised wound across front of chin, and the thumb and index finger of right hand crushed.

Second event, two men, 10 minutes—A man is found in a portion of the mines filled with bad air, unconscious, but heart is beating. Show as rapidly as possible how you would care for such a case. Distance to good air, 25 yd. Show two methods of artificial respiration with one or both arms broken.

Third event, three men, 15 minutes—Incised wound of right wrist, 3 in. above hand, cutting both arteries. Left elbow dislocated, forearm flexed at a right angle to arm. Dress burn on face, using a triangular bandage.

Fourth event, four men, 15 minutes—Dislocation of left hip backward. Show all the places on the body where tourniquets can be used to control hemorrhage. Show how you would control severe hemorrhage from the palm of the hand. If there is any difference in the method of applying tourniquet to arm and leg, show what it is.

Fifth event, full team, 20 minutes—Fracture of right arm and forearm. Compound fracture of left thigh at middle. Broken back. After dressing, load on stretcher, carry 100 ft., return and unload.

Event for special prizes, one man, 15 minutes, practical work—Bandage both eyes, apply roller bandage to both shoulders and both groins. Questions and demonstration—Point out location of different important arteries. Show how you would control bleeding from them by hand and tourniquet.

Fernwood Slope, Winners of Hillside-Pennsylvania Contest, with Officials

In the rear are the officials in charge of the meet.

Among the prominent mining men present were: Capt. W. A. May,; Mine Inspector S. J. Jennings, Eighth Anthracite District; Inspector H. T. McMillan; H. E. Yewens, superintendent of the Forest City District; J. W. Reed, superintendent of the Avoca District; David Girvan, superintendent of the South Pittston District; C. H. Frederick, auditor; F. H Wright, secretary and treasurer.

⁂

Mine-Rescue Automobile

Special Correspondence

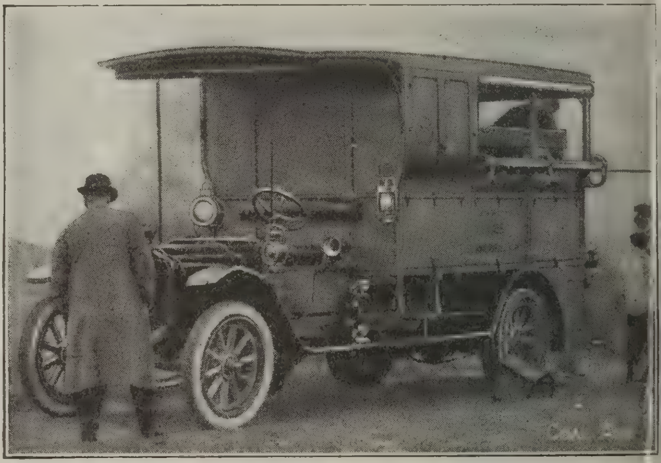
The first mine-rescue automobile car built in the United States, as far as we know, was recently delivered to the United States Bureau of Mines, at Pittsburgh, Penn., and after being given thorough and severe tests will be forwarded to the Birmingham, Ala., station of the Bureau of Mines. Whether or not a similar car will be stationed at Pittsburgh, will be determined later.

The car was made by the White Co., of Cleveland, Ohio, upon a competitive bid. It is a 40-hp. machine, and has made a trial run through a rugged country at a speed of 33 miles an hour, although possibly 35 to 40 miles per hour might be attained under the most favorable conditions. While built on a regular 3000-lb. chassis, the body, however, is of special design to meet the requirements of the service for which it was built. Besides the regular twin lights, a special 8-in. swivel gas headlight has been added so that it will be possible to throw a light a distance of several hundred feet ahead or alongside, and when stationed at the scene of an accident, this special equipment can be made to serve the part of a strong searchlight. Besides a gong, similar to that on a police-patrol automobile, this machine is equipped with a siren horn. Through the city, the car will carry the "yellow" automobile flag, as well as the "Stars and Stripes."

The car contains two standard fire extinguishers ready for instant use, and these are of the same type that are to be found on a municipal firetruck. The body of the car is so designed that it will carry a crew of 12 men, including the driver, although it is just possible that only 10 men may be retained for that purpose. Under the seats, and along the side of the body of the car, are five special compartments, in which helmets will be placed. Both doors and seats are movable.

Additional equipment consists of two pulmotors and six Linde Oxygen tanks. A telephone box and set is furnished and is equipped with several hundred feet of wire. There are also 50 regenerator potash cartridges and a life-line reel. Stretchers are lashed to the side of the car as shown in the photograph. One tent, covering a space 12x21 ft., with a 5-ft. partition, is an important part of the equipment. This tent will be pitched as soon as the automobile arrives at the scene of an accident, and will be used as a general headquarters.

One special feature of the car is an oxygen pump, working at 150 lb. above atmospheric pressure; this is driven by the car motor. There is also a complete equipment of sledges, axes, hammers, bars and the like; also 100 ft. of 1-in. and 100 ft. of 2-in. hose with nozzles and reducer attachments.



The Bureau of Mines Rescue Automobile

This car has pneumatic front tires, 36x4½, while the rear tires are solid dual-cushion. It is to be used to travel moderate distances, from 25 up to 100 miles.

⁂

Interesting Articles in Our Next Issue

Lack of space in this issue has compelled us to hold over several interesting and valuable articles dealing with the subject of "Safety in coal mines." One of these articles which we will print next week was written by F. W. Whiteside, chief engineer of the Victor-American Fuel Co. Mr. Whiteside tells of the many safety provisions of Western coal corporations, paying particular attention to the precautions inaugurated by his own company. Another article will deal with "Shot Firing and Watering Systems in Utah Mines." A third article will discuss the problem of "Preparing and Burning Anthracite Culm."

American Mine Safety Association's Session

Editorial Correspondence

SYNOPSIS—The American Mine Safety Association held an interesting meet and created much sentiment in favor of safety. It also completed its organization but did little toward fixing standards. The most notable event at the meet was Dr. McHenry's method of splinting a broken back. The mine explosion established the return or inward draft in a most spectacular manner and proved the efficacy of stone-dust barriers in isolating explosions.

⁂

The American Mine Safety Association held what might be termed its second annual session on Sept. 22 to 24. At the first meeting the body received neither a name nor a constitution, but a large amount of business was done. In fact it commenced to work before it really began to exist, while at this second meeting it established its existence and did but little effective administrative work. However, it held a most successful first-aid meet and put new life into the safety movement. As the chairman rightly declared, the program was so full of events and so much organizational work had to be done, that there was little time left for deliberation and discussion is, we think, the main reason for which the association was created.

Doctors Do Not Go on Record.

It is much to be regretted that the doctors have not made more rulings as to first-aid methods, because the matter is extremely urgent. We believe that first-aid men should have a book of first-aid principles as ample and complete as a Materia Medica, to quote Dr. A. F. Knœfel. This book would serve to make first-aid meets fair to all contestants. No game from checkers to baseball is without its rules. When serious disputes arise, in such well organized and regulated pastimes, they are seldom about the *laws* which govern the game. All the stress and strife centers around the relation of the rules to the actions of the players. As in such games, so also in first-aid contests, the judges should not umpire the question of right treatment, they should solely decide whether the contestments have performed that course of procedure which has been prescribed. Like a court jury, first-aid judges should only decide questions of fact, the supreme A. M. S. A. should adjudicate beforehand all questions of law.

Seeing that nothing was done in this direction; despite all the enthusiasm, good-fellowship and promise of better things yet to come, we were somewhat disappointed in the showing and can only console ourselves with the thought that in time the end will be accomplished, no matter how long it is delayed. Dr. Knœfel urged in committee that due consideration be taken by that body, so that no half-digested schemes be recommended to the public.

The Demerit List.

We had hoped that the discounts or demerits in first-aid contests would have been amended, seeing that the old schedule was not used in the meet held by the very institution by which it was adopted and promulgated. The new demerit list seems at least worthy of careful consideration and might have been adopted temporarily, subject to later revision.

This report of the meeting may seem inverted as it does not follow the order of events, but we wish to emphasize the paramount place of the medical profession in the A. M. S. A. It was that surgeons might be drawn into conference that we advocated the formation of the body in an editorial on July 13, 1912, before the conference was called.

In the morning of Sept. 22, a meeting of the Executive Committee was held in the Fort Pitt hotel. The doctors also met and went over the forthcoming contest. It was decided to use the same events in the first-aid meet as were chosen at Knoxville, Tenn., and Major R. U. Patterson announced, we understand, to the assembled doctors the difficulties occurring at the Tennessee meet and asked how they would decide these matters of debate.

In the afternoon after some delay, the mine-rescue and first-aid contest was held in the Arsenal Park to the east of Butler Street, some distance from any of the Arsenal buildings, and from those loaned by the War Department to the Bureaus of Mines and of Standards. The field, while not large, was level and well fitted for its purpose and somewhat elaborately prepared for the meet. Thirty-five first-aid teams were entered in the contest and nearly all were on hand. One team came from West Virginia (that of the Consolidation Coal Co.) and one from Terre Haute, Ind. (that of the Vandalia Coal Co.). All the others were Pennsylvania teams.

The events being the same as those at Knoxville, reference to the article on that meet will give the necessary information. Doctors were appointed, each one to judge three teams or less, and so the examination was as adequate as could be reasonably desired. Many of the judges questioned the captains of teams and examined the bandaging with care, and a disposition to criticize the work openly made some bad feelings, it is true, but did no little good.

Some Errors in Treatment

In the second event where a man is lying over an electric wire, some of the teams passed strips under the upper and lower parts of his body and lifted him by these. However, as performed, this took four men and the event was listed for two.

In the third event, most of the victims were treated lying at full length. One team sat the patient up and the doctor who had trained these men and one of his colleagues urged that, when recumbent, a victim could not be properly dressed for such burns as were described in the program, and that in similar cases of burning, men had persisted in sitting up. The judges had unanimously agreed that to avoid secondary shock, the patient should be treated on his back. In the opinion of Major R. U. Patterson, not only was it possible to dress a patient for such injuries in that position, but even if he insisted on sitting, he should be induced to remain on his back. It is certain that because some victims will not do what is best for them is not a reason for treating a subject as if he were such a rebellious patient.

A NEW SPINAL TREATMENT

The dressing of the injured spine in the fourth event, developed a new method of operation. Dr. R. F. McHenry had taught the Penn.-Mary Coal Co.'s team a new method of bandaging and splinting, and had moreover decided to imagine the patient as lying prone (on his face) and not supine (on his back). This last point was well made.

After preparing the bed suitably on which the injured could be laid, he was lifted into place by taking hold on his clothing. We do not recall having seen at any meet such a perfect operation of this raising-and-lowering feat. There was nothing new in it, but the slow synchronism of the movements brought the minimum strain on the patient.

It is true, one authority did criticize the lifting of the victim, saying that the boards should have been slipped under him. That may be possible on a level field, or on a street, but in the mines, the chances are against the victim being found lying on anything resembling a level surface on which this could be done. He would be more likely to be doubled over a pile of coal or a rail. In this case, either the splint would have to be bent to conform with this curvature, or he would have to be bent into the line of the splint, which is contrary to resolution 18 of the Mine Rescue and First-Aid Conference. If such careful men as those of the Penn-Mary team be found to handle him when thus lying in an imperfectly recumbent position, his lot would be as fortunate as could be desired for a man in such a terrible predicament.

In dressing the victim, picks were placed under each arm, so that the eyes of the iron heads of the picks served to relax the tension of the brachial muscles and the handles lay between the arms and the body of the victim. These picks were secured to the arms by bandages and both were attached to the framework below by bandaging. Another pick was placed so that the eye of the head of the tool gave support to the ischium at the pubic arch and so saved the spine from the muscular tensions of the lower limbs. Of course, this pick was also secured firmly to the legs and the framework.

THE NEED OF A CLINIC

The manner of dressing and splinting this injury evidently pleased the judge, for the Penn-Mary team received the full percentage 100, and the comments were all favorable except that which we have repeated. We think, however, that entirely new technique such as this, is quite out of place in a contest, and the only reason for its introduction was that no clinic is provided at which to demonstrate such new methods.

Eventually, we believe that a clinic will be held after the regular meet, and doctors present will present new methods and will receive medals of appreciation after these methods have been discussed and adopted by the A. M. S. A. The introduction of such a system without any warning before a judge, who is required to render a prompt decision, is hardly fair to him. Nor is due justice done to the fertile brain of the surgeon developing the new device or method.

The public is watching what might be compared to a 20- to 50-ring circus, and so is not able to see the fine points thus unexpectedly presented. Meanwhile, the most competent persons to judge of the problem, to wit, the medical men, are busy demeriting other teams or watching their own men at a sufficient distance to prevent accusation of collusion. Thus neither the experts nor the public gain any advantage from such an unscheduled exhibition. We hope that the A. M. S. A. will consider Dr. R. F. McHenry's dressing and approve, reject or amend it.

SEPTIC TREATMENT

One team was severely criticized for handling the wound on the left foot in the fifth event. Undoubtedly, such carelessness and septic treatment is censurable at a meet and would be more so under actual conditions. However, it is not likely that in practice a man would deliberately grasp a limb by the wounded part unless ignorantly he might hope to staunch the blood flow thereby. This is a septic action which is not likely to occur in actual practice for the distaste for blood inherent in us all makes us lean toward aseptic treatment.

Yet in meets, the strangest dramatic errors are made. We noticed at another contest a man remove a victim with every precaution from an imaginary electric wire and then we saw three members of that same team line up on that same wire almost clicking their heels on it, in the mechanical perfection of drill. In the mine, they would not have made such an error, nor would this first-aid man of whom we have just been speaking have laid his bare hand on the bleeding surface of a crushed foot.

THE JUDGES

The judging was done largely by army officers and was extremely thorough, there being a judge who was unacquainted with the contestants to every three teams. The judges freely made criticisms, pointing out where some men were smothering in bandages without a hole for breathing, and others had their arms wound tight, when all the bandaging needed was such as to keep the air from the burns. Such judging will tend to make the men all earn 100 per cent. in future meets, unless entirely new problems are presented. The opposition to contests in some quarters, the equality of the contestants, the uncertainty in judging, are all tending to make contests give way to exhibitions. When the uncertainty is removed by the promulgation of detailed methods of action by the A. M. S. A., the equality of the contestants will be still more marked and scores of 100 will be increasingly common. It is interesting to note that the Penn-Mary Coal Co.'s team in five events, judged by five separate judges, received absolutely no demerits.

After four years of exceptional service with the A. R. C., Major Lynch returned to his post with the regular army. Major Patterson has succeeded him and by his professional talent, diplomacy and friendliness, has given everyone assurances that for the four years during which he will occupy the office, the industrial first-aid work of the Red Cross will make rapid progress.

MINE-RESCUE CONTEST, A NEW FEATURE

The mine-rescue contest, first exhibited at this meet, is a feature which has not been understood by the public generally, but it is likely to be as popular and useful as exhibitions of first-aid. The rules promulgated in miners' circular 15, and in the program, are as follows:

1. Each crew shall consist of five men, one of whom shall be the captain. Each man shall be provided with a breathing apparatus, safety and electric lamp, and each crew shall carry a canary bird in a cage to the base of operations.

2. After the men have put on the apparatus, the captain shall command them by signals given by a gong or horn.

3. Before putting on the apparatus the pulse and respiration of each man shall be taken by a surgeon. The apparatus shall be placed at a point convenient to each man, and upon command of the captain each man shall first examine his apparatus, make such tests as will convince him that the apparatus is in proper working order, and put it on without assistance.

4. The captain shall inspect each apparatus, noting the number of each apparatus worn and the reading of the oxygen pressure gage. Rescuer No. 1 shall inspect the apparatus worn by the captain.

5. The team, with its captain, the latter wearing apparatus, shall appear before the judges, who shall be men trained and experienced in the use of breathing apparatus and lamps. The judges shall make rigid inspection of each apparatus and discount for any improper connection or adjustment of the apparatus, lamp or accouterment.

6. Each crew shall then be required to trot 100 yd., then immediately enter an air-tight cage containing strong formaldehyde fumes and remain 10 minutes. As the men come out of the cage their condition shall be ascertained by a surgeon to determine the pulse and respiration of each man; and if the pulse or respiration of any man is abnormal, he shall be dropped from the crew and the crew shall be penalized by heavy discount. (The weakness of a member of a crew would, of course, prevent the crew from participating in the subsequent rescue work unless a substitute should be added who successfully underwent the same test.)

Pittsburgh Coal Co.'s Team. Winners of Mine-Rescue Contest

7. If during the recovery work consecutive members of a crew become separated beyond an interval of 2 yd., a penalty will be applied.

8. Failure to stop at intervals of 300 ft. for periods of one minute for resting will be penalized.

9. For not having a full charge of oxygen and a fresh charge of chemical at the time the apparatus is first put on a penalty will be applied. The committee may arbitrarily designate a supply of oxygen sufficient for one hour as a full charge.

10. For failure on the part of any member to comply with the commands of the captain a penalty will be applied.

11. A fireboss will be stationed at the entrance to the mine who will examine the safety lamps carried by the rescue crew.

12. A recorder designated by the judges will check each member of the crews as he goes in and comes out of the mine, taking his name and giving him a check as he enters and replacing on the board the check as he comes out.

The teams were supposed to find two men who had barricaded themselves in fresh air, and who were still living. They were required to remove them through noxious gases and take them to the surface and give them treatment for burns, shock, thirst and hunger.

Seven teams were entered for this contest, all of them from Pennsylvania. Holding such a competition is a new idea which, we believe, should be credited to the bureau. As none of the participants were experienced in the drill or in the problems actually presented, those who exercised first were under somewhat of a disadvantage.

The threatening rain, unseasonable cold and raw wind, made the day undesirable and there were only about 1000 spectators, though many times that number might well have been expected had the conditions been less wintry.

At 8 p.m., a reception was held in the English room of the Fort Pitt hotel, at which several speeches were made, and the prizes awarded. William B. Wilson, the Secretary of Labor, had been called home by sickness in his family and so could not be present. I. Jones, the Mayor of Pittsburgh, J. I. Parker, chief clerk of the Department of the Interior, Van H. Manning, assistant to the director of the Bureau of Mines, Major R. U. Patterson, in charge of the first-aid industrial work of the American Red Cross, J. P. Reese, vice-president of the A. M. S. A., and W. Green, secretary-treasurer of the United Mine Workers of America spoke at length. The latter made an excellent speech, in which he urged the erection of suitable buildings for the work of the Bureau and commended the efforts the government was putting forth to safeguard the miner.

Prizes for First Aid

The prizes were presented by H. M. Wilson and were as follows:

First Prize—Six silver medals donated by the American Red Cross; six silver medals presented by the American Mine Safety Association: challenge cup presented by the "Colliery Engineer." Won by the Penn-Mary Coal Co., Heilwood, Penn. Score 100.

Second Prize—$18 cash donated by the Mannesmann Light Co.; six bronze medals donated by the A. M. S. A. Won by Penn. Gas Coal Co. (team 17), Irwin, Penn. Score 97⅖.

Third Prize—$12 cash donated by the Mannesmann Light Co. Won by Cambria Steel Co., Johnstown, Penn. Score 97+. (This team, and that receiving the fourth prize tied, and a tie contest was held, which the Cambria team won.)

Fourth Prize—One first-aid cabinet donated by Johnson & Johnson. Won by the Jamison Coal & Coke Co. (team 34), Greensburg, Penn. Score 97.

Fifth Prize—A first-aid cabinet donated by Bauer & Black. Won by Penn. Gas Coal Co. (team 16), Irwin, Penn. Score, 96⅕.

Sixth Prize—One first-aid instruction outfit donated by Johnson & Johnson. Won by Oliver & Snyder Steel Co., Oliver, Penn. Score, 95⅕.

Seventh Prize—One stretcher donated by Frick & Lindsay. Won by Consolidation Coal Co., Fairmont, W. Va. Score 94⅘.

Eighth Prize—One tabloid first-aid box donated by Burroughs, Welcome & Co. Won by the Jamison Coal & Coke Co. (team 10), Greensburg, Penn. Score 94⅗.

Ninth Prize—One year's subscription to the "Coal & Coke Operator." Won by Westmoreland Coal & Coke Co. (team 31), Irwin, Penn. Score 94⅗.

Tenth Prize—Six months' subscription to "Coal & Coke Operator." Won by Vandalia Coal Co., Terre Haute, Ind. Score, 94⅕.

Eleventh Prize—$5 cash donated by "Coal Age." Won by Tunnel Coaling Co., Gallitzin, Penn. Score 94.

Special Resuscitation Prize—One silver challenge cup donated by S. F. Hayward & Co. Won by the Penn.-Mary Coal Co., Heilwood, Penn.

Grand Prize to team making best appearance on field in efficiency, training and drill, regardless of points scored. A silver cup donated by the "Coal Trade Bulletin." Won by the Oliver & Snyder Steel Co., Oliver, Penn.

Prizes for Mine-Rescue Work

In the mine-rescue contest, the results were as follows:

First Prize—Five bronze medals donated by the American Mine Safety Association. A challenge cup donated by the "Colliery Engineer" to become the property of the team which secures the highest score in all events for two consecutive meets. Won by the Pittsburgh Coal Co. Score 95.

Second Prize—Five Ceag electric hand-lamps on a chandelier donated by the Mannesmann Light Co. Won by Pittsburgh-Buffalo Co. Score 93.

Third Prize—One Draeger oxygen inhalator donated by the Draeger Oxygen Apparatus Co., also one year's subscription donated by the "Black Diamond" to the team scoring the sixth highest number of points in all events. Won by H. C. Frick Coke Co. Score 85.

Fourth Prize—One electric mine lamp donated by the Hirsch Electric Mine Lamp Co. to captain of team. $12 cash donated by the American Mine Safety Association for equal division among other four members of team. Won by Jamison Coal & Coke Co. Score 83.

Fifth Prize—$15 cash donated by the Mannesmann Light Co. Won by Ellsworth Collieries Co., Ellsworth, Penn. Score 75.

At the close of the prize giving, several moving pictures were shown of the Fourth of July parade at Gary, W. Va., followed by some excellent mine views, taken at and in the U. S. Coal & Coke Co.'s mines at the same place.

ORGANIZATION

On the morning of the next day, the association met for its opening session, the principal business being to take action on the new constitution.

Some unimportant changes were made; Art. 6, Sec. 1, being made to read in part: "The annual meeting of the association shall be held not later than September of each year," and the last clause in Art. 8 was modified to run: "Each local section may adopt such by-laws as it may find expedient, subject to the approval of the executive committee."

Section 3 of the by-laws now reads: "Only such persons shall be enrolled in the National Service Corps as can produce a certificate of competency in the particular corps work concerned, issued by an organization approved by the committee appointed by the association or by an examiner of that committee." Section 5 was changed so that dues are payable on the first day of the annual meeting, instead of on the first day of September. The nominating committee and other standing committees were appointed.

THE ANTECEDENT CONDITIONS OF THE EXPLOSION

In the afternoon there was an experimental explosion at the Bruceton mine. The main entry and its parallel heading have been driven till both of them are 1303 ft. in the hill, as measured along the main entry from its portal. At the end of the main heading a cannon was placed facing the entrance. This was loaded with 4 lb. of F. F. F. black powder and was stemmed with 8 in. of clay tamping. The hole was 2¼ in. in diameter and 22 in. long in all. In front of this cannon was placed, in a manner and at a level most conducive to an explosion, a platform loaded with 50 lb. of coal dust.

At the corner of the rib, where the inby side of the last crosscut meets the left side of the main entry, a cannon was set on a line dividing the angle between entry and crosscut. It was charged and tamped like the cannon at the end of the entry and the same kind of platform, with an equal amount of coal dust, stood in front of it to insure an explosion, but as it did not go off for some reason, all the effects produced can be ascribed to the cannon in the end of the entry.

It is needless to detail the length of heading charged with coal dust, as that is made amply clear by the shaded area in the illustration. It is necessary only to state that the charge on side shelving and floor was 2 lb. per lineal foot of heading both in the entry and airway. The stone dusting in the Garforth barrier, located in the airway, was heavier, 4 lb. per lineal foot. The Taffanel barrier was in all 60 ft. long and consisted of 10 boards 20 in wide, loaded with dust made by grinding the roof shales of the Bruceton mine. These boards were loaded to capacity.

AN EXTREMELY VIOLENT EXPLOSION

The explosion was a severe one, the cloud of dust escaping from the portal was not accompanied by flame, but could hardly have been more spectacular. The "British Coal-Dust" manometer at substation 150, registered a pressure of 55 lb. per sq.in. That at 550 measured 120 lb., the highest figure obtained in experiments at the Bruceton mine. At a point 750 ft. from the entrance, the pressure was only 12 lb. It is important to remember that this pressure is measured at right angles to the direction of the explosion and much higher pressure might well be anticipated in the direct line of its motion.

The reinforced-concrete stopping, situated 650 ft. from the portal, was cracked, giving two vertical crevices, which measured ⅛ in. across. Near the Taffanel barrier the shelving was torn down and two posts measuring 8 in. by 8 in. by 6 ft., which were recessed and held in place by ¾-in. square irons, were ripped from their places and thrown out of the mine, along the rock dump, and over the ravine to the side of the opposing hill.

WHAT USE IS A MERE BARRIER?

No one present observing the terrible effects of the explosion could feel much confidence in a barrier, however successful in suppressing combustion, and G. S. Rice stated beforehand that a barrier might put out the flame, but that the gases generated by combustion before the barrier was reached made any such protection inadequate. The rescue men carrying a canary met the waste products forced out by the fan and immediately returned, being unable to see in the dense smoke. The canary died immediately and an application of pure oxygen failed to revive it.

THE EXPLOSION AT THE BRUCETON EXPERIMENTAL MINE

Though there was no flame the cloud of smoke and dust amply proved the force of the explosion.

Behind the Taffanel barrier was only 803 ft. of heading, but the force which threw the timbers across the run showed that barriers in a mine would not make the workings safe. Nothing but the continuity provided by the Garforth system can be regarded as furnishing perfect security and then only if perseveringly extended as the headings are driven forward.

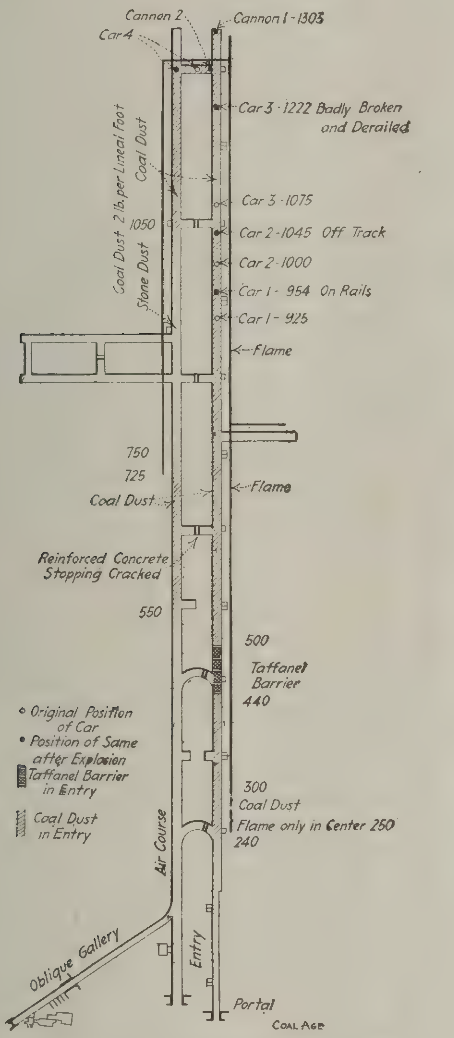
FORCE AND ORIGIN

To those who judge that an explosion is to be traced to the point where the violence is most marked, it will be interesting to note that with one exception the shelving was only torn down where the explosion ended, near the Taffanel barrier. The shelving was unbroken in the crosscut and the air course. In the main entry, as stated, it was ripped down near the barrier and it was also torn down as will be later seen by the side of a flying car.

The extent of flame is measured by tufts of guncotton, held in place by stiff wires. Every 25 ft. one of these stands stiffly from the roof and one stands out from he rib. Of course, the flame may strike one of these or both or neither. Hence it is not entirely safe to conclude that the flame ended where the guncottons ceased to be burned. On the other hand, it seems without inquiry that the cottons may be burned by hot particles of dust, even without flame.

The Flame Died after It Passed the Barrier

However, judging by the indications furnished by these tufts of guncotton, the flame in the main entry traveled past the Taffanel barrier 115 ft., and so completely filled the heading that two guncottons were burned at that distance. At 190 ft. outby from the barrier, at substation 250, the guncotton was consumed, but neither the cotton at the side nor the current breaker was burned. Beyond this point, the guncottons were either blown away or were intact. The Taffanel barrier at last had done its work, not by a descending shower, but by mixing with the coal-dust cloud and quenching it on its way. The flame did not die for lack of fuel, for there was coal dust in plenty where it was extinguished.



Plan of Experimental Mine

The extent of the flame, following the explosion of Sept. 23, 1913, is indicated by the black lines adjacent to the headings where the flame traveled.

The Garforth stone-dusting was also effectual, the small carbonaceous percentage in the dust not showing an objectionable action here or in the Taffanel barrier. In the air course the flame apparently went to 725, or 25 ft. beyond the stone-dust zone, the greater effectiveness of the barrier being probably due to its greater length.

How the Three Cars Were Blown Inward

Perhaps the most interesting feature was the action of four mine cars filled with stone dust, which were left to withstand the force of the explosion. So far from being expelled from the mine, three went inward. Of course, experts have known of this action long ago, but such convincing, measurable evidence has perhaps never before been presented.

Three cars stood on the track in the main entry, one 925, one 1000 and one 1075 ft. from the portal. After the explosion the outby car was on the rails at 954 having moved 29 ft., the next car was off the track against the rib at 1045 having moved 45 ft., the third car had scraped off the shelving from 1075 to 1222. The sides of the car were broken and the load discharged. The car was found diagonally across entry.

This return draught was not juggling with empty cars. Each car on the track before the experiment was loaded full and rounded up with about 2 tons of fine dirt. The cars themselves weighed about 1500 lb., light. It will be noted that the cars furthest from the initial point of explosion traveled the least distance and were least injured; thus the return current was least forcible at points where the explosion was most violent. The platform on which dust was spread opposite the cannon at the crosscut was also drawn to the end of the main entry. On the other hand, a car in the crosscut near the cannon, which did not go off, was driven *with* the explosion and struck violently against the air course opposite the crosscut, and half the fine dirt was thrown out.

Judging an Explosion by Indications

All of which shows that it is a difficult matter to judge the direction (the mathematicians would rather term it "sense") of an explosion from the movements which it causes.

"Clearly" the expert of fifteen years ago, or even of today, would say, "the explosion started near the Taffanel barrier, for it was most violent at that point. There posts were thrown outward and cars driven inward. Note, he would add that the platform went to the end of the heading and the car in the crosscut being round the turn was blown to the air course." Hardly any but those who actually know the antecedents of the explosion would today venture to focus it in the cannon at the end of the entry, the point toward which nearly all loose objects approached and where least damage was done.

The Post-Explosion Vacuum Theory

The theory that the draft inward occurs *after* the explosion hardly seems tenable. For the car (at 925), which stood where the explosive wave was most nearly at detonating speed, was least disturbed. Had it met the full blast going outward, surely we should have found it in the valley, empty and dismantled instead of further in the mine than before the explosion and uninjured and with its load still intact.

Seeing that the explosion traveled in both directions and that the shot was fired in a blind heading, it is not of much importance in which sense the current moved. It entered, however, at the main entry and the air supplied every minute was 8000 cu.ft., giving a velocity of roughly

150 ft. per min. This has been determined from careful measurements when the fan was making the same number of revolutions as at the time of the explosion.

The explosion went up the blind entry on the right to within 25 ft. of the face, though there was no coal dust in this entry, nor was it protected with any stone dust. The two left butt entries free of dust of any kind were hardly penetrated by the flame, but in the second of these, the guncotton 25 ft. from the entry was partly burned.

View of the Steel Gallery at Bruceton Mine

This photograph was taken from the end of the oblique gallery, and shows on the left the fan house and the side passage leading thereto. In the rear are the barricade of earth and concrete, the engine and boiler houses, dust mill and stable.

The "British Coal-Dust" samplers failed to be effective. The sampling bottles prepared by the bureau partly succeeded. Apparently, bottles 1 and 3 of the series received the gas from the explosion, but bottle 2 failed. These bottles are all close together in the heading. The explosion breaks the head of the first bottle, the mine air is admitted and a wax plug is automatically inserted almost immediately. The other bottles in turn are caused to be broken by clockwork and they are sealed by the outside pressure forcing wax into the head of the sampler.

Some Follies and More Business

In the evening a smoker was held with songs, stogies, steins, speeches and "stunts." G. A. Burrell, the chemist for gas investigations, was master of ceremonies, and revealed an unsuspected satirical side. He roasted in verse many of the Bureau of Mines men, and did not forget to show up with some good judgment the failings of others, who had to defend their reputations, if they could, with a speech.

On Sept. 24, the business session commenced somewhat late, committee meetings having delayed its convening. Nearly every committee merely recorded proggress. Questions which had been submitted as to first-aid methods were not discussed in committee, and no report was made on them. Consequently the work was more or less perfunctory except the election.

H. M. Wilson, First President

It was decided, and, we think, with no little justice, that H. M. Wilson, who has served as chairman, who built up the organization, who has labored unceasingly for its development, and whose original ideas it clearly reflects, should be elected its first president. He refused to serve another year as he thought someone not with the bureau would better serve to place the organization on an independent footing. So H. M. Wilson was elected president for the balance of the present business year. His tenure of office lasted almost 15 min., after which he was followed by J. R. Reese, general superintendent, Chicago & North-Western Railway Coal Properties, Gillespie, Ill.

The following were elected as vice-presidents:

Dr. A. F. Knœfel, surgeon, Vandalia Coal Co., Linton, Ind.
J. A. Fletcher, general superintendent, Cherokee-Pittsburgh Coal & Mining Co., Frontenac, Kan.
J. Wells, Newport, Mo.

The executive committee is as follows:

Dr. W. S. Rountree, chief surgeon, Tennessee Coal, Iron & R.R. Co., Birmingham, Ala.
E. H. Weitzel, general manager coal mines, Colorado Fuel & Iron Co., Pueblo, Colo.
R. A. Phillips, general manager, coal department, Delaware, Lackawanna & Western R.R., Scranton, Penn.
Dr. G. H. Halberstadt, chief surgeon, Philadelphia & Reading Coal & Iron Co., Pottsville, Penn.
F. W. Sperr, professor of civil and mining engineering, Michigan College of Mines, Ann Arbor, Mich.
W. H. Aldridge, managing director, Inspiration Consolidated Copper Co., 14 Wall St., New York City.

The meeting decided not to commit itself on the question, "One day's rest in seven for the promotion of greater safety," on the ground apparently that it would interfere with existing contracts. We are sorry a stand was not taken on this subject.

A first-aid round table luncheon was held at noon, the genial Dr. A. F. Knœfel presiding. Doctor McHenry spoke at some length on the fact that a physician should take care of the sick not only by prescribing medicine, but by insisting that proper care be taken of patients and he should guard the healthy by demanding sanitary conditions at the school and around the homes and stores. He said that at the Penn-Mary mines, men who did not obey sanitary laws, who did not care properly for the sick, and who thus showed themselves undesirables, were discharged, regardless of their value as workmen.

The afternoon was occupied by a visit to the Bureau of Mines and the Museum of Safety of the U. S. Steel Corporation.

⁂

According to the new English coal mines act, a place shall not be deemed in a fit state for working if the air contains less than 19 per cent. oxygen or more than 1¼ per cent. carbon dioxide. The percentage of inflammable gas must not exceed 0.25 per cent. in an intake airway.

The Meet of the Susquehanna Interests

By R. Dawson Hall

SYNOPSIS—At the Shamokin first-aid meet of the Susquehanna Coal Co., some instructive events illustrated how to rescue a man who has fallen into water in a low place full of noxious gases and how to bandage and care for a victim who has had an arm torn from the socket. Notes are added on the prone-pressure method.

⁂

The first-aid teams of the Susquehanna Coal Co., the Mineral Railroad & Mining Co., the Summit Branch Mining Co., and the Lytle Coal Co., held a common meet at Edgewood Park, Shamokin, Penn., on Sept. 13, 1913.

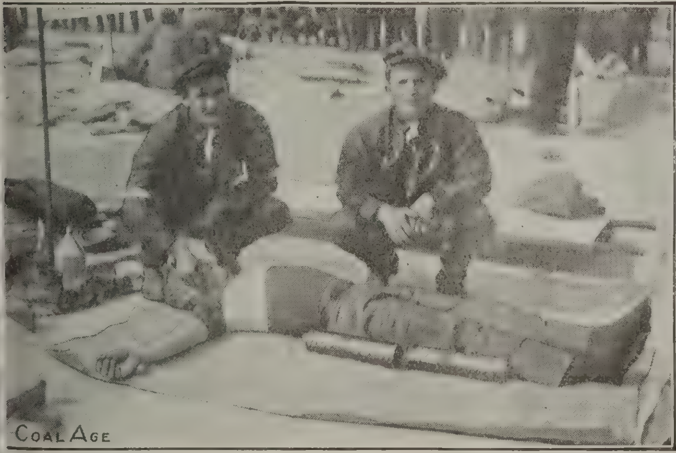
The Meet of the Susquehanna Interests in Edgewood Park

The photograph was taken in the afternoon and represents the final contests when only 14 teams competed.

Thus, Nanticoke No. 5 colliery, had four teams represented, known as Outside, No. 4 slope, No. 2 slope and Stearns. J. Wadzinski represented No. 2 slope in the one-man event, and was pitted against three other contestants representing the other sections of Nanticoke No. 5 colliery. Being victor in that contest, he was selected to meet the winners, similarly chosen from the teams of other collieries. This final contest, like those of the other events, took place in the afternoon, and the winner of this second contest was G. Esher, one of the outside men at Hickory Ridge colliery, who bested the representative of the inside men of that mine in the elimination contests. J. Wadzinski, however, won the second prize for the one-man event.

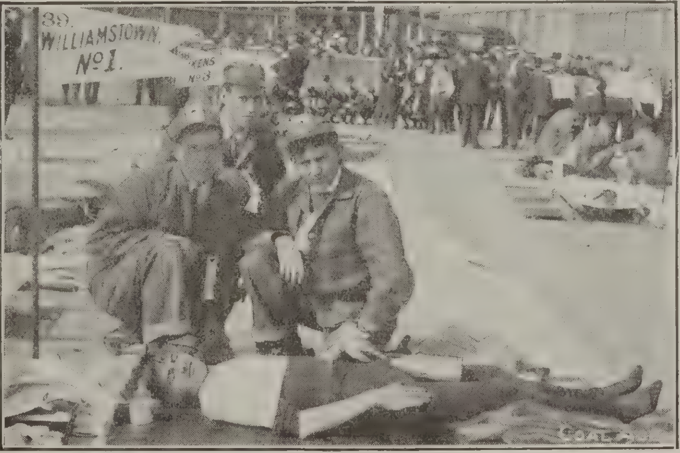
Similarly, J. Butchko and J. Schrama, of Nanticoke No. 5 colliery, No. 4 slope, were successful in carrying off the honors for their teams in the two-man event, as against their competitors of the other three sections of the same workings. In the afternoon they were pitted against the best men at the other thirteen collieries and were successful in getting first prize.

It is in this way that the teams were chosen for the final contest in both the three-man and full-team events. Each team stood on its merits. If it showed skill in the one-man event, it was allowed to contest the honor in the finals; the lack of skill in other events did not act as a bar.



Pennsylvania Colliery, Nos. 1 and 5 Slopes

The subject is supposed to have had his arm torn from he socket. This arm is stretched out at full length. The ıan at the head is compressing the artery which runs along he collar bone.



Williamstown No. 1 Summit Branch Mining Co.

Same event as in adjacent illustration. The compress shows plainly over the shoulder. The team has placed the arm, which is supposed to be torn out, along the side of the subject.

hree large trainloads of participants and guests from hree different directions arrived in the early morning at hamokin.

How the Elimination Contests Were Conducted

The forenoon was occupied by the elimination contests, y which the contesting teams were reduced from 43 to 4. Several teams representing sections of each colliery ere engaged in the elimination trials, but as a result of ıese first contests representative teams were chosen from ıch colliery to represent that mine in the afternoon ontest.

Dr. S. M. Maurer, of the Susquehanna Coal Co. (Shaft Post-Office Division), and of the Mineral Railroad & Mining Co., Dr. G. M. Stites, of the Summit Branch Mining Co., Dr. B. C. Guldin, of the Lytle Coal Co., and Dr. J. H. Hughes, of the Susquehanna Coal Co. (Nanticoke and Glen Lyon divisions), were the judges in the elimination contests.

The Winning Teams

The victors in the final trials were:

One-Man Event—1st prize, G. Esher, Hickory Ridge colliery, outside; 2d prize, J. Wadzinski, Nanticoke No. 5 colliery, No. 2 shaft.

Two-Man Event—1st prize, J. Butehko and J. Schrama, Nanticoke No. 5 colliery, No. 4 slope; 2d prize, J. Williams and J. Eister, Luke Fidler colliery, outside.

Three-Man Event—1st prize, J. A. Buggy, J. Morlock and J. Hine, Cameron colliery, outside; 2d prize, W. Matthews, R. Kantner, Andrew Sadusky, Pennsylvania colliery, Nos. 1 and 5 slopes.

Full-Team Event—1st price, W. Horn, captain, A. Parker, G. Morse, G. Lessig, M. Rafferty, H. Straub, subject, Scott colliery, outside; 2d prize, W. Matthews, captain, R. Kantner, A. Sadusky, A. Zigray, F. Feifer and J. Burt, subject.

The judges of the final contests were Drs. T. B. Rogers, of Pottsville, Penn., D. H. Lake, of Kingston, Penn., J. W. Geist, of Wilkes-Barre, Penn. They made a thorough investigation of all the victims, noting with great care how each was bandaged. Each judge made his own marking, and the team was given the average of those three separate scores. The captain in each case was asked how the work was done, and very definite, clear and complete were the replies given.

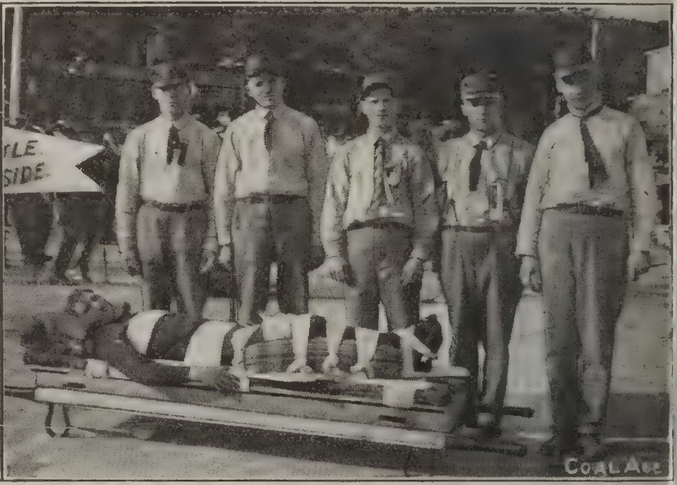
Rescue and Resuscitation

The first or one-man event was as follows:

An explosion of gas has occurred, a man is found unconscious lying face down in a ditch ;the place in which he is found is only 3 ft. high; rescue and carry 10 ft. Perform artificial respiration by Sylvester method; dress simple fracture of jaw and wound of right temple, time limit 15 minutes.

The Prone-Pressure Method

The head is placed on one side, resting on the hand. The hands are placed on the sides over floating ribs. In this case the demonstrator is not using his weight for compression.



Lytle Inside Colliery—Lytle Coal Co.

Subject dressed for dislocation of right hip. The team does not attempt to reduce dislocation, but retains it in place by folded blankets and bandages, as it is found.

The teams all adopted Dr. M. J. Shields' method of turning the victim on his back and tying the hands together. The rescuer then passed his head through the hands of the victim with his back to the victim's chest. Then squirming around, he worked the victim onto his back and crawled with him the required 10 ft. Of course, if the distance of travel were only 10 ft., neither Dr. Shields' system nor this modification would be necessary, but it is natural to suppose that a longer distance was in contemplation, and the space was reduced only because of the exigencies of the meet.

It is true that if a man has any water in his lungs, it is not well to carry him with his mouth upward, more than a few feet. He should be rolled over, in this event, so as to drain all the water out of his mouth and lungs. On arriving with his subject at the required place, the contestant placed him over his knees and endeavored in a more perfect way to relieve his lungs of all liquid secretions.

The Sylvester method seemed quite generally performed by pressure on the chest instead of by thrusting the elbows into the ribs, after the method commonly taught. The explosion of gas probably did not affect the abdomen; in fact, the burning may well be assumed not to have been severe, or the prone-pressure method would have been ordered. Consequently, there does not seem any reason for the teams avoiding the side-swiping pressure action, recommended by many authorities and replacing that method by direct compression of the chest.

An Arm Torn Out of the Socket

The second or two-man event was as follows:

A man has his right arm caught in machinery, tearing it completely off and out of the socket at the shoulder joint. Control hemorrhage, dress wound. State to judges what was your first method of stopping bleeding and your final method. State also your final disposition of the injured man. Time limit, 10 minutes.

Passing along the upper edge of the clavicle, or collar bone, runs the subclavian artery, well protected from injury, but a difficult artery to reach in case it is desired to stop it from bleeding. For a long distance it is covered by the sterno-mastoid muscle and cannot be readily reached. But in a depression, markedly visible in lean persons, the subclavian artery can be forced down onto the first rib and thus caused to cease flowing. The artery changes its name beyond this point and is known as the axillary artery until it reaches the arm, where it is renamed the brachial artery.

When the arm is torn out of the socket, this artery is torn apart, and as it carries a large flow of blood, its severing subjects the victim to immediate risk of death. The first action of the first-aid man is to press on the subclavian artery with his thumb at the point stated, and then take a stick wrapped with something soft and press firmly on the artery so as to pinch it between the stick and the upper side of the first rib.

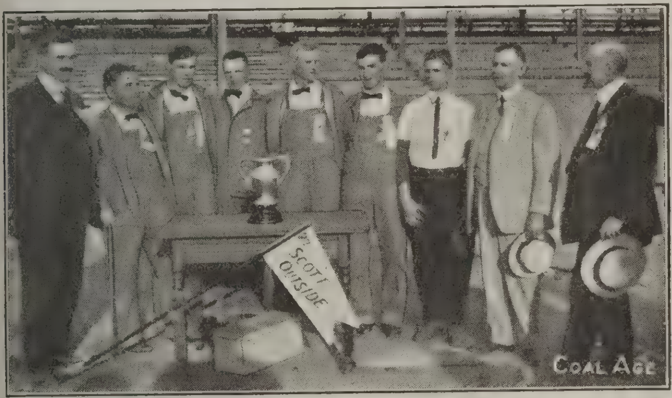
One of the teams arranged for continued pressure by passing a bandage over the pressing body, down between the legs of the patient. Whether this was approved by the judges did not appear.

Additional Precautions

After the patient was thus provided for, the team was supposed to fill the vacuity where the arm had been torn out, with gauze and put a compress over it, preferably a hemispherical ball, but in practice anything which might be available, to secure everything in place by a bandage passing from side to side of the subject and to tighten the bandage with a Spanish windlass. Of course, shock was to be cared for, hot-water bottles being used to that end.

It will be noted in the illustrations that the arm not being torn from the subject, the compress and bandage were put by some below the arm in the armpit. Some put it on the shoulder, and the bandaging then showed its purpose better, though it could not be said that it was any more correct. Note how the Williamstown No. 1 team put a water bottle at the base of the spine—a good place to stimulate the whole nervous system.

The teams had been taught to reply to inquiries that it was not safe to move a subject whose arm had been torn out at the socket. They were told it was the duty of those rendering first-aid to send immediately for a doctor to tie the artery, and meanwhile keep the patient from bleeding to death by continued pressure on the subclavian artery, supplemented by the action of the compress, which would prevent such blood from escaping as might not be held back by direct pressure on the artery.



THE WINNING TEAM—SCOTT COLLIERY OUTSIDE

From left to right, R. Stroup, outside foreman; W. Horn, captain; A. Parker, G. Morse, G. Lessig, M. Rafferty; H. Straub, subject; W. R. Reinhardt, superintendent; J. M. Maurer, medical director.

The third, or three-man event, was as follows:

> Rescue a man from electric contact, carry 10 ft., perform artificial respiration by the prone method. Treat burns of right arm and forehead, and a compound fracture of third and fourth ribs of right side. Time limit, 15 minutes.

The prone-pressure method is shown in the illustration. It is interesting to note that all the first-aid men have been instructed to release their hold on the floating ribs suddenly, so that the quick outward movement of the chest will make a more marked current flow in toward the lungs and thus sweep away any obstructions.

The fourth and full-team event was:

> Laceration of the middle-third of right thigh; dislocation of right hip; dislocation of spinal column. Handle by four bearers, carrying subject in front of reviewing stand, passing over obstruction and return to station.

Much credit should be given C. K. Gloman for his excellent work in supervising the arrangements for the meet. After the cup was presented, speeches were made by R. A. Quinn, the vice-president and Morris Williams, the president of the companies. It was announced that the companies had formed a safety committee and would make every effort to reduce accidents, and desired suggestions from their employees.

⁂

The Situation in Colorado

It has been variously estimated that from 50 to 90 per cent. of the miners in the southern Colorado coal field laid down their tools, Sept. 23, in response to the strike call issued by the United Mine Workers of America. Officials of the various mining companies claim that only about one-half their men went on strike, while the officials of the miners' union say that fully nine-tenths of the mine workers are out.

A few of the smaller mines are being worked practically full force, while many of the larger operations are at least seriously handicapped, if not practically closed down. It is impossible to say how long conditions will remain as they are, or what the changes will be.

The miners early began a general exodus from company houses and took up their quarters in tented camps. The mining companies have also made provision for the comfort and safety of the men at work.

On Sept. 25 three negro strikebreakers were mobbed by miners at Ludlow. With one exception, the identity of these men, as well as their fate, is unknown. Aside from this, and one or two other minor outbreaks of mob violence, the entire mining region is comparatively quiet. It is hoped and believed that it will be unnecessary to call out the state militia, although that organization is held in readiness for immediate service.

⁂

First-Aid Meet of the Navigation Co.

By E. H. Suender*

The Lehigh Coal & Navigation Co. held its First Annual Field Day and First-Aid Contest at Lakeside, Aug. 30, 1913; it was attended by 550 employees, including a number of invited guests. A special train of eight passenger cars left Lansford at 8 a.m., accompanied by a band of 26 pieces. The invited employees included first-aid men, mine-rescue men, all of the department heads, foremen, assistant foremen and loader bosses.

The First-Aid Contest

There were 20 teams in the first-aid contest, composed of five men each, including the subject. The teams represented the various operations, both inside and outside. Great credit is due to the company's first-aid physician, Dr. J. H. Young, and his assistant, J. L. Simons, fire inspector of the Lehigh Coal & Navigation Co., for the showing made by the contestants. The following shows the average of the various teams:

Team	Colliery	Captain	Per Cent.
No. 1	No. 8 slope	T. J. Evans	98.8
2	Lansford (outside)	Alex Gibson	98.4
3	Springdale	Thos. Whildin	96.8
4	No. 11 shaft	Jas. Tiler	96.8
5	No. 9 shaft	Dan Moser	96.4
6	No. 8 shaft	John Boyle	96.4
7	No. 10 shaft	Alex Jones	96.0
8	Hauto washery and Summit	Thos. Reese	95.2
9	Coal Dale (outside)	Wm. Calahan	95.2
10	No. 6 shaft	Fred Fetzer	94.8
11	No. 14 shaft	Oscar Beltz	94.8
12	Nesquehoning (outside)	Wm. Adams	94.8
13	No. 4 shaft	Robt. Sinyard	93.6
14	No. 5 shaft	Sam Hollenback	93.6
15	Foster's Tunnel	Thomas Thomas	93.6
16	Greenwood (outside)	Thos. Mitchell	92.8
17	No. 2 shaft	John Priestly	92.8
18	Electrical	Harold Ramsey	92.8
19	Lansford shops	Dan Jones	92.0
20	No. 3 slope	John Lewis	92.0

---

*Lansford, Penn.

First Annual Outing, Lehigh Coal & Naviga

The judging staff of the first-aid contest included Dr. E. H. Kistler, Lansford; Dr. E. E. Shifferstein, superintendent Coal Dale State Hospital; Dr. W. H. Clewell, Summit Hill; Dr. W. H. Kasten, Lansford, and Dr. M. H. Neumuller, Lansford. The time keeping was in charge of Mining Engineer W. B. Richards.

Awarding of Prizes

First Prize of $25 in gold and a silver medal for each member was won by No. 5 Slope team composed of the following:

Thomas J. Evans, **Captain,**
John Rimbach,
Evan Phillips,
Arthur Jeffries,
John Neznamy, Patient.

Second Prize of $15 in gold was won by Lansford (outside) team composed of the following:

Alex. Gibson, **Captain,**
Earnest Hugel,
Howard Lesher,
Grant Blyler,
Joseph O'Donnell, Patient.

Third Prize of $10 in gold was won by Springdale team composed of the following:

Thomas Whildin, **Captain,**
John Pasco,
John Haughton,
James Monroe,
David Griffiths.

Athletic Contests

The company has created a healthy spirit of rivalry among its employees by stimulating interest in athletic contests. Vice-President Ludlow has presented a large silver cup which will be competed for at each annual outing, until same is won by one district for three times,

Iining Department, Lakeside, Penn., Aug. 30, 1913

when cup will become the property of that district. The districts are:

- No. 1 Headquarters (general office, shops, store, storage yard, etc.).
- No. 2 Nesquehoning.
- No. 3 Lansford.
- No. 4 Coal Dale.
- No. 5 Greenwood.

Details of the results were as follows:

50-Yd. Swim—1st, C. Lutzcavage; 2d, A. G. Morlach; 3d, D. C. Helms.

300-Yd. Single-Oar Boat Race—1st, H. H. Houser; 2d, G. Roads; 3d, J. Priestly.

100-Yd. Swim—1st, Lutzcavage; 2d, E. M. McDermott; 3d, A. Luschman.

400-Yd. Double-Oar Boat Race—1st, H. Houser; 2d, E. Suender; 3d, G. G. Gardner.

Standing Broad Jump—1st, E. H. Thomas; 2d, W. James.

Running Broad Jump—1st, E. H. Suender, 16 ft. 9 in.; 2d, J. McHugh; 3d, D. Thomas.

Putting 16-Lb. Shot—1st, E. Brennan, 32 ft.; 2d, J. Melley; 3d, J. Davis.

Throwing Baseball—1st, Joseph Cunning, 267 ft. 8 in.; 2d, E. McDermott; 3d, T. Dermott.

100-Yd. Dash—W. James, 10$\frac{3}{5}$ seconds; 2d, S. Gluck; 3d, A. Mertz.

50-Yd. Dash (all entrants over 200 lb.)—1st, J. Denis; 2d, W. Miller; 3d, G. Thomas.

50-Yd. Race—1st, P. Bauer; 2d, G. Rose; 3d, J. Sweeney.

100-Yd. Three-Legged Race—1st, G. Rose and J. Tate; 2d, D. Griffith and A. Pascoe; 3d, M. Morgan and P. Boner.

220-Yd. Dash—1st, W. James; 2d, C. Mertz; 3d, N. McCullion.

50-Yd. Dash (entrants over 50 years old)—1st, M. O. Morgan; 2d, A. Haughton; 3d, P. O'Donnell.

Tug of War—Won by Coal Dale.

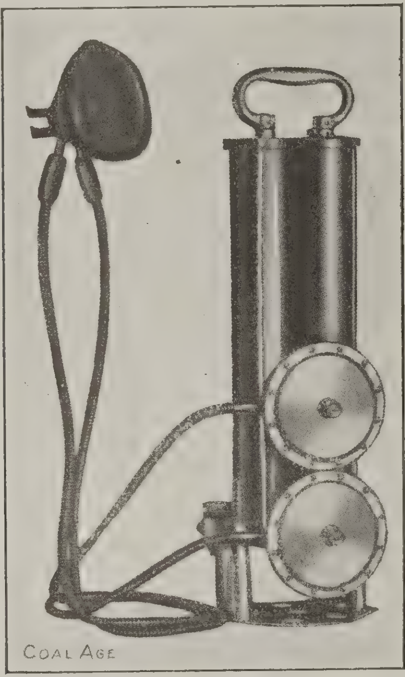
Total Points—Headquarters, 43; Coal Dale, 33; Lansford, 32; Greenwood, 20, and Nesquehoning, 11.

Baseball—The Lansford shop team captured the baseball game from the Lansford District by a narrow margin of 3 to 1. It was a hotly contested game throughout, the score standing one to one at the beginning of the ninth.

A New Resuscitation Apparatus

Heretofore most devices for resuscitation have been automatic in operation. A supply of oxygen is contained in a cartridge or cylinder under high pressure, and serves not only to furnish the wherewithal for breathing to the patient, but also by virtue of its pressure it operates the machine itself.

The Life Saving Devices Co., of Chicago, has recently placed upon the market a resuscitation device called the "Lungmotor" which does not depend upon the action of any compressed gas for operation. Furthermore, this device makes use of atmospheric air, or any desired mixture of atmospheric air and pure oxygen. Being operated by hand, the rapidity of forced breathing is at all times under control of the operator.



LUNGMOTOR WITH MOUTHPIECE

The instrument consists essentially of a double-chamber pump, connected by flexible tubing to a mouthpiece, fitting over the patient's face. A suitable governing device is also provided so that the pressure upon the lungs cannot be raised above a safe amount. Adjustment can be immediately made to the capacity of the lungs of the person being treated. Thus a new-born child and a large adult could be resuscitated by the same machine.

The air pump proper is composed of two cylinders, each provided with a piston and piston rod. The reciprocating parts in each working barrel move simultaneously, being connected at their upper ends by a common handle. One cylinder thus pumps air into the lungs while the other on the return stroke removes it therefrom. A simple device permits of the substitution of a tracheal tube for the ordinary soft-rubber face piece.

AN OXYGEN GENERATOR IS PROVIDED

As an auxiliary to this Lungmotor pump, an oxygen generator is provided and connected thereto with suitable flexible piping. In this generator, oxygen is made by the union of water with an oxygen powder which, for convenience, is put up in 7½-oz. tins, each furnishing approximately 8 gals. of chemically pure oxygen, which is ordinarily enough for about 2½ hours' use in treating asphyxiation.

Both the Sylvester and the Schaefer method of resuscitation leave much to be desired and both are admittedly inferior to mechanical means. In operation the device above described closely approximates natural breathing and furnishes only the proper amount of air, avoiding all danger of too much pressure or overinflation of the lungs.

One great advantage of this new apparatus is its lightness and the ease with which it may be transported from place to place. The pump and oxygen generator, packed complete in a carrying case, together weigh approximately only 30 lb. Another advantage, which under certain circumstances may be of primary importance, is the fact that resuscitation by this machine is not dependent upon a supply of ready prepared oxygen. Fresh air is always available, and under most circumstances will answer every resuscitational need.

⁂

Itinerary of Federal Mine-Rescue Cars

Evansville Car No. 3—Itinerary No. 1—Revised September 24, 1913

		1913	
At	Companies	Arrive	Leave
Shelburn, Ind.	Monon Coal Co., Alliance Coal Co., Peabody Coal Co., Brazil Block Coal Co., Gregory Coal Co.	Sept. 29	Oct. 11
Terre Haute, Ind.	Vandalia Coal Co., United Fourth Vein, Big Vein Coal Co., Monon Coal Co., etc.	Oct. 13	Oct. 18
Clinton, Ind.	Shirley Hill Coal Co., Brazil Block Coal Co., Oak Hill Coal Co., Clinton Coal Co., Bunsen Coal Co., etc.	Oct. 20	Oct. 25
Jasonville, Ind.	Green Valley Coal Co., Monon Coal Co., Letsinger Coal Co., United Fourth Vein	Oct. 27	Nov. 1
Linton, Ind.	Vandalia Coal Co., United Fourth Vein	Nov. 3	Nov. 15
Bicknell, Ind.	Bicknell Coal Co., Freeman Coal Co., Linn Coal Co., Tecumseh Coal & M. Co.	Nov. 17	Nov. 26

Pittsburgh Car No. 6—Itinerary No. 1—Revised September 10, 1913

		1913	
At	Companies	Arrive	Leave
Fairmont, W. Va. (Special Siding)	Consolidation Coal Co., Jamison Coal & Coke Co., Hutchinson Coal Co., New Central Coal Co., Madeira-Hill-Clark Coal Co., Virginia & Pittsburgh C. & C. Co., Winchester & Virginia C. & C. Co., Federal Coal & Coke Co., Four States Coal & Coke Co., Virginia-Maryland Coal Corp., Elkins Coal & Coke Co	Sept. 29	Dec. 30

Mine Rescue Car No. 7—Itinerary No. 1—Revised September 24, 1913

		1913	
At	Companies	Arrive	Leave
Inman, Virginia	Virginia Iron, Coal & Coke Co.	Sept. 29	Oct. 4
Oak Hill, W. Va.	Fayette County Fair Association.	Oct. 6	Oct. 11
Stone, Ky., Peg, Ky., Hardy, Ky., McVeigh, Ky.	Pond Creek Coal Co.	Oct. 13	Oct. 25
Gary, W. Va., Elbert, W. Va., Anawalt, W. Va.	United States Coal & Coke Co.	Oct. 27	Nov. 8
Jenkin Jones, W. Va., Pocahontas, Va., Switchback, W. Va.	Pocahontas Consolidated Collieries Co.	Nov. 10	Nov. 29
Olmstead, W. Va.	Houston Coal & Coke Co., Lake Superior Coal Co.	Dec. 1	Dec. 6
Vivian, W. Va.	Tidewater Coal & Coke Co., Bottom Creek Coal & Coke Co.	Dec. 8	Dec. 13
Eckman, W. Va.	Shawnee Coal & Coke Co., Houston Coal & Coke Co., Eureka Coal & Coke Co.	Dec. 15	Dec. 20

⁂

The next issue of "Coal Age" will contain a full description of "The Muckle Cup Contest" (American Red Cross Meet), held at Valley View Park, Inkerman, Penn., Sept. 27. This number will also show a photograph of the third annual outing of the Lehigh Valley Coal Co. Social Association, held at Hazle Park, Penn., in August. A further article will deal with "Safety Precautions of the Consolidation Coal Co. of West Virginia."

EDITORIALS

It is poor economy to reduce the speed of the mine ventilating fan during the night hours and on holidays when the mine is idle. This practice has been the direct cause of many serious and fatal accidents.

⁂

The good results said to have been obtained by the systematic division of labor in mines, a plan inaugurated some time ago, by one of the largest coal-mining companies in Montana; and the system of close supervision of miners, during working hours—a plan recently adopted by the Lehigh Valley Coal Co., operating in the northern anthracite district of Pennsylvania, are hopeful indications that the death rate in coal mining for 1913 will be much reduced.

⁂

Is it a fact, as has been suggested, that there is among a large class of miners a certain "uncanny" feeling, in respect to the presence of the safety lamp in the mine; and does this create an antipathy for the lamp, on the part of mine workers, that deters some operators from introducing the lamp into their mines when their best judgment dictates that safeties should be used? To answer this question in the affirmative would be to bow in submission to a recognized superstition, on the part of mine workers, that is a relic of the past.

⁂

Driving It Home

The marked success which has attended the efforts of the H. C. Frick Coke Co. and the various other mining organizations subsidiary to the United States Steel Corporation in conducting their "Safety-first" campaign, has been due largely to the fact that they have brought home to the miners themselves a realization that they, and they particularly, are responsible for accidents. The mine worker is made to feel that, after his employer has spent vast sums for accident prevention, the occurrence of any mishap, be it ever so trivial, is a disgrace not only to the company, but to him, and to him personally.

It has been said, and truthfully, that habit is stronger that nature. A soldier never knows the manual of arms until, through continuous drill and practice, the various gun-movements have become purely and solely a matter of routine, requiring no mental effort whatever. A miner is never secure from preventable accidents until he has contracted the "safety habit," until the exercise of caution and forethought has become as much a part of his day's work as the manipulation of drill, pick or shovel.

In order to keep the thought of safety continuously before the men, many ingenious methods are adopted. The lead pencils furnished the various company employees, bear the legend "Get the Safety Habit" or some similar admonition. The matches sold at the commissary will perhaps bear upon the box the red danger signal, and the words "Safety-first," possibly also the company's monogram. The cigars which the superintendent occasionally confers upon some worthy employee or friend are encircled with "Boost for Safety" bands, and the pay envelope in which each worker receives his semimonthly stipend, is adorned with some pointed admonition, concerning dangerous practices, such as riding on trips, etc. Furthermore every scrap of official paper that leaves the office, regardless of whether it is a notice that Sam Smith has been appointed stable boss, or a check to John Doe for $1000, will have "Safety the First Consideration" printed conspicuously across its face.

These are perhaps insignificant details and cannot compare either in importance or results with the appointment and maintainance of work's committees from the miners themselves. They are, nevertheless, minutiae in the practice of a great humanitarian idea, and serve to drive home to the person into whose hands such articles as have been mentioned above may come, that with those who make coal-getting their occupation, tonnage may be important, but safety should be paramount.

⁂

The Federal Bureau of Mines

About a year ago we asked Doctor Holmes, director of the Federal Bureau of Mines, to investigate the possible electrification of the mine air by a current of high potential, conducted into the mine for lighting and power purposes. Doctor Holmes promised to have the matter taken up, at their experimental station, and thoroughly investigated to ascertain if it were possible for a dangerous condition of mine air to develop, owing to stray electrical currents; or if a possible electrical condition could develop in the air that would favor and assist the ignition of gas or dust or otherwise endanger the mine.

This is an important matter and has been recently emphasized by evidence that points to the possibility of a still further influence of high-potential currents in causing the premature explosion of powder, in blasting coal in the mine. A suggestive feature, in this connection, is the fact that many unexplained accidents have occurred in well equipped uptodate mines, using currents of high potential. While it is impossible, as yet, to more than speculate on the possible influence of electrical mine equipment to increase the danger in mines, the question is one demanding immediate and intelligent investigation, for which the Federal Bureau of Mines is equipped and which is its special work and province.

Without seeming to unjustly criticize the work the Bureau of Mines is doing, at the present time, attention may properly be drawn to some of the matters published by the bureau that are, to say the least, misleading to a large class of mining men. In this connection, we would refer, briefly, to Technical Paper No. 43, just issued by the bureau. The paper is entitled, "The Influence of Inert Gases on Inflammable Mixtures." Its author,

J. K. Clement, has produced an interesting and, in some respects, valuable paper. The purpose of the paper and the ground desired to be covered by the investigation is clearly outlined in the preface by George S. Rice. The information made available by the experiments of Mr. Clement undoubtedly has a value that will be appreciated by men who are able to apply the results, in a proper manner, to the solution of mining problems. To a large class of practical mining men, however, there are statements in the paper that are not only misleading but as yet unwarranted, in respect to their application to general mining conditions.

To make clear our position in this regard, we would assert a firm belief and confidence in the value of experimental study; but great caution is needed in setting forth the suggested application to the practice of mining, of the positive and unquestioned determinations in the laboratory.

The paper to which we refer describes the methods used and the results obtained in determining the explosive limits of mixtures of four out of the five important mine gases; namely, methane, oxygen, carbon dioxide and nitrogen. The purpose was to make clear the influence of the extinctive gases, carbon dioxide and nitrogen, on the explosion of varying percentages of methane, in the presence of varying percentages of oxygen. There are two points in the paper to which we wish to draw attention, not for the purpose of criticism so much as to lead to the elucidation of points that have an important practical bearing.

The instruments used in the experiments in the laboratory, were a comparatively small Hempel pipette, having an electric-spark igniter; and a larger steel vessel in which the explosion of the gaseous mixture was effected by the electric arc of a 220-volt current. The steel cylinder used was provided with an opening for the release of the pressure developed in the explosion, the opening being covered by a paraffined-paper diaphragm. In reference to these experiments, two points are worthy of notice, in respect to applying the results too widely, in mining practice: (1) the character of the source of ignition, and (2) the limited confines of the explosion chamber. The effect of these factors can only be judged intelligently by the physicist possessing a broad, practical experience.

The points to which we call attention, and in respect to which we advise caution are the defined limits of explosion for the several gaseous mixtures; and the statement found at the top of p. 17 of the paper, to the effect that "No distinction could be drawn between limits of burning and limits of explosion."

Every practical mining man knows that gas burns in the mine workings; or, in other words, is inflammable when no explosion takes place. The small confines of the laboratory experiments would not represent truthfully mining conditions, in this regard. There is unquestionably a limit of explosion and, beyond this, a limit of inflammability of gaseous mixtures, in mining practice.

Referring, again, to the first point, we desire to recall the well established fact that an explosive mixture of methane and air, at its maximum explosive point, becomes inexplosive by the addition of one-seventh of its volume of carbon dioxide. Making the addition of this proportion of carbon dioxide to a mixture of methane and normal air, at its maximum explosive point, gives the following gaseous mixture: Methane, 8.28 per cent.; oxygen, 16.59 per cent.; nitrogen, 62.63 per cent.; and carbon dioxide, 12.50 per cent.

Now, plotting the coördinates of methane and carbon dioxide, according to the percentages in this mixture and, as stated on p. 21 of the paper, using the diagram, Fig. 3, p. 11, for this purpose, the intersection of the coördinates falls very near the center of the explosive area indicated for a 16-per-cent. oxygen content. This result is plainly at variance with the teaching of the paper, as we understand it. An explanation of this seeming discrepancy between the teaching of the paper and well established facts in mining practice should be given.

⁂

A New Aspect to Trust Busting

For many years there has been a decided inclination on the part of the people to wage unceasing war upon all trusts. With the man who earned his bread by the sweat of his face, the conviction was strong that all aggregations of capital controlled by highly centralized managements were public malefactors, and consequently only fit for dismemberment.

Politicians and demagogues who are ever alert to trim their sails to the varying currents of public approval, have carefully promulgated and fostered the idea that there is only one good trust, and that is a dead one.

In the recent past, however, a new note has been sounded by the voters of the land, and one to which legislators may well hearken and pay heed. As an act entirely of their own free will and accord, several thousand employees of the H. C. Frick Coke Co. petitioned Congress to prevent the dissolution of the United States Steel Corporation. And following the example of the Frick employees, it is expected that those of many other constituent and subsidiary companies of the "Steel Trust" will present similar petitions.

There are few, if any, so-called "trusts" the stocks of which are as widely and as thoroughly disseminated among their employees as are those of the Steel Corporation. Its dissolution would not, therefore, affect merely the vast accumulations of a small group of extremely wealthy money owners, but would endanger the meagre capital and cripple the earning power of the savings of thousands and thousands of honest hardworking mill hands and miners, whose holdings of stock represent the net earnings of long years of toil, economy and thrift.

In forcing this dissolution suit the government has touched thousands of voters in a spot where all men are not only vulnerable but sensitive—the pocketbook. More and more as years go by the poor man is seeing the wisdom of investing his earnings in securities, which yield at least a reasonable rate of interest. And, when a vast number of voters become capitalists, what politician or ring, Legislature or Congress can threaten the earning power of their savings with impunity?

⁂

At the present time we are attempting to solve our troublesome mining problems by the enactment of repressive legislation. The policy of former periods was one whereby invention was used to surmount difficulties. The electric spark is not more dangerous today than the naked flame was a century ago. Can't the electrical profession produce a Sir Humphrey Davy to solve the problem of electricity in gaseous mines?

The Philadelphia & Reading Coal & Iron Co. Meet

Special Correspondence

The ninth annual first-aid contest of the Philadelphia & Reading Coal & Iron Co. was held at Edgewood Park, near Shamokin, Sept. 20. To show the importance of the meeting and the emphasis placed on first-aid work by the company it should be stated that G. F. Baer, president of the Philadelphia & Reading Coal & Iron Co., was present to signalize the event. It was pronounced by all present to have been the most successful ever held by the company.

The big event of the day, the final contest for full teams, was won by the Outside team of the Draper colliery of the Shenandoah Division with a percentage of 97 points, while the Henry Clay team was a close second with a percentage of 95. Eight other teams participated in the final event.

It had been originally planned to hold the meet in Lakeside Park at East Mahanoy Junction, where former contests have been held by the company. Every arrangement was made for the moving of special trains to that point, carrying the first-aid teams and the employees of the various collieries, but early in the morning General Manager W. J. Richards, learning that shelter, in case of rain, could not be secured at Lakeside, gave orders that the contests should be held at Edgewood Park.

The orders were carried out in the short time available, but one of the five special trains carrying the crowds went to Lakeside and on its arrival was forwarded immediately to Shamokin.

A commissary train carrying a company caterer, chefs and waiters to the number of a couple of a hundred, together with their equipment, was rushed to Edgewood Park and at noon served a most tempting lunch. This part of the day's program came immediately after the close of the elimination contests.

The Standing of the Teams

There was much interest and considerable rivalry manifested in the final contest. The problem was considered a difficult one, but all the teams competing made fairly good percentages. The problem in the final contest was: Dress foot, leg, thigh and hip, using spiral reverse for leg and thigh and the spica for hip. Bandages 10½ inches.

The following is a list of the contesting teams with the percentages they obtained:

Teams	Percentages	Teams	Percentages
Draper, outside	97	Alaska	90
Henry Clay, inside	95	Good Springs	89
Otto colliery	94	Turkey Run, inside	85
Tunnel Ridge, inside	93	Knickerbocker, inside	85
Bast, outside	90	Schuylkill Haven, storage yard	84

Drs. J. B. Rogers, of Pottsville, F. C. Fegley, of Fairmount, and E. F. Bickel, of Shamokin, acted as the judges and as soon as they announced their decision President Baer addressed the large audience and presented the pennant to the Draper team, which won first honors. He referred to his recent tour of Europe and to the first-aid work he had seen there and stated that he was more pleased with the work of the P. & R. C. & I. Co.'s teams than with any that he had ever seen. He closed by making a plea for continued loyalty to the company on the part of the men in its employ.

Pennants were then presented to the district winners by President Baer's daughter, Mrs. Smith, of Pottsville, Misses Helen and Loraine Richards, daughters of General Manager Richards, of Pottsville; Miss Clara Deckert, Miss Louise Smyth, Dr. George Halberstadt and G. H. Hoover. Field and water sports which had been planned were not carried out, owing to the lateness of the hour at which the final first-aid contest was completed.

The contests were held on the baseball field immediately in front of the grand stand in which a capacity crowd was seated. There were 76 first-aid teams to participate in the elimination contests in the morning. These teams represent 40 collieries which are distributed throughout Schuylkill and Northumberland Counties and at which more than 25,000 men are employed.

Original Problems

The various corps from each district were allowed to draw one of ten problems submitted by officials of the company. These were worked out and the winners of the various districts were the competitors in the afternoon when the final event took place.

The ten problems were:

Rescue from electrical contact and administer artificial respiration by the Schaefer and Sylvester methods. Also use the oxygen tank and pulmotor. Time allowance, 10 minutes.

Handlings by one, two and three men and on litter. Cross-obstruction and load ambulance. Time allowance, 12 minutes.

Compound fracture of the skull. Dislocated shoulder. Two 2½-in. gauze bandages, one 3-in., one 4-in., and one triangular. Time allowance, 10 minutes.

Simple fracture of the forearm. Laceration of fingers and hand. Separate fingers and apply spica of the hand. Two 2½-in. bandages and two 2-in. bandages. Time allowance, 10 minutes.

Compound fracture of the leg and dislocated hip. Bandages, nine 4-in., three 3-in., and one 2½-in. Time allowance, 15 minutes.

Burns of head, neck, body and right arm. Eight 2½-in. gauze bandages. Gauze and cotton. Time allowance, 20 minutes.

Fracture of the spine and lacerated buttock. Bandages, five 4-in. and six 2½-in. Time allowance, 20 minutes.

Fracture of the right patella and crushed left foot. Bandages, two 2½-in., two 2-in., and one 4-in. Time allowance, 10 minutes.

Lacerated ear foreign body in eye. Bandages, one 2-in. and one 1½-in. Time allowance, 5 minutes.

Dislocated shoulder, fractured ribs. Bandages, two 4-in. and one 3-in. Time allowance, 6 minutes.

Rules of Meet

The following general rules governed the work of the contestants:

The dressings will start and stop at the sound of a gong. The dressing of all injuries to be done with materials issued for the purpose. In the application of the spiral reverse bandage, one-third of the width of the bandage must be left exposed. Subjects should wear tight-fitting underclothing or have the skin exposed. All splints to be padded. There will be three judges, and three districts will work at one time, one judge will be assigned to each district. Final dressing to be decided by the three judges.

The Draper Colliery team has made rapid advancement in first-aid work during the past two years. The team has never before distinguished itself in the contests except in 1911, when it took seventh place.

The winners in former years were: Bear Ridge, 1912; Phoenix Park and Wadesville, 1911; Wadesville, 1910; Glendower, 1909; Tunnel Ridge, 1908; Wadesville, 1907; Lincoln, 1906; Wadesville, 1905.

LEGAL DEPARTMENT

Removal of Coal through Adjoining Land

By A. L. H. Street*

SYNOPSIS—Damage to landowner, and not benefit to operator is proper basis for valuation of right-of-way. Decisions of American and English Courts summarized. Cases stated when right passes with conveyance of coal under particular land. Right cannot be condemned for private purpose.

⁂

Ques.—A Tennessee coal-mining company writes Coal Age as follows: "Can you advise us on the question of the value of the right to haul coal originating on the land of one party through the land of another, and on to the land of a third party? This question is now coming up in our coal field and no standards of value are set. Would you please advise us where we could find some of the older cases covering this point in either America or England"?

Ans.—I find but few American or English cases bearing directly on this question; the scarcity being due, probably, to the fact that such right-of-way generally depends upon express agreement with the landowners affected, since it is usually held that it cannot be condemned. Therefore, the question is not apt to arise in litigation, except in suits for damage in making an unauthorized use of land in hauling coal through it.

What the Courts Have Held

In England, the measure of damages for the use of land as a mining right-of-way is said in *The Laws of England,* Vol. 20, p. 588, to be "the value of the land for the purposes for which it is used; compensation is measured by wayleave rent in respect of the minerals carried, and the rate (if any) usual in the neighborhood is adopted as a convenient measure." This statement is supported by citation of the following English cases: Powell vs. Aiken (1858) 4 Kay & Johnson's Reports 343; Martin vs. Porter (1839) 5 Meeson & Welsby's Reports 351; Whitwham vs. Westminster Brymbo Coal & Coke Co. (1896) 2 Chancery Division Reports 538; Jegon vs. Vivian (1871) 6 Chancery Appeal Reports 742; Phillips vs. Homfray (1871) 6 Chancery Appeal Reports 770; A. G. vs. Tomline (1880) 15 Chancery Division Reports 150; Hilton vs. Woods (1867) Law Reports, 3 Eq. 432. In the second cited case four cents per ton was allowed as wayleave.

The Pennsylvania Supreme Court has held that the measure of damages resulting from the establishment of an underground railroad for the transportation of coal is the difference between the value of the tract as a whole at the time of the entry and its value after the completion of the road, as determined from the opinions of witnesses of skill and judgment, who have had opportunities to learn the value of the property in question, or of similar properties in the same neighborhood (45 Pennsylvania State Reports 495). Another decision of the same court is to the effect that mere *unauthorized* use by the owner of underlying coal of a tunnel to convey coal from adjoining lands does not entitle the landowner to punitive damages, or to any recovery exceeding compensation for injury actually resulting from the wrong, though he is entitled to nominal damages, which were allowed in this case (46 Atlantic Reporter 370). In this interesting case, the Supreme Court approved a statement of the trial judge that the *value to the operator of the privilege of running coal through the tunnel could not be considered*; and that any recovery beyond nominal damages must be based on a showing of substantial injury to the landowner.

Rights in cases where coal is sought to be removed from adjoining land through a mine on particular premises are illustrated by a decision of the Illinois Supreme Court. A lease of eleven acres of land for 35 years to the purchaser of coal underlying that and remaining lands owned by the lessor, for the purpose of mining and removing the coal, was held by the Illinois Supreme Court to give the right, before the exhaustion of such coal, to use the leased premises for the transportation of coal mined on other land (25 Northeastern Reporter 795). In this case the court said: "By the sale and conveyance of the fee of the coal, appellee (the owner of the land) severed it from her estate in the land, and the right of her grantees or their assigns to use the estate thus granted by her in the coal so long as her property is not interfered with or injured in any way, cannot be questioned. It is manifest that until the expiration of the term or until appellant or its assigns shall exhaust the coal under her land, she can have no right of reëntry in the mines, or the leasehold estate. It is not conceivable how the proposed use of appellant's mine and shaft can result in damage to appellee. Any action brought by her for supposed trespass for running its cars through the entries in the mines or for hoisting and delivering the same at the shaft, or for any use of the leased land, would be answered by the fact that appellant was rightfully in possession under the contract."

The Pennsylvania cases cited above, and decisions generally on the measure of damage to land resulting from trespass or condemnation of rights-of-way in general fairly indicate a policy of the courts of this country to fix the amount of depreciation in the market value of the land, if any, as the value of such rights as are here considered, without regard to the value of such rights to the coal operators who acquire them.

When Compensation Is Unnecessary

But it is interesting to note, in this connection, that the right to use tunnels, shafts, and other ways on or under particular land, in removing coal from adjoining land, often passes under the terms of the lease or deed covering coal underlying the particular land, thus rendering it unnecessary for the operator to pay additional ompensation for this right. Application of this prin-iple is illustrated by the following decisions:

---

*Attorney and Counselor at Law, St. Paul, Minn.

Unless the instrument whereby right to mine coal is ranted contains a provision to the contrary, the space eft by the mining operations may be used during the ontinuance of the grant for the purpose of hauling min-rals and draining water through such space from other nines (Ohio Supreme Court, 80 Northeastern Reporter).

A lease of coal lands with surface right-of-way for racks, etc., at a specified rental, with the privilege to ontinue their use after exhaustion of the coal, at an nusual rental of $20, was held by the Iowa Supreme ourt to give the right to use the way for the removal of oal mined under adjoining land, including the use of nderground entries and shafts, and, hence, not to en-itle the landowner to additional compensation (86 orthwestern Reporter 41).

A conveyance of all the coal under certain land, "to ave and to hold * * * until the exhaustion thereof" rants right to carry, through a chamber, or tunnel cut n the same, other coal dug out of an adjacent mine, for he purpose of taking it out through an opening in land f his own (Pennsylvania Supreme Court, 22 Atlantic eporter 1035). The court held in this case that this ule is not affected by the question whether the mining ight is the subject of an express grant or of an excep-ion in a conveyance of the remaining interests in the and. But, in a later Pennsylvania case, it was held that deed to underlying coal, with a right on the land to arry the coal away did not give the right to take out f the pit on the land, and carry by such right-of-way oal mined under another tract, nor to dump at the pit's nouth refuse from the other mine. It was further held hat the right did not arise because of a practice of the ormer common owner of both tracts (28 Atlantic Re-orter 226).

Noting the conflict between the holdings in the two ast mentioned cases, the Pennsylvania Supreme Court 42 Atlantic Reporter 4) declared that it intended to dhere to the rule that the purchaser of underlying coal vith a right-of-way over and under the land, is entitled o haul through the gangways of the mine coal mined under adjoining land, so long as the mine is necessarily ept open to mine coal still remaining under the par-icular land. And as late as 1909, the same court de-ided that the lessee of a coal mine cannot be charged for se of gangways on the premises for transporting coal rom other premises (74 Atlantic Reporter 26).

Although a conveyance of minerals implies a right-of-vay over the grantor's land, under which they lie, for heir removal, there is no right over the lands of one ther than the grantor (Tennessee Supreme Court, 90 enn. Reports 619; 118 Southwestern Reporter 649).

Statutes in several states purport to give the right to ondemn rights-of-way for mining purposes, but such aws are held by the courts to be unconstitutional so ar as they may be construed to authorize condemnation f a way for private use only. The connection of two eds of minerals belonging to the same owner by a way assing through the land of another is a private use for vhich land cannot be condemned. But statutes provid-ng for condemnation of land for railroads open to the ublic on payment of proper compensation are valid. (Barringer & Adams on Mines and Mining, 1st Ed., pp. 591, 592.)

Who Is Liable for Taxes on Coal Stored on Docks?

The question as to whether delivery under certain conditions is such delivery to the buyer as passes title to him may become important in the question as to who is liable for taxes on coal constituting the subject of sale. This point was involved in a Wisconsin case, reported at *page 227, 120 Northwestern Reporter*. Under the particular wording of the contract of sale in that case, it was held by the Wisconsin Supreme Court that title to Pittsburgh coal sold to railway companies for delivery at Superior, Wis., did not pass until delivery, f.o.b. cars, rendering the seller liable for taxes on the fuel while on docks at Superior before being loaded on cars.

Recent Decisions

When Corporation May Purchase Own Stock—It is beyond the power of a corporation to purchase its own stock, unless expressly so authorized by law. (Maryland Court of Appeals, Bear Creek Lumber Co. vs. Second National Bank of Cumberland, 87 Atlantic Reporter, 1084.)

Right to Question Validity of Mortgage—On suit to foreclose a mortgage covering the property of a coal-mining company, a defense that the mortgage was executed without authority from the stockholders can be raised by them only, and not by the company itself. (Colorado Court of Appeals, Firestone Coal Co. vs. McKissick, 134 Pacific Reporter, 147.)

Liability for Mine Foreman's Negligence—A Pennsylvania coal operator is not responsible for injury to a miner, resulting from negligent failure of a properly qualified mine foreman to make an examination for gases, as required by the law of that state. (Pennsylvania Supreme Court, Watkins vs. Lehigh Coal & Navigation Co., 87 Atlantic Reporter, 860.)

Corporation Disqualified to Issue Accommodation Paper—A business or industrial corporation has no power to make or indorse commercial paper for the accommodation of third parties, unless its charter expressly confers such authority; corporations have only such powers as are expressly or impliedly granted by their charters and the laws of the state under which they exist. (Georgia Court of Appeals, Savannah Ice Co. vs. Canal-Louisiana Bank & Trust Co., 79 Southeastern Reporter, 45.)

Checks Should Be Presented Immediately—Bank checks are not designed as a medium of circulation, but as a means of securing expeditious payment in money; and when a check drawn by a third person is received by an indorsee he acts at his peril, so far as the payee and indorsers are concerned, in failing to promptly present the check for payment, if it appears that it would have been paid if presented within a reasonable time, notwithstanding the drawer's subsequent insolvency. (Georgia Supreme Court, Kennedy vs. Jones, 78 Southeastern Reporter, 1069.)

Lessor's Right to Share in Stock Issue—Where a lease of coal lands reserved to the lessors a one-tenth interest in the lease, in the nature of paid-up and nonassessable stock of the lessee corporation, the lessors were entitled to share only in the stock issued under authority vested in the company when the lease was made, and not in additional stock subsequently issued under authority afterwards conferred by the state, after valuable mining property, other than that covered by the lease, was acquired by the company. (West Virginia Supreme Court of Appeals, Taylor vs. Buffalo Collieries Co., 79 Southeastern Reporter, 27.)

Defense of Employees' Personal Injury Claims in Oklahoma—Under the laws of Oklahoma, it is a complete defense to a suit against a coal operator for injury to a miner that the latter failed to use ordinary care for his own safety, and that such neglect was a direct cause of the accident, regardless of any negligence of the employer; the legal doctrine, in force in some states, that an employee may recover notwithstanding contributory negligence on his part, if that negligence was slight as compared with the employer's neglect, not being in force in Oklahoma. (Oklahoma Supreme Court, Hailey-Ola Coal Co. vs. Morgan, 134 Pacific Reporter, 29.)

DISCUSSION BY READERS

Collapsible Stoppings

Letter No. 1—The question has been asked, Coal Age, Sept. 20, p. 424, whether or not collapsible stoppings would localize an explosion of gas or dust in the mine. I have always been in favor of collapsible stoppings in small mines where the mine is ventilated in, say one or two splits. I would not approve of their use, however, in a large mine, except in the live workings or on the butt headings.

I believe that the best way to localize a mine explosion is to arrange a separate air split for each "flat," by building an overcast at the entrance to that section. If the section contains more than, say 10 pairs of headings, it may be necessary to provide a second main air course, to tap the section midway, which will then require another overcast at that point. It has proven, in many instances, that where a large section containing many rooms is ventilated by a single split of air, a small explosion of gas or dust is confined, generally, to that section in which it occurred.

I have observed that the general practice in large uptodate mines is to build collapsible stoppings of wood or a single course of brick, in the live workings; while the stoppings on the main haulage roads and cross-headings are permanent stoppings built of brick, stone or concrete. This is generally done, however, from an economical consideration, rather than for the purpose of localizing a possible explosion. In these mines, the stoppings on the butt headings driven off the cross-entries, as well as the stoppings in the rooms, are light collapsible stoppings. Here are the live workings where the coal is produced.

It is my belief that a small explosion of gas or dust, in these rooms or butt headings, would be confined to one section, provided that section was ventilated by a single air split. But, if the air current was conducted through other butt headings and rooms, the explosion would probably be carried through the entire air split. It might develop sufficient force, in its course, to blow down one or more permanent stoppings; and, in that case, it would extend into other sections of the mine. We have an example of this in the Monongah explosion, Dec. 6, 1907; the Darr explosion, Dec. 19, 1907; and the Marianna explosion, Nov. 28, 1908. All of these mines had collapsible stoppings throughout their live workings.

The question may well be asked: What is a permanent and what is a collapsible stopping, in a mine containing both gas and dust? Previous to the explosion, the stoppings in the Monongah mine were considered permanent stoppings; but, being blown to pieces by the force of the explosion, they might properly be called collapsible stoppings.

There can be no question but that permanent stoppings should be built on all main haulage roads and airways, in order to maintain a sufficient circulation of air at the working face. Any kind of collapsible stoppings, on these headings, would not receive the attention necessary to keep them in proper shape to maintain the required circulation of air in the workings.

In closing, I want to say that any efficient method for localizing explosions of gas and dust in the mines would be hailed with delight by all mining men. I fear, however, that the collapsible stopping, suggested by the Bureau of Mines, is not the remedy for which we are seeking. It must be remembered that dust is a dangerous factor, and that it permeates the entire mine to a greater or less extent. Mines that are not considered dangerous on account of gas, may be dangerous, owing to the presence of dust and a small amount of gas, perhaps too small an amount to be detected on the lamp. Or a slight disarrangement of the ventilating current may permit the accumulation of gas, in an otherwise well ventilated mine. Only too often, the mine we had considered safest has been wrecked by an explosion.

I cannot see where collapsible stoppings will localize an explosion of dust. We have learned much in regard to the phenomena of explosions; but their frequent recurrence proves our knowledge is not complete.

Pennsylvania Superintendent.

Oliphant Furnace, Penn.

Letter No. 2—My attention has been called to the suggestion that collapsible stoppings built in the crosscuts or breakthroughs between entries, near the working face, would localize a possible explosion of gas or dust in the workings. While I have not, as yet, seen the full statement of this question, I do not hesitate to say that I fail to see the point of the argument that these light stoppings would, in any manner, prevent the development of an explosion and its extension throughout the mine.

I would draw attention to the fact that the usual practice in coal mining is to build the stopping at about the center of the crosscut. This allows the accumulation of more dust in these void places in the crosscuts, than can be found upon the gangways or in the air courses or chambers. My thought is that if these stoppings were collapsible under the pressure of a light gas or dust explosion, all the dust in those crosscuts would be blown into the air and explode, greatly increasing the disturbance and extending rather than localizing the explosion.

Another point should be borne in mind, namely, such light stoppings would frequently be thrown down by the concussion of a heavy blast or a windy or blownout shot; and the quantity of dust thrown into the air, as a result, might be ignited by the flame of succeeding shots and cause an explosion that would not otherwise occur.

For the reasons stated and with the present extent of my knowledge of the question, I would consider the matter of putting collapsible stoppings in cross-headings a very impracticable proposition.

W. D. Owens, Div. Supt.,
Lehigh Valley Coal Co.

West Pittston, Penn.

The Mine Air Current and Explosions

In connection with the interesting discussion on this subject, Coal Age, Sept. 13, p. 390, I want to draw attention to the fact that whether the movement of the ventilating current, in a mine, is caused by an exhaust fan or a blower, it is certain that when either of these fans is stopped, the air current traveling in the mine will not cease immediately. In the use of either fan, the upcast shaft has been warmed by the return air and the heat of the shaft will serve, for a considerable time, to raise the temperature of the upcast current. This will produce an air column in the upcast shaft, that will serve the same purpose as a small furnace, to produce circulation in the mine. This alone would prevent any sudden outflow of gas from the goaves, except in the most fiery mine.

I want to suggest that barometric readings taken at the surface, and in the fan drift, and at different points throughout the mine would prove of considerable interest in the study of mine ventilation.

James Ashworth,
Mining Engineer.

Vancouver, B. C., Canada.

⁂

Education and Training for Mining Men

It is indeed encouraging to note the interest that is being taken, generally, in the education and training of all classes of mining men; but, particularly, the miner. While many may differ as to means and methods employed, all will agree that there is great need for the education and training of men engaged in the mining industry. The broad and intelligent discussion of the subject will eventually develop the best means and methods to employ.

I cannot agree with Samson Smith, who, in discussing this subject, Coal Age, Aug. 30, p. 318, criticizes the suggestion of Mine Inspector C. H. Nesbitt, that safety inspectors and instructors be employed in the mines as a means of training miners in the best and safest methods of doing their work. Mr. Smith claims that the boys should be trained when young, according to the old proverb, "Train up a child in the way he should go and when he is old he will not depart from it." He states that boys should be taken into the mines by their fathers and trained in the work of mining coal.

It is a sad fact that many parents are neither morally nor intellectually qualified to train their children; and we must look to some other source for this training, such as public schools, Sunday schools and other institutions. Again, many fathers, though they have worked in the mines most of their lives, are not practical miners. They cannot build a mine door; or do a first-class job of timbering; or lay a good piece of track; much less lay down a mine switch. Many know little of the laws of ventilation, the dangerous character of coal dust and the nature and effect of mine gases upon the human system. It is evident that fathers who are deficient in the knowledge of these things are not competent to teach or train their sons; and, as I said before, such training and instruction must come from another source. The suggestion of the safety instructor and inspector in mines, appeals to me as it must to many practical men, as a wise suggestion.

The age limit for boys entering the mine, which, in Tennessee and many other states, is 16 years, would make impossible the early training suggested by Mr. Smith. Some of the most practical miners I know, however, are men who entered the mine after they were 21 years of age. These men studied to enlarge their practical experience by acquiring a knowledge of the theory of mining and applying it in their daily work.

I think that Mr. Nesbitt's suggestion for the organization of a department of safety and instruction for each mine, with a practical and efficient person in charge, who commands the respect and confidence of the miners, who knows how to enforce rules and maintain discipline, who looks after the ventilation and sanitation of the mine, and who knows the difference between safe and unsafe conditions as they arise, is an efficient medium of educating and training miners, and must prove much more effective in producing competent and proficient mining men than any training of fathers whose mining knowledge and experience may be limited. As in all other trades and professions, good common "hoss" sense is a valuable element to mix with the experience acquired in mining.

Through lack of discipline, force and system, many mine foremen drift into the habit of telling miners to timber their working places and keep them safe, without expecting them to comply. Upon the mine foreman devolves the responsibility for the coal output. The operator presses him for a few more tons, and in turn he pushes the miner for more cars; and, in order that he may load more cars, the foreman permits the miner to postpone setting a timber his better judgment tells him ought to be set without delay. The slate falls, the miner is killed, a funeral is held and a damage suit follows. If a vigilant inspector was in charge who was responsible for the safety of men and not for the output of coal, he would have recognized the danger and had the timber set instead of permitting the miner to load the car. Perhaps the day's run might be short a car, but a good miner would still be living to provide for his family. My experience as miner, mine foreman and assistant state mine inspector has taught me that it is, generally, the miner that has spent years in mining who gets hurt by falling slate or coal. And nine times out of ten it is owing to his own neglect or carelessness. If the mine had a vigilant inspector who would not let miners grow careless, in the matter of timbering and keeping their working places safe, many accidents would be avoided in coal mines.

John Rose,
District Mine Inspector.

Dayton, Tenn.

⁂

Starting a Fan after an Explosion

Letter No. 1—Referring to the inquiry, Coal Age, Sept. 20, p. 430, and the editorial suggestion, p. 423, of the same issue, that this question be further discussed, permit me to say that, in my opinion, the question of starting up the fan after a short period of idleness, following an explosion that damaged the fan, so that it required to be repaired, will depend on the conditions existing in the mine. There are two possible cases, which differ so materially in the effect produced on the conditions in the mine after the explosion that they should be considered separately.

On the one hand, if the overcasts and stoppings are built of lumber, the stopping being light and collapsible, it may be taken for granted that they will have been blown down by the force of the explosion. The circulation in the mine would thus be cut off, even the natural current that might otherwise prevail, nothwithstanding the fan has been so badly damaged that it is not working. Under these conditions, if the fan is repaired and again started, it may be assumed that the air will be short-circuited at a point not far from the foot of the shaft, by reason of the overcasts and stoppings being destroyed. The air current therefore will not reach the face until these overcasts and stoppings are repaired. As this work of repair progresses, the air current will circulate closer and closer to the face of the workings, and the work will become more dangerous and require greater caution, in order to avoid driving any accumulated gases into an area in the mine where fire might exist.

On the other hand, assuming the overcasts and stoppings are built in a substantial manner and have, for the most part, withstood the force of the blast, the starting up of the fan after the repairs are complete would certainly be accompanied with great danger, because the accumulated gases would be driven into the fire area, which may reasonably be assumed to exist in portions of the mine. The ignition of these gases would cause a second explosion more disastrous than the first; and all hope of rescuing any persons in the mine who had possibly survived the first explosion would be destroyed. In my opinion, it would be safer not to start the fan until a properly equipped exploring party can enter the mine and ascertain its condition, if this is at all possible.

This seems the only wise course to pursue, unless some definite knowledge of the inside condition of the mine is obtainable by observations at the surface. The only hope of rescue, in any event, lies in the calm, intelligent judgment of those in charge; and this judgment must be based on accurate knowledge in the face of the grave dangers the conditions present. It is, of course, necessary that rescue parties should be fitted out with breathing apparatus and safety lamps. Should no evidence of fire existing in the mine be reported by rescuers or be forthcoming after a considerable period of time, the repairs being completed, the fan can be started with a reasonable expectancy of safety. Before this is done, however, all persons should be withdrawn from the mine.

JOHN E. AMBROSE,
Mining Engineer.

New Durham, N. J.

Study Course in Coal Mining

By J. T. Beard

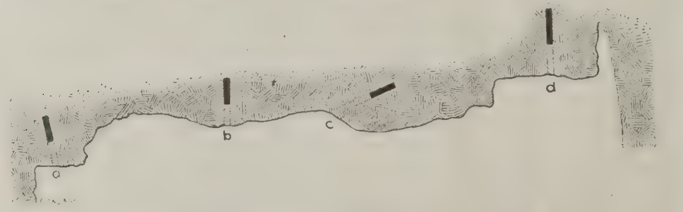
The Coal Age Pocket Book

BLASTING IN MINES

The removal of the coal from its position in the seam generally requires blasting, which under many conditions common to coal mining is a dangerous operation and requires both knowledge and experience.

Theory of Blasting Coal—The blasting of coal differs from that of rock; the former being soft and friable, while the latter is generally hard and brittle. The chief consideration, however, in the blasting of coal, is to break it from its bed in such size as can be readily handled and loaded into the mine cars, but without producing an unnecessary amount of fine coal and slack. To do this requires careful study of the character of the coal to be blasted and a knowledge of the explosive used.

Kinds of Shots—In the accompanying figure are shown four of the principal shots employed in blasting coal. The "rib shot" shown on the left (a) is for the purpose of cutting the rib by blasting, instead of using a pick and shearing the coal as shown on the right. A rib shot is very apt to prove a "tight" shot, unless, as shown in the figure, the coal is blasted back so as to give this shot an opportunity to free itself. A "dead hole" is one that is perpendicular to a practically straight face of coal, as shown at (b). The shot shown at (d) would be a dead hole were it not for the side cut on the right rib, which frees the shot. A "grip shot" is one that is laid at a considerable angle with the face of the coal, as shown at (c), in the figure.



SHOWING DIFFERENT SHOTS IN COAL FACE

Dangerous Shots—The shots classed as dangerous are the following: "blownout," "windy," "squealer" and "heavy" shots. A blownout shot is one that blows its tamping, owing to the charge being laid too deeply on the solid, or the shot being bound and unable to free itself. The same effect is often produced by reason of the charge being insufficient for the work to be performed, or the hole being improperly tamped, or having too large a diameter for the depth of the "stemming," as the tamping is called.

A windy shot is a shot that for any reason expends much of its energy on the air.

The Coal Age Pocket Book

A squealer, in mining language, is a shot that does little more than crack the coal; the force of the explosion finding vent through the crevices made in the coal, produces a peculiar sound like a shrill whistle; hence the name.

A heavy shot is one that produces a strong concussion of the mine air. It is an effect similar to that of a windy shot, but less powerful.

Placing Shots—A shot is well-placed when it performs the work it was expected to do in breaking down the coal, and produces no marked effect on the air. Experience alone is the great teacher in knowing how and where a shot should be laid in the coal in order to produce the desired results. A few illustrations will suggest some important facts and principles in the practice of shooting coal.

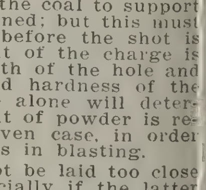


FIG. 1. A GOOD SHOT

In Fig. 1, is shown a well-placed shot in a hard-shooting coal. The coal has been undercut so as to enable the shot the better to free itself. A sprag is shown set under the coal to support it while being mined; but this must be knocked out before the shot is fired. The weight of the charge is suited to the depth of the hole and the thickness and hardness of the coal. Experience alone will determine what weight of powder is required in any given case, in order to avoid accidents in blasting.

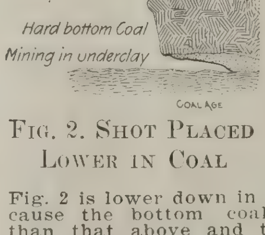

FIG. 2. SHOT PLACED LOWER IN COAL

A shot must not be laid too close to the roof, especially if the latter is harder or softer than the coal itself, or the force of the shot will be lost. The force of gravity must also be considered as acting to break the coal. The shot shown in Fig. 2 is lower down in the coal, because the bottom coal is harder than that above and the force of the shot is more evenly distributed between the hard and soft strata.

Much trouble is experienced in shooting soft seamy coal inlaid in the seam, as shown in Fig. 3. The shot is here laid in an inclined position so as to blow out the hard top coal without shattering the softer coal below. If this shot had been laid horizontaly in the seam the softer measures would have "seamed out" and the shot have proved a failure or perhaps dangerous.

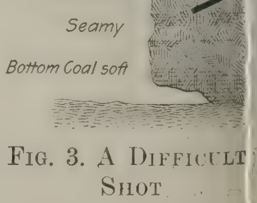

FIG. 3. A DIFFICULT SHOT

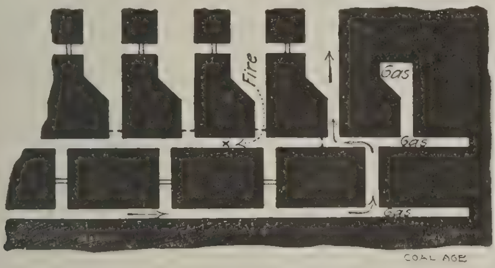
INQUIRIES OF GENERAL INTEREST

Fire in Heading Making Gas

I inclose sketch of a pair of headings driven on the strike of a moderately inclined seam, with rooms turned to the pitch, and showing a fire started on the heading a short distance back from the face of the entry. As marked on the sketch, gas is being freely generated in the last chamber turned and at the face of this heading. The chamber has not yet reached the first crosscut. The fire is outside of the second crosscut from the face of the heading, and has gotten a fair start. I would like to ask the best and safest method of dealing with this fire.



Showing Location of Fire

As shown on the sketch, the fire is on the return entry and a curtain hung outside of the last crosscut diverts the most of the air, so that the main current is following the face of the rooms.

A. E. J.

Shamokin, Penn.

On the first discovery of the fire, every precaution should be taken to prevent the air current from reaching the fire, by making the curtains in the heading and in the mouths of the chambers inby from the fire, as tight as possible. This should be done quietly, so as not to disturb the air more than necessary. If men are working in the chambers on this heading, they should be notified to withdraw; and it may be necessary for them to come out by the last chamber but one on the heading, and reach the intake airway through the last crosscut on the heading. In this manner, they will avoid the fumes and gases from the fire. The men should be instructed to move quietly so as not to disturb the air current and any accumulation of gas at the face of the heading, more than necessary.

In the meantime, men should have been put to work to open the stopping from the intake side, in the next to the last crosscut on the heading, just inside of the fire. This must be done with caution and, to avoid a strong air current short-circuiting at this point and passing over the fire, a curtain should be hung so as to practically close the mouth of this crosscut on the intake side, allowing only sufficient air to pass through the crosscut to enable the men to work and keep back the gases generated by the fire. The circulation through these headings may be reduced if necessary. Safety lamps only should be used, all open lights, if any, being promptly extinguished.

The fire should now be fought from the opening made in the crosscut, by stretching a line of hose from the nearest fire-plug on the gangway, or by whatever means are available for fighting the fire. It may be assumed that a mine working under the conditions described would be equipped with hose and pipeline, having fire-plugs at convenient points in the gangway.

During the entire progress of the work, competent men should be stationed in the return heading, at the last crosscut, to observe constantly the action and condition of the air current at this point. It may prove of advantage to hang curtains on the heading inby from this crosscut and at the mouth of the last chamber, so as to partially obstruct the flow of gas, if it becomes too strong. This, however, will depend on conditions observed and will call for the exercise of the best judgment of experienced men.

As soon as the fire is thorougly extinguished and there is no danger of ignition of gas, the curtain on the return heading should be removed and the air current allowed to pass down the return airway sweeping the point where the fire has been. This place should be carefully watched, for some time after the fresh air has been restored, to observe that there are no indications of fire remaining. When it is certain that the fire is extinguished and after the full air current has been gradually restored, the curtains may be removed cautiously from the mouth of the last chamber and from the heading to allow the escape of the gas, which should be made to pass out by the return airway without traversing the face of the chambers. The removal of the gas must be performed gradually, after protecting every point of entrance to the return airway.

⁂

The Hoisting Engineer

What regulations would you suggest to govern the hoisting of men in a mine shaft, in order to secure the greatest degree of safety and avoid accidents that occur as the result of insufficient supervision of the work?

Mine Superintendent.

Hazleton, Penn.

Strict regulations should be adopted and enforced at all shaft mines, restricting the number of men to be hoisted at one time. The rules should be printed in different languages and posted at the cage landings and should permit no one to enter or loiter in the engine room or to communicate with the engineer, in any manner, while he is on duty, except a mine official in case of necessity. An important precaution is to require the engineer to make one trip with an empty cage after any season of idleness however brief, before signaling that he is ready to hoist or lower men. The purpose of this is to clear the cylinders of any water of condensation, and to insure the proper working of the engine. No coal or other material should be allowed to be lowered or hoisted on the opposite cage while men are in the shaft.

EXAMINATION QUESTIONS

Precautions and Safety Appliances

Ques.—What precautions should be taken in respect to abandoned mines?

Ans.—Before a mine is abandoned, a final survey should be made and the mine map extended, so as to show the full extent of all working places in the mine. The elevation should be marked on the map at different points of the working face and at the head of all entries. This map should be kept on file in the mine office and a copy sent to the state mine inspection department as a matter of record. When mining in proximity to abandoned mines an accurate survey should be made at frequent intervals and the map extended and kept uptodate. The survey should be connected accurately with the previous survey of the adjoining mine, which is abandoned.

In addition to these precautions, prospect headings should be driven in advance of all working places approaching the abandoned mine. Such headings should be driven single and should not exceed 8 ft. in width. A drillhole should be kept from 5 to 7 yd. in advance of the face of the heading and flank holes should be bored every 5 yd. on each side of the heading and at an angle forward, in the direction of driving, of about 60 deg. with the center line of the entry. A constant watch should be kept for any increase of water or gas; and plugs should be kept in readiness for instant use, to stop the holes if necessary. Only safety lamps should be used in the work, when driving headings toward abandoned workings.

As far as possible, the condition of the adjoining abandoned mine should be ascertained, with respect to the water that may collect in the mine. A sufficient barrier pillar should be maintained to protect the new workings against any inrush of water or gas from the old mine.

Ques.—Name the different safety appliances that should be employed at the hoisting shaft of a mine.

Ans.—The top of the shaft should be protected by safety gates operated automatically, by the movement of the cages. The cages should be provided with safety catches to prevent their falling in case the rope should break; also bridle chains should be provided to guard against the breaking of the coupling or chain by which the rope is connected to the cage. In deep shafts or in rapid hoisting, gates are often provided on the cage, in addition to the gates at the upper, lower and all intermediate landings. All cages should be provided with covers or hoods to protect men riding on them, from anything falling in the shaft.

All hoisting shafts should be provided with suitable signal apparatus, and deep shafts should be further provided with telephone connection or speaking tubes for communication between the surface and the foot of the shaft. The signals used in hoisting should be posted at all landings, and permanent lights properly protected should be kept at all landings underground.

Ques.—What safety appliances should be maintained in mine slopes?

Ans.—The mouth of the slope should be protected by suitable head-blocks or safety-blocks, to prevent cars from running down the slope by accident. The slope should also be guarded by an automatic derailing switch, for the same purpose. All slopes should be provided with refuge holes cut in the sides at suitable intervals apart, for the protection of men traveling or working on the slope. The switch at the foot of the slope should be automatic, and so arranged that all cars descending the slope will take the empty track. A heavy drag or "dog" should be attached to the rear end of each ascending trip, to prevent the cars from running back down the slope, in case a coupling, or the chain or rope should break while hoisting.

A suitable signal system should be provided, and means of communication established between the surface and the foot of the slope, either by telephone or speaking tubes. The signal wire should be available for giving signals at any point on the slope. The code of signals in use should be posted at the foot and the head of the slope, as well as in the engine room.

Ques.—What precautions and safety appliances are required in the engine room of a mine hoisting plant?

Ans.—The winding drum should be provided with an efficient brake of sufficient power or force to control the movement of the cage at all points in the shaft. Whenever practicable, an emergency brake should be provided, for use in case of accident. An indicator should be provided to show at a glance the position of the cage in the shaft; but too much dependence should not be placed on the working of such a device. The hoisting rope should be marked with paint of different colors, to indicate both the near approach of the cage to the landing and its position at the landing.

To prevent overwinding, many shafts are provided with a device to shut off the steam and apply the brake when the cage arrives at a certain position near the top of the shaft. Like other safety appliances, this one is open to the criticism that its constant use makes the engineer less careful. Barring this objection, however, it is a good safeguard.

Ques.—What general precautions are necessary in hoisting men, in a mine shaft?

Ans.—Place a competent man, as cager, at the head and another at the foot of the shaft, who will have complete control of the signal system at these two stations. They must remain on duty until relieved by substitutes, whenever men are in the mine. Limit the number of men to be hoisted at one time, to what can be safely accomodated on the cage without crowding. Permit no tools or explosives to be carried by the men on the cage. Require that the cager signal the engineer and receive his reply that he is ready to hoist men, before allowing anyone to step on the cage. Allow no one to give signals or bell away the cage other than the regular cager.

COAL AND COKE NEWS

Washington, D. C.

Probably the most important mining suit with regard to the corporation tax brought before the Supreme Court of the United States for a long time past has been filed and briefs have been put in during the past week. The case comes on a certificate from the United States circuit court of appeals for the eighth circuit. The statement of the case is as follows:

> Stratton's Independence, Limited, is a corporation organized under the laws of the Kingdom of Great Britain and Ireland, carrying on mining operations in the State of Colorado, and is the plaintiff in error in Cause No. 3862 in the United States Circuit Court of Appeals, Eighth Circuit, from which court the questions herein are certified.
>
> During all the time in question in said action this company has owned certain mining premises purchased by it for three hundred and thirty-five thousand dollars ($335,000) in cash, on July 29, 1909, and its sole activities have been the mining and marketing of the ores therefrom. During the years 1909 and 1910 it mined ores therefrom and sold the metal contents for a price in excess of the cost of mining, extracting, and marketing the same.
>
> By stipulation in the case it is agreed that such excess represents the true value of the ores so extracted, when in place. The collector of internal revenue for the District of Colorado assessed, levied, and collected from the company a tax of one per cent. (1%) upon such excess, without deduction, other than the arbitrary deduction of five thousand dollars ($5000) per annum, claiming that such excess represented the net income of the company, and that a tax was properly collectible thereon, under the provisions of section 38 of the act of Congress entitled "An act to provide revenue, equalize duties, and encourage the industries of the United States, and for other purposes," approved Aug. 5, 1909 (36 Stat. at Large, p. 11).
>
> The company laid proper foundation for the recovery of the tax, by the necessary appeals to the Commissioner of Internal Revenue, and by payment under protest.
>
> Three questions are certified to this court, as follows:
>
> I. Does Section 38 of the Act of Congress entitled "An Act to provide revenue, equalize duties, and encourage the industries of the United States, and for other purposes" approved Aug. 5, 1909 (36 Stat., p. 11), apply to mining corporations?
>
> II. Are the proceeds of ores mined by a corporation from its own premises income within the meaning of the aforementioned Act of Congress?
>
> III. If the proceeds from ore sales are to be treated as income, is such a corporation entitled to deduct the value of such ore in place and before it is mined as depreciation within the meaning of Section 38 of said Act of Congress?

In defense of their position the attorneys say:

> And we contend that, if a part of the capital assets are removed and sold, the property, as it originally stood, is actually depreciated in value to the exact extent of such removal.
>
> As an actual matter of experience, the original cost of the property must, from its very nature, be highly speculative. The values in the property are invisible and impossible of determination. They may be worth many times the cost or they may be worth nothing. We submit, therefore, that any such basis of capitalization is purely fictitious and this contention is sustained by the manner in which mining companies are capitalized.

The brief goes on to state that a large number of cases both of metallic and coal mining corporations are awaiting the decision of the Court in this case and it is urged that the matter shall be settled as quickly as possible on that ground. In closing the attorneys say:

> First—That Section 38 of the act in question does not apply to mining corporations.
>
> Second—That the proceeds of mining operations are not "income" within the meaning of the act.
>
> Third—That, if such proceeds are held to be income within the meaning of the act, then the value of the ores extracted, when in place, should be deducted as depreciation before the tax is computed.

HARRISBURG, PENN.

In a brief statement this week, Samuel Rea, president of the Pennsylvania Railroad Co., announced that the directors had decided to sell the company's security holdings in anthracite companies.

It is generally accepted that this indicates that the Pennsylvania Railroad Co. will dispose of all stocks which might invite Government investigation. The sale of these coal company securities in themselves is not regarded as momentous from a Pennsylvania Railroad point of view; for the aggregate par value of these securities is only $8,265,802.

These securities consist of 21,368 shares of the Susquehanna Coal Co. par value $2,136,800, and five per cent. certificates of indebtedness par value $6,000,000; 16,667 installment receipts of the Mineral Railroad & Mining Co., valued at $100,002; 500 shares of the Summit Branch Mining Co., par value $25,000 and 200 shares of the Lykens Valley Railroad Co. par value $4000. The income of the Pennsylvania received from these securities aggregated $385,632 last year.

The Pennsylvania Railroad Co. went into the anthracite coal business about forty years ago under the head of the late General Isaac J. Wister. Later, when George B. Roberts was president of the Pennsylvania Railroad, the company built its Schuylkill Valley line at a great expense, partly as an attack upon the Reading Co., and partly for the purpose of getting into the anthracite mining business in an important way.

With all its power this company has never been so large a factor in the anthracite fields as the Reading, the Lehigh Valley, the C. R.R. of N. J. and the Lackawanna. For the first eight months of 1913 its shipments coming practically from the controlled mining companies were 4,076,893 tons, out of a total of 45,709,606 tons.

To whom the securities will be sold has not been ascertained.

That the Pennsylvania Railroad Co. by disposing of its coal suits, has removed itself from attack is evident from dispatches from Washington saying that the Department of Justice will conduct an active campaign to divorce the so called anthracite railroads from the coal properties.

Recently the Pennsylvania rid itself of its holdings of Baltimore & Ohio stock amounting to $42,000,000 by exchanging with the Union Pacific for $38,000,000 of Southern Pacific.

On top of this Mr. Rea has opened negotiations concerning a plan to sell the company' holdings in Cambria Steel, it is also supposed that he will dispose of other securities, including the Pennsylvania Steel, Maryland Steel and Norfolk and Western.

Mr. Rea believes that it is the duty of a railroad company to confine itself strictly to railroad transportation. He made himself clear on this point recently, when he testified as a director of the New York, New Haven and Hartford before the Public Service Commission of Massachusetts at the hearing of the plan to issue $67,000,000 convertible debentures by the New Haven road. On this point Mr. Rea said: "I am opposed to the railroad being interested in other than purely railroad transportation."

Whether or not the stocks of the coal companies will be sold to stockholders of the railroad company, resulting in simply a transfer from the corporation to the individuals that control it, is an interesting question.

The Pennsylvania R.R. will undoubtedly make a full statement to the Interstate Commerce Commission and the Pennsylvania Public Service Commission without waiting for an inquiry to be started by either body.

There has been rumor that the Reading would buy these coal properties in, but there was incorporated a few months ago, a company known as the Eastern Pennsylvania Coal Co., and its capital was raised to a considerable amount, and this is the corporation that the buyers of the coal properties may use in taking title to the property.

Some years ago the Baltimore & Ohio R.R., in order not to antagonize the Commodities Clause of the Hepburn Act, sold its bituminous coal interests. The railroad attached a string to the sale by providing that the shipment be made over the Baltimore & Ohio. It is possible that the Pennsylvanit has incorporated some such provision in its present contract of sale, so that it will not lose the traffic from anthracite mines.

The suits of the Government vs. the Reading Co. will be closely contested, and a tremendous effort will be made to preserve the right to mine and transport anthracite, which double function has proved to be a source of great profit.

PENNSYLVANIA

Anthracite

Wilkes-Barre—On Sept. 23 a carpenter dropping a lighted match in the No. 3 shaft of the Woodward colliery started a fire which, for a time, threatened the lives of 500 men. Gas was ignited and the fire made considerable headway, but was finally checked by a large force of experienced fire fighters.

Pottsville—The recent heavy rains effectually ended the long drought which has prevailed in the anthracite region in the vicinity of Pottsville for several months. A number of the washeries which were compelled to close down because of the scarcity of water have resumed activities.

Shenandoah—Employees of the West Shenandoah, Turkey Run and Kohinoor Collieries, which operations employ 2500 hands, are on strike because of the rock-tunnel contractors' employing nonunion men to take the place of union rockmen, who have been on strike for two months.

Larkville—Three collieries of the D. & H. Co., located in Larksville, have suspended operations for a period of at least two weeks, and 1500 men and boys have been thrown out of work temporarily. The collieries are No. 5, No. 4, and the Boston. The suspension is caused by repairs which are necessary at the No. 5 mine and breaker, through which the coal from the other two collieries is hoisted to the surface and prepared for market. The shaft is in bad condition, and the automatic dumps at its head are to be replaced with more improved apparatus. The breaker is badly in need of reairs, and will be thoroughly overhauled before work is resumed.

Bituminous

Charleroi—Fred Lambert became lost in a mine of the Valley Crystal Ice & Storage Co. on Sept. 22, and wandered all day and all night without sleep or food before he was finally found by a searching party. He had himself given up hope of ever getting out of the mine.

Indiana—Three officials of the Buffalo, Rochester and Pittsburgh R.R. received serious injuries and four others were badly shaken up when their special train collided with a switching engine in the Creekside yards near here.

WEST VIRGINIA

Fairmont—Coal operators are again complaining of the inability of the Baltimore & Ohio R.R. to furnish a sufficient car supply for the mines of the Fairmont field. The railroad people say that conditions will be improved along this line when the Monongah cutoff is constructed and put in operation. The survey for the cutoff has been made and bids for its construction will soon be asked.

Charleston—After 14 years of almost ceaseless litigation, the suit of the Kanawha Hardwood Co. against Stephenson & Coon was settled recently, in favor of the defendant. The controversy involved the title to 720 acres of coal land situated on Cabin Creek and valued at from $300 to $500 per acre; also about 240,000 ft. of timber, valued at $40 per 1000 ft.

Algoma—The Algoma Coal Co. started operations Sept. 24 after a shutdown of eight days following the loss of their electric-power house by fire. The Appalachian Power Co. rushed the necessary equipment to the scene, and, in spite of unfavorable weather, placed a 300-kw. rotary converter and other machinery to furnish power to operate the mine.

Bluefield—The Norfolk & Western has notified the coal operators on its lines that the car allotments would be cut down one-third until further notice.

ALABAMA

Birmingham—The Alabama coal production, which fell off slightly during the month of August, has recovered fully from the depression and the indications are that the coal production for the state for 1913 will exceed 18,000,000 tons, and probably 19,000,000 tons. Reports received by Chief Mine Inspector Nesbitt for the first six months of the year indicate that the production for that period was well over 9,000,000 tons, and from information gathered to date, the production for the first nine months shows over 14,000,000 tons, with several mines which have been running only part time for the past 90 days, running to their full capacity.

TENNESSEE

Knoxville—The Southern Appalachian Coal Operators' Association held its regular quarterly meeting at Knoxville, Tenn., in conjunction with the miners' field day held there recently. A large attendance resulted from the interest taken in the meet, as well as in the various matters up for the attention of the operators, which include as one of the most important the impending question of workmen's compensation acts in Kentucky and Tennessee. K. U. Meguire, of Louisville, Ky., president of the Harlan Coal Mining Co., made an address on this subject.

KENTUCKY

Hartford—The Rockport Coal Co., operating in Ohio County, Ky., recently amended its articles of incorporation for the purpose of acquiring authority to run company stores and operate boats.

Fleming—Announcement was made recently at Whitesburg that another spur is to be constructed at once from Fleming, the new town built by the Mineral Fuel Co., up Bottom Branch, a distance of a mile to reach the company's new mines in that vicinity.

Greenville—Arguments were made recently at Greenville before the circuit court on demurrers filed by the Illinois Central R.R. Co. to the petitions of several miners who are suing for losses in wages suffered by reason of the alleged failure of the railroad to furnish cars to the mines last winter. The court took the matter under advisement, and will probably await the decision of the Kentucky Court of Appeals on similar cases pending before that tribunal.

OHIO

Zanesville—The announcement is made that the Imperial mine of the O'Gara Col Co., which recently went in the hands of a receiver, will continue in operation.

A number of Zanesville people have begun leasing coal lands along the Zanesville, Marietta and Parkersburg Ry., which has been building into the West Virginia coal fields. Developments in that territory will start soon.

Columbus—The Ohio Commission named by Governor Cox to investigate conditions surrounding mining in Ohio has spent the greater part of the past week in Missouri inspecting conditions in mines in that state. They have inspected mines in Indiana, Illinois and Ohio. It is reported that the commission finds a woeful lack of management in the operation of mines, in that only 60 per cent. of coal is removed from the ground. One of the results of the investigation will probably be the introduction of a bill in the next general assembly providing for a greater concervation of the coal properties in Ohio.

INDIANA

New Albany—Edward T. Snider has filed suit in the Circuit Court against the Monon road for $3000 damages, for alleged violation of the statute known as the "shippers bill." It is alleged plaintiff ordered empty coal cars on nine different occasions in March, 1912, and that because of failure to deliver them the plaintiff lost several coal contracts. One dollar a day is claimed for each car that defendant failed to deliver and damages additional to cover losses caused by an advance in coal of $1 a ton while plaintiff was waiting for the cars.

ILLINOIS

Sparta—After being located on the Illinois Southern for ten years, the Moffatt Coal Co. has torn out the Illinois Southern tracks and are now connecting with the M. & O. Failure on the part of the Illinois Southern to find a developing market for coal caused the change. In connection with this, the Illinois Fuel Co. is also putting in the M. & O. for the same reason.

Springfield—The United Mine Workers of the State of Illinois have advertised the fact that they have appropriated another $100,000 for the striking miners in Colorado. It is generally understood, however, that this does not mean that the money will be sent. It is appropriated, but the executive committee will decide later as to whether or not it would be best to send the money.

Herrin—The continued drought is making it expensive to many operators in this field and has for some weeks. Some operators are paying the railroads as high as $25 a day to haul water for their boilers. In many instances the water has to be hauled from 10 to 20 miles or more. In a few places the recent rains have overcome this, but water trains are running on schedule time on many of the roads.

Edwardsville—During the past year 14,755,321 tons of coal were mined from the 27 mines in Madison County. The coal was valued at $1 a ton at the mines.

Belleville—In the circuit court the Western Coal & Mining Co. has been sued for $5000 and the Consolidated Coal Co. for $10,000 by the Illinois Coal Operators' Mutual Liability Insurance Co., who claims the defendant companies refused to pay notes held by the plaintiff, which notes it is said were given in payment for the assessment levied by the plaintiff.

OKLAHOMA

Wilburton—The Union Coal Co. will shortly commence active operations in the mines near Gowan. These are now being equipped with coal-mining machinery, and it is said they will be the best mines, in the way of equipment, in Oklahoma. Nearly all the local operators have commenced installing telephones in their mines in accordance with the requirements of the recently adopted state law.

Yale—A bed of coal 14 ft. thick was struck while drilling a well on the Wright farm, three miles east of Yale recently.

This coal was encountered at a considerable depth, and is said to be of excellent quality.

MISSOURI

Joplin—It is expected that the coal business in the vicinity of Pittsburg, Kan., will be exceptionally large during the winter of 1913-1914. This is due largely to the evident shortage of the gas supply and its unreliability, similar conditions prevailing in the crude-oil industry. Many of the operators have booked orders ahead as far as January and February, and all are preparing to work their mines to their greatest capacity. There is a possibility of double-shifting in some of them.

IOWA

Des Moines—The aggregate coal output of the state of Iowa last year was 7,415,757 tons, the total for the previous year being 6,820,828 tons. A gain was thus made of 594,929 tons. There was a total of 24 fatal accidents, which was six less than the year previous. Monroe County was the greatest producer, having mined 1,535,136 tons, employing 2206 miners.

KANSAS

Norway—D. A. Haney has discovered a 4-ft. bed of coal on a farm a few miles east of Norway. The discovery was made at a depth of 140 ft. This coal is believed to be of a paying quality, and the only drawback in its development is the lack of capital. This will probably be forthcoming in the near future.

WASHINGTON

Forks—A good supply of natural gas has been found at a depth of 1300 feet near Forks, above the Hoh River. The well is said to have been drilled by railroad interests and will be drilled deeper with the hope of striking oil. The gas flows freely, it is stated, and with good pressure.

OREGON

Florence—Coal in promising amounts has been found near Florence at the mouth of the Siuslaw river. Frank Ferguson, of Alder Ridge, has opened a tunnel into a mountain on his place, about nine miles from Florence. He has now reached a depth of 150 feet, finding three veins in that distance and indications are good for another one. Mr. Ferguson is an experienced coal miner and it is his opinion that the hills around the town are underlaid with veins of good coal. Other parties have commenced prospecting in that location.

FOREIGN NEWS

London, England—The strike fever is not entirely allayed in Great Britain. This is indicated by the fact that on Sept. 23, 4000 colliers went on strike because a company policeman is alleged to have insulted a miner's wife. The company refused to dismiss the policeman and expected to close the pit as the result of the strike.

Manila, Philippine Islands—For the last five years the coal consumption of the Philippine Islands has increased at the rate of about 8% annually. Last year 436,687 tons were imported aside from 82,000 tons received at the naval coaling station. Practically all the coal which is used on shore comes from China, Japan and Australia, and the bulk is taken by the railroads and the electric companies, although one tobacco-manufacturing concern uses about 16,000 tons annually. The principal consumers have recently formed an association for the coöperative buying of coal, instigated thereto by the higher prices which have prevailed during the past year.

PERSONALS

Governor Major of Missouri has appointed as delegates to the American Mining Congress, to be held in Philadelphia on Oct. 20 to 24, P. N. Moore and E. S. Gotsch.

John T. Fuller, mining and civil engineer, has opened a consulting office in Little Rock, Ark., and will pay particular attention to the mining of coal and zinc.

Frank M. Fritchman has resigned his position as manager of mines for the Pittsburgh Coal Co. and, on Oct. 1 he will become the general manager of the Pittsburgh & Rochester Coal & Iron Co.

Percy C. Madeira, president of Madeira, Hill & Co., gave a stag dinner in honor of Samuel Rea, president of the Pennsylvania R.R., at his country place "Brookwood," on Sept. 26. Covers were laid for twenty-two other guests.

J. E. Berwind, president of the Berwind-White Coal Mining Co., and H. P. Favison, of J. P. Morgan & Co., have been elected directors of the Erie R.R. The election was to fill vacancies caused by the death of H. McK. Twombley and the retirement of Vice-President Richardson.

President White of the United Mine Workers of America has been named as arbitrator in the dispute involving 3000 coal miners of Bay City and Saginaw, Mich. The strikers were ordered to return to work pending President White's decision at a conference held at Columbus, Ohio. The strike started Sept. 15, following the dismissal of three miners, an alleged violation of the contract between the union and the Michigan operators.

George F. Baer, president of the Reading-Jersey Central Railroads, celebrated his 71st birthday on Sept. 26. Much of the day was spent closely engaged in his office at the Reading Terminal, Philadelphia, in conference with the operating managers of the Philadelphia & Reading Coal & Iron Co., and the Wilkes-Barre Coal Co., on questions pertaining to the production and the trade. Mr. Baer was in good spirits and has no idea of giving up work.

Thomas Toshesky, on Friday, Sept. 26, while at work in the Continental mine of the Lehigh Valley Coal Co., escaping a fall of earth, found himself imprisoned behind a rock barrier. Rescuers immediately set to work, although they believed Toshesky buried under tons of débris. A hole was bored down to the chamber where the man had been working, and a tube lowered. Through this an electric light bulb, food, clothing and finally reading matter, were passed to the imprisoned miner. On Sept. 30, after four days of incarceration Toshesky, speaking through the pipe, sent the message to his family not to worry, that he was in fairly good condition after absorbing several bottles of milk and whipped eggs.

OBITUARY

Andrew Robertson, of Pottsville Penn., died in his summer home at Asbury Park, N. J., Sept. 21, at the age of 88 years. Mr. Robertson was a native of Nova Scotia, but spent most of his life in Schuylkill County. He became wealthy through the operation of the Helfenstein, Greenback, Grady, Henry Clay, Excelsior and Corbin Collieries in the Shamokin region. He also held considerable coal and oil interests in West Virginia and Pennsylvania.

Col. Wm. Busby, known as the coal king of Oklahoma, died at McAlester on Sept. 23, his death being caused by a carbuncle. Col. Busby was born in Pemberton, N. J., 59 years ago. He came to McAlester from Parsons, Kan., where he was mayor and for several years general sales agent of the Choctaw & Gulf R.R., now the Rock Island. He then went into the mining business, becoming one of the largest operators in the field. His estate, which is roughly valued at $1,000,000, will be shared by a wife and six children.

William Armstrong Ingham, engineer, capitalist, scientist and lawyer, died on Sept. 23, at his home in Philadelphia, after a short illness from heart disease. He was 87 years old, and continued active in business until a week prior to his being taken sick. He was president of the Highland Coal Co., the Union Improvement Co., the Broad Top Improvement Co., and the Beverly Ore Co., at one time being president of the Rock Hill Iron & Coal Co., and the Broad Top Railroad Co. He was a member of the American Philosophical Society, of the Franklin Institute, and American Society of Mining Engineers. At the time of his death he was secretary of the Pennsylvania Geological Survey board, having been connected with that organization for many years.

CONSTRUCTION NEWS

Marquette, Mich.—Pickards & Co. will, within the coming year, provide themselves with a new coal dock and the necessary coal-handling equipments.

Belaire, Ohio—A large force of men was put to work Sept. 22, building a new tipple and power plant at the Franklin coal mine, west of Belaire. The estimated cost of these buildings will be $7000.

Earlington, Ky.—The St. Bernard Mining Co. has completed, at a considerable expense, a new coal washer, and installed the best of machinery for making coke. The new turbine generator will soon be completed also, and this will lower the cost of electricity to the city and the mines.

Wheeling, W. Va.—A new 33,000-volt transmission line to the eastern part of Belmont County was recently completed by the Wheeling Electrical Co., and put into service. The new line is for the purpose of serving the coal industry of the section mentioned. The Belmont Coal Co., at Glencoe, is one of the big current consumers.

DuBois, Penn.—The Pennsylvania R.R. is extending a spur two miles in length between Punxsutawney and Clover Run to reach a tipple at a new opening of the Madeira Hill Coal Co. This company is also making a number of new openings, and when these are completed and tipples finished work at the mines will be pushed to its utmost.

Windber, Penn.—Approximately 350 men are at work pushing through to Cairnbrook the eight-mile extension of the South Fork branch of the Pennsylvania R.R. The contractors are urged on by necessity. The Loyalhanna Coal & Coke Co., the Berwind-White Co. and John Lochrie, of Windber, are all waiting for the railroad before tapping rich beds of virgin coal.

Mobile, Ala.—It is reported that the United States Steel Corporation will purchase a large tract of land at Mobile, Ala., and build a plant to receive their Cuban ores. This plant will cost in the neighborhood of $800,000. The Steel Corporation owns a large tract of ore in Cuba, and it is the intention to mine it and send it to this country through the Mobile plant.

St. Louis, Mo.—The Chicago & Eastern Illinois Ry. has a force of 1200 men working 10 hours a day getting its bad order coal cars into condition. The receivers decided some time ago to spend all available money in putting their equipment and motive power in shape, and the Chicago & Eastern Illinois expects to have every car lined up for business within the next 60 days.

Birmingham, Ala.—The Ensley plant of the Tennessee Coal, Iron & R.R. Co., is to have a new blast furnace and steel converter at a cost of $200,000. The new furnace and converter are already under construction. A new process in openhearth-steel manufacture where a 12-hour run will produce 300 tons of steel has required a larger output of pig iron. The erection of the addition follows the need for the material to supply the openhearth furnaces. Further appropriations to the extent of $1,000,000 will probably be made for the Ensley plant in the near future for further improvements.

Pineville, Ky.—The grade work on the new Chesapeake & Ohio route through the Breaks of the Cumberlands is practically finished, with the exception of the Sandy Ridge Tunnel on the Virginia side, and track laying will begin shortly. This tunnel, however, is one of the most difficult pieces of work on the road. It will be two miles long, with a steep grade. An unusual feature of its construction is that a shaft has been driven from the top of the ridge at the center of the line of the tunnel, and two crews will work from this point, in addition to those working from the two ends. The completion of this road will mean greatly increased activity in industrial and mining work in the section affected.

NEW INCORPORATIONS

Elberfeld, Ind.—The Elberfeld Coal Co. has been organized with a capital stock of $15,000 to mine and deal in coal, etc. The incorporators are C. A. Heldt, H. Holtz, W. F. Dassel.

Cadiz, Ohio—The Selway Coal Co., of Cadiz, Ohio, has been incorporated with a capital stock of $1000 to mine and deal in coal. The incorporators are R. H. Menter. D. W. Selway, H. T. Selway, Henry Selway and L. E. Selway.

Pomeroy, Ohio—The Martin Ebersbach Co. has been organized for the mining and selling of coal. The capital stock is $250,000, and the incorporators are H. C. Royal, K. F. Marburger, C. L. Lehr, C. E. Herrman, and F. A. Siebold.

Windber, Penn.—The Lake Trade Coal Mining Co. has been organized with a capital of $30,000. The incorporators are John Lochrie, Thos. Lochrie, C. A. Davis, Windber, Penn., F. B. Filer, Mercer, Penn., J. H. Filer, and E. W. Filer, of Sharon, Penn.

Charleston, W. Va.—The Mingo Land Co., organized by Mercer County capitalists, has been granted a charter by the secretary of state. The authorized capital stock is $150,000. The principal office of the new company is to be in Bramwell, Mercer County, and the chief works in War Eagle, Mingo County. The incorporators are J. B. Perry, E. S. Baker, H. X. Morton, Jr., W. A. Jameson, and Harry Bowen, all of Bramwell.

Philadelphia, Penn.—The regular monthly meeting of the stockholders of the Geo. B. Newton Coal Co. will be held in Philadelphia, on Nov. 24, and the stockholders will be requested to take action upon the proposition to secure by mortgage $242,000, thus increasing the indebtedness of the corporation from nothing to that amount, for the purpose of refunding mortgage liens amounting to $242,000 now existing on the concern's real estate.

Huntington, W. Va.—Huntington capitalists have formed a company for coal and coke production and the development of oil and gas in the Burning Springs property, in Mingo County. The company, which is named after the property, has received a charter. The authorized capital stock is $50,000, of which $500 has been subscribed and paid. The incorporators are David McCormick, of St. Louis, Mo.; F. B. Enslow, J. W. Haden, Jr., N. H. Richardson and W. R. Fulton, all of Huntington, W. Va.

INDUSTRIAL NEWS

Michigan City, Ind.—The Chicago, Burlington & Quincy R.R. has ordered 3000 coal cars from the Haskell-Barker Car Co., of this city, to be delivered as they are completed.

Scranton, Penn.—The Rivenburg-Blackwood Co., Inc., has closed a contract with the Witherbee Igniter Co., for the sale of their electric mine lamps in Pennsylvania and West Virginia.

Gadsen, Ala.—The Alabama Power Co. is beginning the work of storing 10,000 tons of coal at its East Dresden power plant. About 70 tons are used daily and 25 men are given employment.

Cincinnati, Ohio—The Bewley-Darst Coal Co. has closed its Cincinnati branch which is to be consolidated with the Knoxville office of the company. This order was effective Sept. 15 and the business of the office will be finally wound up by Oct. 1. Calvin Holmes will have charge of the Knoxville offices of the company, and Fred A. Gore, of Macon, Ga., will sell the Bewley-Darst product.

St. Louis, Mo.—The Chicago & Northwestern, it is expected, will enter St. Louis during the next month, as its line is practically completed through the coal fields adjacent to the city on the east. Something like 12,000 tons daily is being moved over the Chicago & Northwestern, south of Peoria, and after all connections are made several times this tonnage will likely move via this road to the Northwest.

Sandusky, Ohio—All records are declared to have been broken at the Pennsylvania railroad docks at Sandusky, in the matter of coal shipments this season, and there are two more months of navigation left. Last year the shipments from these docks amounted to 2,000,000 tons of coal, while, according to Supt. C. C. Hand, the 2,000,000-ton mark will have been reached by Oct. 1. The docks will be doubled next season. Seven years ago 400,000 tons was the high mark for a season's shipping from these docks.

Toledo, Ohio—A number of Toledo shippers are planning to enforce the payment of the rebate granted them by the ruling of Judge E. B. Kinkead, of the Franklin County, Ohio, common pleas court, rendered Sept. 9, 1913. This ruling upheld an order of the Ohio Public Service Commission reducing the freight rate on coal from Nelsonville, Ohio. The reduction amounts to 15c. on each ton of Hocking coal received in Toledo and dealers are claiming a rebate dated from Jan. 15, 1910, to the present time, that being the date of the filing of the first complaint.

Toronto, Canada—The merger of the Western Coal & Coke Co. the Pacific Pass Coal Fields, the St. Albert Collieries and the Lethbridge Collieries under the title of the Canadian Coal & Coke Co. has been completed and the respective properties made over to the new company. The authorized capital of the Canadian Coal & Coke Co. is $15,000,000, of which $11,000,000 is common and $4,000,000 preferred stock. Between nine and ten million of the common stock and $3,750,000 of the preferred has been issued, the balance being retained in the treasury. An issue of $3,000,000 of bonds will be placed at once to raise funds for discharging current liabilities, and developing and equipping the properties.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite market quiet but with a generally good demand in all branches; production being increased to full capacity. Bituminous business continues at a maximum and buyers appear resigned to the new high prices. Car supply now one of the leading factors in the situation.

Hard-coal production will shortly be up to full rated capacity, practically all companies having now resumed full time operation. While this would seem to indicate an active market, there is no important change in the wholesale end, nor is any anticipated in less than a month, unless weather conditions become unexpectedly severe. In fact, it will be essentially a weather market from now on. Fear is even expresed in some quarters that the present heavy production may result in the market being overshipped, but it should be remembered that much of this tonnage is being used to make up the deficiency in last year's production.

The demand for bituminous coal continues at a maximum with the better qualities being held closer and closer. Probably the only condition that has prevented a spectacular advance in soft-coal prices is the fact that most consumers and producers are so completely covered that little free coal remains to be negotiated. The larger consumers seem to be resigned to paying higher prices, even those who have overstayed the market in anticipation of a break. Slow dispatch is the rule coastwise, and vessels are beginning to accumulate at the loading ports.

There is no free coal to be had in the Pittsburgh district at base rates, while slack has never before been so scarce during the Lake shipping season. The car supply is becoming steadily worse, but probably not to the extent of seriously restricting operations. Production remains at the maximum for the season probably within 10 to 20% of the full rated theoretical capacity.

The car and labor shortage in Ohio is making it difficult to keep up the output, while the advent of some cooler weather has materially stimulated business; the movement is probably up to the full limit of the car supply. The domestic grades are particularly strong, the retailers endeavoring to accumulate some winter surpluses. Prices are being as firmly maintained as ever. Shippers at Hampton Roads are still short, but the situation is notably easier and more nearly normal supplies are on hand; the demand is also showing some improvement.

The situation in the Southern market is unchanged, operators waiting better prices before increasing the production; however, a good volume of business is being done even now, while it is anticipated that the next 30 days will show a material improvement. The announcement of the withdrawal of the O'Gara Co. has stiffened up the Middle Western market notably; this meant a reduction of some 3000 tons of screenings per day in the Chicago market and precipitated some sharp bidding for this grade. The Eastern coals are fairly steady, but in shorter supply than before.

BOSTON, MASS.

The Southern coals are firmer, but with no material change in prices. Car supply affecting the output of Georges Creek. Small advances made in the Pennsylvania grades and a more active market in prospect. Shortage on stove coal looks serious.

Bituminous—The Pocahontas and New River situation is notably firmer, although there has been no tangible price movement as yet. Transportation has begun to accumulate at the Hampton Roads piers and already there is enough congestion so that certain of the agencies are declining to accept further bottoms. The output is rather lighter than for some weeks and it is clear that we are in for a strong market late in October. Nothing higher than $3 f.o.b. Norfolk has so far been reported but this is due probably to contract requisitions taking practically all the coal at the piers. The Government has come in for large shipments and this together with an active export trade further accounts for the small supply of spot coal for coastwise delivery. What spot sales have been effected have been mostly to other shippers to fill out cargoes.

The movement to New England is gradually getting straightened out after the prolonged heavy weather. Some of the tows took ten day to get from the Delaware to Boston.

Car supply is reported to be poor on some of the roads, particularly from the Maryland districts, and this condition seriously affects the output of Georges Creek. There is still practically none of this grade to be had except by putting in transportation for indefinite waits. Several boats that would normally load at Baltimore have been seeking tonnage at Hampton Roads, but at the present writing, dispatch there is practically no better than at Baltimore.

Prices are up 5c. or so on the Pennsylvania grades and further advances are predicted. Buyers here, however, are not showing as much interest as might be expected. Several of the smaller consumers found they had over-stayed in waiting for Pocahontas and New River to ease off and are now taking relatively small lots of the better Pennsylvania to tide them over. Slow dispatch at Baltimore and at Hampton Roads is so likely to grow rapidly worse and runs up such heavy demurrage bills that an extra demand is bound to fall on coals out of Philadelphia.

Anthracite—All the shippers are now short of stove and dealers here are finding it extremely hard to make room for the other sizes it is necessary to take in order to get this grade; the demand from the public for this size is increasing very fast and it is becoming a big problem. The retailers with relatively small storage are finding it especially hard to manage. Orders are piling up at the other end and shipments are very slow. It is an anxious season for the average retailer.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.10@1.55	$1.30@1.70	$1.67@1.77	
Philadelphia*	2.35@2.80	2.55@2.95	2.92@3.02	
New York*	2.65@3.10	2.85@3.25	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.90@3.00
Providence†				3.88@3.99
Boston†				2.98@4.08

*F.o.b. †On cars.

NEW YORK

Anthracite companies working practically full time and no coal going into storage; retail trade showing improvement but wholesale still rather inactive. Bituminous quiet but firm. Car shortage spreading.

Bituminous—The spot market on soft coal is quiet, probably because both producers and consumers are so completely covered that there is little business to be negotiated. The tendency to ease up is noticeable at some points, but not to a serious extent. Gas coals are in very sharp demand, while slack is showing an abnormal strength, which will be further accentuated when the Lake season closes.

The car supply is causing more anxiety as the season advances, the situation on both the Pennsylvania and the B. & O. already being rather bad; reports are to the effect that the latter road showed indications of falling behind quite rapidly. There has been only a slight shortage so far on the New York Central. A great deal of trouble is being experienced with labor also, not so much in the supply, which is not any too good, however, as in the difficulty in maintaining continuous operations.

A large local railroad was reported to be in the market for a moderate tonnage recently, but on the whole the spot business is rather quiet. We continue previous quotations unchanged as follows:

West Virginia steam, $2.60@2.65; fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—The retail end of the hard-coal market is at a standstill at the moment awaiting the appearance of some colder weather. As may be expected during a transitional period from one season to another, reports are of a more or less contradictory nature. On the one hand, it is noted that mines are being put under full capacity operations which would seem to indicate an increased demand. But on the other hand, the feeling prevails that dealers are very heavily stocked, because of the acute shortage and consequent high tension which prevailed in the fall market last year.

Generally speaking, the market may be considered a weather proposition entirely from now on; a protracted spell of cold weather must inevitably develop a sharp demand, while a period of moderately high temperatures up to, say Christmas, will surely bring about a depressed condition and low prices. The fact that production is running substantially ahead of previous years is being mistakably taken as indicative of an easy situation this winter; it must be remembered in this connection that production last year was the lowest on record, with one exception since 1906, and was some 6,000,000 tons below the output for 1911. It is equally true, of course, that consumption was materially restricted last season by the moderate weather conditions, but even allowing for this it is still reasonable to believe that there has been a demand for large extra tonnage this year to fill up the holes caused by the deficiency last year.

At the present time stove coal is in the heaviest demand, and it is freely predicted that it will be selling as high as chestnut before the winter is over. Egg is heavy and difficult to move, with chestnut and pea in rather free supply. Stocking of all grades has been practically discontinued.

Quotations remain practically unchanged as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	....
Egg	5.25	$5.15@5.25	5.20	$5.10@5.20
Stove	5.25	5.25	5.20	5.20
Chestnut	5.50	5.40@5.50	5.45	5.30@5.45
Pea	3.50	3.40@3.50	3.45	3.35@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.35@2.70
Rice	2.25	2.25@2.35	1.95@2.20	1.80@2.20
Barley	1.75	1.75	1.50	1.50@1.70

PHILADELPHIA, PENN.

Hard-coal producers are opening up full time. Better tone generally with dealers reporting more inquiries. Weather market from now on and no great activity anticipated for 30 days. Bituminous showing a sagging tendency.

Everything now points to the fact that the anthracite business in this vicinity will soon be on in full swing. It is understood that one of the large producing companies which has been running on a curtailed basis, has now commenced to operate on full time, which in itself is an indication of an immediate improvement. While the conditions locally are not what they might be, at the same time it is evident that there is a better tone to the market; dealers as a rule report that inquiries are better, and deliveries heavier.

It is a weather proposition from now on. An early touch of frost will have the effect of starting up the fires, creating further inroads into available supplies. Of course, no actual winter conditions are expected for at least a month, but the trade generally remembers the situation last year, when the demand was far in excess of the supply, and the prospect not at all definite. However, conditions this year are not likely to be so strenuous, as the companies have fairly good stocks of coal, at least sufficient to keep the market fairly well supplied. Broken coal still continues far short of requirements, and there is a marked improvement in stove, chestnut and pea. Prices ruling at the present time are: Broken, $3.50; egg, $3.75; stove, $4; chestnut, $4.15 and pea, $2.50 at the mines.

While there has been no marked change in the bituminous trade during the past week, yet the tendency seems to be backward. Demurrage on coal at tidewater has again been heard of, but whether on account of lack of facilities for vessel movement, or cancellations due to a falling off in the demand, is not evident. The fact remains, however, that there has been a decrease in prices during the past week of from 10 to 25c. per ton; this doubtless reflects a desire on the part of operators to dispose of standing coal. Taking the market as a whole, however, there is nothing to indicate that it is not holding its own.

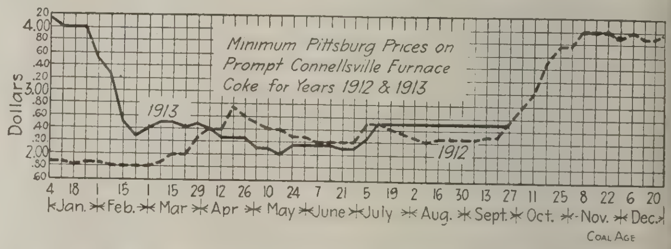
PITTSBURGH, PENN.

Demand for free coal increased, especially domestic. Unusual condition of slack commanding premiums, with stock accumulation this season very light. Increased use of slack and crushed mine-run. Labor and car supply fair. Connellsville coke market uncertain. Accretions to the ranks of the "regulars." Shipments increased.

Bituminous—There has been a further increase in the demand for domestic coal by dealers, who are not well covered by contracts, and operators' asking prices range up to $1.75 for 1¼-in. domestic. There is slightly better demand for free coal from other buyers, and there is practically none to be had at base rates, quotations generally ranging from $1.40 to $1.50 for mine-run. Slack has become decidedly scarce, and readily brings $1, while one large interest would not sell under $1.10, and would buy freely at the circular price of 90c. if the product were offered. Never has so small an amount of slack been accumulated during the Lake shipping season and even those operators who make a practice of storing slack during the summer, for their winter demand, have very small piles. The increase in the use of stokers is shown by the steadily growing demand for crushed mine-run, which usually takes an extra of 5c., being better than ordinary slack as it is lower in ash and of greater thermal value.

Car supply is not satisfactory, but only limits production slightly. Last Saturday one important division furnished only a 30% supply, but Saturday is normally expected to be bad. Men are not working full time, but are doing as well as formerly. On account of shortage of labor and cars, production is probably between 10 and 20% below theoretical maximum, but is substantially as heavy as at at any time this season. We quote regular circular prices, subject to premiums of 10@20c. for prompt lots, unchanged as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The market continues to be cut up by offerings of furnace coke at under the regular $2.50 price, down to $2.25 or $2.20 for coke alleged to be standard grade, but about which there seems to be considerable question. In some quarters it is claimed the market has definitely broken, but this statement cannot be accepted at par when it is universally admitted that the regulars who have held out for $2.50 have not weakened, and it is known absolutely that late last week a sale of some 6000 tons, shipment to the end of October, was made at the full price of $2.50 to a discriminating buyer in the East. From sources hitherto found trustworthy it is learned that in the past ten days one large operator and two small ones have agreed to work with the regulars in the matter of curtailing output to harmonize with the average demand. This will enable the regulars to work at a better percentage provided demand does not decrease further, and as to this there is serious question. We quote prompt and contract at $2.50 for furnace and $2.90@3 for foundry, per ton at ovens.



The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 20 at 378,437 tons, an increase of 3647 tons, and shipments at 389,742 tons, an increase of 14,831 tons. The excess of shipments over production is represented to be due to the lifting of about 10,000 tons of stock coke by steel works interests.

Later—The Producers Coke Co., which has been handling the output of the "regulars" has just made an announcement which may change the prospects of the market and which has aroused the greatest interest. It publishes a new list of the companies represented, the following additions being represented: Mt. Pleasant Coke Co., Consolidated Connellsville Coke Co., Genuine Connellsville Coke Co., Champion Connellsville Coke Co., Whyel Coke Co. and Puritain Coke Co. The Producers Coke Co. formerly claimed to represent operators producing 2,400,000 tons of coke annually, but with these additions the amount is increased to 3,500,000 tons. A rough count indicates 3000 ovens formerly represented, and 2000 ovens added through the new companies announced this week.

BALTIMORE, MD.

Heavy demand for good grade coals, and they are practically all sold up. Cheap steam fuels still weak and Eastern market for gas coals flat. Coke market off color. Slack still a feature and continues advancing.

The heavy demand for good grade fuels continues unabated. All free coal of this kind is being held tighter and tighter as far as prices are concerned. From $1.55 to $1.60 is now no unusual figure; for the most part, however, producers have little to offer in the open market. Contract calls for this class of fuel are practically at a maximum and most of the consumers would like the opportunity of increasing their tonnages if they were able. A number of mining interests are giving their regular customers first call on what little surplus they have. Most of the larger interests, seem to fully appreciate the present situation and are paying spot prices on excess above their contracts.

Cheaper grades of Pennsylvania steam coals are not any too strong. The movement has been able to meet all demands, and prices are about the same as the previous week, running between $1 and $1.10, the former figure being most generally heard. Poorer grade West Virginia gas coals are in rather poor demand, especially eastward, and sales at from 85 to 95c. were recorded. Slack continued the big feature, the figures demanded and obtained being in excess of the previous week. Sales at from $1 to $1.10 were not infrequent, this being from 10 to 15c. as a general proposition above run-of-mine gas coals.

Coke is not over-strong just now. The West Virginia market was the real barometer, the Connellsville fuels being pretty well sustained, apparently under pressure. Anthracite demand locally is improving, although it will be a month yet before the real rush is on. Steam sizes were in fair demand.

BUFFALO, N. Y.

Bituminous holding up well without any indications of weakness. Car situation becoming steadily worse with practically no gondolas obtainable. Anthracite picking up rapidly.

Bituminous—The local bituminous operators are unanimous in the opinion that the market continues to show all its former firmness; it is a difficult matter to get any shipments even among those who have their own mines. This condition is due mostly to the fact that the production appears to be so completely covered by contracts, that there is little or no free coal available.

The car situation is reaching more serious proportions right along, particularly where the buyer refuses to accept shipments in the regular steel hoppers. These cars have been replacing the gondola type so that the latter could be diverted for use in the steel trade. Producers flatly refuse to consider any orders specifying gondola cars. Although abnormally strong, there is really little of interest in the bituminous trade. Slack seems to be quite as strong and difficult to obtain as the sizes and if this general shortage continues up until Lake shipping closes, the mines will be able to continue making this grade.

Quotations continue very firm at $2.90 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run, and $2.25 for slack, with Allegheny Valley about 20c. lower.

Coke—The coke trade continues much weaker than the coal market. Prices having reached an abnormally high level, the inevitable reaction has resulted in an equally complete depression. Connellsville foundry sells f.o.b. Buffalo at $4.85, with high grade 48-hr. furnace, $4.40, and very little stock.

Anthracite—The demand in this trade is becoming steadily more active as the season advances, some of the large shippers already reporting that they are not getting as much coal as they would like. It appears that some companies still have dock room available at the head of the Lakes, while rumors are to the effect that the production of hard coal is not being kept up to the market requirements. Some of the independent operators are asking premiums on the short sizes, particularly stove, but as yet no sales have been recorded at anything above the regular circular. However, it is clear that much more anthracite is coming to this market than ever before. Shipments by Lake are still much reduced, although it is reported that they will show a steady increase from now on; shipments for the week amounted to 86,000 tons.

TOLEDO, OHIO

Car shortage and unsatisfactory labor conditions restricting production. Prices firm or advancing. Cool weather stimulated domestic business.

The demand for lake coal continues good and shipments are being made as fast as coal and boats are available. There is some car shortage and this combined with unsatisfactory labor conditions at the mines has retarded the movement here to some degree. The cool weather of the past week brought on a much better domestic demand while steam coal kept up to the notch. Prices were firm and as a matter of fact, were better maintained than they have been at any time during the season, although prices have been holding close to the list all along.

Pocahontas which has been lagging somewhat came right to the front and slack is very strong. Pittsburgh, No. 8, which has been at the high-water mark for a long time, is expected to reach a dollar within a few days unless some unforeseen circumstance should come up. Despite the traffic difficulties, of which there is continued complaint, more coal has been going up the lakes than is usual at this season and shippers are straining every nerve to secure adequate stocks. An unusual amount of slack has been demanded for lake shipment which has caused a shortage. It is predicted by coal men here that there will be an advance in Hocking coal Oct. 1.

The market is now quotable as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump.........	$2.50	$1.75	$2.50	$2.00	$2.50	$1.45	$1.35
Egg..................	2.50	1.35	2.50	1.50	2.50	....	...
Nut..................	2.00	1.25	2.25	1.75	2.50	1.35	....
¾ lump...............	....	1.65	....	....	....	1.25	1.25
Mine-run.............	1.60	1.35	....	....	....	1.12	1.15
Slack................	....	0.70	....	....	....	0.80	....

Cannel Coal is quotable about as follows: Pennsylvania, lump, $2.85; egg, $2.35; nut, $2.25; Ohio lump, $3.25; Kentucky lump, $3.

COLUMBUS, OHIO

The car shortage gradually increasing and is the controlling factor in the local trade. Demand from all sources continues good and prices strong. No new circular has been issued but some advances have been announced.

The feature of the coal trade in Ohio during the past week is the growing car shortage which has had the effect of still further strengthening prices. No new circular has been issued effective Oct. 1 as was expected but prices on all grades have advanced to a certain extent and no weakness of any sort is reported. The volume of business is all that the car supply can care for and the prospects for the future are bright in every way.

There is a good demand for all domestic grades, which appears to be the strongest point in the trade. Dealers are placing larger orders and are asking for immediate shipment if possible. Retailers are making every effort to accumulate stocks to guard against the rush which is expected at the first cold spell; they are also busy on deliveries now and prices are strong and will probably be advanced soon.

Lake trade is still active although the short car supply is cutting into the tonnage moving to the Northwest. Chartering of bottoms is still going on and the trade will likely be steady right up to the close of navigation. Practically no congestion is reported from the docks at the upper lake ports; dock prices are still strong and no weakness has developed. The total tonnage from Ohio fields will be much more than last season.

The car shortage has interfered with production to a large extent in every mining section of the state. In the Hocking Valley the output is estimated at 75 per cent. which is the best reported. In the Pomeroy Bend field the output is estimated at 50 per cent. and in Eastern Ohio it is 60 per cent. of the average.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$1.75 @ 1.70	....	$2.00 @ 1.90	$1.70 @ 1.65
3-4 inch...........	1.60 @ 1.55	$1.50 @ 1.40	1.75 @ 1.65	1.55 @ 1.50
Nut...............	1.30 @ 1.20	....	1.60 @ 1.55	1.25 @ 1.20
Mine-run...........	1.40 @ 1.30	1.25 @ 1.20	1.35 @ 1.30	1.25 @ 1.20
Nut, pea and slack..	0.80 @ 0.70	....	1.00 @ 0.90	0.75 @ 0.70
Coarse slack........	0.70 @ 0.60	0.95 @ 0.85	0.90 @ 0.80	0.65 @ 0.60

HAMPTON ROADS, VA.

Recent shortage somewhat relieved. Movement coastwise and foreign during the week only fair. Good demand for coal inland.

Although some of the shippers from tidewater are still short the situation at all Hampton Roads piers is greatly improved and the quantity of coal remaining on hand at the end of the week is practically normal. The number of cargo and bunker vessels loading during the week will not compare favorably with the previous ones although there has been several large cargoes to New England and foreign ports. Few spot sales have been made and these only in small quantities at a price around $3 per ton. On these small sales it is difficult to ascertain exact figures as buyers and sellers prefer to withhold these figures.

The demand for coal inland continues good and prices fair. Shipments for foreign points moved to Naples and Trieste, Cristobal, Genoa, Dakar and Cuban ports.

Dealers in domestic coal and coke are complaining at the poor demand during the last few days. Orders are coming in slowly for both prompt delivery and also for October and November delivery.

LOUISVILLE, KY.

Shipments out of state have been so heavy that local supplies are short; strike talk has been discontinued, for the time being at least. Car supply moderately good.

There has been but little change in the local market, domestic coal still continuing in heavy demand, with screenings much in oversupply, and prices abnormally low. The best grades of eastern Kentucky screenings are selling around 70 and 75c., as compared with 90 and 95c. a few weeks ago; the lower grades can be had at almost any figure. The domestic demand has been stimulated by the advancing season, and the generally acknowledged fact that stocks on hand are below normal; the maximum supply of coal in the hands of any dealer will not exceed requirements for a single month. This is probably due to the fact that most of the summer shipments went to the Northern and Northwestern markets. This movement is still continuing, and, with the time approaching when large tonnages will be required for actual consumption purposes, the local dealers are naturally becoming a little anxious to accumulate some surpluses; the same applies to consumers, but the coal is not available.

Cars are in rather short supply, but the situation is by no means acute as yet. The movement is largely confined to other states, both to the North and South, with the result that local dealers are receiving only sufficient to supply current requirements, and are finding it impossible to accumulate any surpluses.

Production at the mines is fairly heavy, and, as already noted, the demand for domestic coals is all that could be desired; except for the weakness which has developed on the steam grades, the local market conditions might be considered ideal.

First-grade eastern Kentucky block coal has been quoted as high as $2.50 f.o.b. mines, although the real market is probably around $2 to $2.25. However, the strong rising tendency is still evident in the market.

BIRMINGHAM, ALA.

Little change in coal market this week. Coke is getting stronger and sales of blacksmith coal increasing. Pig iron firm at $11.50 for balance of year.

There has been little change this past week, either in the amount of tonnage sold, or prices, on both domestic and steam coal. The operators state that they are moving what they get out, but that they are not trying to break any production records and are, rather waiting for a slightly better market and higher prices. The volume of business is good for this season of the year, and prices are holding up well indeed. The next thirty days will show a decided improvement.

There was little doing in furnace coke this week, though foundry coke held its own, some good sales being made. Blacksmith coal is gradually getting better, after the usual dull summer months.

Southern foundry iron for delivery during the remainder of the year is firm at $11.50. There does not appear to be any other price, and it is either a sale at this price or no sale at all. The quotation for the first quarter of next year is $12, though it is believed the $11.50 basis could be obtained on business closed now. Practically all producers are shipping more than their monthly output, thus reducing the amount of storage iron in the yards.

DETROIT, MICH.

Conditions active with cars in short supply and shipments delayed. Domestic market particularly strong; an advance of 50c. scheduled for Oct. 1.

Bituminous—The local market is very active considering all prevailing conditions. The car supply is the predominating feature at the moment, prompt delivery being entirely dependent upon this. The situation in this respect appears to be about holding its own, although the recent cool weather has had a tendency to cause some uneasiness.

The steam business continues strong in every way, manufacturing plants taking large tonnages and showing a renewed interest in contracts, the indications being that these latter will be closed at appreciably higher figures than the old ones expiring. Domestic business is also good, dealers making an effort to obtain some surplus stocks in preparation for the winter rush; most of the large jobbers, however, have their winter requirements covered. Retail prices continue very firm with an advance of 50c. per ton scheduled to take place on all grades Oct. 1.

The Lake shipping still takes a large tonnage, efforts being made to get as much coal into the Northwest as possible before the car shortage becomes acute. The strike in the Michigan coal fields has also become a feature in the situation. The restricted production in this district naturally must be made up from other fields.

Anthracite—The trade is opening up in fairly good condition, and the prospects are for a good fall and winter business. As yet the market is not particularly active, but there are plenty of preparations being made for increased shipments.

The current bituminous market is quotable on approximately the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	$1.50	....	....	$2.75	$2.50
Egg..........	1.65	....	1.50	....	....	2.75	2.20
Steam lump....	1.25	....	1.10	....	....	....	....
$\frac{3}{4}$-in. lump.....	1.10	$1.15	1.10	....	....	....	....
Mine-run.......	1.05	1.10	....	1.00	1.00	1.60	....
Slack..........	1.00	1.00	0.80	1.00	1.00	....	....

INDIANAPOLIS

Difficult to keep up a supply of anthracite, especially chestnut. Other Eastern coal coming fairly steady but in smaller shipments. A touch of frost has increased retail activity. Car situation improved.

Mining conditions and the coal trade generally continue quite satisfactory. There is less complaint about car shortage, the railroads evidently having made an effort to catch up. Coal is moving quite regularly from mines to yards and from yards to consumers. A frost on two or three recent mornings has stimulated buying. In industrial circles, there has not been any material falling off, although some of the smaller automobile concerns are not very active; in fact five of them in this state have gone into receivers' hands the last few weeks. Dealers are finding it difficult to keep up the anthracite supply, especially chestnut. Last winter there was a famine and consumers this season are trying to get a winter's stock in before cold weather. Other Eastern coals keep coming irregularly and in restricted quantities, one car at a time where formerly it was three cars. This is taken to mean that operators are parcelling it out among their customers, trying to serve all with at least part of their order. Any car shortage that may come with the movement of the corn crop will not be severely felt in this territory. The only way the trade can suffer is by the occupation of the motive power in grain rather than in coal carrying.

There has been no change in retail prices in this city since the advance of 25 to 50c., Sept. 23. Operators here are advising the purchase of all the coal possible at the present figures.

CHICAGO

Market stiffened up materially on the report that the production of the O'Gara properties would be temporarily withdrawn. Some cold weather has also stimulated buying. Car shortage becoming a factor in the situation.

The market during the last week was affected somewhat by the appointment of receivers for the O'Gara interests here, which resulted in the withdrawal from the market, of the production of the properties involved in the receivership. The supply for certain large screenings contracts being thus restricted the demand was thrown upon the open market, stiffening the general tone considerably. Another factor was the continuation of the car shortage while there was an increased demand from retailers.

Last week's cold weather resulted in the starting of furnaces in apartment buildings, favoring the smokeless coal market to a great extent. Mine-run smokeless is selling at from $1.40 to $1.50 at the mines, the latter figure prevailing in a large measure. The market for lump and egg is not quite as strong, prices being $2.25 at the mines. There is an improved demand for domestic coke and an increasing supply is attracting attention. An increase of 10c. a ton was evident in the byproduct coke market, while there is little spot buying of furnace and foundry coke. The fulfillment of contracts on the latter is normal.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump............	$2.57	$3.05	$2.52	
Steam lump..............	2.02		2.07	
Egg.....................		2.80@3.05		$4.30@4.55
Mine-run................	1.92	2.30	1.87	3.45@3.55
Screenings..............	1.22@1.32	1.60@1.70	1.22@1.32	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; byproduct egg, stove and nut, $4.85; gas house, $4.65@4.75.

ST. LOUIS, MO.

Considerable activity in domestic sizes. Prices advancing. Screenings market on Standard demoralized but exceptionally good on the high grades. Car shortage will likely keep the market in good shape.

The coal operator here is at last coming into his own; prices are advancing on all grades with the exception of steam sizes, and the effect of the Keokuk Electric Service is driving some cold hard facts home to the operator in the Standard district. Standard screenings are down to 10c. a ton at the mines, and, of course, this has caused the price of screened sizes to go up, but even then, with screenings at 10c., some operators are selling the other 65% of their coal at $1.05, with the cost of production ranging anywhere from 80 to 90 cents.

The Carterville field, so far as steam sizes are concerned,
as come to the front with a jump since the O'Gara oper-
tions went into the hands of receivers. The banks are
sking a higher rate of interest than the receivers antici-
ated, and, as a result, the mines are idle. This has taken
bout 3000 tons of screenings a day out of the Chicago mar-
et, and Chicago is drawing the Carterville screenings that
sually come to St. Louis, so that in a week's time screen-
gs jumped from 40 to 65c., and will likely continue strong.

The market is now quotable on the following basis, fo.b.
ines:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
in. lump	....	....	....	$1.10@1.20
in. lump	....	....	$1.50	....

OGDEN, UTAH

**Coal market much stronger. Plenty of equipment at
yoming mines but Utah suffering severely from car short-
ge. Cold snap in Utah draws heavily on storage coal.
ugar factories placing orders for large shipments. Strike
Colorado affecting Eastern market.**

With the demand for immediate shipments increasing,
e coal operators are beginning to run the mines full time,
nd while there are still a few weak spots the demand for
mp coal is good, and all the mines are disposing of this
rade. The surplus of nut coal has been greatly decreased
d very little is now standing on track. Sugar beets are
eing harvested and Oct. 1, will find all the factories run-
ing and consuming the surplus slack. Shipments of steam
al were resumed during the week and the surplus of this
rade is being rapidly diminished.

The car situation at Rock Springs and Kemmerer, Wyo.,
all that the operators can expect. The Union Pacific
ailroad has put forth an extra effort to keep the mines
pplied with equipment and during September, not a day
s been lost on account of cars. If the railroad can do as
ell during October as they have during September, the
ines will no doubt have a very successful winter. Utah
perators have not been so fortunate. The Rio Grande Rail-
ad has been unable to furnish equipment and the mines
e only working two and three days per week.

Quotations remain as follows: Lump, $2.75; egg, $2.50;
t, $2.25; mine run, $1.85; slack, $1.

PORTLAND, ORE.

**Car shortage is beginning to make itself felt as result
heavy demand for equipment. Shipments of coal to this
ty during the past week have shown material decrease.**

The heavy demand upon the railroads for rolling stock to
ove the crop now going to tidewater, is being felt by
e coal dealers here; during the past week shipments from
e mines have been reduced more than 50%. That the
tuation may become quite serious is admitted by dealers,
hose stocks are none too heavy at this time. The indica-
ons are for a good active demand this fall and winter, con-
derably better than last year, when the market was rather
ll, due largely to the open winter throughout the Pacific
orthwest.

A decided car shortage may serve to act as an incentive
importations of coal by water from Australia or other
ints, although there is little probability of any coming
om British Columbia owing to the strike there.

FOREIGN MARKETS

GREAT BRITAIN

Sept. 19—Tonnage is not arriving as freely as anticipated,
t most shippers have sufficient ready steamers for their
mediate requirements. The inferior classes of large and
all coal are in plentiful supply for prompt loading, with
ices weak. There is very little business doing for for-
rd shipment in any class of coal.

t Welsh steam	$4.74@4.92	Best Monmouthshires	$4.02@4.08
t seconds	4.44@4.62	Seconds	3.84@3.96
onds	4.20@4.38	Best Cardiff smalls	2.40@2.46
t dry coals	4.32@4.56	Seconds	2.22@2.34

The prices for Cardiff coal are f.o.b. Cardiff, Penarth or
rry, while those for Monmouthshire descriptions are f.o.b.
wport; both exclusive of wharfage, and for cash in 30
ys.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN R.R.

The following is a statement of tonnages shipped over this road from mines in West Virginia and the commercial and company coal, for the month of August, in short tons:

Field	Shipped	Tipple	Total	Commercial	Company
Pocahontas	1,318,149	16,177	1,334,326	1,345,377	86,137
Tug River	232,865	2,382	235,247	199,313	35,935
Thacker	296,422	12,285	308,707	219,876	88,825
Kenova	89,271	10,088	99,359	83,632	15,721
Clinch Valley				158,902	16,376
	1,936,707	40,932	1,977,639	2,007,100	242,934

Shipments of coke entirely from the Pocahontas field amounted to 86,384 tons.

THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Sept. 15, as follows:

	Surplus	Shortage	Net*

DIVIDENDS

Delaware, Lackawanna & Western Co.—Regular quarterly dividend of 2½% payable Oct. 15 to holders of records Oct. 1.

Lehigh Valley Coal Sales Co.—Regular quarterly dividend of $1.25 payable Oct. 20 to holders of records Oct. 9.

Nova Scotia Steel & Coal Co., Ltd.—Regular quarterly dividend of 1½% on the common, and 2% on the preferred, both payable Oct. 15 to holders of records Sept. 30.

FINANCIAL DEPARTMENT

The New River Co.

The output of the 15 subsidiaries of this company was 1,755,105 tons with a net loss from operations of $116,578. The New River Co. has an investment of $17,069,182 in stock and loans of its subsidiaries of which $16,585,358 is stock. Also an investment in coal and timber lands held for future development aggregating $2,927,218. In addition the company has invested $1,968,395 in the White Oak Ry. and Piney River & Paint Creek R.R. and $7047 in sundry items, making a total of all investments amounting to $21,971,843.

Treasurer Dowst says:

After the present management took charge of the affairs of the company, it was found that certain accounts were being carried on the books which, in the opinion of the new management, should be charged off. The president was authorized to cause the necessary charges to be made against accumulated earnings or losses as of Mar. 31, 1912. The principal items are as follows:

Plant account has been credited with a total of $444,972, losses in plant value as inventory. Mine development has been credited with $153,267, same being largely on account of Sherwood and Skelton developments; $42,920 has been charged off on merchandise, after taking complete inventory at all of the companies' stores. Accounts receivable have been credited with $107,822, largely made up of accounts receivable standing on the White Oak Coal Co. books which are considered not collectible, also covering losses sustained in adjusting differences between the White Oak Coal Co. and the Coal Supply Co. of Chicago.

A further amount of $108,726 has been charged off on notes on which the collateral has been sold and credited and on which the collectibility of the balance is doubtful. The royalty account is credited with $181,176 of minimum royalties on which the time limit of recovery has expired. Underwriting expense is credited with an amount of $625,000. This represents discount and underwriting of $2,500,000 bonds of the company which were placed in July, 1909, which it is deemed advisable to charge off at this time rather than by installments.

Depreciation is credited with $233,406 in order to make it possible for all plant investment unrecoverable at the termination of the life of the operation to be charged off by a fair annual rate of depreciation during the life of the coal in the ground. No appreciation has been made of coal lands or of coal in the ground on leased lands.

There was charged off for depreciation $65,920 in 1911-12, against $66,650 in 1910-11.

* Indicates a loss.

⁂

Colorado Fuel & Iron Co.—The surplus after all charges for the fiscal year to June of this year shows a decrease of $74,036 from that for the same period to June, 1912, but a gain of $476,520 over 1911. The gross earnings for this year increased $47,430, but expenses also showed an increase of $199,450.

The National Bituminous Coal & Coke Co. (Washington, D. C.)—The $1,000,000 6% first mortgage 20-year profit sharing gold bonds of 1911, of this company, were offered during last May by a British corporation. The issue has a certain peculiarity in that besides the fixed rate of 6% per annum, the bond holders are entitled to 25% of the net profits. For the year to June 30, 1912, an extra of 2% was paid, making a total disbursement of 8%.

PRICES OF MINING SUPPLIES

MARKETS IN GENERAL

Apprehension is apparent in many quarters over the unsettlement in Washington, and the currency bill looms up as one of the largest factors causing this unrest. It evidently contains more benefits to the agricultural than to the manufacturing interests, and while manufacturers of the country are evidently able to hold their own as far as the tariff is concerned, it will be a little difficult for them to maintain their position with an unfavorable tariff and, at the same time, a currency less suited to their needs than the present one.

The crop situation shows practically no change from a month ago, but the wheat crop shows slight improvement, and there has been no further deterioration in the corn crop.

Railroads of the country are not expanding, and many of hem have all they can do to meet their current expenses and fixed charges. There are a few conspicuous examples, which through careful management, attending to the business of running a railroad, and conserving their resources, are able o put aside money for improvements, but these are few. It s evident that a change is coming over the railroad world, and the recent election of a student of economics to the board of directors of a leading eastern line shows that is slowly permeating through the railroad field.

The statistics compiled by the Copper Producers' Association were uniformly favorable to the holders of the metal, howing as they did only about two weeks' stock.

Financial conditions continue to improve, but there has been more demand for funds to the crop moving, and t is evident that the vast sums hoarded in the continent of Europe will find their way into loans to the Balkan States. The troubles there are not entirely settled as yet, and fresh outbreaks are not at all unlikely. On the other hand, condiions in the bond market have decidedly improved and bond ealers in New York and other large cities have been able o sell a great many securities which they have been carryng for several years.

Railway equipment is being more fully used and the report for the fortnight ending Sept. 15 showed a decrease in dle equipment of 18,000 cars. It does not look as though here would be any serious shortage later in the year.

LABOR

Conditions in the labor world are fairly satisfactory. Complaints come from contractors doing road work, and other utside construction, that there is a dearth of men, but that is lmost always the case at this season. There are comparaively few strikes, and it is evident that there are not going o be any serious disturbances before spring. The arbitration etween the trainmen and their employers continues, and a reat deal of matter is being brought out which is of little r no pertinent value to the question at hand. The strike f the copper miners in the upper Michigan peninsula is altering, and it is evident that this will be ended some time n the near future. Some New England mills report that it is ifficult to secure enough laborers and the railways have acked men to do maintenance work.

Outside labor commands $2 per day. The latest figures f immigration show that 138,244 immigrant aliens were admitted into the United States during July. This aggregates 38,000 immigrants in the first seven months of the calendar ear.

IRON AND STEEL PRODUCTS

Prices of pig iron have advanced. In most finished lines here has been a decline, and in old material the market ppears to be breaking of its own weight with not enough usiness to seriously affect prices. The favorable factor, the nfilled orders of the Steel Corporation which fell off less than 00,000 tons during August, was well received, but coupled ith this came a most pessimistic statement by the president one of the largest independent concerns, and a knowledge the fact that the bookings during September were by no eans as large as during August. It must be remembered hat in wire products the U. S. Steel Corporation alone booked bout 7000 tons daily, and it is stated on excellent authority hat the incoming bookings of this Corporation during Sepmber will average from 30,000 to 31,000 tons daily, compared ith 33.000 tons daily in August. Shipments are not quite s heavy as during August. Hope is held out that the larger railways will order rails in the near future, and it is expected that the leading trunk lines reaching out from New York will order about the same tonnage as a year ago. This would in itself go a long way toward relieving the situation and bringing other consumers into the market. Especial weakness has been shown in steel sheets, and some exceedingly low prices have been named on these commodities.

Pig Iron—In September some fairly good sales were made, not only for delivery during the fourth quarter of the present year, but well into the first quarter of 1914. Foundries purchased freely and prices advanced from 25c. to 50c. per ton in the more active brands. While there was, at no time, any concerted buying movement, nor has there been any large buying of iron, still consumers, both large and small, made it a point to replenish their stocks and prepare for the future. One reason for this lay in the belief that prices were about as low as they could normally be expected to go with the business of the country at least 80% of the maximum, and another that foundries using pig iron had some fair orders on hand which they felt they should cover. Orders are not large, most consumers preferring to wait and see which way the market is going to move before they make any large commitments. One factor which has been most reassuring in the pig-iron market has been a fairly active demand for cast-iron pipe and some very good orders have been placed in this line within the last fortnight. Steel-making iron has also been in good demand irrespective of the fact that steel is much less active.

As stated, prices are somewhat higher, and for fairly large lots are quoted as follows: Southern Foundry No. 2, Cincinnati, $14.25@14.75; Southern Foundry No. 4, Cincinnati, $13.25@13.50; No. 2 Northern Foundry, Chicago, $15@15.50. Bessemer iron in Pittsburgh is $16.65; this includes the 90c. freight rate from the valley to Pittsburgh. No. 2 Southern Foundry or Birmingham is $11@11.50.

Steel Rails—A few orders for 1000 and 2000 tons have been received from minor lines, but the large railroads of the country have not placed any orders for next year's delivery. It is understood that the Pennsylvania and the New York Central are preparing their schedules, but as yet no announcement has been made relative to these orders. It is evident, however, that they will require about the same quantity of rails as this year, and if they do not order them as early the amount will be about the same. The mills are fairly active at present and will probably continue so for the next two or three months. An indication given was the announcement made that the Pennsylvania was figuring on buying 100 locomotives and had appropriated $1,200,000 for the electrification of a branch leading out of Philadelphia.

Quotations are unchanged at $28 per ton for standard sections of bessemer rails and $30 per ton for openhearth rails, both f.o.b. Pittsburgh. These prices represent a quotation of 1.25c. for 25- to 45-lb. rails; 1.20c. for 16- to 20-lb. rails. In Chicago, 16- to 20-lb. rails are quoted at 1.30c., and 12-lb. rails at 1.33c. Relaying rails in Chicago and other points in the Central West are quoted at $24 per gross ton and in New York at $22.

Track Supplies—Orders coming into the mills are mostly for small lots, and these are few. The spike market has not been as quiet in many months as it now is, and prices are weak, as follows: Large lots, $1.75@1.80 Pittsburgh; small lots, $1.90@1.95. In Chicago spikes are $1.90@2; track bolts with square nuts, $2.25@2.40; angle bars, $1.50.

Structural Steel—Business has been better in the last month. Quite a few new orders have been placed and the outlook for new business is very fair. Fabricators in the Chicago market are reported to have about four months' business on their books, and this includes some work for the Panama Pacific Exposition in San Francisco. A fair amount of bridge work is coming out not only for railroads, but for municipalities and counties. In the East most of the new work is for factory extensions with the exception of a large amount of structural work that will be required for new subways in New York. The fabricated steel for the Panama Canal has been practically finished. The contract for the new Ford factory in Philadelphia was let last month, and a new factory in Detroit will be let in the near future for the same company. An elevator plant in New Jersey let a contract for structural work last week. Fabricating steel is fully as cheap as last month, and structural shapes are slightly easier, 1.45c. being obtainable in Pittsburgh. In Chicago 1.63c. is quoted. These prices are per pound in large lots.

Pipe—The market is not as active as last month, and for the smaller sizes of pipe there has been quite a falling off in demand. For line pipe, business is just as active as it has been any time this year, and indications are that the oil-producing companies will buy as much pipe in the next six months as they have in the last for their business is exceptionally active. From present indications it would not be at all surprising if there were another downward revision in the price of pipe, especially for the smaller sizes. At present quotations show no change and the discounts from net prices are repeated from last month as follows:

	Black	Galvanized
¾- to 2-in. steel butt welded..........	80%	71½%
2½- to 6-in. steel lap welded..........	78%	69½%
7- to 12-in. steel lap welded..........	75%	64½%

At these discounts the net prices of pipe per foot at Pittsburgh are as follows:

Diameter	Cents		Diameter	Cents	
	Black	Galvanized		Black	Galvanized
¾-in.........	2.30	3.26	5-in.........	30.50	45.00
1-in.........	3.40	4.83	6-in.........	42.25	58.25
1¼-in.......	4.60	6.60	7-in.........	59.50	85.00
1½-in.......	5.50	7.90	8-in.........	62.50	89.00
2½-in.......	12.90	17.80	10-in.......	$1.03	$1.46
3-in.........	16.80	23.30	11-in.......	1.13	1.64
4-in.........	23.00	33.20	12-in.......	1.27	1.82

Sheets—Business has been reported as low at 2.05c. Pittsburgh for large lots. This must have been a special transaction, if it was done at all, for some sales to consumers who ordinarily secure about as good a price as any, have been made at 2.10c. for No. 28 black. The sheet markt is exceedingly quiet, operations are at a low figure and mills are probably not running more than 50% of capacity. In addition to the new producing capacity that has sprung up in the last year, there is considerable apprehension that foreign producers may be able to sell sheets in this market, particularly on the seaboard, at close competition with the mills in the Pittsburgh district. The price for large lots is, as stated, $1 per ton lower than last month, quoted at 2.15c. f.o.b. Pittsburgh for No. 28 black.

SMALL LOTS IN CENTS PER POUND

	Pittsburgh, Penn.		Chicago	
	Black	Galv.	Black	Galv.
Nos. 22 and 24.............	2.65	3.45	2.60	3.40
Nos. 25 and 26.............	2.70	3.60	2.65	3.55
No. 27	2.75	3.85	2.70	3.80
No. 28	2.80	3.90	2.75	3.85

WIRE PRODUCTS

Wire—Activity in the wire trade fell off considerably during September, but this was to be expected after the enormous business transacted in August. Quotations of wire products have been steady, and there has been little or no cutting, although some rumors were current that nails had been cut. Wire-nail makers have enough business on their books to keep them actively engaged for the remainder of the year. Quotations are unchanged as follows: Annealed fence wire in large lots, $1.50; galvanized barbed wire, $2.15; annealed barbed wire, $1.75. These quotations are per 100 lb. f.o.b. Pittsburgh. In Chicago plain wire is $1.73; painted barbed wire, $1.93, and galvanized, $2.33. These quotations are also for large lots.

Copper Wire—Business has not been especially active, but the recent announcement that the Pennsylvania would electrify a portion of its line, and the very favorable report given to the development of electrical properties by a prominent financier in New York, leads to the belief that wire will be in good demand for some time to come. Prices have not been shaded, although copper can be had at slightly less figures than a month ago. Wire sold on a basis of 17½@18c. per lb.

Telegraph Wire—For lots of fair size measured in Birmingham wire gage, prices in cents per pound are as follows: Extra best, Nos. 6 to 9, 4⅜c.; Nos. 10 and 11, 4½c.; No .12, 4⅝c.; No. 14, 5⅛c.; "Best Best" Nos. 6 to 9, 3½c.; Nos. 10 and 11, 3⅜c.; No. 12, 3½c.; No. 14, 4c. Actual freight is allowed from Trenton, N. J., where it does not exceed 25c. per 100 lb.

METALS

Copper—The heavy buying by consumers in both Europe and the United States carried the price of electrolytic copper well up to 17c. and a few sales were made at that figure. At around 16¾c., however, a very large business was transacted and consumers supplied their needs not only for the present, but for some time in the future. All of the favorable news being out, the copper market lagged and prices toward the end of the month declined and sales were made at 16.62½c. New York for electrolytic. One favorable feature from the consumers' standpoint was the apparent breaking down of the strike in the Lake Superior region, and the probability that by the end of the year the output from this district would return to normal. The statistical position of copper is very strong, and with a continuation of business at the present rate it is likely that prices will remain steady or possibly advance to slightly higher levels.

Tin—As a result of exceedingly heavy shipments from Europe to the United States, prices of tin declined and sales were made at 42c. The shipments from Europe to the United States during September amounted to more than 4000 tons.

Solder—Strictly half-and-half solder is about ½c. per pound cheaper and quoted at 25½@26½c. per lb.

HARDWARE

Nails—There are some reports that nails have been sold at exceedingly low figures in Central Ohio, and when traced to the source this was found to be true. It represented a special case where a mill made an unusual quotation in order to offset an unfavorable freight rate. Wire nails are held at $1.75 Pittsburgh and $2.05 New York in kegs of 100 lb. and large lots to consumers, but for small lots from jobber's store $1.95 is quoted in Pittsburgh and $2.15 at New York.

Iron and Steel—Stocks at jobbers' warehouses are better assorted than last month, but the demand continues heavy. Prices are without change from warehouse in Pittsburgh and other distributing centers, as follows:

	Per lb.
Refined iron:	
1 to 1⅞ in., round and square......................	2.10c.
1½ to 4 in. x ⅜ to 1 in..............................	2.10c.
1½ to 4 in. x ¼ in. to 5/16 in........................	2.30c.
Norway bars	3.60c.
Soft steel:	
¾ to 3 in., round and square........................	2.05c.
1 to 6 in. x ⅜ to 1 in................................	2.05c.
1 to 6 in. x ¼ and 5/16 in............................	2.20c.
Rods—⅝ and 11/16 in..................................	2.15c.
Bands—1½ to 6 3/16 in. to No. 8......................	2.35c.
Beams and channels—3 to 15 in......................	2.15c.

MISCELLANEOUS

Portland Cement—Manufacturers of cement have experienced just as active a demand throughout last month as any time this year, and already talk is current that there may be somewhat higher prices in force next year. Several reasons are given for this, principally the enormous demand for cement for roads and an excellent demand for cement for ordinary uses. There will probably be as much cement used in New York State in 1914 as in 1912 or the present year, irrespective of the fact that the barge-canal work is practically completed and very little work is to be done on the Ashokan aqueduct. Prices are absolutely without change as follows:

Boston, $1.32; not including package.
Pittsburgh, $1.18; not including package.
Chicago, $1.25 f.o.b. not including package.
Cleveland, $1.36 f.o.b. not including package.
Detroit, $1.34 f.o.b. not including package.
Minneapolis, $1.45 f.o.b. not including package.
Pittsburgh, $1.28 f.o.b. not including package.
St. Paul, $1.45 f.o.b. not including package.

Paint—The price of linseed oil is slightly lower at 52@53c. per gal. in 5-bbl. lots. Spirits of turpentine is higher at 42c. per gal. in New York. White lead in oil is steady at the higher figures quoted last month: 8c. per lb. in 100-, 200- and 500-lb. kegs.

Bars, Concrete Reinforcing—Business is fair, but lower quotations have been made, and those given below represent a decline of $1 per ton compared with last month.

PITTSBURGH, CENTS PER POUND

	Warehouse Stock
¾-in.	1.69@2.00
⅝-in.	1.95@2.05
½-in.	2.00@2.10
⅜-in.	2.15@2.25

Brattice Cloth—The market is just as firm as it was a month ago, and the outlook is that brattice cloth may advance to even higher levels. Stocks are fair, but consumers are only buying sparingly.

Roofing Paper—There is a fair demand, and prices are steady and without change. The largest size sheeting which is sold in rolls of 500 sq.ft. is quoted as follows: 20-lb. per roll, 28c.; 30-lb. per roll, 43c.; 40 lb. per roll, 58c. Rubber roofing, which is sold in rolls of 108 sq.ft., is as follows: 1 ply, 35 lb., $1.90; 2 ply, 45 lb., $1.10 3 ply, 55 lb., $1.30.

Tin Plate—The demand for tin plate continues large, the Standard Oil Co. being one of the largest consumers at this time. The reported sale is of 40,000 boxes, but this has not been confirmed. In Pittsburgh, 100-lb. coke plates are quoted at $3.60 per box, and 100-lb. terne plates are $3.45 per box. These quotations are per box of 112 sheets in large lots.

CURRENT COAL LITERATURE

We will furnish copy of any article (if in print) in the iginal language for the price quoted. Where no price is oted, the cost is unknown. Inasmuch as the papers must ordered from the publishers, there will be some delay for reign papers. Remittance must be sent with order.

The Cast Steel Bar Frame

(***Barsteel***)

of Baldwin-Westinghouse Mine Locomotives

This frame is of the same type as that used on the famous Baldwin Mikado steam freight locomotives. It is designed to give greater strength than any other type of frame for a specified weight of locomotive and to allow easy access to all parts so that the locomotive can be inspected or overhauled, when necessary, with the least possible cost of time and labor.

The motors; brake shoes; brake rigging and sand boxes are all quickly reached, and excellent ventilation is given to the motors and resistance, through the openings allowed by the ***Barsteel*** frame construction. The journals and the motor armature and axle bearings are also easy to get at for thorough lubrication.

The ***Barsteel*** frame is only one of the important features of Baldwin-Westinghouse Mine locomotives, which give the user the greatest possible service.

Full information can be obtained by addressing either Company.

Baldwin Locomotive Works
Philadelphia, Pa.

Westinghouse Electric & Manufacturing Co.
East Pittsburgh, Pa.

The frame on this Baldwin Mikado locomotive and the mining locomotive frame shown above are of the same type—simple, accessible, strong and durable.

VOLUME 4 OCTOBER 11, 1913 NUMBER 15

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 527

Practical talk about salesmanship and its relation to coal mining. It is shown that the success of a mine is often dependent on a sales engineer. The first step in selling coal is to find out what each particular fuel is most suitable for. COAL AGE, Vol. 4.

*SAFETY PROVISIONS OF VICTOR-AMERICAN FUEL CO.: *Pages* 528-530

Describes the many precautions that are taken to prevent accidents from explosions, shot-firing, etc. The main object is to impress the thought of danger on a man's mind, so as to eliminate carelessness from his daily work. Several unique devices are employed in the furtherance of mine safety. F. W. Whiteside. COAL AGE, Vol. 4.

*COAL SHIPPING ON THE GREAT LAKES: *Pages* 531-533

A description of the docking facilities at Chicago, which is one of the more important coal-receiving ports. Also some comments on the personnel of the trade and a look into the future. This is the concluding article on this subject. Herbert Waters and J. W. Chamberlin. COAL AGE, Vol. 4.

DON'TS FOR THOSE USING DETONATORS: *Page* 533

*EXPERIMENTAL EXPLOSION AT BRUCETON MINE: *Pages* 534-535

Details of the explosion and conclusions reached by Messrs. Rice and Jones. They believe the cars were blown into the mine by detonation and not by unbalanced atmospheric pressure resulting from a vacuum formed at the face after the explosion. COAL AGE, Vol. 4.

*SHOTFIRING AND WATERING SYSTEMS IN UTAH MINES: *Pages* 536-537

A good description of electric shotfiring, as conducted in the mines of the Utah Fuel Co.; division of the work of mining the coal, drilling, charging and firing the holes and inspecting the system; the spraying method in use; effect of humidity in reducing the dust danger in mines. John E. Ambrose. COAL AGE, Vol. 4.

EXAMINATION QUESTIONS WITH ANSWERS: *Page* 553

COAL AND COKE NEWS: *Pages* 557-560

POWER DEPARTMENT: *Pages* 538-541

*BURNING ANTHRACITE CULM:

At the present time no anthracite which will pass through a $\frac{3}{32}$-in. mesh screen is salable. A few years ago there was no market for sizes as large as pea. Improvements in boiler and furnace design have rendered the reworking of the old unsightly culm banks not only possible but profitable. J. E. Parrish. COAL AGE, Vol. 4.

Caveat Emptor?

The Weekly Ad-Talk Page

Old prejudices cling. Like the barnacles on the ship's bottom, they impede progress but don't stop it.

There are folks in the world who believe that automobiles are the invention of the devil—there are horses, old enough to know better, who insist on climbing the fence every time one passes them.

Years ago, when business was done that way, some graybeards accepted things as they were and set up a principle of law which they called "CAVEAT EMPTOR." Put into plain English it means, "Let the buyer beware."

We don't know whether that still holds as a principle in law or not—it doesn't make any difference.

Nowadays, the *seller* has learned that if he tries to do business on that basis his next appeal to the law will be in bankruptcy proceedings.

Yet there are many people who still believe that the seller's first object is to "do" the buyer if he can and that advertising is the advance messenger heralding the coming swindle.

"Truth," says Dr. Charles W. Eliot, "is the new virtue."

Advertising is largely responsible for the place this "new virtue" holds in trade. Instead of doing business in the dark, we get into the light of publicity.

Instead of playing a hold-up game in a dark alley when the moon goes behind a cloud, we come out on the brightest street and plant our wares where all may see.

There is no more potent selling argument for a good article than the truth about it.

There is no more disastrous experiment than juggling with the truth in an advertisement.

There is nothing so expensive as advertising goods that can't make good.

There is nothing better on earth that a manufacturer can have than a customer satisfied that the article lives up to the claims made for it—unless it be a few hundred more of the same customers.

That is why it pays to advertise good goods by telling the truth about them—and likewise why it doesn't pay to advertise poor goods in any way.

The purpose of advertising is to sell things, but in the process it must inform, interest, inspire and educate; it must knit buyer and seller in closer relationship, discover human wants and fill them, promote mutual confidence and spread the truth.

"Caveat Emptor?" Not when the seller prints his claims in plain language, circulates them broadcast, guarantees them—in short, not when he advertises.

COAL AGE

Vol. 4 NEW YORK, OCTOBER 11, 1913 No. 15

There has been a noticeable change in the qualifications of salesmen sent out by various manufacturers. The days of the "four flusher" are numbered and in his stead we find men who are eminently capable of discussing their products from any angle.

As a "mixer" and human visiting card the "four flusher" was almost hypnotic, but, somehow, when arguments and counter arguments were required, he sometimes lost control and his subject's mind would dwell on such proverbs as: "A fool's mouth is his destruction."

The coal industry, along with the other industries, has much to gain by the transformation. We have noted three instances, lately, which demonstrate the efficiency of the new type of salesmanship.

1. A coal mine which produced a low-volatile coal, suddenly found its accessible market territory nearly doubled by a reduction in freight rates. Trial orders were received from a number of possible customers, and everything looked good. But the trial orders failed to result in contracts. Other salesmen were employed, and still the business did not progress beyond the trial-order stage. It was left for a sales engineer to unravel the mystery. All of the prospective customers were accustomed to a high-volatile coal, naturally they did not know that low-volatile coal had different characteristics. This sales engineer made a few trips on locomotives of the railroad whose business was most desirable, and experimented with the nozzles until they were properly adjusted for this particular fuel. After that, the coal sold itself.

2. A coal mine which produced a medium grade of lump coal was unable to show a profit on its operations, because of the fact that too large a percentage had to be screened out and sold as slack. The slack ran very high in ash, and no profitable market could be found for it. A man who had had a wide experience with all kinds of coal was called into consultation. He suggested that a cement works employing the wet process could use the slack coal to advantage. A few cars were sent to a nearby cement plant. Within two weeks a contract was closed for all of the slack, at a satisfactory price.

3. Another mine, producing medium-grade lump coal, had trouble in disposing of its slack at a satisfactory price, notwithstanding the fact that its slack was thoroughly washed. A little experimenting by a coal expert developed the fact that the nut coal contained in the slack gave excellent results as a furnace coal. Following this discovery, preparation was made to screen out the nut from the balance of the washed slack, and this nut coal was extensively advertised. To make a long story short, the nut soon brought in more than the entire slack output had previously sold for, and two-thirds of the slack was still available for sale, at no reduction in price.

Don't think that these three illustrations exhaust the list.

Selling coal often resolves itself, simply, into finding out what the coal is most suitable for, and just so often the success of a coal mine is dependent on a sales engineer.

Safety Provisions of Victor-American Fuel Co.

By F. W. Whiteside*

SYNOPSIS—Describes the many precautions that are taken to prevent accidents from explosions, shot-firing, etc. The main object is to impress the thought of danger on a man's mind, so as to eliminate carelessness from his daily work. Several unique devices are employed in the furtherance of mine safety.

⁂

With the sincere desire of safe-guarding the mine employees in and about its properties, the Victor-American Fuel Co., of Denver, has been making a careful study of the many sources from which accidents originate, keeping ever in mind the more primitive causes which are so often overlooked or forgotten.

A Landing at Gray Creek, Where Experimental Mine Is Located

Some of the Top Workings at Hastings, Where Instruction Car Is Kept

A great deal has appeared in technical and trade magazines relative to protecting the workman from revolving gears, swiftly moving belts and pulleys, electric wires carrying high voltage, and many of the other mechanical appliances where danger lurks. There is also an education necessary to the workman, to teach him to protect his person against himself, his own personal carelessness, thoughtlessness and the inclination to take unnecessary risks.

Never a day passes in a large city but that someone is maimed or killed. The cause may be an automobile, a street car, a motorcycle or a railroad train. The blame is usually first placed upon the vehicle rather than the victim, yet we know, in the great majority of cases, that the accident was due to the injured individual's carelessness or absent-mindedness rather than to the cause usually assigned. The great majority of people need to learn the simple lesson "Always be careful," "Do not take a chance" and "Safety first." Familiarity is said to breed contempt. It is undoubtedly true that it cultivates carelessness. One who is constantly following a hazardous occupation gradually forgets his own danger and that of his fellows, and becoming over-confident, takes unnecessary risks until he is caught.

A Plan to Overcome Carelessness

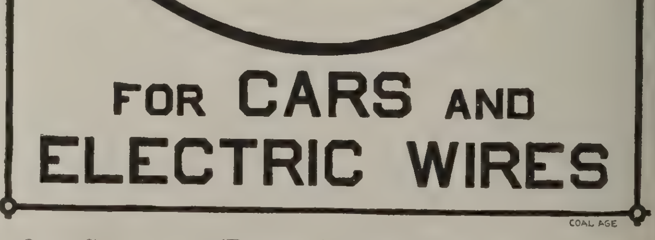
With the view of correcting the tendency toward this growing carelessness, the company has had a pamphlet printed in six different languages, on the subject "Suggestions as to How to Avoid Accidents to Our Employees." This has been freely distributed to the miners, drivers, trackmen, timbermen, trappers and general utility men about the mines. In it, each can find words of caution and advice as to how to safeguard himself and his fellow workmen.

Following the text in each language is a cut of the company's standard danger signal, the word "Danger" in white letters on a dark background, surrounded by the while line of an ellipse. The idea is to create so strong a mental impression upon the man's mind that whenever he sees the sign he will not pass it heedlessly by, but will instantly come to the full realization of its meaning and govern himself accordingly. This sign, as well as others with appropriate wording, are displayed about the mines where there is need of signal, caution or warning. The standard adopted was drawn up by the Engineering Department upon tracing linen from which blueprints are made upon cloth. This is then varnished on both front and back and mounted upon a board.

In the larger mines of the company as the men enter the mine and travel a sufficient distance for their eyes to become accustomed to the darkness, they are confronted by a flash-light sign with the words "Always be careful" in five different languages. The effect upon the mind is very marked. The surrounding darkness accentuates the vivid white letters which repeatedly flash before the eye.

Handling Powder

To further insure his safety, the miner carries his permissible powder in a fiber box holding eight sticks.



One Style of "Danger" Sign Used by Victor-American Company

---

*Chief engineer, Victor-American Fuel Co., Denver, Colo.

Flash-Light Sign Placed along Entries

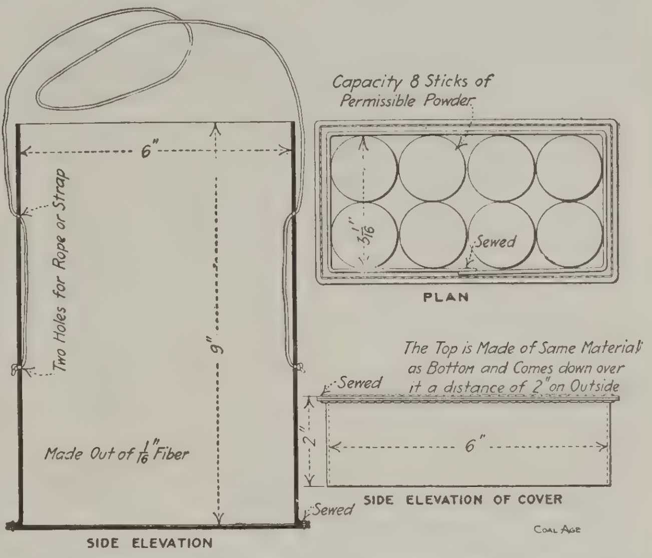
This is hung from his shoulder by a rope or strap. The box is light in weight, and has an air- and moisture-tight cover. Aside from its convenient size and shape, it fixes the maximum amount of explosive that a man will carry into the mine.

The shot-firer carries his firing caps in a fiber box which contains a cork receptacle in which are drilled 72 holes, in each of which is placed a cap, which is thus protected from jar and contact with any metal substance.

The shot-firer is furnished with a blank form (shown below) on which he makes out his report daily, this he signs and turns in to the Superintendent. On the back of this report the following complete list of instructions are printed. There may be no deviation from these rules except by written consent of the Superintendent:

INSTRUCTIONS TO SHOTFIRERS

1. Holes in coal must not be charged if they are drilled into the solid, or drilled deeper than the undermining.
2. Use only a wooden tamping bar with no metal parts.
3. See that all holes are thoroughly cleaned out and are free from coal dust before charging.



Capacity 8 Sticks of Permissible Powder

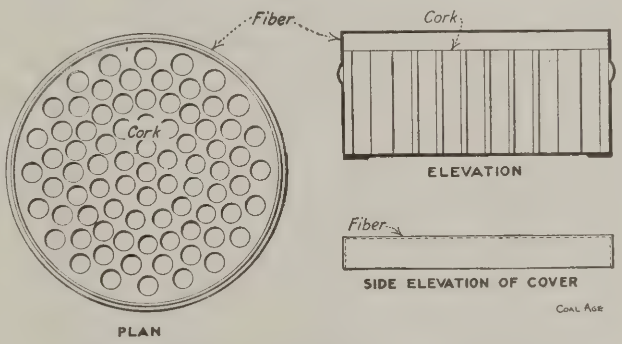
The Miner Carries His Powder in This Box



Shot-Firer's Box for Carrying Caps

4. The charge limit is 1½ lb. of permissible powder per shot.
5. Do not fire any shots on main haulageroads unless you have written authority from the superintendent, and unless the roof, floor and sides are drenched with water, or covered with adobe dust or stone dust, and are free from coal dust for a distance of 100 ft. on each side of the shot.
6. Avoid shooting through a narrow web of coal into an adjoining place.
7. Tamp all holes firmly to the mouth with damp adobe.
8. Fence off every place in which there is a missed shot.
9. Do not smoke when handling explosives or detonators and do not handle them near an open light.

THE VICTOR-AMERICAN FUEL COMPANY

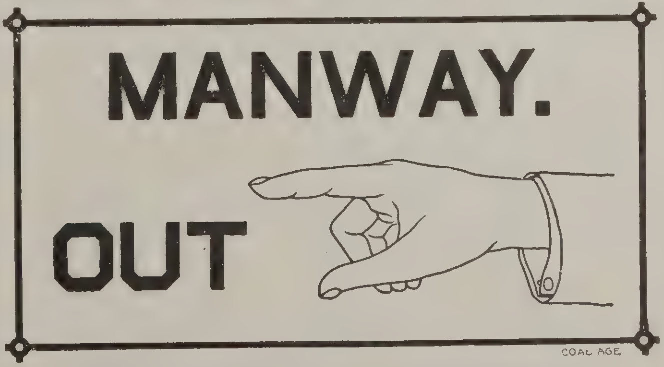
Engineer will give return signal by raising cage one foot, setting it back slowly. Men will then get on cage and cager will give engineer one bell to hoist.
4....Bells...Hoist....Slowly
5.... " ...Lower....Slowly
6.... " ...Rock
7.... " ...Accident move cage
By 'phone orders only.

ALWAYS BE CAREFUL



Type of Sign Placed at All Manways

10. Do not try to force a primer into a hole of insufficient size.

11. Use great care in carrying and handling blasting caps.

12. Examine during your inspections after firing for gas or fire, using a locked safety lamp. You are warned that powder smoke may contain dangerous gases.

13. Do not charge or fire any holes in a place where you find an explosive mixture of gas.

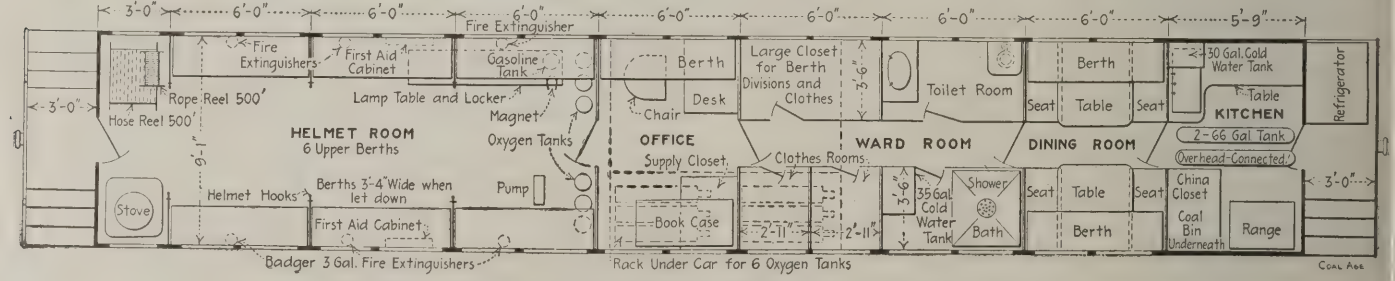
14. Missed shots must not be drilled out, but a new hole drilled and fired; the new hole to be at least 18 in. away from the missed hole and pointed in a direction from it. After relieving holes are fired, the shotfirer is instructed to endeavor to recover the unexploded caps and powder, or satisfy himself that the cap in the missed shot has been exploded from the concussion of the relieving shot, and report the result in either event after question relating to missed shots.

15. Do not commence firing before time appointed by superintendent.

16. Fill in the daily report accurately and completely.

Fan Shaft Operates Flashlight

At the larger and more important of the company's mines flashlights are operated by the revolving shaft of the ventilating fan, so that so long as the fan is working the lights continue to flash. They are placed in the power station and upon some prominent parting and on one or more of the main haulage ways in the mine. The superintendent, foreman or inspector, by timing the number of flashes, is enabled to determine the fan speed and satisfy himself that the machine is revolving at its normal rate. Should he find that the light is shining steadily or has ceased to show, he knows that the fan has stopped and he is prepared to act accordingly.



Plan of the Victor-American Fuel Co.'s Instruction Car

While this device may appear to be an unnecessary refinement, yet where the fan is located in an isolated place, far from the power house and the main beaten track, it has proved to be of much value, for without some signal of this nature, it might be stationary for a considerable time before the fact was discovered.

Much has been written concerning First-Aid Work in and about the mines, so that little need be said here.

The fully equipped instruction car of the company is stationed at Hastings, in charge of a regular foreman. Every Saturday four men from other mines come to Hastings to receive helmet and mine-rescue instruction. Located near the car is an abndoned mine, the main entry of which is so full of carbon dioxide and other noxious gases that a safety lamp is usually extinguished within 25 ft. of the mouth. Here in this deadly atmosphere the helmet men receive a part of their training.

The Victor-American electric-mine lamp was devised by some of the company employees at Hastings and has been brought to a high state of perfection. The lamp has extremely high illuminating power, is light, convenient and safe.

Expect to Test Adobe Dust in Experimental Mine

At Gray Creek, work is now in progress fitting up an old abandoned mine as an experiment station where the efficacy of rock and adobe dust, wet zones and air humidifying as an antedote for dust explosions will each be given a thorough trial.

The Victor company has great faith in adobe dust and has devised a spraying machine for spreading it over the timbers, walls and floors of the mines. It has hundreds of adobe dust shelves in the different workings so that great interest will naturally center in these experiments.

This Abandoned Fan-Engine House Was Converted into an Emergency Hospital

The new Colorado Coal Mining Law, which recently went into effect, prescribes very definitely the manner in which the men shall be checked into and out of the mines. It covers practically all of the main points necessary to safeguard the life of the miner. The operators have been gradually getting their properties in condition to comply with the law, so that it is safe to assume that never in the history of coal mining in Colorado were the mines better protected with safety provisions than today.

⁂

University Extension

One of the hopeful signs of the times is the attempt of the universities to make their work universally available. H. B. Meller, dean of the school of mines, University of Pittsburgh, is sending out a staff of 35 instructors to the mines of Western Pennsylvania, and it is hoped that 5000 miners will receive training. The dangers of underground work will be explained to those attending the schools, and miners will be prepared for the state examinations, which are held semiannually for the positions of fireboss and mine foreman.

Dean Meller's plans have already received a preliminary test as they were first put in operation in January and proved sufficiently successful to warrant doubling the number of classes and instructors in the new field. State College has a similar scheme under consideration.

Coal Shipping on the Great Lakes

SYNOPSIS—A description of the docking facilities at Chicago, which is one of the more important coal-receiving ports. Also some comments on the personnel of the trade and a look into the future. This is the concluding article on Coal Shipping on the Great Lakes.

⁂

THE LAKE BUSINESS AT CHICAGO*

With splendid dock facilities, an immense demand for fuel and a well defined policy for improvements in its harbor and river facilities, Chicago stands among the important ports on the Great Lakes so far as the transportation of coal by vessels is concerned.

LOADING AT THE B. & O. DOCK NO. 2 AT LORAIN, OHIO

FREIGHTER "HENRY S. HILL" CLEARING FROM THE Y. & O. DOCK AT ERIE, PENN.

There is an average of six large boats bringing coal to this city daily. Records show that the volume of this tonnage has been increasing steadily for many years and the receipts for the current year are estimated at 7 million tons. The record from the opening of navigation, Apr. 10, to Aug. 1 was 2,500,000 tons of anthracite coal and four months remain before the season for navigation is closed. Receipts of bituminous coal by boat are negligible, nearly all of that fuel coming in by rail.

There are many large coal docks here with storage capacities running as high as 200,000 tons. G. G. Schenck operates two, one on the north branch of the Chicago River at Division St. and the other on the south branch at Thirty-fifth St. The latter is equipped with two Mead hoists, has an unloading capacity of 250 tons per hour and a storage capacity of 100,000 tons. The depth of water at the dock is 18 ft. 6 in. and the largest boats plying the river can be handled.

The Division St. dock is a replica of the one at Thirty-fifth St. so far as hoisting facilities are concerned. At Division St. a storage capacity of 55,000 tons is provided and the maximum length of boats which can be handled is 500 ft. At Chester St. on the north branch of the river the City Fuel Co. has a dock with an unloading capacity of 240 tons per hour of soft coal and 300 tons of hard coal; the storage capacity is 45,000 tons and vessels 325 ft. long can be handled.

Three docks are owned by the Lehigh Valley Coal Co. The largest is located at One Hundredth St., in South Chicago, and has a storage capacity of 100,000 tons. The unloading capacity for small boats is 300 tons per hour and for large boats 400 tons per hour. There is 20 ft. of water at the dock and boats 480 ft. long can be accommodated. The Chicago Ave. dock of this company has three hoists and an unloading capacity of 2000 tons per day. Its Clybourn Ave. dock is equipped with four Brownhoists and has an unloading capacity of 2000 tons per day. There is storage room at this dock for 35,000 tons of coal and the maximum length of boats which can be handled is 408 feet.

E. L. Hedstrom & Co. operate two docks. The North Ave. dock has two Mead hoists and the unloading capacity is 2000 tons daily; there is storage room for 30,000 tons of coal. The depth of water at this dock is 18 ft. 6 in. and 440 ft. is the maximum length for boats.

At the Ninety-fifth St. dock of the company there is a storage capacity for 60,000 tons of coal. Three thousand tons can be unloaded daily and there is room for boats 525 ft. in length. The dock with the largest storage capacity is owned by the Byproducts Coke Corporation. It is located at 112th St. and has storage room for 200,000 tons of coal. Facilities have been provided for unloading 500 tons per hour. Any coal-carrying vessel not longer than 600 ft. can be handled.

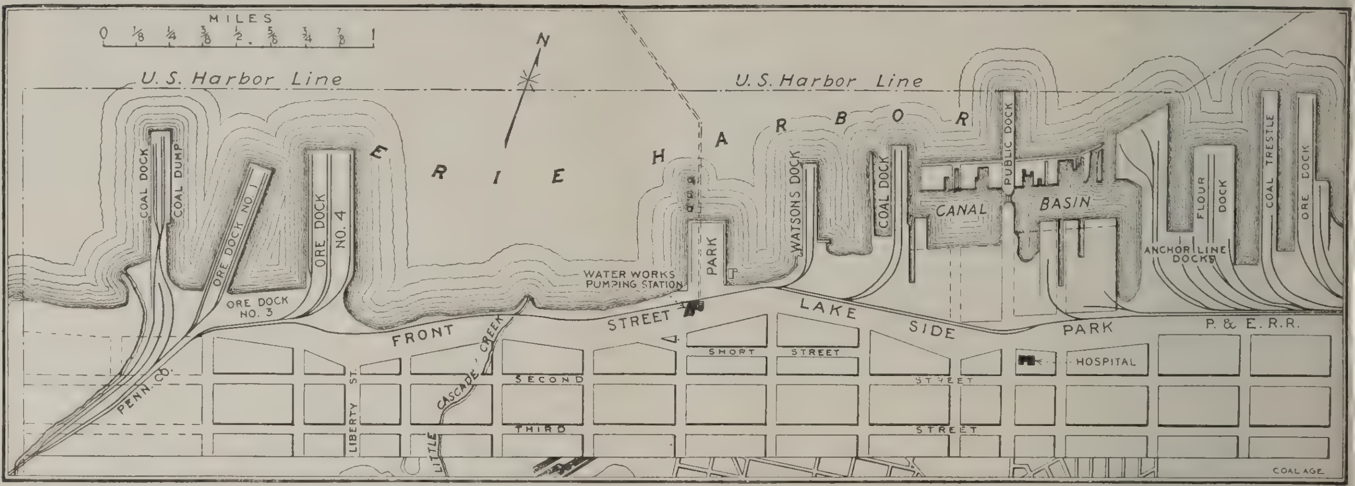
Other docks in Chicago used for handling coal are owned by the Philadelphia & Reading Coal & Iron Co., O. S. Richardson & Co., Pittsburgh Coal Co., Dreske & Minners, Eureka Coal Co. and O. F. Scheunemann & Company.

---

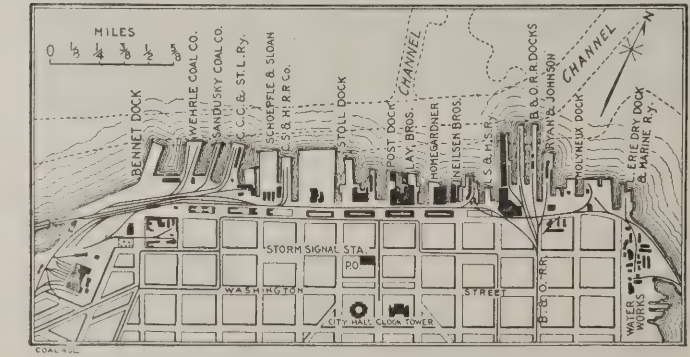
*By Herbert Waters.

The Personnel of the Lake Trade*

Distinctiveness as coal merchants and shippers is due rather to the members of the anthracite trade of the lower lakes than to those in bituminous, for the latter are more closely identified with mining and the iron-ore trade. The anthracite mines are farther from the lakes as a rule than the bituminous. It is not easy to mention a heavy shipper of bituminous on the lower lakes who is not also in some other and allied business. At the same time the personalities are much more apparent in the receiving territory of the upper lakes, in which case both anthracite and bituminous are generally handled by the same concern. On the lower lakes the two are usually separate, although there are one or two notable exceptions.



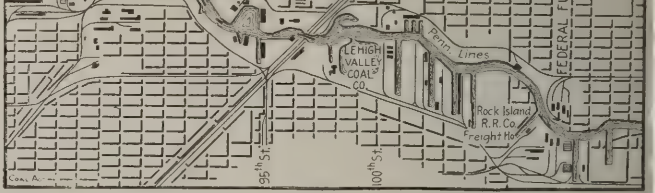
Map of Erie Harbor at Erie, Penn., One of the Largest Bituminous Loading Ports on the Lakes



Map of Sandusky Harbor, Ohio

Without going back to the pioneer days of the trade, when all concerns as a rule were on a small scale, the name of A. B. Meeker, of Chicago, will always be remembered as a powerful factor, both as an organizer and a producer of business. He was connected in Buffalo through E. L. Hedstrom, who located there about 1864, and was also prominent in the trade while he lived. The name of Jervis Langdon is also among the older shippers of anthracite from Buffalo. At one time at the Buffalo office of J. Langdon & Co., C. M. Underhill and J. J. McWilliams were employed, the latter long known later on as the Buffalo representative of the Delaware, Lackawanna & Western interests, the heaviest anthracite shippers on the lakes. Mr. Underhill is still living, having been prominent in the trade all his life. Among others of that trade are H. M. Benjamin, of Milwaukee, and O. S. Richardson, of Chicago. Out of the Benjami office also came men who are still in the trade as managers of later companies such as the Milwaukee-Western Fuel Co. For a long time Robert Law was a leading member of the coal trade in Chicago, handling large amounts of coal received by lake. With him ranked S. C. Schenck, of Toledo, and later on also in Chicago.

At other lake ports large coal shipping and receiving interests have grown up. At Sheboygan, on Lake Michigan, the activity and good business talent of Conrad Reiss long ago laid the foundation of the C. Reiss Coal Co., which is now a large family concern, with receiving docks in several upper-lake ports. At Erie, Penn., the leading name in the trade was that of W. L. Scott & Co., which company shipped both anthracite and bituminous as does its successor, the Susquehanna Coal Company.



Map of Docking Facilities at South Chicago

A Look into the Future

It may be possible that the younger members of the lake coal trade of today have as many problems to solve as did their predecessors, but in that older day most of the difficulties were of a formative nature requiring business talent of a high order and there is no doubt that these men possessed it. The great problems of their day had to do with the establishing and extension of trade in new territory and the adaptation of new routes and appliances to the needs of such a trade. There was more mpetition from other fuels then than now, but the mpetition, especially in bituminous coal, is now chiefly thin the trade itself.

---

*By John W. Chamberlin, 90 Johnson Park, Buffalo, N. Y.

The present leaders of the lake trade have to deal with e shipping and handling facilities offered. They have sisted in transforming the 600-ton lake schooner into e 10,000-ton steamer and the old horse-and-bucket isting device into the fast car dump and the clam-shell loader. The change has been so well made that, like e size of the freight car and the length of the freight ain, mechanical genius appears to have found its limit.

The natural question is "What next?" Pioneer work all done. The merely mechanical aids to cheapness d facility are about at the limit, yet the tendency is advance, if not by the old lines then by the new ones. common with most branches of the distributing indusies the problem of cheap selling has in no wise kept pace with the decrease in handling and distributing costs. What the consumer pays is often very much more than the aggregate first price and the cost of transportation. Here is still a wide field for the trade to improve upon.

"FINIS"

As to the future of the lake coal trade not much needs to be said. There have been no great changes in late years and if all-rail competition has reached its limit, as seems to be the case, the natural growth of demand from increased population will accrue to the lake trade. Competition from gasoline, electricity and water power direct is mostly a matter for conjecture. The general idea is that coal will more than hold its own for a long time yet. The lake cities and towns are developing very fast and they must have fuel and power. The rail competition does not control the lake coal carriers as it does the package-freight vessels, so that competition between the two is open and free, with coal shippers always in the market for the lowest possible rates.

It would seem that the coal trade of the lakes has a long and prosperous future and if the enlarged Welland Canal adds Lake Ontario to the list of inland seas this unrivaled water route of 1000 miles will add very materially to its available scope and territory.

⁂

Don'ts for Those Using Detonators

The E. I. du Pont de Nemours Powder Co. publishes the following instructions for those using blasting caps:

There are about 600 accidents every year caused by children and others playing with or investigating the contents of electric and other blasting caps. In nearly every instance these accidents result in loss of the sight, one or more fingers, or perhaps hands, rendering the unfortunate victim a cripple for life and a charge on his relatives or the community. As long as miners, quarrymen and blasters carry blasting caps, electric or other, loose in their pockets or leave them in unguarded places, children will find them and will almost invariably be badly hurt.

Blasting caps should never be carried loose in the clothing and no more than the number required at the time should be taken from the storehouse. They should always be kept under lock and key and in a place where unauthorized persons and children can, by no possibility get at them. This is a matter which should have the serious consideration of every person who has to do with the use of these articles.

(1) Don't forget the nature of blasting caps, but remember that with proper care they can be handled with comparative safety.

(2) Don't smoke while you are handling blasting caps, and always keep them away from lights.

(3) Don't shoot into blasting caps, whether electric or other, with a rifle or pistol.

(4) Don't handle or store blasting caps in or near a residence.

(5) Don't allow blasting caps to be stored where children or irresponsible persons can get at them. Keep them under lock and key.

(6) Don't store or transport blasting caps of any kind with high explosives.

(7) Don't keep blasting caps, electric or other, in a damp place.

(8) Don't carry them in your pocket.

(9) Don't tap or otherwise investigate them.

(10) Don't try to pull the wires from an electric blasting cap. The wires should not be jerked or roughly handled.

(11) Don't attempt to take blasting caps from the box by inserting a wire nail or other sharp instrument.

(12) Don't allow priming (the placing of a blasting cap in dynamite) to be done in a thawing house.

(13) Don't fasten the blasting cap to the fuse with the teeth or with a knife. Use a cap crimper made for that special purpose.

(14) Don't handle electric blasting caps during the immediate approach or progress of a thunder storm.

(15) Don't attempt to use electric blasting caps with the regular insulation for very wet work. For that purpose, use waterproof fuses.

(16) Don't use old broken leading or connecting wire for electric blasting caps. A new supply will not cost much and will pay for itself many times over.

Experimental Explosion at Bruceton Mine

SYNOPSIS—Details of the explosion and conclusions reached by Messrs. Rice and Jones. They believe the cars were blown into the mine by detonation and not by unbalanced atmospheric pressure resulting from a vacuum formed at the face after the explosion.

⁂

G. S. Rice and L. M. Jones have made public a report on the experimental explosion at Bruceton, Sept. 23, 1913, known to the Bureau of Mines as experiment No. 46. The following minor supplementary facts are culled from this report:

Coal Dust—In all 2200 lb. of coal dust were placed inby of the Garforth and Taffanel barriers and 800 lb. were distributed outside these so as to extend the explosion should they fail to do their work.

This loading of coal dust gives a layer of ¼ to ¾ of an inch on the 3-in. width of each of the ten shelves along the sides of the entries. Some dust was spilled on the floor in distributing it and wherever a puddle of water was encountered, a small amount of coal dust was spread over it. The cross-section of the entries measures approximately 60 sq.ft.; 2 lb. per foot of entry would, therefore, be equivalent to 0.523 oz. per cubic foot of space. This is 4.3 times the theoretical amount which for complete combustion will exhaust the oxygen present.

The Taffanel and Garforth Barriers—The average depth of the stone dust in the Taffanel barrier was 9 in. and its total weight on the shelves was about 1.8 tons. The under sides of the shelf boards were 5 ft. 6 in. from the bottom and the height of the entry averaged about 6 ft. 10 in., the shelves and dust occupying 10 in. The ratio of the cross-section occupied by the barrier shelves to total cross-section of the entry was 10/82 or 12.2 per cent. The stone-dust zone in the air course was 300 ft. long, from A 1050 to A 750, and the stone dust was placed on the side shelves and partly on the ribs, the loading being 4½ lb. per linear foot of entry.

Character of Coal and Stone Dust Used—The coal dust was prepared by grinding the coal mined from the face of the air course. As will be remembered the coal worked at the experimental mine is part of the Pittsburgh bed. An average analysis and screen test give the following results:

Analysis		Fineness	
Moisture	2.43	100 %	through 80 mesh
Volatile matter	35.10	99.1%	through 100 mesh
Fixed carbon	54.49	94.2%	through 150 mesh
Ash	7.90	88 %	through 200 mesh
	99.92		
Sulphur	1.18		

The stone dust used was prepared by grinding the draw slate which occurs above the Pittsburgh seam in a hammer crusher equipped with a very fine screen. A screen test gave the following results: 50.5 per cent. through 80 mesh; 41.5 per cent. through 100 mesh; 38 per cent. through 150 mesh; 35.5 per cent. through 200 mesh.

The dust contains about 7.98 per cent. of combustible matter.

Air Current—A sample of mine air taken at the face of the main entry before firing the igniting shot showed normal mine air with no methane present.

The humidity of the air current increased from 82 per cent. at a point in the main entry 200 ft. from the portal to 97 per cent. at the last crosscut.

General Humidity Conditions—The sides and roof of the mine were damp and sticky to the touch and in some places on the main entry from 150 to 300 ft. from the face the roof was wet. The floor for the most part was damp and well packed. The surface had been swept and the floor cleaned so that practically the only coal dust likely to have taken part in the explosion was that artificially distributed and this the analysis indicates was quite dry.

Obstructions—The cars were placed in the main entry for the purpose of obstructing the passage of the explosion, thus increasing the resulting pressures; the one in the cut-through was used to prevent, as far as possible, the dissipation of pressure near the origin which might occur due to the increased space at this point.

Appearance of Explosion at Openings—A small puff of smoke first appeared at the main opening and a muffled report, which was probably the sound of the igniting shot. Immediately afterward a tremendous cloud of smoke and dust shot out of the main opening accompanied by a loud report. Some of the $\frac{3}{16}$-in. steel plates covering the top of the concrete relief section were thrown high in the air, one of them about 20 ft. above its original position. Pieces of boards and shelves were scattered in front of the opening, on the slate dump and in a field on the opposite side of the valley from the mine. Two 8x8-in. posts were found, one 250 ft. and the other 350 ft. from the opening.

Length of Flame—All points in the main entry are measured from the main portal and the distances are marked with a capital E preceding the figure. All points in the airway immediately opposed to points in the main entry are marked with a capital A and the figures denoting their distance along the airway are identical with those of corresponding points in the main entry. This preliminary statement will help in interpreting what follows.

The evidence concerning the length of flame was somewhat complicated. Gun cotton is used to get supplementary information as to length of the flame, but the chief reliance is placed on the lead foil of the circuit breakers in the main entry. However, in this heading the gun cotton on the station plate at E 250, as well as the tin-foil flame circuit breaker, was gone but those on the wires at E 275 and on station plate E 350 were not burned while those at E 325 and E 372 were only partially consumed. The stone dust, therefore, did not at once completely blanket the flame, but permitted a tongue of flame to extend some distance beyond. It is improbable that the coal dust outby the barrier influenced the explosion.

Rescue Corps of Bureau of Mines at Mouth of Experimental Mine

In the air course the flame extended out to about A-700. On this side also there were a number of gun-cotton tufts only partially consumed; although the flame probably extended beyond the stone-dust zone, yet it is improbable that any of the coal-dust outby that point took part in the explosion, or the flame would have extended to a point much farther out.

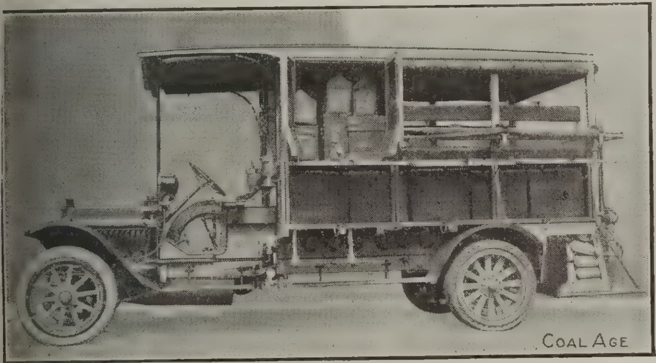
Damage Within Mine—An 8x8-in. post from E 232 was found at E 75. Pieces of the Taffanel barrier from E 500 to E 440 were found along the floor from E 180 to the opening. The posts found in the field across the ravine probably were blown from rib grooves at E 425 and E 460 indicating travel of over 700 ft. A post found across the track at E 310 was probably blown from the rib at E 495. A post against the east rib at E 410 was thought to have been blown from the rib at E 525. A post at E 425 near the east rib was identified as having been blown from E 550. A post at E 570 was originally at E 588. The reinforced-concrete stopping in the crosscut at E 650 has a small crack for a foot above the door. Two cracks, $\frac{1}{16}$ in. wide, extending from top to bottom of the stopping in line with the sides of a doorway through the stopping appear on the air-course side. There are also minor parallel cracks. A post from the line brattice at E 775 was found at E 745. The loaded car originally at E 925, with sprag set, was moved to E 954. It was still on the track. The loaded car which had been at E 1000 had jumped the track 3 or 4 ft. inby and was caught against the rib, at E 1045. About 8 in. of topping had been blown off. A shelving post against the west rib at E 1092 was identified as having been in a groove at E 950. The loaded car which had been at E 1075 was lifted from the track not far from its original position and thrown inby. Near E 1105 it made a scar in the roof 11 ft. long and several gouges in the floor, breaking a tie at E 1107. The car broke numerous side shelves and finally landed diagonally across the entry at E 1222 with all dirt out of the car and with sideboards and closed end badly broken.

he track at E 1222 was moved 3 in. to the east by the car edging between the rib and rails.

A shelving post originally set at E 1090 was found against he east rib at E 1132. The boards in front of the cut-hrough cannon had been broken up and scattered. Four hort 8x8-in. blocks from this bench were blown to the face f the entry; the other was found in the air course at A 1240. he car placed in the cut-through was blown against the ir-course rib opposite the crosscut and part of the load pilled out. It knocked out the lead rail and scarred the ransfer rail of the crosscut switch. The cross bar of the urtain frame on the air course at A 875 between the butt ntries was blown outby to A 500, 375 ft. of travel.

Coked Dust—Very little coked dust was observed after the xplosion. Some was seen on the outby side of the ost at E 639 on the east side of the heading. A small atch of coked dust was noted on the outby side of a nut on shelving bolt at E 700, on the west side of the entry. Coked ust deposit was found on the outby side of a post at E 755 on he west side of the entry. Coke globules were found on the ntry side of the crosscut stopping at 850. Coke globules, $\frac{1}{16}$ in. nd less in diameter, were found on the floor from E 855 to 1000. A coked dust deposit was found on the outby side of post near the top at E 1072 on the east side. Coked dust eposit was found on the outby side of a post at A 1118, on the west side of the entry; also on outby side of post at A 1090, n the east side.

Coal Dust—Practically all the coal dust was swept off the helves by the explosion. The only exception was in the air course from 1250 to 1050, where about one-third remained in position. There was considerably more dust on the floor in the inner portion of the mine than in the outer and it seems probable that much of this remained on the shelves when the explosion passed, but was swept off by later pressure waves passing inby.



THE RESCUE AUTOMOBILE, SHOWING MANNER OF LOADING

Conclusions—This test confirmed previous experiments: (1) That it is possible to get a violent explosion in a mine where the surfaces are damp, if there is an ample supply of dry coal dust present. (2) That as a secondary defense, the Taffanel barrier is of great advantage. It is fully recognized that an explosion, such as this, would suffocate all the men in the section of the mine in which it occurred and hence means to prevent an explosion originating are most important; but if by any mishap an explosion should take place in one section of the mine, it would be desirable to have the other sections of other splits defended by such barriers, in order to prevent the explosion from passing from one section to other sections. (3) That a zone treated with sufficient rock dust will prevent the passage of an ordinary explosion, which is also illustrative of the impossibility of starting an explosion in a well treated zone.

There was one feature of more than passing interest in this explosion, confirming other explosion experiments at the mine, namely, the development of the explosion center; its passage past the cars, and its increase in intensity, whereby it was enabled to throw the cars back toward the origin of the explosion. The latter effect cannot be considered the result of a wind filling the vacuum at the face following an explosion, for while this would be able to throw light articles it could hardly have hurled heavily laden cars through the air.

⁂

The gas engine operated by producer gas furnishes an efficient means for conserving fuels by making available for power generation such low grade fuels as peat, lignite, low grade coals, waste gases and even cornstalks; in fact, almost any low grade combustibles or wastes may be used to furnish the gas.

The Situation in Colorado

SPECIAL CORRESPONDENCE

The strike situation in the southern Colorado field has not materially changed since last week. There have been some clashes between strikers and mine guards, the most notable being that at Oakdale, near Walsenburg.

These have been stigmatized by union leaders as "frame-ups" on the part of operators and guards in order to mold public sentiment. This assertion is hardly logical. Men are not given to firing such formidable cartridges as the 25-35, 30-30, and those of similar type and power at each other, even at distances of 500 yd., merely for the purpose of producing a psychological impression upon the public.

Although the net changes in the situation have, as stated above, been small, the condition is nevertheless assuming a portentous aspect. More than once the governor has been requested to call out the state troops, and although this request has come from civil officers, it has been persistently denied. Both parties to the strike seem as determined as ever to fight until the end.

⁂

To Make Shotfiring Less Dangerous

BY CHARLTON DIXON*

The flame-producing explosives, now largely used in mines, should be and, in my opinion, will be, at no distant day, replaced by a comparatively safe means of blasting. The science of chemistry is yet in its infancy, and things that seemed impossible, a few years ago, are now commonplace. If the scientists and specialists of the great Carnegie, Rockefeller and other Institutes were requested to specialize on the matter of providing a safe explosive for the coal mines, and were encouraged in the work by the guarantee of a substantial reward, there is little doubt, but that a satisfactory substitute for black blasting powder would be found in a short time. I would like to see this matter brought prominently to their attention. It is certainly as important, if not more so, than the annihilation of the hookworm, which has received so much attention recently.

⁂

Colliery Construction in Yorkshire, England

Arrangements are being made, according to the *Daily Consular and Trade Reports,* for sinking a new colliery at Darton, near Barnsley, Yorkshire. An area of 2300 acres has been acquired. It is expected to reach a 4-ft. bed of coal at a depth of 260 yd. The new colliery will have two shafts 14 ft. in diameter, with steel headgear of the latest design, and arrangements to facilitate handling coal.

A screening and washing plant will be erected 80 yd. from the shaft. Steam power will be used for winding purposes, but electricity will be employed for driving the fan and other surface plant, and lighting. The loaded cars will gravitate from the screens to the railroad. Coal will be carried from the shaft to the screens by creepers. The colliery, when completed, is expected to employ 1500 men.

Shotfiring and Watering Systems in Utah Mines

By John E. Ambrose*

SYNOPSIS—A good description of electric shotfiring, as conducted in the mines of the Utah Fuel Company. Division of the work of mining the coal, drilling, charging and firing the holes, and inspecting the system. The spraying system in use. Effect of humidity in reducing the dust danger in mines.

⁂

During a recent inspection of the Utah Fuel Co.'s coal operations at Winter Quarters, Clear Creek, Castle Gate, Willow Creek and Sunnyside, I had the pleasure of seeing one of the most complete shotfiring and watering systems that has ever come under my observation, during my experience of 30 years in coal mining. These mines are all under the direct supervision of W. B. Williams, the general superintendent of the company. Mr. Williams is an able and practical mining man to whom a great deal of credit is due for the system he has installed at all the mines under his supervision. The system may be described as follows:

The Work of the Miners

Each miner takes his required allowance of explosives or black powder into the mines in the morning. This amount, not to exceed 5 lb., is kept in a wooden box made for the purpose. He then proceeds to undercut the coal to a depth of 4½ or 5½ ft. Holes are then drilled to a depth 6 in. less than the depth of the mining. When undercutting the coal, the strict rules of the company compel the putting in of sprags, for the better protection of the miner while doing the work. All minings are loaded out as the cutting progresses.

The Work of the Inspectors

About 12 o'clock, noon, the local inspectors of the various districts, proceed to the mine, taking with them the detonators (electric exploders) and make inspection of all cuts made in the coal. These cuts are measured; also, the depth of each hole, which must clear the rib by at least 12 in. The resistance against each shot is carefully considered by the inspector, who then proceeds to charge the hole, after first seeing that it has been previously cleaned out thoroughly by the miner. These holes are tamped with damp surface clay, to the mouth of the hole, with a wooden tamping stick.

The miners are not allowed to go near the shots after the holes are loaded. The inspector proceeds thus to the end of his district. All drill holes must have a sufficient clearance in the hole to allow the charge to be pressed home, without friction or jamming, thus overcoming the danger of prematurely exploding the charge.

The Work of the Shotfirers

During the afternoon, the shotfirers proceed to the separate districts allotted to them. Each man unlocks the box containing the switch for his entry, and sees that it has not been tampered with. He leaves the switch thrown out and again locks the box. It may be remarked here that this does not interfere with the haulage motors, as they are on a separate line. He then proceeds to the face of the entries and connects up the shots; from here he goes from room to room, till the work of connecting up the shots is completed. The method of connecting the shots is illustrated in the accompanying figure.

The miners are now all out of the mine and the shotfirers return to the entry where the main switches are still thrown out. The company has a system of checking off the men as they enter and leave the mine. The checkboard is kept in a case made for the purpose, at the fan house and in charge of the fan man, whose duty it is to check off each miner as he comes out of the mine. When all the miners are out of the mine, and the proper time has arrived, as previously arranged by the shotfirers, the fan man throws out the main switch and gives a series of signals to the shotfirers, who are at their respective places on the main entry, waiting for the signal. They then throw in the main-entry switches, and retire to the bottom of the shaft, where they meet previous to going out of the mine. The fan man now informs them that all the miners are out of the mine, according to the checking up of the board and they return to the surface.

Firing the Shots

The fan is then slowed down, and after a few minutes have elapsed, to allow the air current to come to a partial state of rest, the main switch on the surface is thrown in, which fires all the shots simultaneously. After the lapse of half an hour or so, the shotfirers again enter the mine and, going to their respective districts, throw out the main-entry switches, at the different places on the main cross-entries. Having done this, they lock all boxes and the firing is complete.

Inspection and Repair Work

During the forenoon, wiremen go into the mine and examine the different districts, putting up and repairing the wires blown down by the shots the night previous. The inspectors locate all blownout and missed shots, if there are any, and make a report of them in a report book kept on the outside for the purpose. These missed shots will occur with the best and most experienced men. If, however, the inspectors would carry a testing machine with them, for testing the electric exploders, they would overcome some of the difficulty. At the same time, many misfire shots are caused during the act of loading the holes; as, in tamping, the insulation is liable to be rubbed off the wires, which causes a contact and short-circuits the current.

The Spraying or Watering System

The system of watering the mine is as follows: A pipe line is laid along the main entry and sections run up each cross-entry, from which branch-line connections are made to each separate room. Sprinklers are employed, who have a certain section to sprinkle during the day, till a certain time before the time of firing the shots. The mines are kept saturated with water, the spraying being done not in the haphazard way seen in some mines today, but the system is kept up continually. at all working faces as they advance, and the ribs, pillars and all roadways are well watered, not once a week, but every day; and not sparingly, but plentifully.

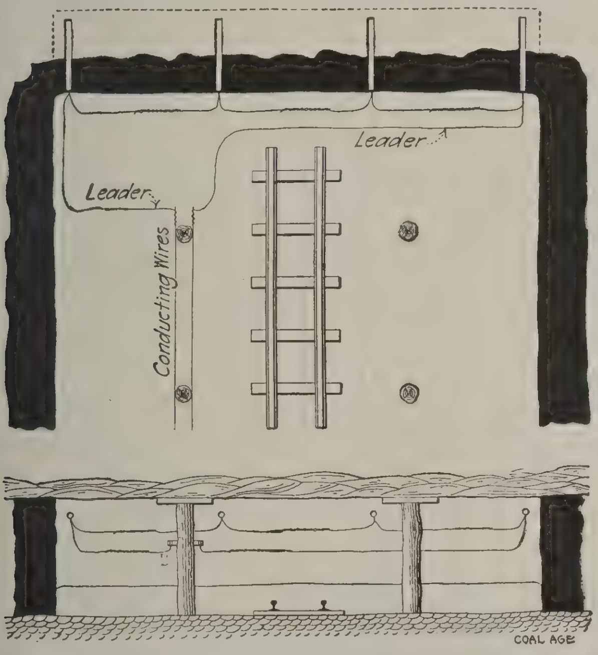
---

*Mining Engineer, New Durham, N. J.

THE IGNITION OF AN INFLAMMABLE ATMOSPHERE

It was stated before the Coal Mining Institute of America (June, 1908), that coal dust cannot be made wet in a usual sense. The method of fine spraying is productive of the best results; but even then, it is questionable, as the most careful system of watering is merely an "ounce of prevention" and it is an open question whether it is not positively detrimental.

These statements are fallacies, in my opinion. Mr. Ashworth referring to this matter, pointed out (*Transactions I.M.E.* Vol. XXXIII, 193) that no form of water except steam could saturate an air current sufficiently to place a barrier in front of a gas or dust explosion. But if the dust is properly saturated and made wet, there will be no floating dust and there will result only a local explosion of gas.



SHOWING METHOD OF CONNECTING SHOTS TO BE FIRED BY ELECTRICITY

Mr. Ashworth further deduced from the hygrometrical observations taken at Wingate Grange, that air saturated with moisture was no protection against the extension of an explosion, claiming on the other hand that it assisted in the oxidation process; and stated, in addition, that the explosion (Wingate Grange) was reported to have passed over two wet places of considerable length. Now, it seems clear to me that if the so called wet places referred to, had been extended to the outside, along each haulage road, the force of the explosion would have been spent in its passage out, having nothing to feed upon. I think that if these places are kept saturated constantly, like the system installed at the above named operations, there can then be no dust, and these explosions, if there are any, must be local. At the above operations the exhaust steam from the fans is turned into the intake airways, directly after the shots are fired, and anyone coming out of the mines then can feel the effect of it for some distance before reaching the outside as the steam moistens the air for thousands of feet in the workings of the mine.

Again, J. B. Atkinson, late H. M. Inspector of mines, in his report on the circumstances attending the explosion that occurred at the Washington Glebe Colliery, Durham, Feb. 20, 1908, comments on the general interpretation of the Coal Mines Regulation Act, and the explosives in Coal Mines Order, and states that a claim of exemption from watering cannot be supported.

CONCERNING PERMITTED EXPLOSIVES

It may be said, however, that shotfirers look upon permitted explosives in this light; and do not take the precaution they would take if using black powder. Mr. Atkinson further states, "I do not altogether share the view held by some of my colleagues, that the decline in explosions, in recent years, is principally due to the employment of permitted explosives. I think it is more probably due to the increased knowledge of the causes of explosions, generally. Safety should be sought outside the shothole, and the use of permissible explosives should only be looked upon as an additional safeguard."

I am of the same opinion myself and believe the above are practical facts, considering the risks that some classes of shotfirers assume in doing their work in a careless, daredevil sort-of-way. As Mr. Atkinson states, exemption from watering cannot be upheld. The practice stands upon record as the best system, if thoroughly installed, of laying the dust in coal mines as a prevention against the extension of explosions. It stands to reason and good judgment, that if the system is properly installed, and then kept down, by loading it out of the mine, it must have the desired effect.

In Bulletin, No. 425, Department of the Interior, on The Explosibility of Coal Dust, p. 73, in reference to the treatment of coal dust, there is the following statement:

> The method of using pipe lines through the mine, with connections at intervals for attachment of hose, was introduced in England and used to a slight extent, after the report, in 1886, of the Accidents In Mines Commission. In the same year, W. N. and J. B. Atkinson published their book "Explosions in Coal Mines." In their suggestions for remedies, they state that the use of water pipes, with cocks at short intervals and hose, is a better system, and they advise that where watering causes trouble by affecting the roof and floor, the mine may be divided into sections by arching entries, whitewashing the arched sections, and sweeping up the bottom dust.
>
> In Germany, in consequence of the report of the Prussian Firedamp Commission of 1885, watering, chiefly by hose sprinkling, was introduced. . . . The mining department now insists that the roof and walls of the gangways, be not merely sprinkled, but washed by a stream from a hose. . . .
>
> In the United States, the system of watering by hose and nozzle has been employed in the coal mines of Utah, since the Scofield disaster of May 1, 1900, and it is now required by the Utah mining law. The conditions for the use of this method in the Utah field are very favorable, as the floor and roof are generally sandstone, and are therefore not affected by the direct application of water. . . .
>
> Wherever the method can be employed it is undoubtedly an efficacious one, particularly if the water pressure is good, but it requires constant effort, and the employment of men to go continually from point to point.

The writer is of the opinion that too much time is allowed to elapse between the shots fired by the shotfirers and the time the firebosses make their inspection of the mine, the following morning. We may assume that a feeder of gas is ignited at the face when the shots are fired, as happens every day, in some of our mines. This feeder burns several hours, and sets fire to the loose coal at the face, which is not detected until the fireboss makes his rounds the next morning, causing untold troubles and disastrous results. I think this is a point that should be well considerd.

POWER DEPARTMENT

Burning Anthracite Culm

By J. E. Parrish*

SYNOPSIS—At the present time no anthracite which will pass through a $\frac{3}{32}$-in mesh screen is salable. A few years ago there was no market for sizes as large as pea. Improvements in boiler and furnace design have rendered the reworking of the old unsightly culm banks not only possible but profitable. It is not unreasonable to expect that in the near future further refinements in grate and furnace construction will render available for steam-making even the "slush" or "mud."

⁂

According to statistics, the anthracite coal fields of Pennsylvania cover an area of about 480 sq.mi. Approximately, 200 sq.mi. are comprised in the northern or Wyoming territory, 130 sq.mi. in the middle territory, while 140 sq.mi. or thereabouts, is included in the southern territory.

The growth of the anthracite industry is well illu trated by statistics. In 1820, the anthracite productio was 365 short tons, or one ton for each day in the yea in 1912, it was 84,426,869 short tons, or 231,306 to daily.

Mr. L. F. Loree, president of the Delaware & Hu son Coal Co. in July furnished to the Philadelphi *North American* some interesting figures as to the co per ton for producing anthracite coal during the yea of 1902 to 1912. The article by Mr. Loree has probabl been read by many interested in coal mining as well a other similar articles upon the production of coal whic have appeared from time to time in the papers.

There is still another point of interest to many a more especially to those who live in the coal territory o whom the writer is one. This is the rapid diminution o the culm of refuse piles which in former days were rightfully called "eye sores," but which in latter years ha proved to be veritable "bonanzas."

During the early days of mining the marketable, o what was considered consumable, coal was prepared i

A Culm Pile Being Worked Over and the Larger

Type of Cylindrical Boiler Used in the Early Days. Many of These Boilers Are Still in Use at the Older Mines, Burning Pea or Coarser Fuel

the sizes now known as lump, broken, egg, stove, and a little later, a small quantity of chestnut. While the sizes termed pea and chestnut had to be made in the process of preparing the coal for market, they could not be sold. Consequently, they went to the culm pile, together with what is now known as the buckwheats, barley, rice and dust, there to remain as refuse until improvements in boilers and steam engineering created a demand for the smaller sizes.

These culm or refuse piles mountain high, covering thousands of acres of ground, containing millions of tons of what in later years proved to be the very best coal for steaming purposes, were the accumulated rejections of the early mining days.

Prepared for Market. The "Mud" Does Not Show in This Picture

Appearance after Culm Pile Has Been Worked Off

A history of boiler improvements, boiler specialties and advances in steam engineering with reference to economy in the use of fuel covering the past and present years of coal mining, would make an extremely interesting article in itself.

Fifteen or twenty years ago when it became known that the refuse in these piles contained as much carbon and consequently as large a heat content as the larger sizes of the then marketable coal, improvements in boilers and grates paved the way for the demand for the smaller sizes. The demand being thus created, the coal operators by means of suitable changes in the breakers, etc., perfected the means of preparing the buckwhe barley and rice sizes for the consumer. They then we back to these culm or refuse piles and by suitable r working methods, secured large quantities of the small sizes therefrom.

Twenty years ago anyone could buy all he wanted these culm piles for 10c. a ton. The writer well r members that his company in 1889 bought a culm pi at that price, made the necessary changes and additio in the boiler plant, added more units and successful burned this refuse.

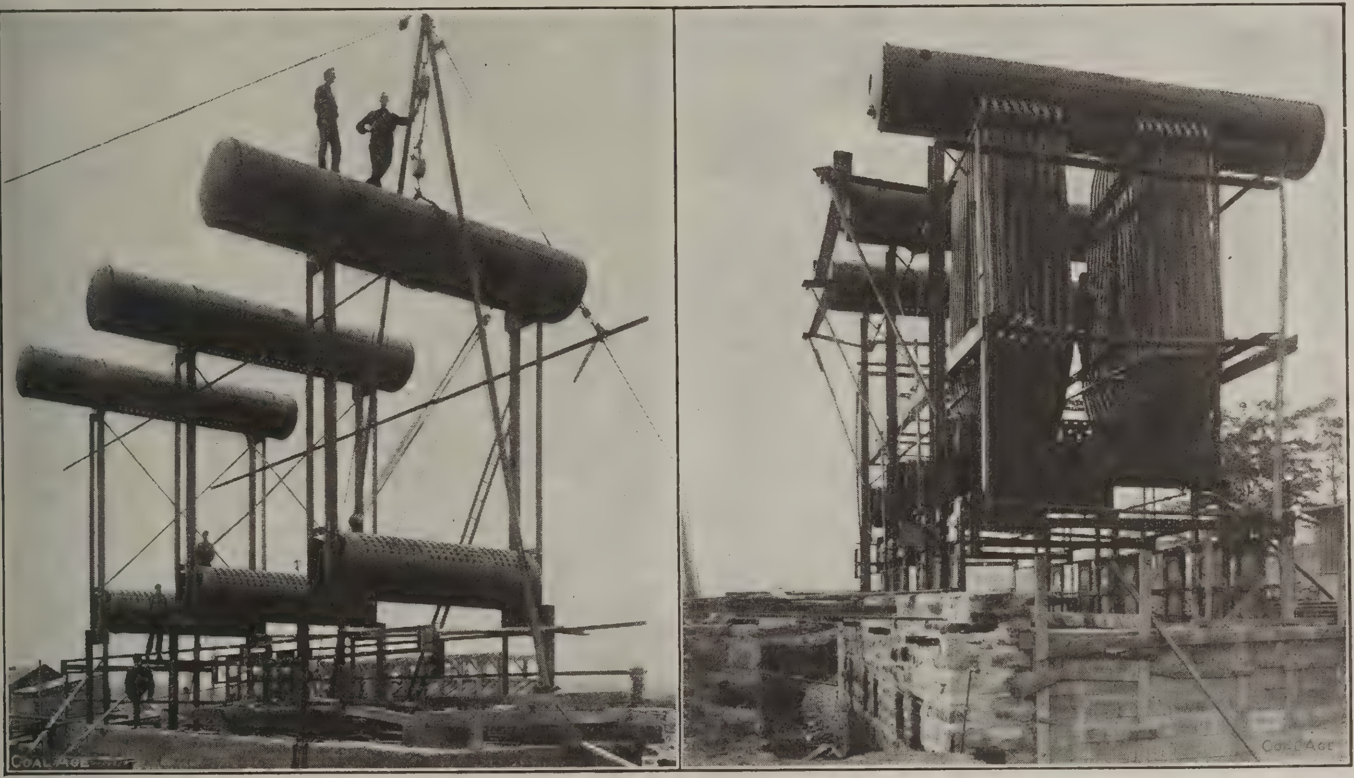
Looking over the anthracite fields now, anyone can s

Picking Coal from a Culm Bank

Working Over a Culm Pile

that these vast culm piles are rapidly diminishing, and it is safe to predict that in ten years or possibly five years all will be gone except what is called "slush" or "mud"—that which has passed through screens with $\frac{3}{32}$-in. meshes.

Many will affirm that this slush or mud is worthless and cannot be used for fuel under boilers. This is not true, for it has been found that there is as much or nearly as much carbon in this slush as there is in the buckwheat, barley and rice sizes. It is safe, therefore, to predict that this slush or mud can and will be used for steam making, so that eventually nothing will be left of the old culm piles and as no new ones are being created, nothing will be wasted on every ton of coal brought to the surface. Sooner or later also bony coal or what is part coal and part slate will be crushed, mixed with the slush or "fine stuff" and used for fuel in making steam.



Three Modern Water-Tube Boilers in Process of Erection. These Boilers Burn Refuse and Are Each Equal to 30 to 40 of the Cylindrical Type Illustrated above, in Steam Capacity

To do this is purely a question of furnace design, proper ratio of grate area to heating surface, a low percentage of air space in the grate, high ash-pit pressure, balanced stack draft conditions and a stoker suitable to handle or feed the "fine stuff" into the furnace. These conditions will all be worked out by the boiler, grate bar, forced draft and stoker manufacturers and indeed one large boiler concern is now preparing special plans along these lines.

Seven to 10 years ago grates with 20 to 30 per cent. air space, employing a forced-draft pressure of ½ in. water in the ash pit, was the general rule. Today, grates with 4, 5, 6, or even up to 10 per cent. of air space with ash-pit pressures ranging from 3 to 5 in. of water-gage are being adopted and used.

It is interesting indeed to trace the path of improvements from the plain cylindrical boilers, as used in the mining regions years ago, fired with lump and broken coal and employing natural draft, down to the modern water-tube boilers burning buckwheat, barley and rice sizes with forced and balanced draft. What improvements are to come later in order to burn slush and mud with "bone" ground down to slush size, will be far more interesting, and these improvements are not far distant either.

In many cases manufacturers and coal operators, who have old boiler plants in operation consuming high-grade fuel, would like to burn that of a lower quality. They believe, however, that they cannot do this with the present boilers, and, of course, do not wish to go to the expense of installing those of a more modern type. They need not believe, however, that their condition cannot be improved, for this is in many cases perfectly possible. Many others, finding themselves in the same predicament, have derived great benefit from certain changes which have been made in their old boiler plants, giving either increased power or a reduction of expenses through the use of lower grades of fuel.

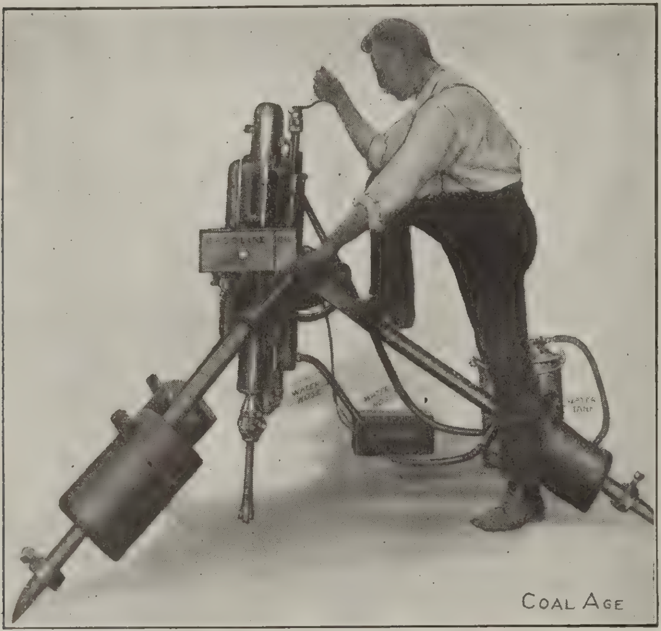
Meeting of American Mining Congress

This society meets for its 16th annual session at Philadelphia, Penn., Oct. 20-24. The prepared addresses will be printed and distributed among the members of the convention at the first day's session. Each author will be given 10 min. to make any supplementary statement. The subject will then be open for discussion. Among the important questions to be discussed are safety, workmen's compensation, mine taxation, the Alaska situation, Federal aid for mining schools, mining investments, revision of mineral land laws and conservation of coal resources. The mining exposition will contain exhibits of the various kinds of machinery used in and about mines.

A New Gasoline Rock Drill

The advantages of the power-operated rock drill are obvious, but for small jobs or temporary work its shortcomings are many. The expense of installing boilers, air compressors and the necessary pipe lines is frequently sufficient to exclude rock drills from work and cause a reversion to hand methods.

The Rice Gasoline Rock Drill Co., of Philadelphia, has just placed upon the market a machine which, it is claimed, is as rapid and reliable in action as the air drill, and has the advantage of being self-contained.

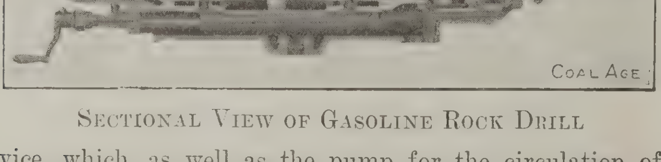


The New Drill upon Tripod

The constructural principle involved in this machine is simple and easily understood. The drill, which is mounted upon an ordinary tripod or bar, is practically two two-cycle, three-port engines, opposing each other, the piston rod, carrying two pistons, oscillating backward and forward between the impact of alternate explosions upon either end.

The rapidity of operation is at all times under control of the drill runner. This is of great advantage in starting a hole, particularly if the drill does not deliver its blow exactly perpendicular to the rock surface.

Ignition is accomplished by an electric sparking device, which, as well as the pump for the circulation of jacket water, is actuated by the plunger. Lubrication is automatic, the cylinder oil entering with the fuel.



Sectional View of Gasoline Rock Drill

The moving parts of this drill are few. It has been subjected to long and severe tests under adverse weather and rock conditions before being placed upon the market. It is the firm belief of the makers that it will give a satisfactory account of itself under any and all conditions for which it is intended.

Oklahoma's Coal Output

The total production of coal in Oklahoma in 1912, according to E. W. Parker, of the U. S. Geological Survey, was 3,675,418 short tons, valued at the mine at $7,867,331.

The coal areas of Oklahoma belong to the Western Interior coalfield. They lie entirely in the eastern and southeastern parts of the state, forming the connection between the Kansas field on the north, and the Arkansas field on the east. The principal developments are in the southern portion of the field, in what was formerly the Choctaw Nation of the Indian Territory, and is now included within Haskell, Latimer and Pittsburg counties. The total area underlain by workable coal is estimated at 10,000 square miles. The coals, of which there are ten or more beds, range from a medium grade to a high-grade bituminous, some of the latter approaching semi-anthracite. Some of the higher grades have coking qualities, but efforts to make coke in the beehive ovens, constructed for that purpose, have not been conspicuously successful.

Diminished production of petroleum and natural gas in the Mid-Continental field is reflected in increased production of coal in Oklahoma, and a substantial advance in prices. The quantity of coal produced increased from 3,074,242 short tons, valued at $6,291,494 in 1911, to 3,675,418 tons, valued at $7,867,331 in 1912.

The record of 1912 exceeded that of the previous maximum output (that of 1907) by nearly 33,000 tons. Compared with 1911 it showed a gain of 601,176 short tons, or 19.6 per cent. in quantity, and $1,575,637, or 25 per cent. in value. The average price per ton advanced from $2.05 to $2.14.

The year 1912 was the first in a decade to encourage the coal-mine operators of Oklahoma, and the other Southwestern states. For ten years the industry in those states had been kept practically at a standstill, the output in 1911 being just about the average for the decade ended in that year. The production in 1912 exceeded that average by nearly 20 per cent.

The only assignable reason for the increased activity appears to be, as already stated, the diminution in the supply of natural gas and fuel oil in the market tributary to Oklahoma coal. Competition with coal from other states, particularly Colorado and New Mexico, is keen.

In 1912 the average number of days worked was 174, the largest number in recent years excepting during the boom period of 1907. The general average of working time among the bituminous mines was 223 days, and the number of men employed was 8785.

In 1912 out of a total of 3,675,418 tons produced, 3,175,455 tons, or 86.4 per cent., were shot off the solid. The quantity mined by machine was relatively small, amounting to 259,719 tons, or 7.1 per cent.

The death rate in Oklahoma in 1912 was unusually high, owing principally to an explosion of gas in the San Bois mine, at McCutcheon, on Mar. 23, which resulted in the loss of 73 lives. According to the Bureau of Mines, the total number of fatal accidents during the year was 99, all being underground. Seventy-seven were due to gas and dust explosions; 11 to mine fires, and 7 to falls of slate and coal. The death rate per thousand was 11.27, and there were 37,125 tons of coal mined for each life lost.

EDITORIALS

The contest for supremacy between approved types of safety lamps and the portable electric mine lamps that have forged their way to the front within the past two years, is still undetermined. The open lamp or torch is a recognized menace in all mines operating in gaseous territory; but, before the electric lamp can fully supplant the safety lamp, in mine work, a reliable means of detecting the presence of dangerous gases in the mine air must be devised. Let someone get busy.

The Tuberculous Miner

Dwight E. Woodbridge, in his bulletin "Sanitation at Mining Villages in the Birmingham District," says that "among miners, tuberculosis alone annually takes many times the number of lives that are lost in accident." An important statement, if true, but we are convinced he cannot prove it. The U. S. census statistics in 1900, which are the most recent reported, show that 1.21 miners and quarrymen per thousand died of consumption in that year. The death rate in 1911 from accidents in all U. S. mines was 3.82 per thousand. The census statistics, covering such a few states, and only those where mining is unimportant, do not prove anything, nor do such unsupported statements as those of Mr. Woodbridge.

He quotes the tubercular death rate of the city of Birmingham in proof of what he says, though we are convinced all are not miners in that city. Yet he can only show 2.77 deaths per thousand at that point, and as our readers know from English experience, quoted in these columns, coal and iron miners have a low death rate from tuberculosis as compared with other occupied males. Another reason why Birmingham is not typical of mining towns, but probably has a higher death rate, is that "the mortality curves for tuberculous and nontuberculous diseases are highest in large towns," as Sir Thomas Oliver stated before the fifteenth International Congress of Hygiene and Demography. He declared further, "These diseases bear a distinct relationship to the size of the town, the density of the population and the social well-being of the people." Mining towns are small, their population relatively scattered and all the men make good wages.

So we believe that the miners in villages are not likely to be as tuberculous as the citizens of Birmingham, and we think that Mr. Woodbridge has been merely guessing. Sometime we will learn whether his guess is right, but at present writing every indication proves he is wrong, and not a single fact, not even those he advances, prove that he has a foot on which to stand.

That there is such a disease as miner's consumption has been abundantly proved. Where conditions are favorable, as on the Rand in the Transvaal, its ravages may be terrible, especially where Kaffirs, who are new to the disease, are engaged. In England the tin and copper miners are said to be seriously infected, but the direct and indirect action of the returning miners from South Africa on the death rate of these workingmen remains to be determined.

Until we know definitely the true menace of miner's consumption it is better for us to use statements which will express the uncertainty of our knowledge.

The Bureau of Mines as a National Force

The Bureau of Mines has been in existence long enough that we have begun to regard its activities as almost preordained by circumstances. We hardly realize that had it been directed by other and less enterprising heads, an entirely different organization might have been created.

It might have been a purely scientific body to determine principles and leave them as such for the more enterprising managers and engineers to apply to their needs. This they would have been slow to do because the expenditures would probably have been resisted by those who, though they hold the purse strings, often know little about mining. These men must be reached not through bulletins but by the public press, not so much by logical argument as by a benign atmosphere. This beneficent influence, so greatly needed, the Bureau has created, and as a result the laggard but generous spirits of the industry have been directed toward a consideration of the needs of miners so that they have followed closely on the wake of those who were first to set the example. As for the more sordid capitalists, public sentiment is now forcing or will soon compel them to follow the lead of the others, and state laws will accomplish what conscience and social pressure cannot perform.

Had it not been for its active work and energetic propaganda, the impress of the Bureau of Mines on the coal industry would have been less marked than that of any organization of like kind in any European country, for most of these have administrative powers which enable them not only to recommend but to enforce. In Great Britain, as in the United States, there is no such power granted to the experimenting faculty but the investigating authorities and the chief inspector being immediately subject to one common head, the Home Office, there is an organic unity between determinatory and administrative powers which makes both one. In the United States, there is no such unity, yet the Bureau of Mines has obtained a most commanding position largely because of its diplomatic combination of mere scientific result with institutional activity. To use an expression borrowed from another sphere, its work as laid down by its officers is not merely to propound dogma but also to engage in active ameliorative work.

The mine-rescue cars, the first-aid training, the gas- and oil-well conference, the demonstrations of explosions at the experimental mine and in galleries, have served to turn mere theories into an actual force and have given the Bureau a power to do by suasion and example that which by virtue of the constitution it cannot perform by law. Thus many excellent practices used by a single corporation or by a group of companies have been diligently spread over the country by the Bureau. Without this careful sowing, the results effected might have been delayed many long years. Wherever the Bureau has found systems worthy of imitation, it has followed them itself and urged their adoption all over the United States.

It must always be remembered that it is hard for any national bureau to introduce some entirely new method involving the expenditure of large amounts of money until some company has had courage and philanthropy enough to adopt that improvement. If ten years ago, a national body had urged the introduction of septic tanks and sewerage in every camp, it would have faced a fierce opposition. Today by showing what enlightened corporations are doing and have done, the sanitation of mining camps will take a rapid step forward.

Great credit should be given to the Bureau for its energy and resource in extending the knowledge of safety and sanitary provisions. It is true that in much it has merely followed the work of the anthracite companies and of the subsidiaries of the U. S. Steel Corporation, but no little credit is due to those who make local conditions national or transplant foreign methods on native soil.

We believe the institutional work of the Bureau will eventually wane when it has served its purpose. Already in the anthracite regions, the coal companies are so well fitted with rescue teams and apparatus and the first-aid men are so well trained that the Bureau cannot do the work there that can be done, for instance, in Oklahoma, Kansas or Tennessee, or even in the bituminous fields of Pennsylvania.

At the Brookside explosion, the Bureau of Mines was almost entirely unrepresented, having only two men and a cook. There are some who think that this revealed the Bureau in an unfavorable light; personally we think it demonstrated that the ability of the anthracite region to take care of its own rescue work had been recognized by the Bureau. Thus the showing was a credit to the anthracite coal companies and no disparagement to the governmental force.

And we think eventually every part of the coal territory will be able to protect itself from disaster, and will have, as in all European countries, its central rescue stations instituted to serve far smaller radii of action than the cars of our Bureau of Mines. It is time for such an organization to be formed in every section of the country, without national aid. Whether an automobile or railroad car is needed should be determined from local conditions but one or other should be owned by every group of mines and should be maintained by all mines near-by, large and small, whether they possess helmets and hire trained men at their works or not, for one squad of men is not enough to do the rescue work of a large mine.

Unless the Bureau of Mines undertakes to teach mining as well as first-aid, it cannot furnish sufficient employment so that it can assemble as many trained men as were mustered at Brookside. It cannot, therefore, do more than supplement rescue work and first-aid, and must be content to be last on the field when explosions and other accidents happen. So that in well developed fields, its largest service will be scientific.

The most desirable rescuemen are those who have worked in the mines where the disaster occurs and the professional men of the Bureau will always lack that intimate knowledge of the intricacies of individual mines which is enjoyed by the men who work therein. Th is markedly true of the anthracite region.

But even if the Bureau ultimately loses its active si and disposes of its cars, ceases its demonstrations and b comes purely scientific, nevertheless it is worthy of th greatest of honor for having spread a movement whi will later continue and develop by its own internal for That credit is rightly due to Joseph A. Holmes and h colleagues.

⁂

Experimental Explosion at Bruceto Mine

We publish today G. S. Rice's interpretation of th mysterious kick-back of the recent experimental expl sion. Though he does not say so, we believe that it is h opinion that the explosion reached a certain maximu violence, died down and then, near the Taffanel barrie but at its inby edge, developed a new force and drov the cars back into areas of inferior pressure. It is a r assertion of the oft-repeated declaration that every e plosion is not a single phenomenon, but a series of cu minations. The space curve of pressure is said to be, n a line gradually rising till a maximum is reached, b a series of waves as the violence rises and falls alon the heading. We suppose that Mr. Rice will justify h conclusion by comparing the low pressure found 750 f from the portal with the pressure ten times as great a 550 ft., only 200 ft. away.

We agree with him that a mere vacuum, doubtless n by any means complete, could hardly impel cars with any thing like the force with which they were thrown durin the explosion. That statement we have already mad But if the new focus was near the Taffanel barrier, w wonder why the cars most remote from that point move furthest inward and otherwise evidenced the mos violence.

Surely the flame did not gain in volume or the blas in force as they together traveled backward through th vitiated air; in fact, we doubt seriously whether the flam ran back at all. Moreover, why did not the cars shoot out ward with the first blast? The torn shelving near th inby car in the entry starts from the point where the ca was standing, as if the loaded wagon did not go outby before it was hurled inward.

Somehow, we have a hankering after a belief in Joh Verner's theory, and we hope some time that the Burea will find out, not only when the cars go in, but when the leave their original stations, and whether they travel bot outby and inby. We are prone to believe that the in-rush really accompanies the initiation of the explosion, i more violent near the originating point, travels along a separate path from the explosion and is not a mere vac uum rush, but is the result of the pressure of the explo sion on the intaking current.

Experiment only will answer, and we hope the Burea will make tests which will determine this moot point Meantime we hope no one will be so dogmatic that h cannot later with grace reverse his own decision, fo the problem is not easy and the answer is as yet far t seek. The advocates of the "vacuum" as a sufficient caus may well believe it could damage cars and track as stated The only difficulty is to grant that a current traveling horizontally could have such *lifting* power.

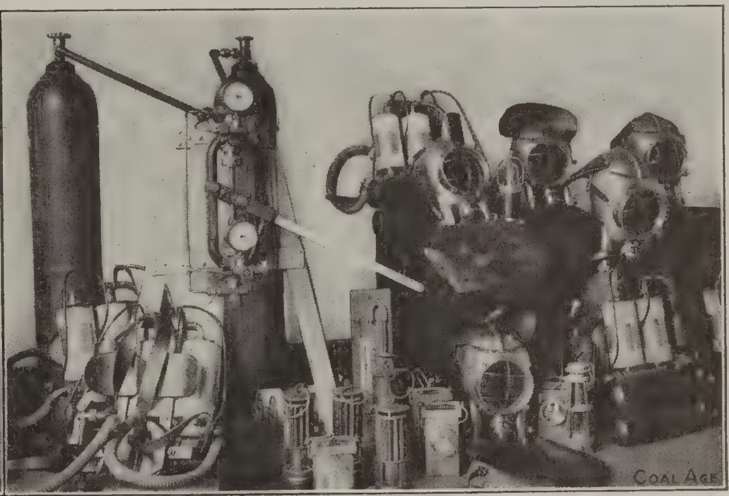
SOCIOLOGICAL DEPARTMENT

Safety Precautions of the Consolidation Coal Co.

By A. W. Hesse*

The "Safety First" movement in the Fairmont region, more particularly with the Consolidation Coal Co., received an impetus at the time of the Monongah explosion, which has kept it going ever since.

This company has spared no expense to introduce devices, or machinery to protect its employees. Arrangements were made at all its mines to introduce steam to keep down the dust; firebosses were established at more than half the operations because oil and gas wells had been drilled in the neighborhood of the workings, although most of these latter were considered nongaseous. An outside field man now follows the drilling of all wells through the company's coal; also, arrangements were made to have all drilling companies protect the outer casing with cement where it passes through the coal seam.



Adjoining operations are no longer connected, but arrangements are made, when the workings of two mines approach each other, whereby they can be readily and quickly connected if desired.

The company has never relied entirely on the state for the inspection of its mines; it employs a chief inspector and three assistants continually who report on safety conditions inside, and make recommendations for improving them. Later a superintendent of mining was established, who with an assistant, continually visits the mines, instructing the foreman and men how to mine coal properly besides supplementing the work of the inspectors.

All these men are trained in the use of rescue helmets, having taken the course at Pittsburgh under the Bureau of Mines. Five sets of helmets, together with necessary charging apparatus, are kept at Fairmont, where they are tested every week by competent men, trained for this work. These men come under the Testing Department and besides keeping the rescue apparatus ready for service, they visit the mines liberating, or likely to liberate any gas, sample the air, analyze it and report the percentage. They also take the humidity on these visits and report on same, in order to determine when to introduce the steam.

Emergency Outlets

In the past few years the company has gone to large expense in making extra openings for emergency outlets. Besides having completed one 195-ft. shaft and the present sinking of another 250-ft. deep, an adjoining property was purchased for the 136-ft. shaft outlet on it. Shotfirers are employed at a number of the mines to increase safety precautions, especially for untrained miners.

The value of this "Safety First" movement is better illustrated by actual figures. The decrease in the death rate per 1000 employees for 1912 over 1911 was 34.9 per cent., whereas the tonnage per death for 1912 was double that for 1911. The death rate for this company for 1911 was more than 16.4 per cent., and more than 45.6 per cent. less in 1912, as compared with the 1911 rate for the state. The tonnage per death was more than double that of the entire state.

The first-aid movement has not had quite the attention given it in other fields, due, perhaps, to the fact that the company's many doctors can reach the scene of accident so quickly; yet the movement has not been entirely ignored.

The accompanying picture shows the team which represented the West Virginia Division of the Consolidation Coal Co., at the recent meet held at Pittsburgh.

⁂

The presence of blackdamp, a mixture of carbon dioxide and nitrogen, will often neutralize the effect of firedamp on a flame. Analyses of mine gas, which gave only a faint cap when tested with a safety lamp, have shown 4 per cent. of methane mixed with blackdamp. When testing with a lamp, remember that the flame is not clear in lamps that have been burned some time in a dusty atmosphere as in lamps burned but a short time in clear air.

The Muckle Cup Contest

Special Correspondence

With 18 teams competing, presenting remarkable demonstrations of primary relief work, the fifth annual inter-company first-aid contest of the American Red Cross was held on Sept. 27, at Valley View Park, Inkerman. The chief prize in this interesting competition is the Muckle silver loving cup, donated in 1909 by Mrs. John S. Muckle, of Philadelphia, as a memorial to her husband. To secure permanent possession of the trophy, it must be won three consecutive times. The winners to date are as follows:

Team from Old Forge Breaker, Pennsylvania Coal Co.

(The winning team in the fifth event. M. Ballentine, captain; M. Quinn, T. Cranston, H. McGerrity, S. Sibley and W. Bennett, subject.)

Old Forge Breaker Team, Pennsylvania Coal Co., and Judges

(The team on the bench was the winner of the Muckle cup at the Red Cross meet, Valley View, Sept. 27, 1913.)

Wilkes-Barre, Oct. 2, 1909, Law Shaft, Avoca, Pennsylvania Coal Co. Valley View, Sept. 17, 1910, Woodward Colliery, Lackawanna Coal Co. Valley View, Sept. 16, 1911, Brisbin Colliery, Lackawanna Coal Co. Valley View, Sept. 28, 1912, Pine Brook Colliery, Scranton Coal Co. Valley View, Sept. 27, 1913, Old Forge Breaker, Pennsylvania Coal Co.

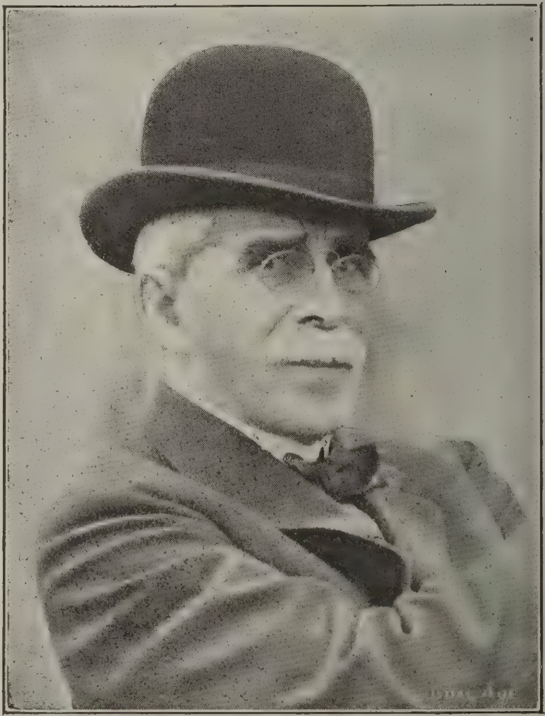
The contest was open to all first-aid teams of the operating companies of the anthracite region, and the 18 teams represented the Pennsylvania, Hillside, Temple, "Lackawanna," Jermyn and Scranton Coal companies. The event is annually the big feature of first-aid work in northeastern Pennsylvania and the teams competing are those making the best scores at previous company meets.

The contests were conducted under the direction of Dr. F. F. Arndt, of Scranton, who has charge of the first-aid work of the Pennsylvania and Hillside companies. The judges were Dr. W. S. Fulton, of Scranton; Dr. John W. Grant, of Carbondale; and Dr. J. A. Singer, of East Stroudsburg. The other officials were: Secretaries—F. D. Conover, secretary to Capt. W. A. May; J. S. Angler, secretary to A. F. Law; Edgar Weichel, timer.

In previous years, the War Department has sent army physicians to Valley View to judge the contests, but this year it was reported that no mileage was obtainable. Major Patterson had been detailed to supervise the event, but his work as doctor of the field work of the American Red Cross drew him away from Washington, and Major Lynch was substituted. A death in the fam-

Forty Fort Colliery Team in Fourth Event

(Injured spine and broken left forearm. P. Williams, captain; J. Casparen, subject; J. Jim, W. Jones, F. Romenkoski and I. Hochreiter.)



Captain W. A. May, General Manager Pennsylvania Coal Co.

(Said to have introduced first-aid methods in the American anthracite field.)

ily of the latter this week prevented his being present, and the department was not represented.

Two of the events were run off before the noon recess, when lunch was served by the companies interested. The problems worked out by the teams were framed by physicians of the War Department at Wishington, and sent to the park in sealed envelopes. There were five events, and the cup award was on the general average. The events were as follows:

1. One-man event. A miner has been injured by a fall. There is an incised wound on the right knee, with little bleeding, and a lacerated wound on the palm of the left hand, which is bleeding profusely. Treat appropriately and carry 50 ft. Time allowed, 8 minutes.

2. Two-man event. A man is found unconscious, lying with his abdomen across a live electric wire. Rescue the patient and give appropriate treatment. Time allowed, 10 minutes.

3. Three-man event. A man has his head, face, neck, shoulders, arms and hands burned, following a gas explosion. Treat the case. Time allowed, 15 minutes.

4. Full-team event. A man is found with his spine injured—apparently broken. The left forearm has sustained a simple fracture of both bones. Treat the patient and carry 50 ft. Time allowed, 20 minutes.

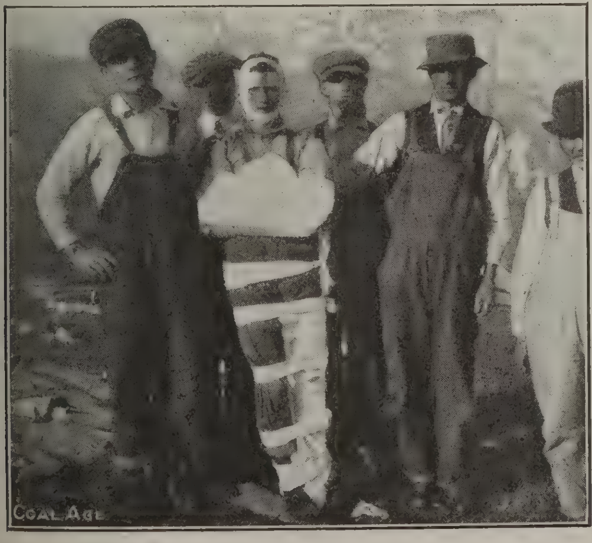
5. Full-team event. A man has been injured by a fall of coal and slate. There is a compound fracture of the right forearm about the middle. His left thigh has a simple fracture 6 in. above the knee. The back of his left hand has a deep cut, which is bleeding profusely. There is also a lacerated wound of the right cheek. Treat the case and carry 50 ft. on an improvised stretcher. Time allowed, 15 minutes.

Some of First-Aid Teams at Work at Red Cross Meet

(Fifth and crowning event.)

A Neat Spiral Bandage—The Hardest of All to Make

(Winning team performing fifth event.)



Team of No. 5 Shaft, No. 6 Colliery, Pennsylvania Coal Co.

(Fifth event. Victim is bandaged for lacerated wound of right cheek, compound fracture of right forearm, a cut in the back of the left hand and a simple fracture of left thigh above knee.)

The participating teams follow:

1. Sterrick Creek Coal Co.—Isaac Davis, captain.
2. Fernwood Slope, Butler Colliery, Hillside Coal & Iron Co.—James R. Pollard, captain.
3. Law Shaft, Pennsylvania Coal Co.—William Creedon, captain.
4. Pine Brook, Scranton Coal Co.—John Igall, captain.
5. Nanticoke Colliery, Delaware, Lackawanna & Western R.R. Co., coal department—William Hill, captain.
6. Brisbin Colliery, Delaware, Lackawanna & Western R.R. Co., coal department—John Pierce, captain.
7. Lackawanna Colliery, Temple Iron Co.—Harry Saxe, captain.
8. Mt. Lookout Colliery, Mt. Lookout Coal Co.—George Bumby, captain.
9. Old Forge Breaker, Pennsylvania Coal Co.—Moses Ballentine, captain.
10. Erie Colliery, Pennsylvania Coal Co.—Martin Cawley, captain.
11. Storrs Colliery, Delaware, Lackawanna & Western R.R. Co., coal department—David Edwards, captain.
12. Forty Fort Colliery, Forty Fort Coal Co.—Fuller Williams, captain.
13. Northwest Colliery, Northwest Coal Co.—Charles Seipher, captain.
14. Sloan Colliery, Delaware, Lackawanna & Western R.R. Co., coal department—William King, captain.
15. No. 2 Shaft, No. 1 Colliery, Pennsylvania Coal Co.—C. F. Beachem, captain.
16. Jermyn Colliery, Jermyn Coal Co.—Charles Llewellyn, captain.
17. No. 5 Shaft, No. 6 Colliery, Pennsylvania Coal Co.—Peter Hoolihan, captain.
18. Bellevue Colliery, Delaware, Lackawanna & Western R.R. Co., coal department—John M. Jones, captain.

The standing of the teams in the different events was as follows:

Team	1	2	3	4	5	Average
Sterrick Creek	94	95	100	95	100	$96\frac{4}{5}$
Fernwood Slope	95	98	100	95	100	$97\frac{3}{5}$
Law Shaft	100	95	96	97	93	$96\frac{1}{5}$
Pine Brook	95	97	97	100	94	$96\frac{3}{5}$
Nanticoke	100	96	100	100	91	$97\frac{2}{5}$
Brisbin	98	88	96	97	89	$93\frac{3}{5}$
Lackawanna	95	98	94	100	91	$95\frac{3}{5}$
Mt. Lookout	90	96	94	100	92	$94\frac{2}{5}$
Old Forge	100	96	96	100	100	$98\frac{2}{5}$
Erie	100	97	91	98	100	$97\frac{1}{5}$
Storrs	98	98	94	96	90	$95\frac{1}{5}$
Forty Fort	100	96	98	98	95	$97\frac{2}{5}$
Northwest	80	85	90	96	90	$88\frac{1}{5}$
Sloan	85	100	95	96	97	$94\frac{3}{5}$
No. 2 Shaft, No. 1 Colliery	98	100	95	90	89	$95\frac{2}{5}$
Jermyn	90	95	98	96	88	$93\frac{2}{5}$
No. 5 Shaft, No. 6 Colliery	89	100	100	98	97	$96\frac{4}{5}$
Bellevue	92	90	96	96	100	$94\frac{4}{5}$

The prizes were presented by Dr. J. A. Singer, of East Stroudsburg, instructor in first-aid for the D. L. & W. R. R. Besides the Muckle Cup, each member of the winning team was given a bronze Red Cross medal, from the American Red Cross.

Third Annual Outing of the Lehig

OFFICIALS AND EMPLOYEES OF THE LEHIGH VALLE

Valley Coal Company Social Association

Coal Co. Met at Hazle Park, Penn., Aug. 23, 1913

Rescue Contest of the Vandalia Coal Company

The third annual first-aid contest of the Vandalia Coal Co. was held in Mahan's skating rink, Linton, Ind., Saturday evening, Sept. 13. A passageway similar to an entry in a mine was erected. Obstructions were placed in this passageway, and the various teams, fitted with breathing apparatus, were compelled to carry a man over these obstructions on a stretcher. Injuries, such as fracture of the thigh and other limbs, burns, electrical shock, etc., were demonstrated and treated by the different teams.

Other Vandalia Teams That Took Part in the Contest

Six teams entered the competition, and the rescue corps from Mine No. 9 received the highest percentage, thus winning first prize. This team was composed of Charles Dodge, captain; Jack Brown, John Parks, Thomas Parks and Dave Beaty. This same team was sent to Pittsburgh to compete in the national meet held there Sept. 22-24.

During the evening William Houston, president of District No. 11, U. M. W. A., delivered an interesting address on "The Desirability of First-Aid Among the Miners." Mr. Houston stated that anyone who looked upon the first-aid movement with scorn and ridicule did so out of ignorance, and that Linton, which is the best coal-mining city in Indiana, should be proud that this great movement originated there.

Some Members of the Vandalia Rescue Teams

The Vandalia Coal Co. is the pioneer of mine-rescue work in the Middle West, having adopted first aid three years ago.

Mine-rescue car No. 3, of the U. S. Bureau of Mines, with Luther Floyd in charge was in Linton at the time and the crew gave training in the use of breathing apparatus to a number of miners.

The following men acted as judges of the contest: John Talbott and Luther Floyd. The various teams of the Vandalia Coal Co. were trained under the direction of Dr. A. F. Knoefel.

⁂

Coal-Dust Explosions

A lecture arranged by the British Association was delivered by Sir Henry Cunynghame, K. C. B., the chairman of the late Royal Commission on Mining Accidents and of the Eskmeals Dust Explosions Committee. His subject was "Explosions in Coal Mines and the Means of Preventing Them." Sir Henry adopted simple language, deeming it best not to presume an acquaintance on the part of his audience with the methods of working coal mines.

Coal, he explained, consists of the residue of the vegetation of bygone ages. The plants of which coal is composed were mostly ferns, many of which were of gigantic size. It contains woody fiber and seeds of a very resinous and inflammable kind. A pound of it when burned will give enough heat to raise about 9 gal. of water from 60 deg. F. to the boiling point, and has a work-doing power of one horse for about five hours; that is, it will raise 4800 tons weight to the height of one foot.

On coal we depend for domestic heating, gas-light, cooking, electric light, for means of locomotion by land and sea, and for almost the whole of our manufactures. This coal we waste in a most unjustifiable way. A common kitchen range burns more than a ton of coal a month—that is, about 75 lb. a day—an amount which if properly employed would cook for 1000 people.

The common gases found in mines are methane, which, roughly speaking, is like common coal gas, and is the gas given off from marshes; carbon dioxide, the gas given off from effervescing drinks; and carbon monoxide, a deadly poison. In common language they nearly correspond to firedamp, chokedamp and afterdamp. The first is capable of rendering air explosive, the second chokes you, and the third poisons you. Thus explosion, suffocation and poison are the dangers to which the miner is exposed.

Methane Was Thought to Be the Only Cause

The old theory of mine explosions that they were caused by methane was the natural one, but Sir Henry explained the improbability of this theory and its utter variance with the phenomena of a coal-mine explosion, discussing the origin and development of the dust theory of explosions. Explosions of gunpowder were shown to be exactly analogous to dust explosions. In the one case the oxygen in a condensed form is supplied to carbon dust at rest in a heap; in the other case oxygen in the gaseous form is supplied to a cloud of finely divided dust particles.

Speaking of the modern theories of mine explosions, the lecturer said death results not so much from violence, still less by suffocation, but almost entirely by reason of poisonous carbon monoxide. The employment of mine ventilation to sweep the mine free of gas has the effect of producing clouds of dry dust which is explosive. The remedies suggested for mine explosions are: (1) regulations as to the use of naked lights, electricity and blasting; (2) wetting the coal, which plan, although difficult to carry out, is effective and still will probably have to be used extensively; (3) incombustible dust. In order to understand the probable action of incombustible dust in impeding the ignition of coal dust, it is necessary to call to mind the kinetic theory of gases.

In reference to the experiments following upon the proposal of Mr. Garforth to spread incombustible dust in mines, it has been found that with three parts of stone dust to five of coal dust, the explosion is feeble; with four to six it is smaller still; with equal proportions it stops. It is highly probable, if the dust in a mine consisted of over 50 per cent. of incombustible matter, it would be almost impossible to explode it, except by a very large-scale explosion, which is in the highest degree unlikely to happen if the whole mine is treated from end to end with the incombustible dust.

⁂

Shock

By A. S. Snyder*

Shock, or collapse, is a depression of the vital functions of the whole system. The action of the heart becomes weak and there is a dilation of the blood vessels of the internal organs, so that an accumulation of the blood occurs in the interior of the body, and the amount of blood circulating near the outer surface and in the head is decreased to such an extent that it produces a profound depression of the nervous system.

SYMPTOMS

Face is pale, anxious and pinched.

Eyelids droop; eyes are dull with dilated pupils.

The patient is stupid and takes no interest in what is going on or happening about him.

He may be partly or totally unconscious.

Breathing is feeble, and there is sighing and great thirst.

The pulse is feeble, fluttering, rapid and barely perceptible.

The skin is cold, the temperature subnormal.

When an injured person begins to get chilly and shiver, no matter how slight the injury, he is suffering from shock.

TREATMENT

Place in a position with the head low, so that more blood will flow to the brain.

Loosen all tight clothing, especially about the neck, wrists and waist, but do not remove more clothing than is necessary to examine and treat the injury thoroughly.

Cover patient with blankets, coats or brattice cloth if no blankets are immediately at hand.

If in a mine where safety lamps are used, apply heat by placing lighted safety lamps under the blankets or covering.†

If the victim is conscious, give him stimulants, such as aromatic spirits of ammonia, tea or coffee.

Rub the limbs to stimulate the circulation.

If unconscious, hold ammonia or smelling salts to the nose, and in severe cases apply artificial respiration.

When warmth is restored and the patient recovers from cold and chilly sensation, the treatment is successful.

⁂

Mining Exhibit at A. M. S. A. Meet

An interesting mining exhibit was held in the parlors of the Fort Pitt hotel. The Lungmotor was shown by the Life Saving Devices Co., Chamber of Commerce Building, Chicago, Ill., and attracted much attention. The apparatus is portable, little liable to get out of order and simple in operation. It is used for resuscitating the asphyxiated.

The Draeger Oxygen Apparatus Co., of Pittsburgh, Penn., demonstrated their well-known helmets and pulmotors. S. F. Hayward Co., of Chambers St., New York City, exhibited the Westfalia long- and short-time helmet outfits, of which nearly 100 are said to have been sold in this country.

The American Red Cross exhibited their dressings as also Johnson and Johnson of New Brunswick. N. J. Burroughs, Welcome & Co. showed their tabloid first-aid packages which are equally available for aviators and for mine use. They are light, compact and therefore easy to carry.

The Mannesmann Light Co., of 55 John St., New York City, made a fine exhibit of their CEAG lamps and the Koehler Manufacturing Co., of Marlboro, Mass., showed their safety lamps and igniters. The lamps give a light of 1.6 candle power. The Hirsch Electric Mine Lamp Co. had a complete exhibit of electric cap lamps and batteries. The Union Electric Co., of Pittsburgh, exhibited mine telephones, headlights, condulets, trolley clamps, and other electric supplies. The Western Electric Co. showed their complete line of mine telephones.

†The more usual practice is to extinguish the lamps. On this matter discussion is invited.—Ed.

DISCUSSION BY READERS

Starting Fan after Explosion

Letter No. 2—Assuming that an explosion has occurred in a mine and the force of the blast has damaged the fan so that it must be repaired before it can be used, the question of starting it up again before the mine has been examined is a serious one. My answer to this question is an emphatic "No."

Experience has shown that there is always more or less unburned marsh gas remaining after an explosion. Miners who have survived an explosion in a mine state that there is usually a reflex wave following the first blast. The result is that most of the oxygen of the mine air is consumed, leaving the atmosphere in the mine, largely devoid of power to support life or flame. Frequently, there are piles of hot dust, and the timbers and ribs of the entries are coated with dust.

In this condition, air from the workings not traversed by the explosion furnishes enough oxygen to start numerous small fires in different parts of the mine. The effect of starting up the fan under these conditions, would be to increase the draft and spread the fire. Moreover, the circulation through the mine would render the gas accummulated in portions of the workings highly explosive and bring this in contact with the fire. A second and more disastrous explosion would certainly follow. This is my reason for saying that the fan should not be started until the helmet men have penetrated far enough into the mine to ascertain its true condition.

FIREBOSS.

Republic, Ala.

⁂

Letter No. 3—I was much interested in the question of Ralph W. Mayer, COAL AGE, Sept. 20, p. 430, referring to the danger of starting a fan that had been thrown out of commission by an explosion, before correctly ascertaining the condition of the mine. While it assumes the worst conditions that could arise, the question is a good, practical one, and, for the benefit of those less familiar with mining conditions, should be discussed thoroughly from a practical standpoint.

There is always the danger of a second explosion following the first, on the restoration of the air current. This is liable to occur whether or not the fan is started. Those familiar with the situation know that ventilation in the mine is always more or less deranged by the destruction of stoppings, brattices, doors, etc., throughout the mine. Frequently, gas feeders and combustible material have been ignited by the flame of the explosion. It must not be thought for a moment that all of the air or available oxygen in the mine has been consumed by the first explosion which belched flame and smoke from the mine openings. It is usually the case that more or less pure air exists in portions of the mine, while other portions are filled with the carbon monoxide, carbon dioxide and nitrogen of the afterdamp. If fire exists at any point in the mine there may result a dangerous amount of carbon monoxide from the incomplet combustion due to the slack ventilation and scarcity o oxygen. Or the fire may start a circulation that woul cause explosive mixtures of this gas or methane accumulated in other parts of the mine, to reach the fire an becoming ignited, produce another explosion.

The fact that a fan is thrown out of commission by a explosion always increases the danger of the situation immediately following; because the period of idleness of th fan affords an opportunity for the accumulation of dangerous bodies of combustible and poisonous gases, whic otherwise would have been removed as they were generated, in those portions of the mine where the circulatio was not deranged too badly. Notwithstanding the ris incurred in entering the mine after an explosion ha taken place, it is the duty of those in charge to do everything in their power to rescue any who may have survived the first explosion. However, action in this regar must be guided and controlled by good judgment an experience, and it is absolutely necessary to disregar sentiment at such times.

A properly equipped rescue party should be organize at once, consisting of the most experienced men amon the volunteers. The best type of breathing apparatu should always be available and portable electric lam should be used; but at least one safety lamp should b carried into the mine to ascertain the gaseous conditio of the mine air.*

Conditions in the mine will determine the method o proceeding underground. If the explosion is general i a large mine, it may be possible to accomplish little i regard to rescue work, until the circulation can be restored with the aid of the fan. It would be advisabl however, to explore the workings as far as possible, no their condition, and ascertain the possible existence o fire in the mine and the probable location of men wh may have survived the explosion and are still alive, so a to render them any possible aid. Where fires are foun they should be extinguished promptly.

On the return of the rescue party to the surface, th fan should be started very slowly at first, the idea bein to restore the circulation in the workings explored an to avoid, as far as possible, setting up a circulation i sections that have not been explored. To accomplis this, the ventilation must be kept under control. It wi now be possible to enter the mine and explore furth other sections; but in no case should the circulation b restored in those sections until it can be ascertained th no fire exists in them.

It is only possible, thus, in a general way, to outli the work; but great care and good judgment must dicta what is best to be done.

BENJAMIN HARTILL

Johnstown, Penn.

---

*A caged bird or mice should also form part of the equi ment, to reveal the presence of dangerous quantities of ca bon monoxide.

The Liquor Problem in Mining

It is candidly admitted that the miner drinks; but whether this habit has any stronger hold upon miners than upon other classes of workers may be seriously questioned. At least, miners, as a class, are entitled to this consideration. For example, select an equal number, say 500 men, from each class of workers such as glass blowers, iron workers, machinists, foundrymen, etc.; and compare the proportion of drinking men in each class, with the proportion of drinking miners. I am confident that such a comparison would not prove unfavorable to the miner.

In all industries, it is common to hear the drinking class referred to as "good workers if they would not drink." To the credit of the miners, I will say that, in my opinion, 75 per cent. of them are honest workers, and the remaining 25 per cent. are mostly honest workers when they are sober. The same can be said of a large number of our best tradesmen; they are good workers when they are sober. Only a few days ago, I heard a boss say of one of his men: "He is the best workman we have on the job, but he will not leave drink alone."

In reference to the increase or decrease of the drinking habit among miners, I would say that there is an increase, generally, in localities where miners are crowded together in a small town or camp, devoted wholly to the coal-mining industry. But, in larger communities, where miners mix with workers in other industries, it cannot be said that they drink any harder or oftener than their fellows in other callings.

While a mine superintendent cannot always employ men who are sober, he can discourage the drink habit among the men by his own example of abstinence and by refusing to hold any position open for a man who drinks habitually. I consider drinking booths, canteens, and bootlegging should be abolished from every mining camp, and more especially for the sake of the coming generation. If we can keep the boys away from the saloons when young, they will not be enslaved to the habit when they become men. The mine foreman, by his example and by the courteous treatment of his men, can do much to overcome the baneful influence of the drink habit among his employees, while a curse and a dark look, in place of a smile, will go far toward increasing the evil.

John Sutton.

West Terre Haute, Ind.

⁂

Mixed Lights in Mining

Letter No. 18—I have been deeply interested in the discussion on this subject, and regret that the question does not seem to have reached a successful climax. One of the cardinal issues, in the operation of a gaseous mine with respect to the health and safety of the employees is, in my opinion, the exclusive use of an approved type of oil-burning safety lamp or electric lamp. This seems necessary as a reasonable precaution to avoid the possible ignition of a body of explosive gas. By prohibiting the use of open lights in such mines, we eliminate one of the factors largely responsible for mining catastrophies.

It is argued by some that the operation of a mine on a mixed light basis is justifiable under certain conditions where the quantity of explosive gas generated is small or the mine makes gas only in the solid or live workings and the circulation is sufficient in quantity and velocity to carry off and render harmless the gases generated. It cannot be guaranteed, however, that the conditions on which this argument is based will continue for any length of time. There are many things of common occurrence in coal mining that impair the efficiency of the ventilation at the working face, to the extent that an apparently safe mine becomes suddenly dangerous. The failure of the ventilating fan; the accumulation of ice in the air shaft; a heavy fall of roof in the air course, by which the mine resistance is increased; a door left open or a brattice torn down; or any one of numerous other causes may, in a moment, so disarrange the ventilating system as to render the workings dangerous where mixed lights are employed.

There are, besides, numerous geological changes that are liable to occur in coal seams and that would prove a menace to the safety of a mine operating in a gaseous district. The presence of spars, faults or clay veins is frequently accompanied with a change in the gaseous condition of the mine workings. It often happens that a strong feeder of gas is liberated by the blast of an explosion, or by the miner's pick or drill, or by the undercutting of the coal, by machines. There is no way of foreseeing and providing against such occurrences, or estimating the amount of gas that may be given off from a clay vein, fault or feeder.

As an illustration of this fact, I will mention an incident that occurred in my own experience. In the mine where I was employed, a clay vein was exposed suddenly, by the undermining of the coal with a machine. The quantity of gas given off from this clay vein was such as to render highly explosive an air current of 10,000 cu.ft. per min., for 3 hr. after the vein was cut. No argument is needed to make clear the fact that an open light, at such a time, would have supplied all that was needed to cause a mining catastrophe, the magnitude of which would be measured only by the number of lives lost and the property destroyed. I am thankful to say that, at this particular mine, safety lamps were used exclusively and this fact alone averted the danger.

The chief claim of the mixed-light advocates is that a man can perform more work in less time, with an open light, than with a safety lamp, because of the fact that the open torch gives a better light and can be carried on the head, leaving the hands free for work; it can also be relit, if extinguished, with less trouble than a safety lamp. It is claimed that the miner can produce better coal and is less liable to injury himself when using an open light. While these statements may be true, in respect to men who have been accustomed to using an open light for years and were compelled, suddenly, to adopt the safety lamp, they do not apply to men long accustomed to the use of safety lamps. The latter become and are as skilled workmen as the open-light miner, and can produce as much coal in the same time.

There are certain benefits that accrue from the exclusive use of the safety lamp. Briefly stated, these are: 1. The safety lamp tends to make the miner more careful, because it is a constant reminder of possible danger. 2. The safety lamp, incidentally, brings the miner into closer contact with the mine foreman and his assistants. When the lamp is given to the miner in the morning the opportunity is afforded of notifying him of any peculiar danger in his place. 3. Safety-lamp mines are more free from smoke and soot, as the oil burned in these lamps is, generally, a better grade than that commonly used in the open light. 4. The flame of the safety lamp being protected, there is less danger of igniting either gas, timber, explosives, or other combustible material.

The contention that a safety lamp in the hands of an ignorant workman may prove as dangerous as an open light, is too absurd to be regarded seriously. One of the well known features of a safety lamp is that it is quickly extinguished in a body of gas, unless great care is exercised by the one holding the lamp. This is an invaluable feature in respect to the use of the safety lamp by ignorant or inexperienced workmen.

The greatest drawback and the feature that most tends to make the safety lamp unpopular with mining men, however, is the difficulty experienced in relighting an extinguished lamp. At times, the workman must travel a considerable distance to a lamp-lighting station. The cause of the lamp being extinguished may be due to careless handling; but it is often caused by the neglect of the attendant in charge of the lamp station to properly fill the lamp with oil or replenish the igniter; or, perhaps, the igniting apparatus is out of order or damp, or, as has happened, has been left out entirely, by mistake. Trouble is largely overcome, at the present time, by the use of a friction plug, the sparks of which relight a lamp burning a volatile oil. This igniter seldom fails and is a great improvement over the tape or match formerly used.

The points I have mentioned demonstrate conclusively, to my mind, that the use of mixed lights in a gaseous mine is a dangerous proposition. In such mines or districts, the life and health of the men underground can only be protected by operating the mine on an exclusive safety-lamp basis. The introduction of the electric lamp at the working face is an innovation in coal mining.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

QUANTITY

The term "quantity," in mine ventilation, refers to the volume of air passing in an airway, estimated in cubic feet per minute. This is often spoken of as the "circulation" of the airway or mine.

How Quantity Is Estimated—As stated above, the quantity of air circulated in an airway or mine, or the "circulation," as it is called, is always estimated, in this country, in cubic feet per minute.

How Quantity is Measured—To measure the quantity, in ventilation, it is necessary (1) to measure the sectional area of the airway at the point of observation and (2) to carefully measure the average velocity of the air current at the same point. From these measurements, the volume of air passing or the circulation is calculated by means of the formula,

$$\text{Quantity} = \text{area} \times \text{velocity}$$
$$q = a\,v$$

Example—Calculate the circulation in an airway having a sectional area of 50 sq.ft., the average velocity of the air current being 600 ft. per min.

Solution—Substituting the given values in the formula for quantity in terms of velocity and area,

$$q = a\,v = 50 \times 600 = 30{,}000 \textit{ cu.ft. per min.}$$

Quantity of Air Required—In determining the required circulation of a mine, it is necessary to consider (1) the requirements of the mining law of the state in which the mine is located and (2) the requirements of the mine as determined by the natural conditions existing in the seam and the enfolding strata.

Requirements of the Mining Law—These vary somewhat in different states. Owing to the numerous and changing conditions, in mines, mining laws are of necessity arbitrary standards, which must, however, be met, except in cases where the law specially confers discretionary powers upon the mine inspector or the mine foreman, thereby authorizing them to decrease the circulation in any mine or section of the mine, as conditions may require or their judgment dictate.

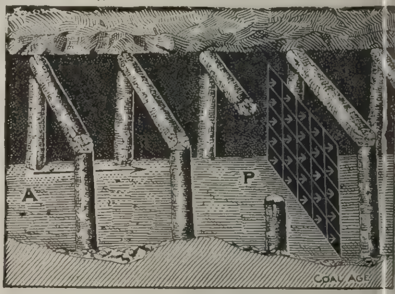
The mining law commonly specifies from 100 to 150 cu.ft. per man, per min. for nongaseous, and 200 cu.ft. per min. for gaseous mines. In addition, some of the laws require from 500 to 600 cu.ft. per min., for each animal employed underground.

Natural Requirements—Gaseous mines naturally require more air than nongaseous mines. The rise workings of seams generating marsh gas or the dip workings of mines giving off quantities of blackdamp are often difficult to ventilate and require a circulation greater than what the law specifies, in order to keep the workings free from gas and healthful and safe for work. Slips and faults often give off much gas when least expected and require, therefore, a larger circulation of air than would otherwise be necessary in the same mine.

The Coal Age Pocket Book

WORK—POWER

The terms "work" and "power," as used in mine ventilation, are synonomous, because the work performed in moving the air through the mine airways is based on a unit of time, both the velocity and the quantity being rated per minute of time.



SHOWING PORTION OF MINE ENTRY AND CROSS-SECTION

Power on the Air—The air current in an airway or mine is moved by a pressure called the "ventilating pressure." The ventilating pressure or the pressure producing the circulation is the total pressure (pa) exerted on the entire sectional area of the airway, as illustrated in the accompanying figure. The small arrowheads represent the unit pressure or the pressure (p) on each square foot of cross-section. The large arrow shown at A represents the total pressure P = pa.

It is a law of mechanics that when a force (pa) moves or is exerted through a distance (v) the work performed is equal to the product (p a v) of the force and the distance. But in this case, the force (pa) moves through the distance (v) in one minute. The work (pav) is, therfore, performed in one minute and is the "power on the air." The work performed per minute or the power on the air is expressed in foot-pounds per minute. Calling this work per minute or power on the air u, the formula for power is

$$\text{Power} = \text{unit pres.} \times \text{area} \times \text{vel.}$$
$$u = p\,a\,v$$

Again, since q = av, the formula for power on the air may be written

$$\text{Power} = \text{quantity} \times \text{unit pres.}$$
$$u = q\,p$$

The formula for horsepower of the circulation is, therefore, since 1 hp. = 33,000 ft.-lb. per min.

$$H = \frac{q\,p}{33{,}000}$$

The power formulas, in ventilation, make it possible to calculate the power required to produce any given circulation, against any given pressure or water gage when the efficiency of the ventilator is known or assumed.

INQUIRIES OF GENERAL INTEREST

Unit Weight of Air

Will you kindly answer, through the columns of COAL AGE, the following question: What is the weight of 1 cu.ft. of air, at a temperature of —460° F., and a pressure corresponding to 1 in. of mercury?

I. C. PARFITT.

Jerome, Penn.

The temperature given, namely, 460 deg. below zero (—460° F.) is the absolute temperature of the Fahrenheit scale. At this temperature and an atmospheric pressure corresponding to 1 in. of mercury column, a cubic foot of dry air has been calculated, from numerous careful determinations, to weigh 1.3273 lb. This is the constant used in the formula:

$$w = \frac{1.3273 \times B}{460 + t}$$

which gives the weight of a cubic foot of dry air, at any temperature (t) and pressure (B), since the weight per cubic foot varies directly as the pressure and inversely as the absolute temperature.

For example, the weight of 1 cu.ft. of dry air at 60 deg. F. and a barometric pressure of 30 in., is

$$w = \frac{1.3273 \times 30}{460 + 60} = 0.0766 \text{ } lb., \textit{ nearly}$$

⁂

Gasoline Mine Locomotives

Kindly state whether the gasoline locomotive is considered safe for hauling coal in a mine.

J. J. HOPKINS.

California, Penn.

Opinions vary in regard to the question of safety, in respect to installing a gasoline locomotive in a coal mine, particularly a gaseous mine. There is, naturally, a strong objection, we may not say prejudice, to permitting so large a quantity of such an explosive liquid as gasoline, to be taken into the mine. For the purpose of haulage, the gasoline is handled in sealed tanks, which are taken into the mines and installed under heavy covers near the center of the machine, to guard against possible accidents due to the breaking of the tanks in the event of collision and the igniting of the gasoline.

It is claimed that with reasonable care the gasoline mine locomotive, as now built, is safer than the electric locomotive used for the same purpose, in mines. It cannot be denied, however, that the presence of gasoline, in the quantities required for mine haulage, is and must necessarily be regarded as a menace to the safe working of the mine. The majority of mine accidents are due to carelessness or neglect; and, to avoid disaster from these sources, all explosive material should be kept out of the mine, as far as possible. Many mines, however, are operating gasoline locomotives successfully, and it may be said that few serious accidents have resulted.

In this connection, another danger aside from that of fire and explosion, must be considered. When a gasoline motor is not working properly, the combustion in the cylinder is incomplete, and the exhaust gases then contain appreciable amounts of carbon monoxide. In the normal working of the engine, the exhaust gases consist chiefly of nitrogen and carbon dioxide, with water vapor. The possibility of poisonous gases in the exhaust, though comparatively slight, may result in fatal consequences under the varied conditions in coal mining. In well ventilated workings there is little danger to be anticipated from the exhaust of the engine; but the poisonous effect of the gases should be thoroughly understood by all concerned in the operation of this class of motors. When the engine is working properly, there is little smoke or odor noticeable in the exhaust; and when these are observable, they indicate incomplete combustion in the cylinder, which should be remedied in order to avoid danger and obtain the highest efficiency of the machine.

⁂

Safety in Mining

Will you kindly state what, in your opinion, are the most essential elements relating to the safe operation of coal mines. There has been so much spoken and written, in recent years, in regard to means and methods, the adoption of which it is claimed would reduce danger and make the mine more immune from accidents, that the practical man is very much confused as to what methods will produce the greatest degree of safety.

The importance of humidifying the mine air by the introduction of steam into the intake airway of the mine, has received special attention and seems reasonable, both as a means of laying the dust on the roadways, and decreasing the capacity of the air traveling through the mine, to absorb moisture and dry out the workings. It has been suggested that the danger of blasting coal in mines is greatly lessened by reducing the air current at the time of firing, but the question is yet unsettled.

A less reasonable suggestion is that the mine air should be immunized by reducing its oxygen content, and even by introducing into the air current certain inert gases, mainly carbon dioxide. Now comes the suggestion of building light collapsible stoppings, in order to localize a possible explosion of gas or dust at the working face. Is there any wonder that the layman is practically at sea in regard to most of these matters?

MINE SUPERINTENDENT.

Pottsville, Penn.

We are glad to receive this inquiry as it reveals the uncertainty that prevails in the minds of a large number of practical mine superintendents and foremen who are desirous of adopting any measures that will make the mine more safe. While no definite answer can be given to this inquiry in detail, we are glad to state that much light has been thrown on many of these questions by the discussions in COAL AGE, giving the views of practical men on these subjects. The question of collapsible stoppings is now being discussed.

EXAMINATION QUESTIONS

Miscellaneous Questions

(*Answered by Request*)

Ques.—What precautions should be taken in the use of safety lamps in mines?

Ans.—All safety lamps used in the mine should be of an approved type and, as nearly as practicable, of the same kind, except those used by the firebosses, who should own and care for their own lamps. The miners' lamps should all be owned by the company and in their charge. They should be examined, cleaned, filled and trimmed in a properly equipped lamp room or station, by competent men, after each shift. Preferably, each lamp should be stamped with a number corresponding to a check to be given to the man using that lamp. As far as practicable, each miner should have the same lamp given him, from day to day, and should be held reasonably responsible for its condition. The lamps should be given out in exchange for the proper check, previous to each shift, and the check should be immediately hung where it can be seen, on the hook or in the place previously occupied by the lamp. At the end of each shift, every miner returns his lamp and receives again his check for the same. The hooks, or pigeonholes, for the lamp should all be numbered to correspond to the number on the lamp.

On receiving his lamp in the morning, each miner should carefully examine the same before leaving the lamp room, to ascertain for himself that it is properly put together and in good condition, trimmed and filled. In the mine, the lamp should be carried in an upright position, at the side or in front of the person, to protect it from a strong draft; it should not be swung or tilted to one side so that the flame inclines toward the gauze or the glass of the lamp. The wick may be cleaned by the pricker when necessary to improve the light, but care must be taken not to raise the wick too high so that the flame will smoke. The lamp must not be exposed to too strong a draft and should be protected, as far as possible, from the concussion of the air caused by a heavy shot. While at work, the miner must put the lamp where it will not be in danger of falling, or being knocked over, or injured by a blow or fall of slate or coal. The miner must observe the lamp continually, at brief intervals during the day. It should not be hung too high in the roof, and, in testing for gas, must not be exposed to the gas longer than to detect the presence of the same.

Ques.—If when making an examination of the mine you found a large body of explosive gas, state what precautions you would take to prevent an accident.

Ans.—If the gas is discovered in the early morning examination, that section of the mine should be fenced off, and no one permitted to enter until the gas has been removed and the workings examined and reported safe. It may be necessary, under certain conditions depending on the arrangement of the ventilating system and the quantity of air in circulation throughout the mine, to adopt the wise precaution of undertaking the removal of the gas before anyone is permitted to enter the mine except those necessary to perform the work. There is always danger in the presence of a large body of firedamp in any section of a mine, however well isolated that section may be from the other workings. The danger lies in the possibility of a heavy roof fall or other unforeseen occurrence driving the gas back into adjoining sections. This could occur, to a dangerous extent, as the result of a slight derangement of the ventilating system, or a heavy fall of roof; and, in case of a serious accident resulting, the mine management would be responsible for not having taken every possible precaution.

In the removal of the gas, only competent men should be employed, and safety lamps should be used exclusively. All entrances to the mine or the affected section should be carefully guarded. The work should be approached from the intake side, and should be conducted with the utmost caution, time being given for the complete removal of the gas from a place, before advancing further. The progress of the work should be carefully watched by making frequent tests for gas with the safety lamp.

Ques.—Is it safe to pass a current of intake air through the abandoned portions of a mine before conducting it to the face of the workings, and if not, why not?

Ans.—The intake air current in a mine should be conducted as directly as possible to the face of the heading or the inby end of the workings and returned along the working face. The air current should never be conducted through abandoned workings before sweeping the working face, for the reason that there is always more or less gas given off and accumulating in these waste places, and, as a result, the air would be contaminated to a dangerous extent. As far as practicable, all abandoned places that are not sealed off should be ventilated by a separate air current, which should then pass directly into the main-return airway and thence out of the mine.

Ques.—A mixture of marsh gas and air at its most explosive point is passing through an airway 4x5 ft. in section. The average velocity of the current is 100 ft. per min. What quantity of fresh air must be added to this current so that it will not be possible to detect gas on the safety lamp, assuming a cap cannot be detected when the gas content in the air is 2 per cent. or less?

Ans.—The area of the cross-section of this airway is $4 \times 5 = 20$ sq.ft. The volume of air in circulation is $20 \times 100 = 2000$ cu.ft. per min. Firedamp at its most explosive point contains 9.46 per cent. of marsh gas. The volume of gas in this air current is, therefore, $2000 \times 0.0946 = 189.2$ cu.ft. per min.

Now, assuming that this quantity of gas is 2 per cent. of the entire mixture after the fresh air is added, the volume of the current would be $189.2 \div 0.02 = 9460$ cu.ft. per min. Subtracting from this total volume of air and gas, the original volume, gives, for the fresh air added, $9460 - 2000 = 7460$ cu.ft. per min.

COAL AND COKE NEWS

Washington, D. C.

President Wilson signed the new tariff bill on Friday, Oct. There were no changes of importance in the rate schedules of the free list, subsequent to the report of the conference committee on Sept. 30. Attention is now being concentrated upon the income tax sections of the law and upon its administrative features. In particular the working of the income tax seems to be the subject of strong interest on the part both of individuals and corporations.

The following summary gives those portions of the income tax law which have a direct and important bearing upon the payment of the tax by those who own mining shares or who are operating mining corporations and are obliged to make tax returns for the same. Some important changes were made by the conference committee in this phase of the law at the last moment, embodying provisions that had not previously become known. The income tax section itself is an extremely lengthy document but the following summary gives practically all of those portions, scattered here and there throughout the section which are germane to the subject.

The provision as to allowances for depreciation in the value of mines in making report of net individual income for taxation is interesting and follows the Senate amendment to the income tax sections. After it has provided for the so-called "normal tax" on ordinary incomes the tariff bill allows certain offsets among which is included the allowance for mine depreciation, in part as follows:

> That is computing net income for the purpose of the normal tax there shall be allowed as deductions: First, the necessary expenses actually paid in carrying on any business, not including personal, living, or family expenses; second all interest paid within the year by a taxable person on indebtedness; third, all national, state, county, school, and municipal taxes paid within the year, not including those assessed against local benefits; fourth, losses actually sustained during the year, incurred in trade or arising from fires, storms, or shipwreck, and not compensated for by insurance or otherwise; fifth, debts due to the taxpayer actually ascertained to be worthless and charged off within the year; sixth, a reasonable allowance for the exhaustion, wear and tear of property arising out of its use or employment in the business, not to exceed, in the case of mines, 5 per centum of the gross value at the mine of the output for the year for which the computation is made; but no deduction shall be made for any amount of expense of restoring property or making good the exhaustion thereof for which an allowance is or has been made: Provided, That no deduction shall be allowed for any amount paid out for new buildings, permanent improvements, or betterments, made to increase the value of any property or estate.

Subsection G. of the income tax provision is practically a re-enactment of the corporation tax now in force. The Conference Committee, however, made important alterations in its terms, leaving it to read in part in the following form:

> G. (a) That the normal tax hereinbefore imposed upon individuals likewise shall be levied, assessed, and paid annually upon the entire net income arising or accruing from all sources during the preceding calendar year to every corporation, joint-stock company or association, and every insurance company, organized in the United States, no matter how created or organized, but not including partnerships; but if organized, authorized, or existing under the laws of any foreign country, then upon the amount of net income arising or accruing by it from business transacted and capital invested within the United States during such year.
>
> (b) Such net income shall be ascertained by deducting from the gross amount of the income of such corporation, joint-stock company or association, or insurance company, received within the year from all sources, (first) all the ordinary and necessary expenses paid within the year in the maintenance and operation of its business and properties, including rentals or other payments required to be made as a condition to the continued use or possession of property; (second) all losses actually sustained within the year and not compensated by insurance or otherwise, including a reasonable allowance for depreciation by use, wear and tear of property, if any; and in the case of mines a reasonable allowance for depletion of ores and all other natural deposits, not to exceed 5 per centum of the gross value at the mine of the output for the year for which the computation is made.

HARRISBURG, PENN.

Members of the Mine Cave Commission of Scranton, have been given a few more days to secure evidence on which will be based whatever action the city finally takes against the Peoples Coal Co. to stop destruction of private and public property through the taking out of coal under the city.

After this evidence is gathered, it will then be decided just what the nature of the action to be brought against the company will be.

Two courses of action are open. The first one is a criminal action against the company under the provisions of the "Davis Mine Cave Bill," passed by the recent Legislature. If the officers of the company are fined or sentenced to jail, nothing can prevent them, after having paid their fines or undergone their sentences from continuing their present methods of mining coal, which methods it is alleged are responsible for the wrecking of many buildings in the city.

The second action open to the city is to bring suit in equity asking that the coal company be restrained from mining coal under the streets. This is the action the citizens want, but it is doubtful if the city does anything more than bring suit under the provisions of the "Davis Mine Cave Act."

If the Mine Cave Commission finds, however, that the coal company is willfully destroying private property while taking out coal, it is possible the city will then make such action the basis for an equity suit.

The City cannot prevent the company from mining its own coal, but the question at issue is, whether or not the city can regulate the manner in which that mining shall be done. If it can, then the city can prescribe the power of the charge of explosive which shall be placed in a vein of coal under any street or private property.

In any event it is certain that some kind of a suit will be brought against the coal company, and that before the suit is finally settled that the constitutionality of the "Davis Mine Cave Law" will be reviewed by the highest court of Pennsylvania.

Efforts are being made to secure an agreement as to the facts in the case. If this plan is successful, both the city and the coal company will agree on a set of facts and the same will be submitted to the lower courts with oral and written arguments by each side in support of the theories which will be advanced by the respective parties to the suit. The decision of the lower court will thus be reviewed by the Supreme Court of this state.

Under this arrangement it will take at least a year and possibly longer before any decision is finally reached. In the meantime the company may or may not continue taking out the coal.

What the city is trying for is some effective action which will prevent the coal company from continuing its present methods of mining, which methods, it is charged are responsible for the destruction of property.

Suits are also being prepared against the Erie Co., and the Kearney & Brown Coal Co., by parties who allege that the coal in the pillars, under their homes after being bought and paid for has been mined by these companies, causing the surface to cave. This is the first time for suits of this nature to be brought up.

The Rescue of Toshesky

On Saturday morning, Oct. 4, at 7:30 a.m., Thomas Toshesky, a Polander, was released from his prison in the Mammoth vein, of the Continnental Colliery, of the Lehigh Valley Coal Co., situated at Centralia. The coal barrier that had held him prisoner since noon on Friday, Sept. 26, had been pierced.

For five days the imprisoned miner was without food. On Tuesday, Sept. 30, a bore hole was drilled through a pillar, after which a 2-in. pipe was inserted into the chamber where he was caught by the rush of coal, and a small quantity of liquid food was sent down. Later came a change of clothing, a blanket, and a rope which he wove into a hammock. These were forced through after greasing them well.

A remarkable spirit of coöperation was displayed by state and company officials and the miners alike. The company issued general orders immediately after the accident that no expense should be spared in the rescue. Throughout the entire coal regions of Pennsylvania there is unending warfare between the Slavs and other races from Central and Southern Europe and the English speaking miners, who are slowly being driven from the region by an influx of non-English labor. But all this race antipathy was forgotten during the present crisis in the effort to rescue a fellow workman of non-English origin.

PENNSYLVANIA

Anthracite

Locust Gap—Great improvements are being made by the Philadelphia & Reading Coal & Iron Co., at the Locust Spring colliery, at Locust Gap. Two new steam dumps have been installed and are proving a great improvement over the old means of dumping the coal into the breakers. A new four-drum Flory friction engine has been placed on the car road, to better facilitate the handling of cars when loading for market.

Pottsville—The cloudburst which flooded this section for a few hours last week furnished only temporary relief from the drought which has prevailed for several months. Another entire week without rain has reduced the water supply lower than it was a week ago, and unless there is a speedy rainfall a number of washeries will again close down. At least a score of towns in this section are short of water.

Wilkes-Barre—The important suit of the executor of Henrietta Baker, et al, against the Keystone Coal Co. and others, tried before Judge Cummings came to a sudden termination this week when the Court gave the jury binding instructions to find for the plaintiffs in the full amount of principal and interest, a total of $14,640. The suit was over the payment of a mortgage of $8000 on the property of the Keystone Coal Co. with interest from Dec. 1, 1899.

Lansford—The Lehigh Coal & Navigation Co. will not only convert the whole of Broad Mountain between Mauch Chunk and Tamaqua into a forest of useful trees to take the place of the present scrub timber, but will endeavor to reforest all its fireswept land, wherever situated.

Bituminous

Brownsville—W. Harry Brown, of Pittsburgh, the well known operator, is preparing to open a new mine near this place. Already work has been started and the plans are to open two slopes and a shaft. The plant will have a capacity of 4000 tons of coal daily. The work of erecting houses for the employees will be started at once. The opening of this mine will make the fourth mine for the Pittsburgh or River Vein of coal in Greene County. The first mine was opened at Rices Landing by the Dilworth Coal Co., now owned by Rice's Landing Coal & Coke Co. The next mine was opened by the Crucible Coal Co., and the third by the Poland Coal Co., and it is expected that the Youngstown Sheet & Tube Co. will soon start operations in this vicinity.

Hackett—An injunction suit has been filed against John Talbot, to restrain him from running water from his mine across the property of Paul Terchek. Terchek claims that the water contains large quantities of sulphur, which is ruining his property.

Brockwayville—The Toby Coal Co. is opening a new mine south of the property of the McKnight Coal Co., on the Shawmut R.R. line near Brockwayville, Penn., where it has a seam about 5 ft. thick. The mine is expected to yield 300 to 400 tons of good-quality coal daily for the next half dozen years.

Punxsutawney—Preparations are being made for opening another mine in the Toby Valley. The Toby Coal Co. has secured a considerable coal acreage out of town near the Pendleton place with the intention of opening it as soon as the Black Diamond Colliery becomes worked out. It is the intention to put in an uptodate plant that will accommodate a large tonnage.

Myersdale—The Huff Coal Co. is pushing two headings into the 7-ft. coal seam that was struck while prospecting last summer. The mine will have a capacity of 1000 tons per day.

WEST VIRGINIA

Charleston—A statement recently made to the effect that plans for purchasing the greater portion of the New River coal field had fallen through has met with emphatic denial. It is stated upon good authority that an American representative has sailed to confer with English capitalists, and it is expected that the deal will be put through in a short time.

Much complaint is being aroused over the car distribution system on the Coal & Coke R.R. It is claimed that the interests of the independent operator are sacrificed for those mines which are connected financially with the road.

War—The Pocahontas Domestic Coal Co. has recently installed an inclined plane to handle its output from a new opening directly to the tipple. This will materially shorten the haulage and increase the output. The company is also installing an electric power house principally for haulage purposes. This with the assistance of a four-ton gasoline locomotive already in operation puts the company in good shape to greatly increase the output of the mine.

Yukon—The Dryfork Colliery Co. is installing an electric plant for the purpose of mine haulage. Power will be supplied by the Appalachian Power Co. to a motor-generator se which delivers direct current to the mine at a voltage of 25

Lex—The Lex Pocahontas Coal Co., recently organized a Lex, West Virginia, with J. H. Hamon, president; R. F. Tay lor, general manager, and C. A. Reynolds, secretary, has com pleted a coal tipple and will soon be in readiness for shipping fuel.

OHIO

Nelsonville—Randall Cable, a mine operator of Nelsonvill filed a petition in the United States Bankruptcy Court wit assets of seven dollars and liabilities of $1505.83.

Columbus—Operators in all parts of Ohio do not fear th announced investigation of Attorney-General Hogan and th Ohio Utilities Commission on the recent advance in coa They say that the present increased circular is brought abou by the car shortage, which is growing worse. When th recent advance was made, Attorney-General Hogan immediately announced an investigation charging that the railroad were in collusion with operators in raising coal quotations He said the railroads were trying to work up sentiment i favor of increased freight rates and possibly increased passenger rates, and that a searching inquiry would be mad to see if the antitrust law was being violated. It wa pointed out to him that the lack of a strong state organization of operators was the best evidence that there was n illegal combination.

KENTUCKY

Greenwood—Captain John A. Geary will shortly begin th shipment of coal from his new mining plant near Greenwood which is in the vicinity of Whitley City, Ky. His mine wil operate one of the finest seams of domestic coal in that section, and is completely equipped. About 100 men will be employed.

Louisville—Coal men throughout the state, operators an dealers alike, are much interested in the Coal Dealers' Fir Insurance Co., recently incorporated at Louisville by Ear Martin, former president of the Continental Coal Corporation K. U. Meguire, president of the Harlan Coal Mining Co., and of the Snead-Meguire Coal Co., and others. The capital stock of the company was fixed at $100,000, but this figure will probably be increased shortly. Mr. Martin has been at work on the organization of the company for some time, having moved some time back from Chattanooga to Louisville, where the principal offices of the company are to be permanently located. The company will confine itself to insuring strictly coal risks, including the yards and equipment of coal dealers and all insurable matter around coal mines. Investigations, which have been conducted in Kentucky, Alabama, Tennessee, Indiana and Illinois, in which five states the company proposes to do business, have shown, according to President Martin, that the kind of business which the company will write can be profitably handled at rates at least one-third lower than those now charged.

INDIANA

Linton—The Little Giant mine has been reopened for the fall trade, giving employment to 300 men.

Princeton—W. H. Rainey, member of the executive committee of the Indiana miners, called out 250 men at the mine of the Princeton Coal Co. He demands the reinstatement of an employee and alleges that he called a strike because he could not get a hearing on the trouble with Mine Superintendent Weir.

Petersburg—After five months' steady pumping following the March and April floods, at a cost of $10,000, both Blackburn mines have resumed operations, giving employment to 200 men.

Terre Haute—Simeon Fermeango, treasurer of the United Mine Workers at Libertyville, was held up and robbed one night recently when leaving the lodge hall by two men. The robbers took $465 and made their escape.

ILLINOIS

Staunton—The Consolidated Coal Co.'s mine No. 7, of this place, which has been idle for the past four years, is resuming operations, and coal will be hoisted this week. The company's improvements involved an outlay of $30,000, and includes a new shaft, tipple, and washer at No. 7, and an electric plant at No. 14, which will furnish power for three mines. Mine No. 1 of the Mt. Olive & Staunton Coal Co., is also starting after six months' suspension, during which its machinery has been completely overhauled.

Belleville—The Hibbard mine south of this place, which has been idle for the past two years, is undergoing repairs, and the operators expect to have it in working order within the next 30 days.

La Salle—The shaft of the La Salle County Carbon Coal Co. that was sunk in 1856, has recently been equipped with electric motors to haul the coal. The above company is at present operating four mines near La Salle and are large producers of Illinois third-vein coal.

Dewmaine—The Madison Coal Corporation will give an exhibition of fire fighting above and below ground, mine-rescue and first-aid work on Tuesday, Oct. 14, at their mine located at Dewmaine. The work will be done by men employed and trained by this company. This exhibition will be instructive and no doubt a success in every way.

Springfield—The Illinois Colliery Co., a $2,000,000 corporation, owning mines in Sangamon, Macoupin, Montgomery, and Bond Counties, will be sold at auction on Saturday, Nov. 15, by Master in Chancery John M. Pfeifer, to satisfy the claims of bondholders. Notice of the sale was issued recently in accordance with an order of Judge Creighton, of the Sangamon Circuit Court. Mines are located at Springfield, Chatham, Virden, Girard, Litchfield, and Sorento, Ill.

MICHIGAN

Bay City—John P. White, international president of the United Mine Workers, has given his decision relative to the trouble in Michigan, where 3000 miners were out, on account of the discharge of three of their number. He holds that the strike was not justified, as the trouble was one subject to arbitration. Mr. White had been selected as arbitrator.

IOWA

Centerville—Poor business management and deals on the Board of Trade are given as the reason for the business failure of the A. Mitchell & Son Coal Co. The assets are given as $26,000, and the liabilities are $36,000.

MISSOURI

Kansas City—The strike situation in Colorado has resulted in a movement of miners eastward, and operators of Missouri, Kansas and Arkansas are now well provided for in the way of help. Full production for the winter is assured by the addition of the strikers. Miners in Colorado demand recognition of the union by operators. This has been refused and probabilities are for a long-drawn disagreement. Most of the mines in Kansas and Missouri are manned by union labor exclusively, and the Colorado miners are seeking this section as a haven of refuge during the storm in the West.

ARKANSAS

Spadra—Lighting struck the top works at the Duck's Nest Mine and destroyed property valued at $75,000.

Denning—The Western Coal & Mining Co. has recently taken options on about 10,000 acres of coal land in the vicinity of Heber Springs.

OKLAHOMA

McCurtain—The mines of the Sans Bois Coal Co., at McCurtain, which have been closed since the disastrous explosion a year ago last March, in which nearly one hundred miners perished, have resumed operations. They will employ about 600 men.

COLORADO

Fruita—Fruita people intend to take advantage of a recent act of Congress permitting municipalities to acquire government coal lands. It is probable that a municipally operated mine will supply the demand if the necessary title or lease can be secured from the Department of the Interior. This matter will be taken up through the proper officials, and Congressman Taylor will be asked to assist in starting the municipal mines.

Crested Butte—The Crested Butte Anthracite Mining Co. has acquired and will operate the old Smith anthracite mine located about four miles northwest of Crested Butte up Slate Creek on Smith hill. This mine has been idle for about six years.

FOREIGN NEWS

Hamilton, Ontario—The Hamilton By-Product Coke Ovens, Ltd., in which American capital is largely interested, is being organized with an authorized capitalization of $1,000,000 to manufacture coke for smelting, foundry and domestic purposes. The contemplated investment is considerably larger than the nominal capital. A site of 33 acres has been secured in Hamilton.

The first unit will consist of 50 ovens each of 16 tons capacity operating on 18-hr. time, and three rows of byproduct apparatus for gas separation; also coal-preparing plant, steam and electric compressing and water-pumping plants, and other adjuncts. The initial cost will be about $1,000,000. There will also be erected a 5,000,000-cu.ft. gas holder at an additional cost of $250,000 and later on another of 3,000,000 cu.ft. capacity. The plant will carbonize 1000 tons of coal per day and will require a high-grade coking fuel, which will be imported from Pennsylvania or West Virginia.

From this coal it is expected there will be produced 700 tons of coke per day and also the byproducts comprising tar, ammonia sulphate and benzol. The tar will be worked up into various marketable products, while the coke will supply the requirements of the blast furnaces of the Steel Co. of Canada, and the foundry industries of Hamilton and neighboring industrial centers, which now import their fuel from the United States. The plant will be electrically equipped, and will use between 700 and 1000 hp. It will give employment to about 300 men, and the subsidiary industries will also require a large number of operatives.

PERSONALS

State Commissioner John H. Page, of Arkansas, has appointed John T. Fuller, of New York City, as state mineralogist and mining engineer.

Raymond D. Clere, of Boyd County, Ky., has been appointed by Governor McCreary an assistant state mine inspector, succeeding H. G. Van Hoose. Inspector Clere took up his duties Oct. 1.

On account of the death of President Cyrus H. Polley, of Buffalo, Harry Yates has been elected president, W. W. Campbell, vice-president, and William H. Nicol, general sales agent of the Seneca and Punxsutawney Coal Mining Companies. Other positions are left unchanged. The Falls Creek Coal Co. will still be managed with the others.

J. B. Atkinson has retired from the position of His Majesty's Inspector of Mines, and begun a practice as consulting mining engineer at 9 Kensington Terrace, Newcastle-upon-Tyne. Mr. Atkinson has had many years of broad experience both as an inspector of mines and while associated with the management of large collieries in Durham and Yorkshire.

Geo. Brymer, superintendent of the Edgewater mine of the Tennessee Coal, Iron & Railroad Co., has resigned his position on account of poor health and will take a six months' rest. His address for the present will be Gwynedd Valley, Penn. Mr. Brymer intends to return to Alabama in the future and is enthusiastic over the climate and business possibilities of that district.

CONSTRUCTION NEWS

Canton, Ill.—Work of repairing the boiler room at the Big Creek mine was begun recently. The rebuilding of the mine has been steadily going on, and indications are that before many weeks it will be possible to ship run of mine coal probably not later than Nov. 1.

Hillsboro, Ill.—The Shoal Creek Coal Co. is preparing to sink a mine on the Woodall farm, about three miles Southwest of Hillsboro. This mine has been under contemplation for the past two years, but even yet all of the arrangements have not been completed. Prospecting is, however, being carried on to determine the most suitable place to sink the shaft.

Middlesboro, Ky.—A number of Eastern capitalists, as well as several prominent coal operators in the Middlesboro district, are interested in a project to construct an electric railway system in and around Middlesboro, to serve the town and also to connect the various mines in that district. It is proposed ultimately to connect Middlesboro and Pineville if the road is successful as first constructed.

Whitley City, Ky.—Work is progressing actively on the operation which is being opened up on the Geary property. Chief Engineer E. W. Vanable, who has charge of the work, has had six crews busy for about three weeks, and recently put on a 24-hr. shift in order to make better progress. It is said that the coal is showing nicely along the river, but Mr. Vanable said recently that the company will probably operate shaft mines along the railroad instead of operating on the river.

Charleston, W. Va.—It is now almost certain that a new railroad will be constructed along Tug River on the south side, a distance of 50 miles or more between Majestic and Turkey Creek. A corps of Norfolk and Western engineers are now on the ground doing preliminary work. No information can be had as to the ultimate plans of the company, but it has been hinted that the activity of the Baltimore & Ohio in the coalfields has caused the Norfolk & Western to take the initiative in further extending its tonnage by acquiring new territory. Whether the survey means immediate building is merely a matter of conjecture.

Bluefield, W. Va.—A scheme is on foot to electrify the coalfields of eastern Kentucky, Tennessee and western Virginia along the lines of the Louisville & Nashville, Norfolk & Western, and the Carolina, Clinchfield & Ohio Ry. Stuart and James, engineers, of Bluefield, are in charge of this work, which will be one of the largest enterprises of its kind in the country, and will probably mean the establishment of at least three steam-operated central plants, located at different mines throughout the section to be traversed. Steel tower transmission lines will run a distance of about 100 miles from Dante, Va., to Jellico, Tenn., passing through the Harlan, Middlesboro, Pineville, and Jellico districts. One of the steam power plants is now under construction, while another now operating has a surplus of power for the immediate feeding of the mines in the districts which will be electrified. Power will probably be transmitted at 110,000 volts and stepped down at the centers above mentioned for local distribution.

Whitesburg, Ky.—It is reported that the Virginia Coal & Coke Co., operating extensive coal-mining plants in the Wise County, Va., coalfields, is starting an extensive plant on the headwaters of Guests' River, a few miles from Whitesburg, on the Virginia border, which will probably be the largest in Virginia. The company has already made good progress in the work, and has established a new town, to be known as Glenmore, which will be reached by the Interstate branch of the Louisville & Nashville, which has been held up at Norton, Va., owing to a right-of-way suit which is pending in the Virginia Court of Appeals.

NEW INCORPORATIONS

Cleveland, Ohio—The M. A. Hanna Dock Co. has increased its capitalization from $210,000 to $500,000.

Cleveland, Ohio—The M. A. Hanna Coal Co. has increased its capitalization from $100,000 to $200,000.

Salem, Ohio—The Deming Co., of Salem, Ohio, manufacturers of mine pumps, has filed papers with the secretary of state, increasing its capital stock from $150,000 to $250,000.

Knoxville, Tenn.—The Catrons Creek Coal Co. has filed amended articles of incorporation increasing its capital stock from $40,000 to $75000, additional capital for development work being desired by the company.

Wilmington Del.—The Pocahontas & Southwestern Coal Co., of Wilmington, Del., was recently granted a charter under the laws of Delaware, with a capital of $200,000; Harry W. Davis, Wilmington, principal incorporator.

Belleville, Ill.—Articles of incorporation for the New Freeburg Coal Co. have been filed at the office of C. A. Sommers, recorder. The capital stock is $6000, and the incorporators are L. Senior, V. M. and John Henderson.

Indianapolis, Ind.—The Linton Summit Coal Co., of Linton, has been organized with a capital stock of $45,000 for the purpose of mining. The directors are J. A. Templeton, W. J. Hamilton, Philip Penna, Davis R. Scott, and J. P. Jeffries.

Pittsburgh, Penn.—The Ozark Bauxite Co. has been organized for the production of coal, gas, and other minerals and ores. The capital stock is $25,000, of which $500 has been subscribed and $50 paid in. The incorporators are W. B. Becher, S. B. Kelly, W. H. Young, J. M. Holliday, and George I. Wolf, all of Pittsburgh.

Kaeferton, W. Va.—The Milburn Coal Co., has been organized to develop 5900 acres of coal land and has already closed a machinery contract. It will install a plant with initial capacity of 2500 tons daily to cost from $200,000 to $300,000 on the Paint Creek division about 18 miles from the main line of the Chesapeake & Ohio R.R.

Denver, Colo.—Articles of incorporation have been filed in the office of the secretary of state for the United Yampa Collieries Co. This is a four million dollar corporation formed to operate large tracts of coal lands in Routt and Moffat Counties. The incorporators are John F. Campion, Fredk. G. Moffat, and Kenneth B. Townsend. The project includes the building of a railroad, 110 miles long, to connect the Denver and Salt Lake at a point near the confluence of the Elk and Bear rivers, and the Union Pacific near Rawlins.

INDUSTRIAL NEWS

Connellsville, Penn.—The Hecla works at Pleasant Unity are turning out about 135 tons of coke per day. Fifty of the 171 new ovens have been completed.

Columbus, Ohio—Notices have been issued for the annual stockholders' meeting of the Hocking Valley Ry., which will be held in the general offices in the Spahr Building. A board of directors will be elected.

Newburg, W. Va.—The Virginia-Maryland Coal Corporation began shipping from its newly opened Scott Hill mine near here on Oct. 2. This mine is one of the most modernly equipped collieries in the state.

St. Clairsville, Ohio—Henry G. Unterzubar, of Bellaire has filed suit in the local court, claiming $15,000 damages for the loss of his arm, which was torn off when he was caught in a cable at the mines owned by the Johnson Coal Co.

Blaine, Ohio—Determining to devote its entire attention to the coal and coal mining business, the Loraine Coal & Dock Co., one of the largest operators in the Belmont County field, has sold its company store at Blaine. The general store sold for something in the neighborhood of $50,000, it is understood.

Belleville, Ill.—Suit has been brought in the circuit court by the trustees for the bondholders of the Royal Coal Mining properties here, to foreclose on the mortgages. They claim that because of financial troubles the mine has been unable to operate for several months, and that the sooner the properties are disposed of the more they will bring.

Whitesburg, Ky.—Announcement is made of the purchase by A. H. McClure, and associates of Frankfort, of the John and Henry Combs coal and timber land tract on Lower Rockhouse Creek at a price which is unusually large although it has not been made public. It is said to be the intention of purchasers to develop the property at an early date.

St. Louis, Mo.—When the Manufacturers R.R. bought the St. Louis & O'Fallon R.R., it was understood that the coal mines at the eastern terminus of the line between Belleville and O'Fallon, Ill., were not included. It has since been announced, however, that the mines also had been purchased and paid for. These produce on the average 135 cars of coal a day.

Owensboro, Ky.—John B. Brasher, representing a syndicate composed of Madisonville, Ky., and Eastern people, recently closed a deal for a coal mine and yard at Owensboro, Ky., and has taken charge of the property as general manager for the purchasers. The property is practically new and is well equipped, its location in Owensboro, a city of 20,000 inhabitants, being particularly favorable.

Springfield, Ill.—On information filed in the Circuit Court by Assistant States Attorney Bernard, a case will be established to determine the constitutionality of the law requiring coal mines, foundries, steel plants, and other factories to provide a wash house for the employees. The information has reference especially to the Cora Coal Mining Co., at Andrew. Here it is said the men are compelled to leave the mine with dust and grime upon their face and hands.

Pittsburgh, Penn.—Fatalities in the coal mines of the United States during the first seven months of the year, numbered 1437 as compared with 1419 in the same period last year, according to the reports of the Bureau of Mines. Pennsylvania leads the list with 763 deaths, an increase of 197 over last year, of these 380 were in the anthracite and 383 in the bituminous fields. West Virginia with 181 deaths shows a decrease of 72 over the fatalities in the first seven months of 1912.

Columbus, Ohio—Attorney-General Hogan has written a letter to Receiver George P. Johnson, of the Detroit, Toledo & Ironton Ry. Co. advising that if steps are not taken at once to improve the service of the road he will ask the Federal Court to annul the company's charter. The same kind of ultimatum was forwarded to the attorney for the bondholders. Of the 20 engines belonging to the road which were condemned recently by the Ohio boiler inspection department 14 have been repaired and returned to service.

COAL TRADE REVIEWS

GENERAL REVIEW

Producers continue in firm control. Market quiet but potency of the situation accentuated with the advancing season. Car supply and weather conditions the predominating influences at the moment.

The coal markets have presented little of additional interest during the past week. In the bituminous situation no uncertainties have developed, and producers continue as firmly in control as at any time during the past few months. The uniformity with which quotations are maintained in all the markets of the country speaks eloquently for the trend of conditions. Where reverses are recorded they are easily traceable to an over-shipping of specialties, principally of the lower grades, into certain restricted markets; their effect on the potency of the general situation may be neglected.

Every confidence is expressed in the outlook, while the general firmness is being accentuated almost daily by the advancing season. One of the most significant features of the situation is the enormous increase in the shipments of the principal coal roads; the September reports for a number of the more important carriers show a continuation of the substantial advance over previous records, while the gain for the year to date is so large as to cause apprehension, were it not known that the coal was going into immediate consumption.

In anthracite, it is becoming increasingly difficult to obtain shipments of nearly all sizes, companies appearing to have more orders than they can take care of for some weeks to come. Concessions by the individuals have now practically ceased altogether. Business is already being turned down, and a little cold weather is all that is necessary to precipitate an active market.

The strong undertone to bituminous continues unchanged, with producers very cautious about future commitments. The improvement is even noticeable in the lower grades. A higher price level has now been definitely established in the Pittsburgh district; contracts for the year can still be closed at the old circular, but, for deliveries up to Apr. 1 only, the new quotations are invariable demanded. Production there has also been seriously curtailed by the car shortage, which is expected to become even more serious before the close of navigation on the lakes.

The car situation in Ohio is the predominating feature in that market. The visible supply of equipment is rapidly diminishing, and production has been seriously curtailed as a result. The Lake shipping is at the maximum, while the steam business is showing good form and the domestic grades are being stimulated by the cool weather. Dumpings at Hampton Roads have fallen off because of the heavy movement to the Lakes, but business, nevertheless, still continues active.

The car shortage in the Middle West has almost reached acute proportions, while one important congestion has already been reported. As a result of the uncertainey in the movement, the market is notably stronger and is now in the most satisfactory condition for the last three years. A sharp fall in temperature is the only thing necessary to make a very active situation in the Middle Western market.

BOSTON, MASS.

Hampton Roads dispatch somewhat improved, shippers holding coal for boats due, and spot market rather light. Georges Creek shortage continues and creates a better demand for certain of the Pennsylvania grades. Dealers waiting turns for anthracite shipments, and broken and stove very hard to get.

Bituminous—Prices at Hampton Roads continue nominal, for there is practically no spot coal available. The agencies are all saving their receipts against transportation that is due to arrive. Dispatch therefore is rather better than a week ago and while this is not regarded as a sign of weakness yet there is not the demand in New England for prompt coal that was expected at this time. Some of the operators are seeking premiums of the various shippers but the latter for the most part are confining themselves to contract obligations. Indeed, it is doubtful if today any considerable tonnage could be sold at $3 f.o.b. There is a strong undertone however with still a considerable anxiety on the part of consumers who have supplies due them on contract.

Thick weather again prevails and should it continue a week or so it will probably put a different face on the distributing market here. At present the supply for inland delivery is ample and on car prices are somewhat easier than a week ago.

On Georges Creek the situation is no better than during September. The bulk of the output is going to fill requisitions from the Government and for export. The loading at Baltimore is still slow and at Philadelphia there is practically none of this grade available for coastwise shipment.

The Pennsylvania coals that can in any way be considered substitutes for Georges Creek are in better demand than for 60 days. Prices are up another five cents on the better known grades and all the shippers are going slow on futures. There is a good deal of inquiry for the Clearfields that are favorably regarded, especially for shipment in conjunction with anthracite from Philadelphia.

Anthracite—The shortage of stove is fast becoming acute. Broken, too, is increasingly hard to get, and dealers are patiently waiting their turns for shipments of any kind. The companies have all the business they can take care of for weeks to come. The recently announced advance in freight rates on anthracite company transportation from New York to points around Cape Cod and on Long Island Sound are apparently in full effect, save only in the case of one or two companies.

At retail, hard coal in Boston was advanced 25c. Oct. 2, making $7.75, $8 and $8.25 respectively the prices for egg, stove and chestnut per net ton delivered. The bituminous market is now quotable as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.10@1.60	$1.30@1.70	$1.67@1.77	
Philadelphia*	2.35@2.85	2.55@2.95	2.92@3.02	
New York*	2.65@3.15	2.85@3.25	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.90@3.00
Providence†				3.88@3.93
Boston†				3.93@3.98

*F.o.b. †On cars.

NEW YORK

Car supply the controlling feature in the bituminous situation. Business continues heavy and prices firmly held. Anthracite trade a weather proposition. A surplus of egg, but stove coal is in equally short supply.

Bituminous—A sharp restriction in the car supply has caused the local soft-coal market to experience a further and quite perceptible tightening up. There has been no change in the situation on the B. & O., which has been notably bad for several weeks, while the Pennsylvania made an unexpectedly poor showing during the last three days of last week, when the supply amounted to only about 40% requirements. The roads ascribe their trouble to the slow return of equipment from foreign lines. The outlook for the current week is not very favorable at this writing, although the roads claim they are receiving their cars back more rapidly, and there will be a moderately good supply this week. No complaints as yet have been received regarding the situation on the New York Central.

There does not seem to be much surplus coal available, and operators are occasionally being forced into the open market for tonnages to fill out their contracts. A great deal of difficulty is still being experienced with labor, miners at a number of the Pennsylvania operations now flatly refusing to work on any Saturday. The volume of spot business, locally, appears to be a little larger, particularly, in the line trade. There is not much contracting being done, and few operators show any disposition to accept anything now for delivery up to Apr. 1, preferring to keep what coal they have available unless a favorable business is offered for the year. We continue to quote the local market on the following basis:

West Virginia steam, $2.60@2.65; fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—The hard-coal market is showing a tendency to drag, pending a change in weather conditions. Egg coal is particularly heavy and can be moved only at concessions from 15@25c. per ton off the regular circular. Shipments of egg and nut are heavy. The better grade steam sizes are in moderately good demand, while the off grades are slow. Stove coal continues generally strong at all points and is still the feature of the market; indications point to a shortage of this grade all winter. With the exception of egg coal, there are little or none of the other grades going into storage.

As already noted, it is essentially a weather market from now on, although there are some who believe that there will be an active situation this winter, regardless of climatic conditions. The return of warm weather this week seems to have had a softening influence upon the local situation. However, it is believed that all the mines will be working full time from now on and, although the situation at tide is rather quiet, the line trade is showing a good healthy undertone.

We now quote the New York market as follows :

	——Upper Ports——		——Lower Ports——	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	....
Egg	5.25	$5.10@5.25	5.20	$5.00@5.20
Stove	5.25	5.25@5.50	5.20	5.20@5.45
Chestnut	5.50	5.50	5.45	5.45
Pea	3.50	3.40@3.50	3.45	3.30@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.35@2.70
Rice	2.25	2.25@2.35	1.95@2.20	1.90@2.20
Barley	1.75	1.75	1.50	1.50@1.70

PHILADELPHIA, PENN.

Broken and stove in very short supply. Price cutting by individuals about stopped.

A little cold weather will spur the anthracite coal trade into activity in this vicinity. All the operators are working their mines full time, and claim to be disposing of every ton of their product. As a matter of fact, broken and stove coal are far behind the demand; while it is yet early in the season, there have been cases of business on the former size being turned down, owing to the inability of the operator to fill it when required. Broken coal has been in poor supply ever since the first of April, and does not seem to improve as the season grows. Reassuring reports come from the dealer as well as the operator for a good business from now on, at circular prices, as the individual operators seem to have declined making further concessions. One hears of very little cutting, and this only when there is danger of coal going on demurrage Only one large operating company in this city seems to make the Pennsylvania state tax condition insistent, refusing to depart from its policy adopted at the inception of this tax; with the demand on, it is likely to make little difference.

Retail prices for the winter are announced as follows: Broken and egg, $6.75; stove, $7; chestnut, $7.25; pea, $5.25@5.50, with 25c. per ton added if carried in. This for a ton of 2240 lb.

Slack or screenings seem to be the leader in the bituminous market at the present time, bringing about a complete change of the situation. Prices are anywhere from 25 to 30c. higher than has been quoted for a month or six weeks back, and the increase only seems to enhance the scarcity; $1@1.05 is about the maximum. The market on the other varieties, however, seems to remain unchanged, although, if anything there is a leaning to weakness rather than strength. One still hears of car shortage, both in the bituminous as well as anthracite regions, and with the advent of cold weather, this is likely to occasion trouble.

PITTSBURGH, PENN.

Regular minimum prices for prompt coal announced by operators corresponding to advanced prices recently quoted in open market. Former circular prices nominally in force for yearly contracts, but no demand. Car supply poorer, decreasing production materially at some mines. Connelsville coke market is definitely lower, all demand having been satisfied without cut prices disappearing.

Bituminous—In recent reports we have noted a growing scarcity of prompt coal at the circular prices, and last week noted the absence of any in the market except at advances of 10@20c. This situation has crystallized into definite announcements of higher minimum prices on the part of various operations. On Oct. 1 the Pittsburgh Coal Co. announced the following as its minimum figures for prompt: Mine-run, $1.40; ¾-in., $1.50; 1¼-in., $1.65. Sales have been effected at these prices without difficulty. Other operators have advanced to at least this level, while some have gone to $1.50 for mine-run, $1.60 for ¾-in. and $1.70@1.75 for 1¼-in. and claim to have made some sales.

As to contracts, many operators will contract for regular deliveries up to Apr. 1 at their prompt prices while some refuse to do so. On contracts for a year the old circular prices, based on $1.30 for mine-run, are nominally still in force, but some operators would decline to sell at them, and in general there is practically no demand for such contracts. We quote the nominal season contract market unchanged as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. domestic, $1.55, and quote the prompt and forward market as follows: Slack, $1.10@1.25; mine-run, $1.40@1.50; ¾-in., $1.50@1.60; 1¼-in., $1.65@1.75, per ton at mine, Pittsburgh district.

Reports as to car supply vary. A large interest reports the supply as much worse than 30 days ago and appreciably worse than 10 days ago, to such an extent that its production is seriously curtailed, while some other operators report the supply as somewhat insufficient, but not measurably worse than 30 days ago. Shortage of labor is a factor but not nearly as serious a one as car supply in determining production. Considering the season, prospects are naturally for a further decrease in car supply during the next 30 days but after the close of lake shipments five or six weeks hence, a good supply should obtain.

Connellsville Coke—The coke market has not been strengthened as hoped by the accretions to the ranks of the "regulars" as reported a week ago. On the contrary the market is now definitely quotable on a lower basis as the October demand for furnace coke has been entirely satisfied without all the cut price coke being absorbed. During the past ten days sales for both prompt and October shipment have been made at $2.15 to $2.25, involving furnace coke of substantially standard grade, while slightly off grade coke has gone at a trifle less. There is now no demand for prompt or October, and only diletante inquiry for November and December, while no interest at all is manifested in next year's deliveries, though quotations of $2.25 could no doubt be secured.

The alignment today is that about 5000 ovens sell through the Producers Coke Co., having a minimum quotation of $2.50, and about the same number sell independently but are adhering to this minimum, while an equal number are controlled by other operators, some of whom are willing to sell at $2.25 or less, and demand is so light that these operators make the market. Unless conditions improve the "regulars" will probably recede to say $2.25 for next year, but for this year they simply stay out of the market. There is a temporary accumulation of coke loaded and awaiting shipping instructions, which points to a special restriction of operations this week by dropping a day or two at the end. We quote: Prompt furnace, $2.15@2.25; contract furnace, $2.25; prompt foundry, $2.75@3; contract foundry, $2.75@3, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Sept. 27 at 385,494 tons, an increase of 7057 tons, and shipments at 383,366 tons, a decrease of 6376 tons.

BALTIMORE, MD.

Generally stronger tone to the market, even for lowest grades. Slack continues to show remarkable form. Export business again on the increase. Retail anthracite prices advanced.

The market here continues to be highly interesting; during the past week it showed decided evidences of strengthening. Not only did the good grade coals, already largely out of the market, hold steady at their high level, but the lower grades, that had showed signs of weakening, were in better call and at advancing prices.

Demand throughout the Northwestern territory continues excellent for West Virginia gas coals. Three-quarter in large lots was being sold at from $1.15 to $1.20 Westward, and what was released East was good for from $1.10 to $1.15, a decided improvement over the figures of a short time previous. Low grade run-of-mine was also doing much better, selling in some cases up to the $1 mark. This was from 10 to 15c. better than previous quotations.

Slack was the decided feature again; sales around $1.10 were not unusual. The demand seems to be increasing steadily and still higher figures are expected. Pennsylvania steam coals were much stronger along with the rest of the market; even ordinary grades there were selling at from $1.15 to $1.20.

Car supply was quite short again during the past week in both the Fairmont and Somerset regions. This was in distinct contrast to the previous week when an exceptionally heavy tonnage was handled. Port business is again improving. A large number of foreign charters have been announced for the coming month's loadings.

Interest was injected into the local anthracite situation by a meeting of the Baltimore Retail Coal Exchange when it was decide to add 25c. per ton to the regular winter schedule. This is to cover the 2½% Pennsylvania, state tax which is being tacked on to most bills to local coal men, and the regular increased cost of winter deliveries.

BUFFALO, N. Y.

Production up to the full limit of the car supply. Heavy ipments of Allegheny Valley coal to the Lakes. The out-k when Lake shipping closes. Anthracite picking up pidly.

Bituminous—The coal production is now up to the full nit of the car supply. Operators generally report that eir outputs are entirely covered for several weeks to come d that they are obliged to go into the open market for y coal required on their side trade. The Pittsburgh dis-ct product is almost unobtainable except where one has rect connection with a mine, and Allegheny Valley grades e almost in the same condition. Lake shipments from the tter district have never before been very heavy, but mines nich formerly shipped but little in this trade are now nding their entire outputs there, superseding the Pitts-rgh coal which formerly controlled this business almost clusively.

The heavy shipping in the Lake trade has created the inion among some, that when this closes, Dec. 1, there ill be a sharp slump in the market. It must be remembered this connection, however, that consumption will be heav-y increased by that time, due to the advancing season, hile, on the other hand, the movement will be materially re-ricted by the inevitable car shortage. While the roads are w handling the situation in fairly good form, this is mostly e to the short haul to the Lake shipping ports; when the neral demand opens up all over the country, the haul will much longer, the movement more complicated and the uipment more scattered. Bituminous is already being aded in box-cars, coke racks, or anything that can be ob-tined.

The scarcity of money among the Canadian consumers is eing commented on a great deal in the local trade; it seems be a question as to whether they will be able to meet eir obligations when the returns from the crops come in. owever, money is not easy locally, either, although there is o general complaint about collections as yet.

Buyers are not alarmed over the outlook, however, for, as rule, they are well covered by contracts on which they re demanding full shipments. Generally speaking, good rices were obtained on this business, but not nearly so uch as might have been in the prompt market at the pres-nt time. Quotations are quite as strong as ever at $2.90 for ittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run nd $2.25 for slack, with Allegheny Valley about 20c. lower, xcept slack, which often sells on a par with Pittsburgh.

Coke—While there appears to be a heavy consumption of his product, consumers seem to be in control of the situa-ion, and the market is weak. Reports are heard that vens are to be blown out but there is always still plenty of he coke to meet the demand. Local quotations remain at 4.85 for best Connellsville foundry.

Anthracite—The demand is improving slowly but steadily. great deal of uncertainty is still evident regarding the ew Pennsylvania state tax, and it is the general opinion hat it will be declared invalid by the courts. Stove is in uch heavy demand, that producers are already obliged to orce the buyers to take a certain percentage of egg with all rders. The shipper or jobber not infrequently adds the 25c. er ton to stove.

Anthracite shipments by lake were 532,115 tons for Sep-tember, which is less than the corresponding month of last season for the first time. For the season to October the amount is 3,840,536 tons, as against 2,482,353 tons to the same date last season. With two full months yet this season the shipments are about 115,000 tons ahead of last season. Shipping agents say that they could handle considerable more coal than they are getting and they are eager to keep up their tonnage.

COLUMBUS, OHIO

Increasing car shortage is restricting production seriously. The situation is steadily becoming worse and as a result prices are strong. The demand for all grades is good. Lake trade continues active.

The feature of the coal trade in Ohio during the past week has been the increasing car shortage which is curtailing production to a large extent. This, together with the good demand has maintained quotations firmly; in fact the tendency is upward and there is very little cutting of prices. On the other hand some premiums are being offered for spot shipments. It is believed that the car shortage will grow worse soon and dealers are preparing to increase stocks if possible.

The strongest point in the market is the demand for the domestic grades. Retailers are placing orders for immediate shipment and their business is growing better as the winter approaches; every effort is being made to guard against a shortage of stocks when the first cold spell arrives. Deliveries to customers are being made now and most of the large householders have laid in their winters supply of fuel. Retail prices are advancing and are now the highest in two years. The Toledo docks of the Hocking Valley Railroad have handled 2,300,000 tons since the opening of navigation.

The steam trade is also rather strong for the season of the year. Manufacturing is active, especially in iron and steel and other metal lines. Requisitions for fuel are holding up well and in some cases are being increased. Coupled with that demand is the good freight movement on railroads which requires a larger fuel tonnage. Contracts are being carried out but renewals are being made at higher figures than prevailed last season.

Car shortage has curtailed production. This is especially true of Eastern Ohio and the Pomeroy Bend district where the shortage of cars has been the most pronounced. It is estimated that those districts only produced 55% of normal during the week. In the strictly domestic fields of Massillon and Cambridge the production was also smaller; in the Hocking Valley the output is estimated at 65%.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$1.75 @ 1.70	....	$2.00 @ 1.90	$1.75 @ 1.70
3-4 inch...........	1.60 @ 1.55	$1.50 @ 1.40	1.75 @ 1.65	1.55 @ 1.50
Nut...............	1.30 @ 1.20	....	1.60 @ 1.55	1.25 @ 1.20
Mine-run..........	1.40 @ 1.30	1.25 @ 1.20	1.50 @ 1.40	1.25 @ 1.20
Nut, pea and slack..	0.85 @ 0.80	....	1.00 @ 0.90	0.75 @ 0.70
Coarse slack........	0.75 @ 0.70	0.95 @ 0.90	0.90 @ 0.80	0.65 @ 0.60

TOLEDO, OHIO

Steam business shows good form while Lake shipping continues up to the maximum for the season. Car shortage affecting the situation. Cool weather stimulating the domestic demand.

The shortage in cars has been more marked during the past week than at any time thus far and the effect on the local trade was quite noticeable. Lake business continues heavy although shippers are complaining bitterly of lack of tonnage from the mines which, of course, makes it difficult to take care of cargoes. Steam coal is in splendid demand and the fine grades continue to strengthen both in demand and in price; coal men here generally predict an increase in prices due largely to the difficulty in securing cars and to the labor trouble at the mines. Domestic coal increased materially in demand after the cool weather of last week and the market is in fine shape.

Toledo's shipments both in coal and coke show remarkable increases over other seasons and with the completion of the large new concrete dock of the Hocking Valley next year the business will be still larger. Prices here remain unchanged.

LOUISVILLE, KY.

A sharp advance in steam grades the feature of the market. Domestic demand continues strong and cars are in excellent supply, considering the abnormal activity. Considerable trouble experienced with the new hopper-bottom equipment.

A gratifying change is noted in the local market by a pronounced tightening up of the steam grades. The demand seems to be no better than it has been, for there is little room for improvement in this respect. The previous weakness was due to a heavy oversupply of screening, but this has ceased to exist now, with the result indicated. A petition of the operators to the Illinois Central R.R., requesting the company to switch their orders from mixed coal to straight mine-run, which the road agreed to do, is one of the principal causes for the changed condition. The almost violent fluctuation of the steam market has been the cause of a great deal of anxiety, and the operators are much relievd at the improved condition. No change is perceptible in general industrial conditions, except possibly, the demand is showing further increases and indications point to a higher price level shortly.

The domestic sizes remain in as heavy demand as ever, with the market strong on all grades. The better qualities of block from eastern Kentucky are selling at $2@2.25, f.o.b. mines, with occasional sales of fancy specialties at as high as $2.40. Nut and slack are now steady at 75@85c. for the better grades, with the second qualities quotable at about 50@60c. The car supply is unusually good, considering the heavy movement. The threatened labor trouble also failed to materialize, due, it is believed, to the weakened financial condition of the miners as a result of their long struggle in West Virginia.

The only troublesome feature in the situation at the present time is the large hopper cars of the Louisville & Nashville R.R., reference to which has been made in these columns. Eastern Kentucky operators feel that they are being discriminated against in this respect by an allotment of a larger percentage of the "battleship" cars, and are protesting vigorously. Producers having low tipples, which can only load the smallest cars, are being favored in this respect, but the railroad is assuming an arbitrary position in the matter with the newer operation, while on all new development it is insisting upon the tipple being designed to load the new equipment. In addition to the difficulties encountered in loading at the mines, there is also the further trouble and greater expense of unloading where trestles are not available. However, the new cars have come to stay, and the coal industry would do well to adapt themselves to the new conditions.

HAMPTON ROADS, VA.

Shipments for the week only fair. Government calling for coal to bunker fleet for its European cruise. Hampton Roads dumpings for September fell below August figures, although Virginian Ry. makes a record month.

Shipments from Hampton Roads during the week have only been about fair, the movement not being so heavy either foreign or Coastwise. There is perhaps a little more than the normal supply of coal at tidewater but this is probably due to the fact that a number of the government suppliers are accumulating coal to take care of colliers which will be loading during the next few days. The Atlantic fleet is now in the Roads coaling from steamers and barges and as soon as it is supplied the colliers will be reloaded and accompany the fleet on its European cruise.

Buyers inland are still anxious for coal and prices are therefore remaining firm with indications that they will continue so for some time. Sales of small tonnages of high volatile coal were made during the week at from $2.60 to $2.75. Pocahontas and New River quotations have been from $2.90 to $3 with little selling of at either price, there being very small quantity of free coal.

A total of 988,465 tons of coal were dumped over the Hampton Roads piers, during the month of September just ended. This is a falling off of about 41,000 tons below the August figures. The decrease occurred with the Norfolk & Western and the Chesapeake & Ohio, the Virginian Ry. showing an increase of over 17,000 tons above their record month. This road alone dumped 300,588 tons, over one pier; the C. & O. Ry. at Newport News dumped 256,934 and the N. & W. from Lamberts Point 430,943 tons. The decrease in dumpings over the N. & W. and C. & O. is probably due to the fact that these two roads move large quantities to the Lake at this particular season while the Virginian's shipments west are not so heavy.

DETROIT, MICH.

Possibility of a car shortage having a steadying influence on the situation. Transportation problem a trifle clearer at the moment. Steam grades strong and anthracite active.

Bituminous—There has been a very heavy movement into Detroit during the past week, several hundred cars having been distributed to operators and manufacturers. This would seem to indicate that the railroads are in an excellent position to take care of the heavy fall business, and that the production will not be seriously restricted. The situation is much improved over a few weeks ago, when it looked for a time as though it might become acute. The railroads are cleaning up their yards of any track coal, and are in a better condition than they have been for some time. The cold weather of the past week has had a moderately stimulating effect upon the trade.

The market is now quotable on approximately the following basis.

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	$1.50	....	....	$2.75	$2.50
Egg..........	1.65	....	1.50	....	....	2.75	2.20
Steam lump....	1.45	....	1.10	....	....	....	....
¾-in. lump......	1.25	$1.25	1.25	1.25	1.25	....	....
Mine-run.......	1.15	1.15	1.15	1.15	1.15	1.60	....
Slack..........	0.90	0.90	0.70	0.85	0.85	....	....

Anthracite—The recent cold snap stimulated the local market to such an extent that shippers are falling behind on their requirements. The shortage has been so pronounced that shipments have been made in gondola cars instead of the usual box-cars. Stove coal is in the greatest demand, the situation being almost acute; dealers are insisting upon a certain percentage of egg being taken with any orders for stove.

BIRMINGHAM, ALA.

Steam coal rather quiet. Lump coal fair. Smithing about normal for this season of the year. Car supply shows some improvement. Pig iron for balance of year selling at $12.

The principle operators report that business on steam coal for the past week has been rather quiet. There is a large accumulation on the tracks and in storage bins, and some the large consumers have asked that their shipments held up for the time being. This is due to the fact that th production has exceeded the demand recently, but with th oil mill business starting soon, it will relieve this cond tion.

The demand for lump coal is fair, but it will take a fe days of good cool weather to make any marked improv ment. The higher grade coals advanced 25c. per ton Oct. 1, and the lower grades 10c. per ton. This is following the regular schedule, and operators are not inclined make any reductions from the circular prices in order obtain business.

Smithing coal shows some improvement. Foundry coke about the same as last week, as is also furnace coke. Foun dry is steady at $4 to $4.25 and furnace $2.75 to $3.25.

The car supply on most of the lines shows some improvement, with the exception of the Southern Railway. few mines on the L. & N. report having to close down f two days last week because of the lack of cars, while thos on the Southern, state that it seems to be almost a matter impossibility to secure sufficient cars to keep going at hal time.

The market on pig iron is firm at $12 for the balance this year, with fairly good sales at that figure, while bookings for the first quarter and half of 1914 are 25 to 50c. advance of that figure.

This district is not expected to suffer to any extent due the tariff on pig iron, all coal operators and iron producer looking for a banner year both in tonnage and prices.

INDIANAPOLIS

The car shortage is making itself felt and shipments ar badly delayed. Congestion due to natural causes and ma soon be relieved. Prices hold firm, the tendency being upward. Steam coals improved and the movemnt of domest grades fully up to normal for the season.

The pinch of the car shortage is felt more in the coal industry. There are delays in the transportation of both Indiana and Eastern bituminous coals. A complaint from Muncie manufacturing company was called to the attentio of the Public Service Commission of Indiana and an investigation showed a coal blockade on the Big Four road both a Indianapolis and Terre Haute. The coal operators have als complained and ask for relief. The railroad company say the short cold spell in September resulted in such a deman that the road was swamped and did not have adequate motiv power. It has promised the commission to give special attention to the coal traffic until the congestion is relievd. Th roads in Ohio and Indiana have not fully recovered from th flood devastation of March and April and they are using ma of their cars for gravel hauling.

Prices at the mines hold firm, the car situation having tendency to cause higher bids from those who need coa Some companies say they are having inquiries from buyer they never had on their books, showing that these are no able to get supplies through their regular channels. Mine are practically on full schedule, stopping only when cars ar not to be had. The retail trade continues fully satisfactor Screenings are moving better, showing a gradual improvement in industrial conditions and steam coals generally ar in better demand than had been expected. The general feeling in the trade is optimistic.

CHICAGO

A sharp upturn in practically all branches of the loca market. An advance ranging from 5 to 15c. a ton in th price for screenings. Larger sales of furnace, foundry an domestic coke. The car supply, as a rule, has been satisfactory.

According to operators and dealers, the Chicago coal market is in a more satisfactory condition than it has been at an time during the past three years. There has been a boom in the anthracite business and reports from various quarter indicate exceptionally heavy sales. This is accounted for i part by the fact that buying was delayed by many dealer who ordinarily send in substantial orders during August.

A decided improvement has been noted in the market fo screenings. Prices for the lower grades have advanced 5c a ton and the better grades are selling at an increase of from 10 to 15c. a ton. The demand for furnace, foundry and domestic coke is strong, a number of exceptionally large sale being reported; prices continue to be firm. Franklin Count operators report a heavy trade. Two of the largest firms i that field have advanced the price for lump, egg and No. nut to $2.25 and others are expected to follow. Carterville operators are quoting $2 for lump, egg and No. 1 washed coal, while No. 1 raw nut and No. 2 washed are selling at $1.60 to $1.75 a ton. Prices for Indiana coals remain firm.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05@3.30	$2.52	
Steam lump	2.07		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.97	2.30	1.87	3.45@3 55
Screenings	1.27@1.32	1.75@1.80	1.22@1.32	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-product, egg, stove and nut, $4.35; gas house, $4.65@4.75.

ST. LOUIS, MO.

The coal market did not advance as was anticipated the first of the month. It continued strong but showed a tendency to weaken. Indications this week are that it will hold up and with a drop in the temperature, prices will likely see an advance.

Franklin County lump and egg is strong at from $2 to $2.15; this quotation is made, however, because the mines are sold up. Carterville is down to about $1.80 to $2. On account of the O'Gara operations being shut down for the past few weeks, the screenings market on high-grade coals has been wonderfully active. When these mines resume, screenings will likely tumble again.

The C. & E. I., Iron Mountain, and Illinois Central, are giving their mines about three days car supply a week. The Wabash is in a deplorable state on account of its bad order equipment. The B. & O., L. & N. and Southern seem to be taking pretty good care of their mines, but the Pennsylvania appears to have the most equipment at this time. Standard coals are still being sold at about the cost of production and there seems to be no hope for that field.

Quotations are about as follows:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.15@1.20
3-in. lump	....	....	$1.40	....
6-in. lump	$1.75 @ 2 00	......	1.60	1.40@1.50
Lump and egg	1.50 @ 1.60	$2.25	....	....
No. 1 nut	1.40 @ 1.60	....	....	....
Screenings	0.50 @ 0.60	....	....	0.25
Mine-run	1.50	....	....	0.90
No. 1 washed nut	1.60 @ 1.70	....	1.40	....
No. 2 washed nut	1.25 @ 1.35	....	1.60	....
No. 3 washed nut	1.10 @ 1.15	....	....	....
No. 4 washed nut	1.10 @ 1.15	....	....	....
No. 5 washed nut	0.40 @ 0.50	....	....	....

KANSAS CITY, MO.

Restricted supply of gas stimulating the demand for coal. Fall in temperature will create an active situation in the coal market.

Demand for all lines is opening up briskly, despite the fact that little or no cold weather has yet appeared. The early call for coal is due largely to the fact that natural gas will no longer be available, according to a recent announcement to the effect that there will be less than one-third of the normal supply during the coming winter. This statement coming from an authoritative source naturally had the result of stimulating the demand in this section. Cold weather is all that is necessary to insure an exceptional activity among the operating companies. Last winter was an open one, and coal business was comparatively light.

Prices are inclined to stiffen as a result of the natural gas situation. Kansas coal is held at from $1.50@2.50 a ton, f.o.b. the mines. Deep shaft, fancy lump is bringing the higher price, while deep shaft steam slack is quoted at the lower. Arkansas coal is held at the following prices: Grate anthracite, $4.35; egg, $4.60; No. 4, $5.50; pea, $3.25. Indications are for a higher range early in November, when the first cold wave of the year is expected.

PRODUCTION AND TRANSPORTATION STATISTICS

LAKE SHIPMENTS

Anthracite Shipments through the Sault canals for the current year to Sept. 1 were 1,809,401 tons as compared with 926,926 tons for the same period last year.

Butuminous Shipments for the same periods were 10,553,201 for the current year as compared with 8,063,094 in 1912, making gross of 12,362,602 for 1913 and 8,990,020 in 1912.

VIRGINIAN RAILWAY

Total shipments of coal over this road for August of the current year were 376,083 tons as compared with 337,366 tons for the same month last year. For the seven months to Aug. 31 of the current year, the shipments were 2,898,742 tons as compared with 2,245,370 tons for the same period last year, showing a substantial increase.

NORFOLK & WESTERN RY.

The following is a statement of the tonnages shipped over this road during August 1913, and for the eight months ending Aug. 31, as compared with corresponding periods of 1912 in short tons:

	August		Eight Months	
Destination	1912	1913	1912	1913
Coal				
Tidewater, foreign	74,964	96,491	1,025,857	1,128,573
Tidewater, coastwise	317,398	372,908	2,437,211	2,597,566
Domestic	1,722,580	1,780,680	11,717,487	12,099,284
Coke				
Tidewater, foreign	2,661	....	52,762	27,199
Domestic	111,801	108,158	901,139	1,032,310
Total	2,229,404	2,358,237	16,134,456	16,884,932

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for August and first eight months of this year and last year in short tons:

	August		Eight Months	
	1913	1912	1913	1912
Anthracite	713,451	927,277	6,851,626	6,452,287
Bituminous	4,562,339	4,032,727	33,396,286	30,207,895
Coke	1,161,484	1,146,390	9,731,462	8,597,730
Total	6,437,274	6,106,394	49,979,374	45,257,912

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for July 1912-13, and for the seven months ending July 1911-12-13, in long tons:

	7 Months			July	
Imports from:	1911	1912	1913	1912	1913
United Kingdom	5,181	2,697	3,464	50	116
Canada	618,807	765,981	678,611	96,284	76,666
Japan	9,221	18,216	63,665	12,105	9,103
Australia and Tasmania	121,995	80,585	77,634	6,109	15,679
Other countries	137	1,924	2,810	150	1
Total	755,301	869,403	826,184	114,698	101,565
Exports:					
Anthracite	1,986,431	1,645,892	2,448,913	514,645	380,974
Bituminous,					
Canada	5,134,007	5,367,821	7,120,245	1,372,490	1,576,481
Panama	305,624	289,825	321,507	32,358	42,725
Mexico	343,142	210,786	350,961	19,737	18,515
Cuba	575,590	646,462	772,366	84,125	88,088
West Indies	313,085	447,769	377,464	54,355	33,236
Other countries	368,521	1,114,514	1,065,469	105,347	217,079
Total	7,039,969	8,077,177	10,008,012	1,668,412	1,976,124
Bunker coal	3,840,183	4,319,514	4,291,801	559,399	597,011

BALTIMORE & OHIO

The following is a comparative statement of the coal and coke movement over this road for August and the first eight months of this year and last year:

	August		Eight Months	
	1913	1912	1913	19 2
Coal	3,295,123	2,919,991	22,899,814	20,588,240
Coke	391,999	409,627	3,231,372	3,063,239
Total	3,687,122	3,329,538	26,131,186	23,651,479

FOREIGN MARKETS

GREAT BRITAIN

Sept. 26—Some men have resumed work, but the Cambrian and Naval men are still "on stop" and it is feared that these pits will remain idle for a few days longer. Very Best Admiralty Large and good second-class qualities are steady for prompt loading, but Monmouthshires are in plentiful supply and prices irregular. Sellers are asking higher figures for prompt smalls, pit stoppages having curtailed supplies. With regard to forward loading, sellers are holding for firm values, but business is slow.

Quotations are approximately:

Best Welsh steam	$4.74@4.92	Best Monmouthshires	$4.02@4.08
Best seconds	4.44@4.62	Seconds	3.84@3.96
Seconds	4.26@4.38	Best Cardiff smalls	2.40@2.52
Best dry coals	4.32@4.56	Seconds	2.22@2.34

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

FINANCIAL DEPARTMENT

The Delaware & Hudson Company

President L. F. Loree of this company reports, in part, for the year to Jan. 1, 1913, as follows:

General Results—The coal-mining department shows a decrease of 842,384 tons in the amount of coal mined, an increase in gross revenue of $42,543, and an increase in net revenue of $469,326. The railroad department shows an increase in gross oper. revenues of $1,058,286, but a decrease of $250,333 in net operating revenues.

Coal-Mining Department—There were mined 6,438,555 gross tons of anthracite coal out of a total of 63,610,578 tons, including product of washeries produced in the region. The amount produced by this company is 842,384 gross tons less than for the year 1911, due to the suspension of work at the collieries from April 1 to May 21, inclusive, on account of strike.

The new agreement entered into by the mine workers on the one hand and the anthracite coal operators on the other, governing the relations of employees and employers in the anthracite region, provides that the terms awarded by the Anthracite Coal Strike Commission and supplemented by the agreements subsequent thereto shall be continued for a further period of 4 years ending Mar. 31, 1916, except in certain particulars [stated seriatim in the pamphlet report], the most important of which is that the contract rates and wage scales for all employees was increased 10% and the sliding scale was abolished.

Other items which tend to cause the cost of producing coal to increase from year to year are: Shafts and slopes are sunk deeper, tunnels extended, and the mined-out area increased, thus lengthening the haul of coal in mine cars, requiring increased transportation facilities, increasing the area to be drained and ventilated, and requiring more employees. Taxes are about four times the amount paid in 1901, notwithstanding the decrease in the unmined coal remaining in the ground. The operating costs of producing coal of this and subsidiary companies, including taxes but excluding sinking fund for depletion of the coal lands, were higher in 1911 than in 1901 by $0.5575 per ton. Some increase in the market price of coal was necessary, even though no increase in wages had occurred, it being impossible to earn a fair return on the investment.

Assuming that in 1912 the mines had been operated under normal conditions, but with the increase of $0.0808 per ton in the cost of mining under the new wage scale, with an increase of $0.0338 per ton in taxes, and with the increase of $0.25 per ton in the market price of pea coal and larger sizes, and with no change in the market price of the smaller sizes (thus making an increase in the average market price per ton of all sizes of $0.1913), there would have resulted an increase over 1901 of $0.6559 per ton in the cost of production and an increase of $0.6231 per ton in the market price, indicating a decreased return to the producer of 3.28c. per ton.

The charges to extraordinary expenses of the coal-mining department amounted to $857,975 (as against $823,654 in 1911, of which $280,323 upon new colliery at Archbald, Penn., which, it is expected, will be placed in operation early in 1913.

Floating Debt—This amounted to $3,500,000 on Dec. 31, 1912, having been increased $2,600,000 in order to finance temporarily addition and betterment work, and to cover advances to sub. companies for construction.

Sinking Funds—There was paid into the sinking fund under the "first & ref." mtge. the sum of $277,040, being 1% on the bonds outstanding May 1, 1912; total paid to date, $896,510, expended in addition and betterments.

The sinking fund under the first lien equipment trust has received $650,000 annually from 1908 to 1912, aggregating $3,250,000, plus interest on balances, etc., $111,968; total, $3,361,968; disbursements, 62 locomotives and 25 cars, etc., acquired, $1,608,494; $306,000 first lien equipment bonds purchased and retired (incl. int.), $312,171; balance, securities and cash in hands of trustees, $1,441,303.

There was also accumulated in the coal department sinking fund $285,486, $11,780 of which was applied toward cost of coal lands purchased in Wyoming section, and the balance to advances to the Schuylkill Coal & Iron Co. and the Shanferoke Coal Co. for acquisition of anthracite coal lands in Schuylkill County, Penn.

G-E Mining Locomotives

The first locomotive, built by the General Electric Company a quarter of a century ago is still in satisfactory operation.

Carefully Consider the Latest Features:

Rolled Steel side frames. **Grade "F" Steel Pinions**
Commutating Pole } **Motors**
Ball Bearing }

These frames give great strength. The pinions are oil treated to give maximum wearing qualities. The motors give longest possible commutation and brush wear as well as only a trifling friction loss due to the ball bearings.

225 H. P. Westinghouse Motor Driving Mine Hoist Previously Operated by Steam.

Replace your steam-hoist engine by electric motor drive and thus secure more reliable and economical operation.

Westinghouse Motors
For Driving Mine Hoists

are especially designed for this work. Heavy pulling power permits quick starts. Small diameter of rotor facilitates quick stops and reversals. Low power consumption insures economical operation.

They will withstand the heaviest overloads without injury and will last for years with practically no attendance. All parts subject to stress and wear are much stronger than the demands of the service require, and are easily inspected and renewed.

The conditions surrounding mine hoist service have been carefully studied by the Westinghouse engineers, who will be glad to assist you in converting hoists from steam to electric operation.

Write today for full information regarding Westinghouse Mine Hoist Motors.

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 567

Deals with the important question of "safeguarding the earnings of employees." The average miner is an improvident sort of fellow who falls easy prey to the "loan shark." Attention is called to various plans whereby a large part of the miners' wages is diverted to the pockets of designing foremen and clerks. COAL AGE, Vol. 4.

IDEAS AND SUGGESTIONS: *Pages* 568-569

A Good Coal-Mine Superintendent—Some Remarks without a Moral—Man-Failure.

*THE COAL FIELDS OF BRITISH INDIA: *Pages* 570-572

The coal fields of India, while not covering a large area, have in places many superposed seams of great thickness, and the fuel is low in sulphur, which, on the whole, is generally true of Asiatic coals. COAL AGE, Vol. 4.

*HANDLING FINE DUST AT A COAL WASHERY: *Pages* 573-575

The operation of washeries would be greatly improved if no sludge were formed. By passing the finer coal, if naturally dry, over a fine wire-cloth screen adapted for the removal of the dust, this end could be attained. J. Drummond Paton. COAL AGE, Vol. 4.

A NEW ACID-PROOF MINE PUMP: ..*Page* 575

*DETERMINATION OF WATER IN COAL: *Pages* 576-577

The determination of water in coal has hitherto been a summation of the effects of four separate actions, though the outcome of only one was sought. Mr. Teed's method gives the actual water expelled at the temperature of desiccation. COAL AGE, Vol. 4.

THE ELECTRIC MINING LOCOMOTIVE: *Pages* 577-578

A general description of the features common to practically all electric mining locomotives. The path of the current is traced through the machine from trolley wire to rail when the two motors are operating either in series or in parallel. Geo. M. Kennedy. COAL AGE, Vol. 4.

Bessemer And Advertising

The Weekly Ad-Talk Page

Sir Henry Bessemer was the inventor of the steel converter.

By his process the price of steel was reduced to $50 a ton, where it had been five times as much, and England's production raised from fifty thousand tons yearly to over a million and a half.

Sir Henry was rightfully the father of the steel age and to his genius as an inventor must be attributed a tremendous step forward in the world's progress.

But to Sir Henry's ability as a *promoter*—a salesman and advertiser—must be attributed more than half of the ultimate success of his invention.

He, like nearly every other inventor and every manufacturer of something new and unusual, ran against that element that balks progress at every step—"human inertia," the inability of people to grasp and live fully up to their opportunities.

* * *

An advertisement or a salesman calls your attention to some new device which, after years of trial and experiment, has been marketed.

Its excuse for existence is that it will save time or money or labor for its user.

What is your attitude toward that advertisement or salesman?

A *negative* one, isn't it? The first thing that comes into your mind or mouth is "*NO!*" spelled in capitals, printed in italics and emphasized.

We all get the wrong viewpoint, a twist in our mental make-up that makes us think that the advertisement is an attempt to put across something "touchin' on and appertainin' to" a lemon.

And, so, advertising must be persistently aggressive and continuous to make us do the things which are good for us to do.

We cannot *buy* all of the machinery or equipment offered us but that is a poor reason for refusing to *investigate* the merits of any of it.

Bessemer had to first convert iron ore into steel and then convert skeptics into believers.

Bell fought opposition left, right and center to get his telephone financed.

Cyrus Field laid the Atlantic cable amid the jeers and hoots of all nations.

The astute Napoleon "turned down" Robert Fulton's steam-propelled vessel—and lost a wonderful advantage to fight England on her own territory.

* * *

The mission of advertising in this paper is to spread information quickly and cheaply to the most men in the coal mining field in the least time—

To make you see that here or there is a piece of machinery or equipment that will enable you to get better results at less cost per result.

We see to it that the crook stays where he belongs—outside these columns.

So that those who do get in have the pass-word, the high sign and the salute.

It is "*Be Square.*"

* * *

It is one thing to read advertising matter and another to benefit by what you read.

What does it avail a man to know that there is a result-getting device on the market which *might* be all that is said for it and do all that is claimed, unless he *investigates?*

COAL AGE

Vol. 4 NEW YORK, OCTOBER 18, 1913 No. 16

"Money calls, but does not stay;
It is round and rolls away."

As poetry, this may pass as a complete picture, but if you reduce it to prose, you'll probably find that a thing can't roll far unless it is furnished with something to roll on.

A tabulation of the average earnings of miners at some camps would suggest that there must be many satisfactory savings accounts at nearby banks. Further inquiry along the same line is apt to start you wondering how all that money gets sidetracked, somewhere between the pay-envelope and the bank. A little investigation as suggested above, is certain to reveal some surprising facts, and if you think these require justification, just remember that any workingman who finds his purse empty at the end of a hard month's labor, is easy prey for the fellow who would exploit him.

One general superintendent, having noticed a conspicuously prosperous looking check clerk from one of his camps, in town pretty often, decided upon a little investigation of his own. The source of the prosperity was soon disclosed.

About once a week, this clerk conducted a raffle: A cow, a gun, a horse, a watch, anything for variety; there was little variation, however, in the final result—he always pocketed about $20. Absurd you say; wait a minute. This clerk was a very obliging fellow. When a miner came to his window for a check, he footed up his debits and credits with painstaking care, and if the case looked doubtful, he gave the miner the benefit of the doubt. Most any other clerk would have said, "You'll have to wait until to-day's sheet comes in." The next time that miner came to the window the clerk would offer him a raffle ticket; of course the miner would not refuse to take it. This clerk was not dishonest—he was only sidetracking some of the dollars.

At another mine, a superintendent began to wonder how one of his mine foremen was able to annex so much real estate to his holdings. A little inquiry uncovered a "loan-shark system," well organized, and growing. The improvident are willing to pay two dollars for the use of one any time, if they really decide that they must have money. This foreman always had the coin, also managed to collect the debt when it became due; the improvident one is generally timid, and is never anxious to fall out with the mine foreman. "Loan Sharks" of this type have been known to accumulate much money, under less favorable circumstances. If you are not familiar with the full significance of the term "Loan Shark," the welfare of your men is in danger.

At some mines, where the commissary is a part of the system, a plan has been devised that makes it possible for the man with ready money to patronize the company store, pay full prices and yet escape any overcharge. The commissary manager allows these customers to buy scrip at a discount from the miners, and use it at its face value in paying for merchandise. By this system, the commissary draws additional trade, the favored few obtain their goods at a most reasonable figure, and the miner—well, he has been permitted to sidetrack about 25 per cent. of his earnings.

We suggest that you do a little investigating yourself, if you have the happiness and prosperity of your men at heart.

IDEAS AND SUGGESTIONS

A Good Coal-Mine Superintendent

By West Virginia Engineer

"Wanted: A good superintendent, capable of producing a large tonnage."

And what constitutes a good superintendent?

Evidently from the want advertisement above, the answer is—a man capable of producing tonnage. However, such a man might fulfill the requisition without being a good superintendent.

We have in mind a fellow who opened a mine, and from the start his tonnage increased rapidly with a correspondingly low cost. To an outsider, and no doubt to the mine owner, this man was a success.

He decided suddenly to resign. The next man to take his place found ample reasons for his predecessor's resignation; the mine was on the squeeze! Inquiry disclosed the fact that in getting out tonnage, this man sacrificed good mining principles to do so. He would go into the mine in case a new man or any man needed a place and order the mine foreman to continue rooms through a barrier intended to protect the next room heading, until he finally had his protection pillars cut to pieces.

A Low-Cost Superintendent

A low-cost superintendent also can get his mine in just as poor condition by lack of judgment in furnishing supplies. This applies particularly to mine props and overhead timbering.

A mine foreman must keep his working places properly timbered, otherwise there will come a time when these same places will need cleaning up and retimbering in order to recover his pillars.

Have you ever noticed that as a general rule the exceptionally low-cost superintendent is always followed by an increased cost with the next man? Either that, or worse follows worse.

The superintendent of today must be a man of judgment. If his mine foreman comes to him with a requisition for supplies he should be familiar enough with the situation to either grant or refuse the request with some degree of wisdom.

He should be a man capable of keeping data on an experimental operation at his mine in order to decide whether or not it is a success. Take, for instance, the laying of wood or steel rail in a room, can your superintendent give you the advantages of one over the other? Can he tell you how many times the driver has been off the wood track while the room was being driven, and how few times he has been off the steel-rail track while driving a parallel room? Can he tell you the car efficiency of his mine, that is, how many trips per car per day are made?

Facts and figures are the most convincing arguments we have; they are the foundation of efficiency. A superintendent need not be an engineer to work out these matters just because they are called efficiency engineering.

Superintendent Must Be a Diplomat

A superintendent is necessarily a sociologist or a diplomat, as you choose to call him.

The foreign element, on whom we must rely principally for our mining population, must be studied and classified. Their whims, ideas, previous environment and many other points about the foreigners must be recognized in order to successfully draw from them the desired results.

It seems to me that the unsophisticated foreigner is much like a small boy. He is not merely a physical organism, but a sentient, self-conscious being; and so he cannot be cut, trimmed, trained and fed to perfection like a plant, with no regard to himself. He should be considered as a bundle of emotions, rather than a physical mechanism, and the point will be clear—that whatever must be done for him, the first thought must be for the effect on his emotions, or the best laid plans will go amiss.

The large coal companies realize that it is not only the acquisition, but the retention of men as well, that they must solve.

The superintendent is the "man on the job," and it rests principally with him to solve these problems.

⁂

Some Remarks without a Moral

By Southern Manager

"You'll be damned if you do and you'll be damned if you don't." The man who first vouched for the truth of that statement probably wasn't familiar with the various pay-roll deductions, familiarly known as cut-outs, that the present-day coal-mine superintendent is expected to maintain if he desires to keep the good will of his management and his men; but he knew human nature pretty well.

Our friend, the superintendent, was just cooling off after partaking of a rather heated interview with his school board, when we butted into his office. Naturally we allowed him to do most of the talking.

"Yes, it's all chargeable to that everlasting bugaboo, the cut-out system. We cut the men for doctor, and blacksmith, and check weighman, and school teacher, and charity lists, and any other old list with their consent, and then let them growl at us—consent or no consent. Take, for example, the physician list and the school-fund list. The men elect the doctor and the school teacher and we deduct a fixed amount from each man's pay envelope to pay them.

"During some of the months when our pay-roll is large, the doctor and school funds assume considerable proportions. If we give all of the collections to the doctor and teacher the men grumble and insist that they do not earn such enormous salaries. If we hold back part of the fund and refurnish our hospital or school house or do similar work for the common good, they grumble louder because we have confiscated their money. If we hold the money in a reserve fund to tide over future lean periods, we are asked constantly to make an accounting.

"Often there are two or more factions to contend with. The doctor or teacher who suits the majority does not suit the minority and the minority lose sleep trying to uncover or discover something that will justify their coming to me with a petition demanding the summary dismissal of the offending party. Even if their efforts along those lines are successful they are not satisfied, but they begin to question the acts of the member of the majority who is unfortunate enough to be acting as treasurer of the funds.

The Superintendent Had to Pay

"Once, in order to settle a row, I was simple enough to volunteer as treasurer myself; it came mighty near costing me $75 per month for 8 months. We had a teacher who was not giving satisfaction and the majority insisted that she be discharged. As the camp was pretty evenly divided into two factions, I decided that harmony could best be restored by getting another teacher, so I prevailed upon most of the men to accept a new teacher. At the close of the year the teacher, whom I had dismissed, entered suit against me as treasurer for breach of contract and her attorney produced a properly executed contract that had been signed by the school committee at the beginning of the school year. The treasury was empty (this had been one of the lean years), so I was mighty glad to compromise the case out of court.

"If it so happens that the men are all satisfied with the presence of a camp physician paid by cut-outs, it more than often happens that the company has cause not to be.

"Take, for example, the ever-recurring fake damage suit. If the testimony of the camp physician is not favorable to the party who is trying to recover damages, he has little trouble in convincing the jury that the physician should be classed as a company employee, drawing a fixed amount every month collected by the company, and as such is more than apt to be prejudiced against one poor man who can be of no further benefit to the physician, if by so doing the latter can strengthen his position with the company.

"What's the moral? I haven't been able to find it."

⁂

Man-Failure

A distressing train of events in the affairs of a big railroad recently led to an exhaustive investigation at the hands of a commission. In making its final report this commission was responsible for the coinage of a new word—"man-failure." To this was attributed the conditions leading up to and allowing of the train of mistakes and disasters which the commission was required to investigate. And although the final report was a lengthy one, the entire chain of deplorable events was attributed to only one general cause, "man-failure."

It is not an everyday thing that so striking a word as "man-failure" is coined or brought so forcibly to our attention. We may wonder how many erroneous polices and serious blunders in operation and management have been explained in some way as due to unfavorable conditions, etc., when "man-failure" was really at the bottom of things. In our own business, coal mining, we do not need to doubt that many ruinous policies have been enforced with serious results, all of which should have been charged to the failure of high officials, directors, etc., because they either did not see that the policies they outlined were safe, or if they knew they were, did not follow them up to see if they were carried out. We can easily recall strikes which were caused by "man-failure" on one side or the other.

Here are a few kinds of "man-failure" in connection with coal-mining work:

A man is made general manager of a company owning several big mines, where pick mining exists. He is a believer in machine-mined coal. Machines are introduced and the men are forced to work them in good places and bad at a rate of differential that is not wholly fair to them. After expending large sums of money on power house, mining machines and other equipment, it is finally found that machine mining is not as profitable to the company as was the pick mining. The "G. M." explains it by showing up the unfavorable attitude of the men and the fact that the inside conditions in some places were against it. And although he may get away with such an excuse, it was really a clear case of man-failure, due to his not studying conditions carefully enough and in fixing the differential incorrectly.

A superintendent allows a "Ring," consisting of perhaps his assistant, one or two foremen, and a few favored men, to exist in his division. They are all capable men, but their ring tactics breed trouble and lead to conditions that the "super" has finally to answer for. It is man-failure on the part of the superintendent to allow rings to exist.

Instructions by Circular Letter

A general superintendent believed too strongly in continually issuing instructions by circular letter and in picking up flaws and small mistakes. He kept his local superintendents so busy answering his letters they could not find time to attend to larger matters of operation, cost, etc. The result was the management finally took up the question of cost, but it was too late.

A mine foreman who had a splendid reputation as a hard worker and all-round good man began work for a progressive company, whose motto was "safety first." But the foreman didn't like "new-fangled notions." He looked after his mine faithfully, the output was good and the cost was right; but he would not follow safety instructions, so finally lost out. It was man-failure on his part in not keeping abreast of the times.

It is all too common for a wealth of instructions to be issued by officials in charge who do not follow up their work to see if rules and instructions are being worked out. Dead rules are dead weight. We should all remember that only 10 per cent. of the work is done by issuing instructions, 90 per cent. is getting them carried out.

We can't afford to overlook the significance of man-failure. In future it will more often be given as a reason for failure because we are growing more frank in our explanation of mistakes.

Do you give instructions? By all means follow them up and make sure they are carried out. Do you receive instructions? Don't fail to study them carefully to find their meaning. Then, be sure to carry them out. These two simple rules will go a long ways toward avoiding man-failure.

The Coal Fields of British India

SYNOPSIS—The coal fields of India while not covering a large area have in places many superposed seams of great thickness, and the fuel is low in sulphur, which, on the whole, is generally true of Asiatic coals.

⁂

The coal seams of India occur in deposits more recent than those in which the principal coal fields of Europe are found. With one or two unimportant exceptions the peninsular fields are confined to the great Gondwana (Permo-Triassic) system of Indian geologists. It is thought that the rocks of this period were almost entirely deposited in fresh water and probably by rivers. As a rule they are found occupying basin-shaped depressions in the older formations, and such depressions frequently coincide with the existing river valleys.

In general the coal of peninsular India may be described as a laminated bituminous coal, in which dull and bright layers alternate. Much of it does not coke freely, while a not inconsiderable portion will not do so at all. However, from the coal of particular seams in the Raniganj, Karharbari and Jharia fields, fairly good qualities of coke can be made. In the Raniganj field the best coke has been made from the Sanctoria coal and in the Jharia field from Nos. 14, 15 and 17 seams.

Incline, Dishargarh Colliery, Raniganj Coal Field, Bengal, India

Fixed Carbon, Ash and Moisture

The average proportion of fixed carbon in the coal of the Raniganj field is under 55 per cent., while in the Karharbari and Jharia fields it is probably about 10 per cent. higher. There is no case of a true anthracite having been discovered in any of these fields; but the crushed and powdered coal at the foot of the Darjiling Himalayas approximates in character to anthracite on account of the removal of its original volatile constituents.

The percentage of ash in Bengal coal which is brought to market averages from 10 to 15, that is to say, that coal with less than 10 per cent. ash does not commonly occur, and coal with more than 15 per cent. does not, as a rule, find a ready sale. In the producing fields of Hyderabad, the Central Provinces and Central India, the ash content is much higher, particularly in the latter provinces, where the ash varies from 15 to 25 per cent.

The moisture or hygrometric water varies much in the coals from the different fields. In those of the Godavari and Wardha areas it is exceptionally high, being often 14 per cent., while in the Raniganj field it varies from 1 per cent. in the Barakar or lowest formation to 3.81 in the lower Raniganj seams and 6.86 per cent. in the upper seams of the Raniganj formation. A similar proportion appears to obtain in the corresponding stages of the Jharia field.

Sulphur and Phosphorus

The quantity of sulphur and phosphorus varies much from seam to seam, and though large quantities of these impurities are often found some of the coal is sufficiently free of them for the manufacture of iron and steel. The average of 31 analyses of coals from Raniganj made by Tween gave sulphuric acid 0.07 per cent.* and phosphoric acid 0.14 per cent.

Dunstan gives the following analyses of Raniganj, Jharia and Giridih coals:

Coalfield	Phosphorus, per cent.	Sulphur, per cent.
Raniganj (average of 34 samples)	0.088	0.74
Jharia (average of 12 samples)	0.143	0.80
Giridih (average of 6 samples)	0.019	0.62

Coals above the Permo-Triassic System

Coal of Upper Jurassic age occurs in Kutch. The workings at Trombow are apparently the largest, where a seam, measuring 16 in., contained only 8 in. of good coal, the remainder being shale. The seams appear to be so thin and inconstant and the coal so brittle and intermixed with shale that they cannot be considered of any economic importance.

Coalfields of Cretaceous age are found in the Khasia and Garo hills in Assam. Coal of Tertiary age is found in the foothills throughout almost the whole of extra-

---

Note—Abstracted from "Memoirs of the Geological Survey of India" written by V. Ball and revised and largely rewritten by R. R. Simpson, inspector of mines.

*This figure appears to be very low and possibly should be 0.7 per cent., the value given in the table below for the sulphur only.

Burning Coal Shaft, Charanpur Colliery

peninsula India, from Baluchistan on the northwest to Assam on the northeast. It also occurs in Sind, Rajputana, Burma and in the Andaman and Nicobar Islands. In upper Assam, however, important deposits of true coal are found, which are considered to be of middle Tertiary, probably Miocene, age.

Generally speaking, the Tertiary coals are bright, jetty and non-laminated, and they contain a larger proportion of volatile matter than the coal of the peninsula fields; many of them are extremely friable and susceptible to disintegration under exposure; they do not cake as a rule and the proportion of ash is usually small.

Distribution of Coal

In 1873, T. W. H. Hughes made the following estimate of the extent of the known coal-bearing rocks in India:

Name of area	Square miles
Godavari and its affluents	11,000
Son	8,000
Sarguja or Gangpur	4,500
Assam	3,000
Narbada and its affluents	3,500
Damuda	2,000
Rajmahal	300
Unsurveyed and uncomputed	2,700
	35,000

This estimate is probably somewhat in excess of the truth, but the additional evidence to date does not permit of a much closer approximation. Over a considerable portion of the area the coal-bearing rocks are covered by younger deposits and must lie at unworkable depths.

Coal Too Far from Coasts

Although the coal-mining industry has now been in operation in India for more than a century, and although there has been a steady increase in production and consumption, which has been especially notable in the last decade, still it must be stated that the development of the coal resources of the country is as yet in an imperfect condition. Of the numerous coal fields of proved value in India, 18 are actually being worked, but only 7 are of any considerable importance, while 89 per cent. of the total output is produced in the Raniganj and Jharia fields. The reason for the relative importance of the various regions is easy to understand. Most of the coal fields are too remote from the ports and centers of manufacturing industry to render it possible for their product to be carried to places where it would have to compete with fuel from the best coal fields of Bengal, which fields,

Head Gear and Screening Plant, Ballarpur Colliery, Central Provinces, India

from their strategic position, within easy reach of the coast, practically command the middle-eastern market. That a lively spirit of enterprise is abroad is, however, evident from the fact that coal-prospecting operations are in progress in nearly a dozen separate coal regions.

THE RANIGANJ COAL FIELD

The Raniganj field is the largest of the coal fields now being worked in India. It is situated from 120 to 140 miles northwest of Calcutta, and the East Indian Railway Co.'s line passes through it centrally. The Bengal-Nagpur Railway Co. also has access to the coal field, and besides these trunk lines there is a growing network of branch lines and sidings for the service of the collieries.

The extent of the exposed coal field is approximately 500 square miles, within which area the Panchet, Damuda and Talchir groups attain an aggregate thickness exceeding 11,000 ft. The general dip of the beds is toward the south at angles of from 5 deg. to 20 deg., and the measures are abruptly cut off at the southern boundary by a fault the throw of which must, at the least, be equal to the full thickness of the beds. On the east the coal measures dip under the Gangetic alluvium, and the boundary of the field is unknown. Recent borings, however, point to their extension eastward to a very great distance, but overlain by the higher beds of the series, and at a considerable depth.

There are numerous faults and dikes, most of which are obscured by the alluvial cap which covers so much of the coalfield, so that their presence is, as a rule, only disclosed during the course of mining operations.

The thickness of the coal at Jharia in measures Nos. 10 to 18, inclusive, aggregates 163 ft., seam 10 being 45 ft. thick and there being two other thick beds which are 23 and 26 ft. thick, respectively. A section taken between Katras and the Jamuni River totals 198 ft. of coal found in 19 seams numbered from No. 1 upward to No. 18, No. 16 being absent, and Nos. 8 and 15 being each in two benches. The thickest beds, Nos. 3 and 4, are not worked, but each measure is 20 ft. thick.

Charanpur Colliery, Raniganj Coal Field, Bengal, India

Handling Fine Dust at a Coal Washery

By J. Drummond Paton

SYNOPSIS—The operation of washeries would be greatly improved if no sludge were formed, and by passing the finer coal, if naturally dry, over a fine wire-cloth screen adapted for the removal of the dust, this end could be attained. This dust is not markedly, if at all, cleaned in the washer, and, if clean, could be sold for many purposes, or, if dirty, could be used at the coal plant. It generally contains more impurities than any other size of coal.

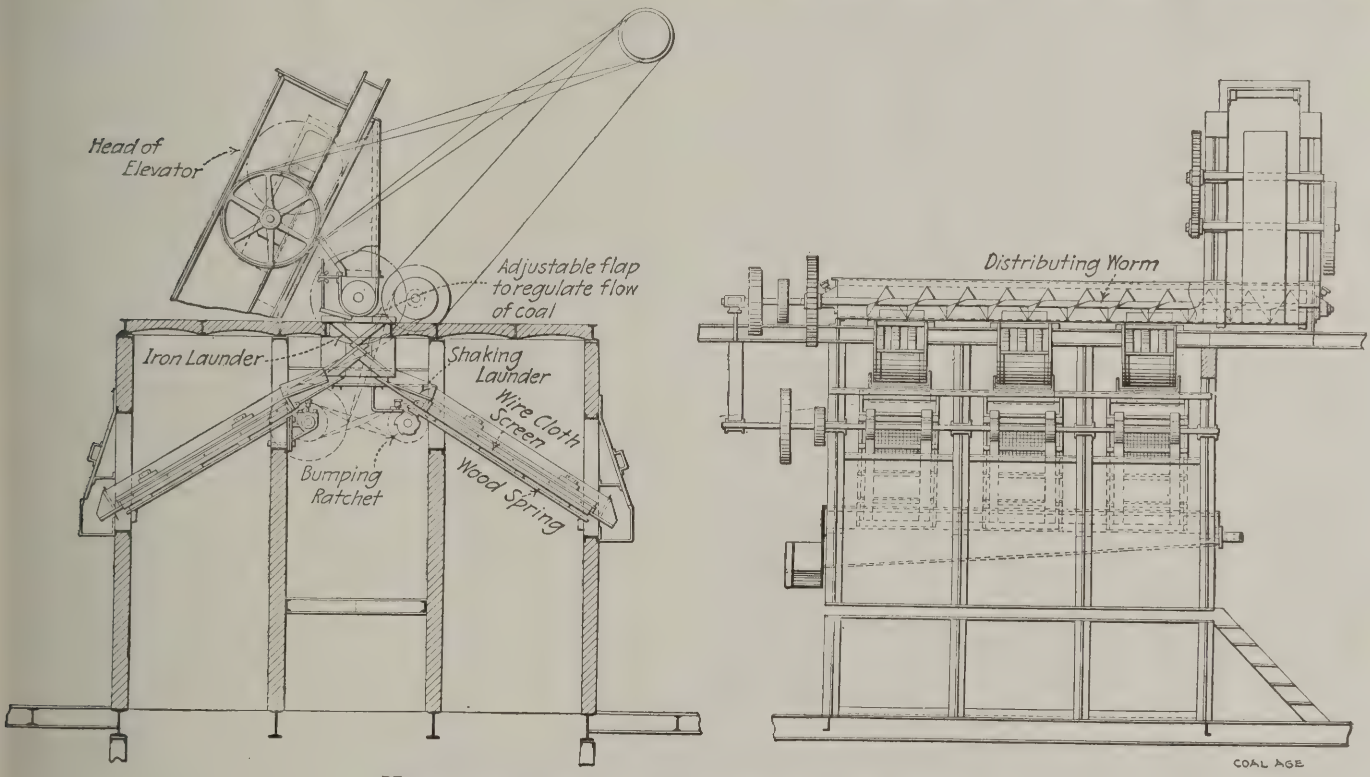
⁂

The method of handling small coal and dust at the surface of the mine is the keynote to successful washing and to allow all the small coal under 1 mm. ($\frac{1}{25}$ in.) cube to pass into the washery is radically wrong. Where the moisture percentage is not over 5, the small dust which is as finely comminuted as that described may as well be removed by "percussive" screens as subjected to any other treatment. Trials and experiments prove that small coal from 0.5 mm. ($\frac{1}{50}$ in.) cube downwards cannot be cleaned in a washer. If the dust together with the coal in grains goes into the jig, the formation of sludge is unavoidable, making the operation of the washery difficult, as it is hard to dry the washed fine coal.

Owing to the sludge with which it is mixed, the mass is so dense that water can only slowly pass through it. Further, the fine sludge, on account of its larger surfaces, can take up an immense quantity of water.

Water Will Not Drain from Sludge

It is a proved fact that a piece of coal of 30 or 50 mm. (1¼ to 2 in.) cube, if taken out of water, contains, after only a few minutes, 3½ to 4½ per cent. of moisture, whereas a quantity of sludge of a similar weight still contains 20 to 25 per cent. of water after several hours' draining. It is, however, most essential to have the fine coal as dry as possible for briquetting and coking purposes; especially is this the case if coal with only 17½ to 18 per cent. of volatile matter is employed. A large number of mines which produce such coal do not succeed in obtaining coke from washed coal when the latter contains more than 11 per cent. of moisture, because the ovens are too slow in reaching the required temperature.



Humboldt-Weissmann Percussive Dust Screen

The screens are jolted 600 times a minute by a bumping cam and will screen out all dust under 1/25 in. in diameter.

How the Coal Is Screened

The Humboldt-Weissmann percussion or bumping screens will extract coal dust below 1 mm. cube from a dust of larger size. The important features in the screens are (1) a continuous feed onto a large screen surface so that the wire cloth may not choke from overloading, and (2) a multiple cam at the upper end of the screen, which, as it revolves, drops the end of the screens resting on it 5 mm. ($\frac{1}{5}$ of an inch) 580 to 600 times a minute. This constant vibration of the screen prevents clogging unless the moisture content in the coal exceeds 4½ per cent., when the wire-cloth openings must be increased to 1.2 or 1.4 mm. The screens give a large output with minimum power consumption at small initial cost and low maintenance charge.

---

*Abstract of paper on "Small Coal and Dust; Its Production, Prevention, Treatment and Utilization (Dry Mines)," presented at meeting, Apr. 13, of the Manchester Geological and Mining Society.

The power consumed by one battery of 18 shaking screens, amounts to only 1 hp., and only 4 hp. is required for driving the screw by which the coal is distributed over the screens.

Coal Dust Is Wetted but Not Washed in a Jig

By using these screens in connection with washers, the sludge is reduced to a minimum, the water can be used again and again without sludge tanks or funnel boxes, and there is no mass of wet coal to handle which will neither drain nor otherwise dry. The impossibility of cleaning the extremely fine dust which forms sludge in the washer is well known. Coal-washing bosses often say "The sludge is too dirty and must be removed from the washery."

Sludge tanks are therefore provided, and they are drained occasionally and the contents sold or used as boiler fuel at the mines. It can easily be proved that coal sludge contains about the same quantity of ash as crude coal of the same size, in some cases even a little more, since soft shale and clay are levigated and tend to disintegrate in water and mix with the finest part of the coal. If my assertions prove correct, the ash contents of a mixture of washed fine coal and dust cannot exceed that of washed fine coal mixed with the whole sludge.* But, unfortunately, the ash contents of the dirt sometimes debar the addition of the whole quantity to the washed coal, if the desired percentage of ash in the briquetting or coking coal is to be obtained, and so in many cases we cannot add all our dry dust to the washed coal and obtain a satisfactory coal product.

It is interesting to note how the quantity of the ash varied with the size of a certain Lancashire coal:

ASH IN A LANCASHIRE SMALL COAL

Size, In.	Weight of ash, per cent.
1¼ to ⅞	14.43
⅞ to ⅝	16.50
⅝ to ⅜	14.43
⅜ to ¼	11.34
¼ to 0	43.30

As an alternative, the fine coal ¼ in. to zero was further classified into the sizes: ¼ in. to 1 mm., of which there was 35 per cent., and dust 1 mm. to zero, forming 65 per cent. of the whole.

The following is the result obtained after washing the various sizes:

ASH IN A LANCASHIRE SMALL COAL AFTER WASHING

	Coal: 70.51 per cent†		Refuse: 29.49 per cent.	
Sizes, in.	Per cent. of size	Per cent. of ash	Per cent. of size	Per cent. of ash
1¼ to ⅞	11.75	4.52	1.65	70.00
⅞ to ⅝	13.61	3.45	2.47	60.00
⅝ to ⅜	11.75	5.37	1.86	75.00
⅜ to ¼	8.66	5.41	1.86	75.00
¼ to 0	23.92	11.18	9.48	68.00
Sludge	......	......	12.17	29.51

The slack divided into sizes between ¼ in. and 1 mm. and 1 mm. and zero yielded the following results:

ASH IN A LANCASHIRE SLACK AFTER SCREENING DUST AND WASHING GRAINS OF COAL

	Coal		Refuse	
Size	Per cent. of size	Per cent. of ash	Per cent. of size	Per cent. of ash
1¼ in. to 1 mm.	26.29	5.81	6.18	75
1 m.m. to 0 mm.	10.82	32.74	Unwashed	

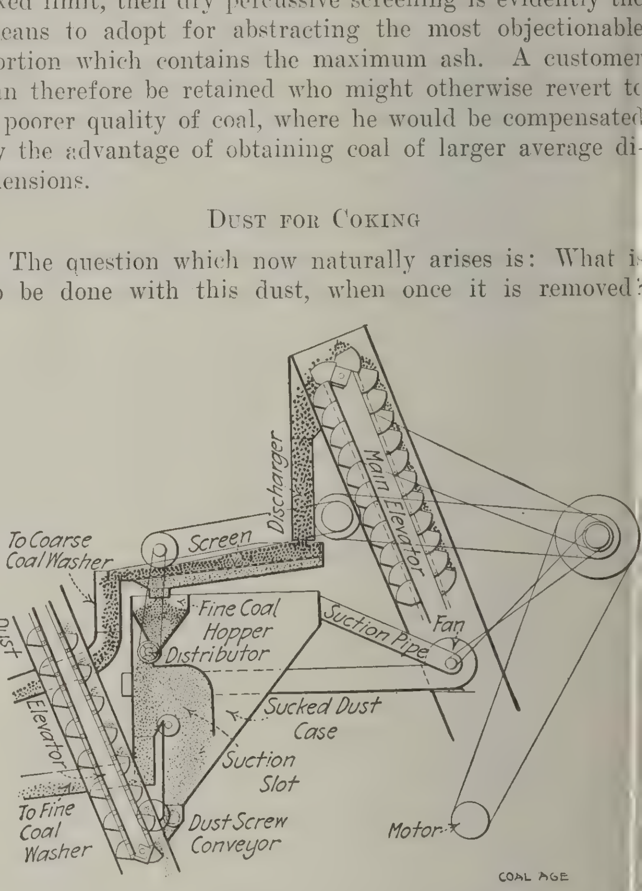
Screening versus Washing

The total final coal of ⅜ in. to zero averaged an ash content of about 10 per cent.; while the fine coal from ⅜ in. to 1 mm. only showed an ash content of about 5.7 per cent., so the great advantage in screening away the dry dust below 1 mm. diameter is confirmed.

If slack is to be sold without washing, and trouble is experienced in keeping the ash percentage within a fixed limit, then dry percussive screening is evidently the means to adopt for abstracting the most objectionable portion which contains the maximum ash. A customer can therefore be retained who might otherwise revert t a poorer quality of coal, where he would be compensate by the advantage of obtaining coal of larger average dimensions.

Dust for Coking

The question which now naturally arises is: What i to be done with this dust, when once it is removed



Suction Method of Dust Extraction

A fan separates the fine dust from the slack by suction This falls into a small hopper and is conveyed to a bin by an elevator.

The quality of this product must first be determined The impalpable coal dust to which reference has jus been made contained 32.74 per cent. of ash, but not a dust between 1 mm. and zero would be equally bad.

The following analysis of another sample shows wha possibilities occasionally lie in that part of the coal whi is called dust:

SAMPLE NO. I

Products	Per cent.	Products	Per cen
Coke yield	74.10	Moisture	0.6
Sulphur salts	1.30	Ash	16.8
Volatile matters	25.90	Coke yield (muck method)	74.8
Tar	3.20	Coke yield (distilling test)	74.1
Benzol	0.83		

SAMPLE NO. 2

Products	Per cent.	Products	Per cen
Coke yield	75.10	Moisture	0.7
Sulphur salts	1.20	Ash	16.
Volatile matters	24.90	Coke yield	75.
Tar	2.90	Coke yield (distilling test)	75.1
Benzol	0.72		

It must be borne in mind, however, that samples and 2 had not been over percussive screens, but nevert less would be regarded as dust by the purchaser and caus him to condemn a shipment if too much of it were prese in his slack.

---

*It is not by any means unlikely that the author of these remarks is justified in his conclusions, but his figures later quoted for the washed sludge of a Lancashire coal show 29.51 per cent. of ash and the same coal screened through a 1-mm. screen shows 32.74 per cent. ash. So in the case he quotes washing was not entirely ineffectual.

†An inexplicable error as the percentages of the various sizes total to 69.69 and not 70.51.

It is impossible to install a coking plant for the sole purpose of disposing of the fine dust formed at a single mine, but it might be well for collieries to establish a plant to which this material might be sent and coked with a saving of byproducts, for development of power or for the manufacture of illuminating gas. The plant of Messrs. Koppers at Joliet, Ill., is making coke out of coal of which 85 per cent. passes through a 1/8-in. screen. If the coke would not prove of the best quality it could be sold for domestic purposes.

The price of such coal in the past has been by no means proportional to the calorific output it delivers when used with suitable stokers or dust-firing appliances under steam boilers.

Dust coal of 1 mm. diameter and under finds a ready market at foundries as a medium to produce blackening for the faces of molds or for reforming foundry sand. Various compounds for this purpose consist almost wholly of just such dust and sell at as much as $43.45 per ton. If the coal has a low ash percentage it can be used for many chemical purposes for which coal is now ground.

If collieries took up the utilization of their own dust for the distillation of oils, etc., the modern market would provide a consumer for the "coalite" coke which would be produced. The following table shows the temperature at which the various oils are distilled.

TEMPERATURES OF DISTILLATION

Temperature, Degs. Fahrenheit	Products
0 to 338	Water, ammonia-liquor, light oil, benzol, naphtha.
338 to 446	Medium oils, naphthalene, carbolic acid.
446 to 518	Heavy oils, creosote.
518 to 572	Anthracene, pitch.

Coking plants have cleared from $10,000 to $15,000 per month on byproducts alone, apart from coke sales, and this on a basis of 200 to 300 tons of coal carbonized per day. On an average, the returns available by coking approximate for each ton of coal carbonized as herewith:

AVERAGE RETURNS FROM COKING ONE SHORT TON OF COAL

Coke, in tons	0.6
Tar, in pounds	89.3
Ammonia salts, in pounds	26.8
Light oils and crude benzol, in U. S. gallons	27.
Available gas, in cubic feet	4500

Undeveloped Markets for Dust

Had the money which has been spent in investigating the effects of coal dust and gas been applied to the collection of dust in the mines and elsewhere, the operators would have been compelled to find a market for it and would have educated the consumer to appreciate its value, but, of course, such dust would have to be collected with a due regard to the necessity for keeping it free from extraneous substances.

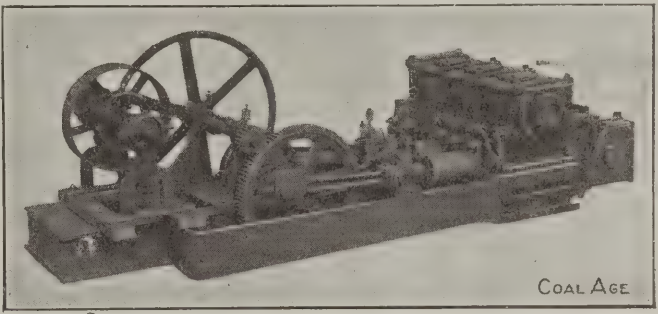
⁂

A New Acid-Proof Mine Pump

Perhaps one of the most vexing problems which confronts the mine operator is successfully handling comparatively small quantities of highly acidulous mine water. The destructive action of this fluid upon pumps and pipe lines is well known. From time to time various expedients have been adopted to circumvent this evil.

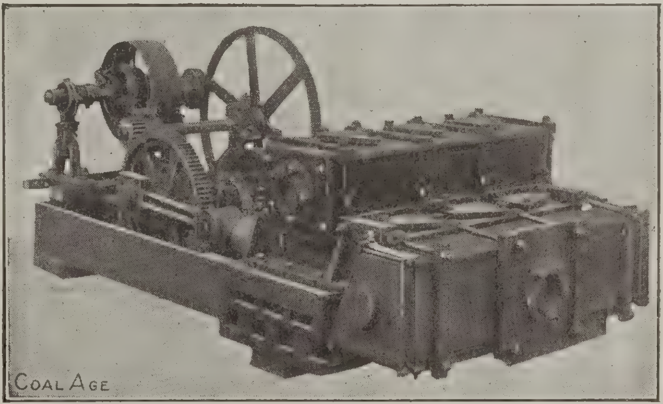
About the most successful material which has been found for resisting the corrosive action of acidulous waters is wood. This material excels even the so called acid-resisting bronze, and under proper conditions will last longer and give more satisfactory service than lead.

It will be readily understood that it is the parts of a pump which come into direct contact with the acidulous water which suffer most from corrosion. It is not uncommon for even brass- or bronze-lined cast-iron pumps to be destroyed by acid water in a comparatively short time. In some mines even a very few shifts are enough to practically destroy the working parts of the pump, particularly the valves, valve seats and valve springs.



Front View of Pump Arranged for Belt Drive

With the foregoing considerations in mind, George Robson, of Murray, Hocking County, Ohio, has invented and is about to place upon the market a type of mine pump wherein practically the only metal coming in contact with the mine water is the plunger. As may be clearly seen from the accompanying illustrations, this pump does not differ materially in principle of operation from the ordinary, horizontal, triplex, outside-packed plunger variety. The cylinders, valve chests and valves are, however, all of wood.



Rear View of Pump, Showing Wooden Construction

In the construction of this pump, all wooden parts which are subject to pressure are thoroughly reinforced with castings upon the outside. The valves operate by gravity, and consequently no valve springs are necessary. In order to effectually prevent the valves from splitting, they are heavily banded around the edge with cast iron. This, however, does not come in contact with the valve seat, and consequently any pitting which may develop in the metal does not interfere with the efficiency of the pump.

This pump, built in a capacity of 250 gal. per min., to work against a 600-ft. head, has been in operation for 28 months in an Ohio coal mine, with an expense for repairs of 85 cents. This record is the more astonishing when we consider the fact that this machine took the place of two bronze-lined, cast-iron pumps, which failed after two weeks' operation.

Determination of Water in Coal

SYNOPSIS—The determination of water in coal has hitherto been a summation of the effects of four separate actions, though the outcome of only one was sought. Mr. Teed's method gives the actual water expelled at the temperature of desiccation.

⁂

In a paper at the meeting of the Institution of Mining and Metallurgy in London, England, P. Litherland Teed refers to the simple drying method universally employed for determining the percentage of moisture in a fuel, in which he says that sources of inaccuracy exist due to the following reactions:

(a) Oxidation of the pyrites making the result too low; (b) Oxidation of the coal itself making the result too high; (c) Volatilization of matter contained in the coal which also gives too high a result.

Mr. Teed claims to have devised a method for the determination of water in coal which gives a high degree of accuracy, is quick in operation and employable in many cases where simple drying would be impossible.

MOISTURE ABSORBED BY LIME

His apparatus consists of a 100-cc. pressure flask, a "U" tube of about ½-in. bore and a sulphuric-acid drying tube, all of which must be capable of withstanding atmospheric pressure; besides these, sound rubber corks and some form of vacuum pump are necessary. With regard to the latter, the Sprengel water vacuum pump worked by the main water-supply has been found to give a reduction in pressure equal to about 725 mm. (28.5 in.) of mercury and to be in every way satisfactory.

The illustration shows the apparatus used and needs no further explanation except to state that the right beaker is filled with boiling water, and the left with a boiling aqueous solution of common salt or calcium chloride.

The pressure on the coal is reduced and its temperature raised to that of the boiling water surrounding the flask in which it is contained. Thus the water content of the fuel, together with some volatile matter varying in quantity and character with the nature of the coal, distil off and pass into the lime tube. In accordance with the following equation

$$CaO + H_2O = Ca\ (OH)_2,$$

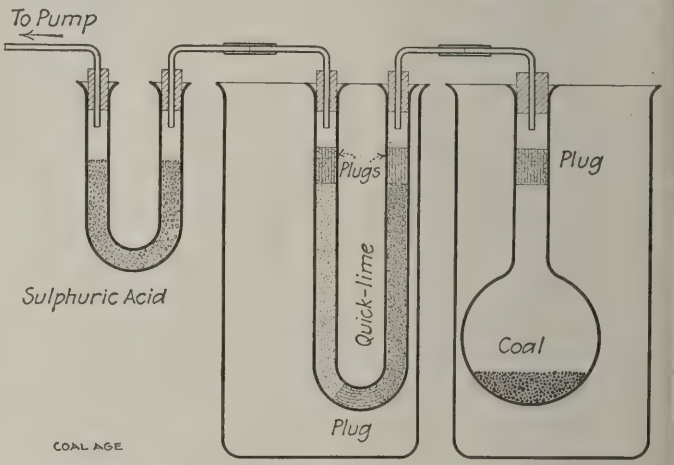
the water originally in the coal is chemically retained, while the other volatile matter because it has no chemical affinity for the lime, and because the temperature of the lime tube is too high for condensation, passes through to the sulphuric-acid drying tube, where some of it is retained, discoloring the sulphuric acid, while other portions pass through to the pump.

At the end of about half an hour, the whole of the water having passed from the coal to the lime tube, the tap adjoining the vacuum pump is turned off, the beaker of boiling water surrounding the coal flask is removed and the air gradually allowed to pass back through the sulphuric-acid drying tube to the vacuum beyond. Then the apparatus is dismantled, the lime tube washed externally, wiped, placed in a desiccator to cool, then weighed, and the increase in weight noted. As this increase is solely due to the water absorbed from the coal, the percentage of water in the fuel is easily calculated.

NO ERRORS DUE TO OXIDATION OR VOLATILIZATION OF HYDROCARBONS AND SULPHUR

In the new method, the author claims that the two errors due to oxidation no longer exist because the water is distilled from the coal in the absence of air, and consequently no oxidation can occur. The volatilization of hydrocarbons and sulphur still takes place, but since the temperature of the quicklime tube is higher than the coal itself, no condensation can occur in this tube unless chemical action takes place.

Mr. Teed says one physical error undoubtedly exists, for the lime tube is attacked with loss in weight by the boiling solution of calcium chloride, and therefore for the most accurate work a correction must be applied, which is dependent on the strength of the calcium chloride solution and the time of immersion. Using the solution employed by the author it was found that the drying tube lost in weight 0.0030 gram per hour. The following table of results of three representative coals examined, shows that the results are independent of the time that the coal is under the influence of heat and reduction pressure.



APPARATUS BY WHICH THE MOISTURE IN COAL CAN BE ACCURATELY DETERMINED

TABLE SHOWING THAT TIME DOES NOT AFFECT RESULTS

Nature of Coal	Weight of Coal Grams	Apparent Increase in Weight of CaO Tube Grams	Time Min.	Correction Grams	True Weight of Water Grams	Water Per cent.	
Anthracite	9.4305	0.2600	30	+0.0015	0.2615	2.77	2.78
	5.2244	0.1427	30	+0.0015	0.1442	2.77	
	3.1360	0.0860	30	+0.0015	0.0875	2.79	
Bituminous....	4.0800	0.2618	45	+0.0022	0.2640	6.46	6.45
	4.3442	0.2784	30	+0.0015	0.2799	6.44	
Lignite	10.4042	1.0588	60	+0.0030	1.0618	10.21	10.20
	3.7666	0.3832	30	+0.0015	0.3847	10.21	
	8.2526	0.8390	30	+0.0015	0.8405	10.19	

DRIED ANTHRACITE HAS LARGE POWERS OF OCCLUSION

The author draws attention to a discovery he made in the course of his investigations in the following terms: When investigating the percentage of moisture in an anthracite, it was found that the increase in weight of the drying tube was greater than the loss in weight of the anthracite in the coal flask, by an amount far greater than would be accounted for by the fact that the aqueous vapor in the air originally in the apparatus would be absorbed by the drying tube. Naturally, it was at first supposed that there must be some leak in the apparatus between the coal flask and the quicklime, but this, on performing a blank experiment, was not found to be the case.

The experiment was repeated, still using anthracite in the coal flask, and it was found that, while the increase in weight of the drying tube was equal to 2.78 per cent. of the anthracite employed, the decrease in the weight of the anthracite in the flask was equal to 2.52 per cent. So striking was this result, Mr. Teed adds, that this experiment was repeated ten times in all, when it was found that the mean increase in weight of the drying tube was equal to 2.78 per cent of the anthracite employed (these results did not differ by more than 0.04 per cent.), while the mean decrease in weight of the anthracite in the coal flask was equal to 2.54 per cent.; however, these results differed from one another by as much as 0.17 per cent., but no result was higher than 2.62 per cent.

In regard to this Mr. Teed can only conclude that when the water left the coal under the influence of the reduced pressure and heat, it left it in the physical condition of charcoal, capable, like that substance, of absorbing many times its own volume of gas.

⁂ ⁂

The Electric Mining Locomotive

By Geo. M. Kennedy

SYNOPSIS—A general description of the features common to practically all electric mining locomotives. The path of the current is traced through the machine from trolley wire to rail both when the motors are operating in series and in parallel.

⁂

We are all familiar with the general appearance and work that is performed by the electric mine locomotive. This machine in its present stage of development embraces many different types and classes, but all of them regardless of make or size have many features in common.

General Construction of the Machine

The side frames are usually made of cast iron and the ends of either the same material or of cast steel. These members are securely bolted together in a thorough and substantial manner, and are designed and constructed for hard service.

Most electric locomotives are equipped with two motors, one suspended from each of the two axles. Movement along the track is obtained by means of pinions on the armature shaft meshing with gears mounted on the axle.

It should be remembered that the locomotive does not generate power in itself, but through its motors transforms electrical into mechanical energy, and thereby does useful work.

The purpose of the trolley wire is to conduct current to the locomotive from a source of supply. The rails upon which the machine operates also perform the function of carrying this current from the locomotive back to the origin of electrical energy. To do this efficiently they must be bonded at every joint and cross-bonded at certain intervals, say, every 200 to 400 feet.

If efficient service is to be obtained, it is important to have the trolley wire, rails and bonding in as good condition as possible. They must be free from leakage and poor joints, for either of these will cause an unnecessary drop in potential, that is, a loss in the driving force required by the locomotive, which results in decreased speed or failure to pull a normal load. In other words, every leak and every poor joint, whether it be in the track or the trolley wire or in fact anywhere in the circuit, dissipates energy, which under good conditions would be utilized by the locomotive in performing useful work.

The locomotive is equipped with a trolley pole which, for various reasons, is made of wood. This supports the pole head, which in turn carries the harp, within which is mounted a deep-grooved wheel by means of an axle.

The Route of the Current through the Machine

This trolley wheel rotates along the trolley wire, making electrical connection therewith. It is here at the contact between wheel and wire that the current enters the locomotive. From the wheel it flows through the harp to the pole head, and from a terminal mounted thereon down a flexible-rubber insulated cable attached to the trolley pole to a movable cable contact block on the locomotive proper.

This contact block fits into and forms a connection with one of two stationary cable contact blocks. These are installed merely for the purpose of furnishing a convenient means of detaching the cable in case of any damage to the trolley pole or parts which are mounted thereon, for without these blocks or couplings loss of time would occur in case a trolley-pole equipment required changing, either due to breakage or some other cause.

Locomotives are usually equipped with two or more of the stationary cable blocks. This permits the pole to be placed in any one of two or more positions according to the number of blocks, or two separate trolley poles may be carried, one on either side of the locomotive. The contact blocks are connected together electrically by means of a suitable insulated cable and also to either a fuse block or to an automatic circuit-breaker, which is mounted on the locomotive close to the motorman's seat.

The fuse block is composed of some insulating material such as slate with suitable clips mounted thereon, into which is inserted a holder containing a fuse wire, which has a certain fixed current-carrying capacity depending upon the size or power of the machine.

The automatic circuit-breaker is a self-operating mechanism which opens the circuit when the current passing through the breaker exceeds a certain predetermined volume, at which the instrument is adjusted to operate.

Function of Fuse or Circuit-Breaker

The fuse, or automatic circuit-breaker, as the case may be, opens the circuit when an excessive current flows. Either of these devices is, therefore, exactly analogous to the safety valve on a steam boiler. From fuse block of circuit-breaker the incoming current flows through a suitable conductor to the controller which governs the speed and direction of travel of the locomotive.

It consists of two drums which are sometimes called cylinders. The first, or main drum, is that by means of which the current is switched on or off, and the resistance, as will be explained later, is cut out step by step. The other is the reverse drum or cylinder. By a proper rotation of this drum by means of a handle provided for that purpose, the direction of flow of current in the motor armatures may be changed, which will in turn reverse the direction of travel of the locomotive.

This drum also connects the motors either in series or parallel as desired. This is accomplished by means of a group of stationary fingers and a group of contacts mounted on the cylinder, which as the latter is turned forms electrical contact with the fingers, making and controlling the circuit.

How Contact Blistering Is Reduced

When an electric connection is broken while current is flowing an arc is formed. In order to reduce to a minimum the blistering and burning of contacts and fingers, due to arcing, a blow-out coil is placed in the controller and is connected in series with the line. All the current used by the locomotive passes through this coil. The result is the existence of a magnetic region which has the effect of blowing out the arcing caused in shutting off the main controlling drum.

The resistance on a locomotive is for the purpose of obstructing or retarding the flow of current. It is made up of a series of cast-iron grids mounted in a suitable frame but insulated therefrom. This resistance reduces the electro-motive force or voltage to a point such as to permit the locomotive to accelerate moderately, which means that the motors will have a chance to speed up and not become damaged. This will be discussed later on.

Taps are taken from the stack of grids at different points to the controller. This permits the resistance to be cut out or reduced step by step until the full line voltage is impressed on the motors, either in series or parallel, depending on the position of the reverse drum.

The current after having passed from the controller to the resistance and back to the controller, now flows to the motors. If the reverse cylinder is set for the series connection, the current passes through one motor, back to the controller and then to the other motor and thence to the casing, axle, wheels and rails.

If, on the other hand, the reverse cylinder is set for the multiple or parallel connection, the current passes through both motors simultaneously, thence as before to the rail, or ground as it is often termed, due to the fact that the negative is of the same potential as the earth.

The controller in feeding the current should never be moved more than one point at a time, since when the motors are not in motion, the feeding of several points at once reduces the resistance to such an extent as to allow an excessive current to flow, causing the deterioration of the insulation and eventually burning out the field, armatures, etc.

Whenever possible, the serious position of the controller should be used in starting the locomotive from rest. Every time this is done with the controller in the multiple position there is an excess of current flowing at the start, or until the locomotive is accelerated. In shutting off the controller it should always be moved to the off position and never held on any intermediate point.

When the Circuit Is Interrupted, Seek the Cause

When a fuse burns out or the automatic circuit breaker is thrown, there is some reason for it and before replacing the fuse or closing the breaker, search should be made to ascertain the cause. Perhaps the trip is too heavy, or an armature has a ground, or a field is short-circuited. A thorough investigation may save the locomotive from more serious damage. Sometimes copper wire is substituted for fuse wire. This should not be allowed under any consideration.

The locomotive should be examined regularly. A general inspection should be made twice each week, when the electrical connections may be examined to make sure that all parts are tight. Frequently controller contacts may be unduly burned, due to the fingers requiring a little more tension.

The air gap is the space between the armature and the field poles. As the shaft bearings wear down, this air gap becomes less, and if not attended to sooner or later the armature will rub on the pole faces, which results in the destruction of its winding and possibly that of the entire motor. The armature cap bolts sometimes work loose with the same results.

The motor bolts rarely work loose if a proper lock washer is provided, but there is a tendency to use this part over and over again. When the tension of the washer is gone, it is virtually flat, and if used in this condition will invariably result in damage to the equipment.

At the begining of each shift the trolley pole equipment should be lubricated. A drop of oil in the hole on the trolley wheel for that purpose reduces the wear on the bushing considerably. The grease cups, both armature and axle, should have a few drops of oil at the same time. A hole can be made to the axle through the grease in these cups by means of a screw driver. A little oil should then be poured into this hole and the grease pressed down again or the cup refilled. This procedure will save considerable wear on the bearings and a great deal of labor and expense. This is a fairly satisfactory method of securing proper lubrication of these parts.

BY THE WAY

F. N. Cameron, general manager of the Castle Valley Coal Co., the Consolidated Fuel Co., the Castle Gate Coal Co. and the Black Hawk Coal Co., all in Utah, has just gotten out a little booklet for free distribution, suggesting and advocating a campaign of "safety first" on the part of all the employees of his companies. As a basis for the printed matter in the booklet, Mr. Cameron has taken a poem on "Safety First," recently published in Coal Age. This interesting little pamphlet has been printed in three languages, and there is no doubt but that considerable good will result from this unique campaign for greater safety in mining.

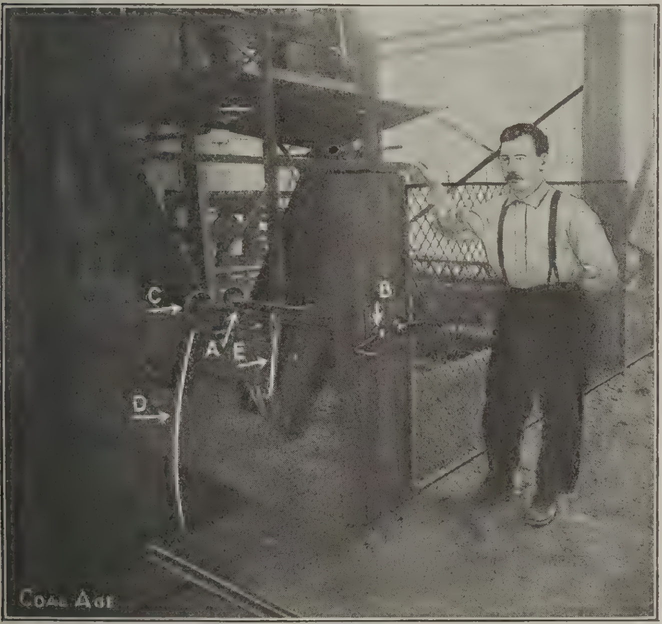
⁂

Thomas Badger (South Yorkshire coroner), addressing the jury summoned to inquire into the cause of deaths of persons killed in the Warren Vale explosion, in 1852, suggested the desirability of establishing a school of mines to teach elementary chemistry and physics to miners and their boys. Fifteen years later the Department of Science and Art, connected with the South Kensington Museum, commenced to send out teachers to coal mining and manufacturing centers, for the purpose of giving technical instruction. One of the best known and most highly successful of these teachers was Mr. Buckmaster, whose district covered the Midland coal field of England. Many readers will remember Mr. Buckmaster.

Safety Lock for Shaft Gates

The accompanying engraving and plans illustrate a safety gate fastener for mine and elevator shafts. Such a device had become imperative because of numerous fatal accidents occurring through persons walking into an open shaft under the impression that the cage was at the landing. This device makes it impossible for the safety gates to open except when the cage is in that position.

The illustration shows the device in position at the surface of the No. 1 mine of the Jenner-Quemahoning Coal Co., at Jerome, Penn. It consists of a shaft *A* supported by two angle irons having circular openings at the top in which the shaft revolves. At the outer end of the shaft is attached a crank *B*. At the inner end is fastened a circular metal disk *C*. On the circumference of this disk is cut a notch. *D* is an arc-shaped spring 14 ft. long, fastened at its lower end to the shaft timbers below the landing, with the curved portion extending into the shaft compartment.



The Safety Device in Position at Shaft Entrance

The object in having the spring arc-shaped is to allow the side of the cage traveling in either direction to strike it at nearly a tangent. At its upper end the spring is bent horizontally to allow it to pass under the disk *C*, the extremity being turned up in a vertical position, to engage the notch in the disk in the manner of a "dog" or pawl on a ratchet, thus preventing movement of the disk either to right or left. *E* is a lever fastened to the shaft *A*, which enables a person standing on the cage to operate the gate lock.

The plan of operation is as follows: When the cage is either above or below the landing, the crank *B* extends horizontally across the movable end of the gate, keeping it closed. The vertical end of the spring prevents the shaft from being revolved by locking the disk *C* in position.

As the cage approaches the landing either ascending or descending the side of the platform strikes the spring *D*, forcing it outward. This removes the dog from contact with the disk, permitting the shaft to be revolved and the gate to be opened.

The commendable features of this device are its simplicity of construction and operation and the effectiveness of its action, it being absolutely impossible to open the gate (except by breaking the mechanism) unless the cage is in position at the landing. The inventor, Mr. D. G. Alsop, of Jerome, Penn., who has patented the device, has also perfected an automatic gate closer as an attachment to the above.

A Large Concrete-Lined Shaft

A new shaft was recently sunk to bed rock at St. Albert, Alberta, eight miles northwest of the business district of Edmonton. This shaft is 29 ft. in diameter, with thick walls of reinforced concrete. It will be used in reaching a bed of coal 8 ft. thick.

The sinking of this shaft was no small task. The earth was dug by a clamshell dredge. When the hole was a few feet in depth, a ring of concrete was poured and permitted to sink. As the dredge dug the excavation deeper, more rings were poured, the construction being continued day by day until the bottom edge struck bed rock. This concrete casing was then cemented and sealed to keep water out of the shaft.

It has been announced that this mine will be equipped with modern machinery, and as soon as the hoisting apparatus is installed the work of drifting through the coal will be begun. The ultimate daily output is placed at 2000 tons. The shaft below the concrete lining is sunk through the rock, the top of the coal vein being 337 ft. below the surface of the ground.

Boiler and Engine House and Temporary Headframe

The company financing this enterprise is a French syndicate of capitalists. It owns in fee a large area of land about a mile from the municipality of St. Albert, and also has extensive leases. The present equipment of machinery and buildings will be enlarged when the mine is putting out its full capacity, and 500 men will be employed as soon as development work is completed.

This coal field was located in 1910, and development work was started a year or so later. The shaft was begun in 1912, the sinking occupying about 10 months. It is expected that work at this mine will be sufficiently advanced so that shipments will begin in a short time.

The builders of this shaft affirm that it is the largest and deepest of its kind in the world. The owners have invested in the neighborhood of $1,000,000 in the enterprise, which is expected to pay handsome dividends from the start of operation. The stock is held by a small group of people, and not a share is on the market.

German Timbering Methods

From a report on mining practice in Prussia during the year 1912, contained in the "Zeitschrift für das Berg- Hütten- und Salinenwesen," Vol. 61, No. 1, the following notes are derived:

At the King Ludwig mine in the East Recklinghausen district, iron* timbering is extensively used. In some parts, especially when the coal contains much gas, the posts and cross-pieces of "timbering sets" are curved so that each is about 3.2 in. out of a straight line at the middle; see Fig. 1. This method has proved satisfactory. The members being fixed firmly at their ends by the incrushing action of the roof and sides serve to convert bending stresses into thrusts, which the material is better fitted to resist.

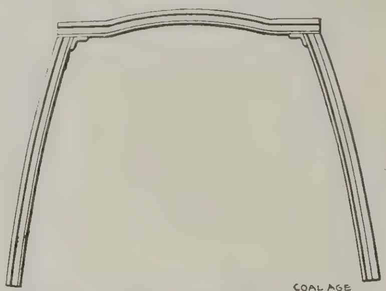


FIG. 1. CURVED "TIMBER SETS" IN GERMAN MINES

At the Recklinghausen I mine in the Herne district, iron and timber sets are cushioned against roof and side pressures by inserting at the joints of post and crosspiece, wooden blocks which, by their elasticity are said to increase the durability of these to a considerable degree (see Fig. 2).

In the Lietstolln region of the Obernkirchen general mining department, South Hanover district, it has been the practice to point the props in order that on subsidence of the roof they may penetrate the soft shale of the floor. In many parts of the workings, however, hard concretionary bodies in the clay oppose the entry of the props, so that they and the cross-pieces break under the roof pressure. Experiments have, therefore, been made with the yielding posts made by Hermann Schwarz, in Kray, Rhineland.

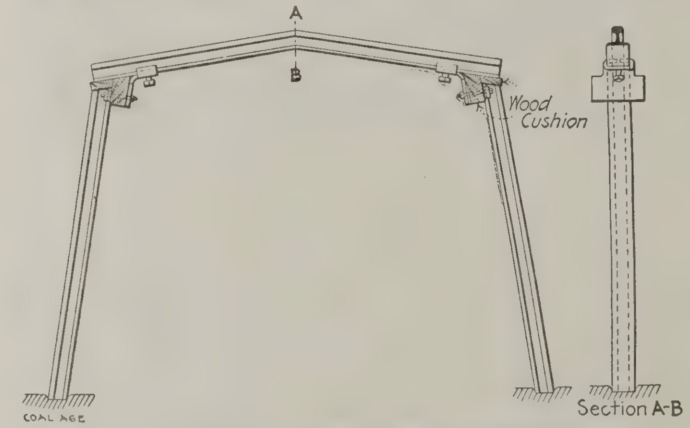

FIG. 2. A CERTAIN DEGREE OF ACCOMMODATION TO ROCK MOVEMENT IS PROVIDED BY WOOD CUSHIONS

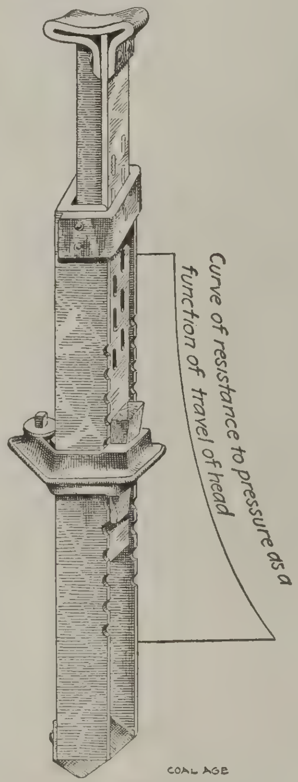
A POST WITH A CERTAIN DEGREE OF "GIVE"

Inside of the channel-iron side post of a "timbering set" a T-iron is caused to slide. This sliding member is shaped like a wedge at the bottom and conformed at the top so as to support the cross-piece. When the T-iron has been slidden up in the post so as to protrude above it as high as is required, it is clamped there by means of a strap and wedge. This rectangular strap, which surrounds the post, has an eccentrically arranged screw bolt, which bears against the back of the U-frame opposite the T-iron, so that the strap does not press against the post directly. A wooden wedge is then driven between the strap and the wedge bottom of the T-iron, so as to clamp it.

Under pressure of the roof the wedges gradually slide together and allow the T-iron to settle. When the roof above the entry has subsided to the packing and no further retraction of the T-iron is observed, the composite iron post is removed elsewhere, being replaced by a weak prop of about 5.2 in. diameter and 6 ft. long. The iron posts are removed by a quarter turning of the bolt, thus loosening the wooden wedge and T-iron in the frame till the headpiece can sink. The experiments with these posts are not yet concluded.



Curve of resistance to pressure as a function of travel of head
COAL AGE

FIG. 3. STEEL ROOF SUPPORT

[This post is illustrated in the accompanying drawing. The curve on the right shows the resistance to compression by horizontal ordinates. It will be seen that the post resists almost four times as large a pressure when at its shortest length as it will resist unyieldingly when fully extended. By changing the wood wedge for one less compressible, the resistance of the post to compression may be increased at will and the adjustment of the position of the wood wedge relative to that of the moving part of the post provides a similar choice in compressive resistance.

These posts are also made by R. Centner Fils, of Verviers, Belgium, and the makers assert that several thousand of them are in actual service and that they save about 6c. per ton, in the cost of the coal at ruling prices of wood posts in Europe.—ED.]

A New Type of Colliery Fan

Although in a good many departments, colliery practice appears to have become standardized, improvements of a radical description frequently arise which open up new possibilities to the colliery engineer. An instance of this kind is to be found in a new type of fan which has recently been introduced in South Wales and which possesses some very distinctive features. This fan, which is produced by the Turbon Patent Fan Co., Ltd., of Llanelly, is here illustrated with the casing removed.

It will be seen that the runner is of peculiar design. In general outline it resembles the usual drum-shaped, multi-blade type, but instead of being made up of a large number of narrow blades of great axial length secured by rivets, the new runner consists of rings pressed into a corrugated shape, and made to interlock with each other in such a way that no rivets are required.

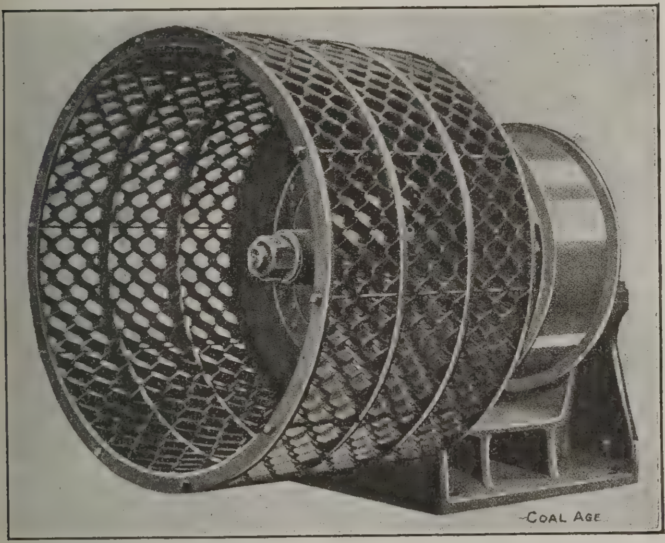
---

*The word "iron" may be used here in a broad sense to cover steel.

The corrugated rings are secured between the driving disk and a holding ring by means of stay-bolts binding the whole construction firmly together. In this way it is impossible for any ring to move out of place, because at every corrugation it is locked into the adjoining rings, and since all the rings are pressed from the same dies, they are perfect duplicates. Hence the runner is self-centering and self-balancing. The importance of this property in connection with the high fan speeds which are employed in connection with fans direct connected to electric motors cannot be overestimated.

It will be seen that this method of construction gives exceptional torsional strength to the fan. The rings are much better fitted to withstand the driving strain transmitted to them than the usual type of blade which is secured by a short lip bent at right angles and riveted to the disk.

The runner can be easily taken apart by unscrewing the nuts from the stay-bolts and drawing off the rings. Hence in case of accidental damage it is an easy matter to replace one or more of the rings. Another important feature is that the rings can be reversed so that the runner is suitable for revolving in the opposite direction and when required the casings can also be made reversible, so that the same fan is suitable for conditions which require either clockwise or counter-clockwise rotation. The casing is, of course, of the spiral type and does not differ materially from that of the ordinary inclosed fan.



New Fan with Casing Removed

Another important point is that the form and construction of the blade rings makes the runner especially suitable for use with high temperatures. The blades being formed of a series of curves, makes them sufficiently elastic to allow of expansion in all directions without the slightest strain on any part of the runner. Hence the fans are useful for a large number of factory processes such as the production of induced draft for boilers. Under these circumstances they can be worked at temperatures up to a dull-red heat.

As regards silence, in operation, it must be remembered that the ordinary fan has a sort of paddle-wheel action, the blades passing the outlet in a series of beats tending to cause vibration and noise. With the new runner, the movement of the blade rings past the outlet is a continuous one, the pulsations being smoothed out, resulting in a continuous output of air. The turbine-like construction assumed by the blade rings when assembled, gives an exceptionally high yield in volume and pressure, while the hold obtained on the air is more effective than in the series of oblong passages.

The capacity compared with overall dimensions is extremely high, and efficiency is maintained over a wide range of conditions. The fan has a high manometric capacity, maintaining high pressures at low blade-tip speeds. On the other hand, owing to the fact that holding rings can be placed between the blade rings in high-speed fans, any required strength to resist centrifugal stress can be easily obtained and hence the fan is well adapted for running at excessive velocities.

The particular runner shown in the illustration, having two inlet holding rings, is designed for water gages of 6 in. and over. Hence the claim can be made that these fans are useful for either high, low or intermediate pressures. Owing to its great adaptability to varying conditions, its strength and simplicity of construction, this new type of fan appears to offer great possibilities, and it will be interesting to watch in further practice how these are realized.

⁂

Explosion in a Welsh Colliery

Special Correspondence

One of the worst mine disasters in British history occurred Oct. 4 in the Universal Colliery at Senghenydd, Glamorganshire. The day shift comprised 935 men. Of this number 489 have been rescued alive, and 12 miners were brought out dead. This leaves 434 men still entombed in the workings.

The explosion occurred about two hours after the men had descended into the mine. The force of the explosion demolished the headframe at the shaft and shook the entire town.

Rescue work was started immediately, and it was due to this prompt help that so many men were brought to the surface uninjured.

Owing to the tremendous falls of roof and the effects of afterdamp and flame, rescue work was abandoned temporarily, and all attention was turned to an effort to control the fire that had resulted from the first explosion. All the men remaining in the mine cannot be reached until the fire has been overcome.

The Universal mine is known as a gaseous colliery and it is stated that on the day before the explosion occurred (Monday) certain portions of the mine were so gassy that they were closed off and no one was permitted to work in these dangerous sections. An explosion in this same mine in 1901 caused the loss of 81 lives.

The violence of the present explosion is clearly indicated by the fact that one man who was working on the surface, 20 yd. from the pithead, was decapitated by the force of the blast. The rescue party was composed of miners belonging to the night shift. They entered the mine by way of an adjacent shaft, and in this way saved the 489 men who were found huddled together in those parts of the workings where the ventilation was still good. The 12 men who were brought up dead had been killed by being dashed against the sides of the entry.

Convention of American Mining Congress

The First National Mining Exposition to be given in Philadelphia, Oct. 17 to 25, under the auspices of the American Mining Congress, has gone far beyond the expectation of its promoters, and promises to be a trade gathering of much importance.

The American Mining Congress, which is to hold its convention at the same time, will bring to Philadelphia a large number of the leading mining men of the country, and these will attend the exposition in addition to those who will come solely for the exhibit. Considering the short time that the exposition has been under way, it promises to be a most interesting show.

A number of the exhibitors and their exhibits are as follows:

Westinghouse Electric & Manufacturing Co., Pittsburgh, and Baldwin Locomotive Co., Philadelphia, mine locomotives; Western Electric Co., New York, mine telephones; Milwaukee Locomotive Co., Milwaukee, Wis., gasoline mine locomotive; Universal Portland Cement Co., Chicago, Ill., use of cement in mining; Streeter-Amet Weighing & Recording Co., Chicago, automatic weight recorder for mine tipple scales; the Lobdell Wheel Car Co., Wilmington, Del., car wheels and axles as applied to mining cars; J. S. McChesney & Co., Chicago, mine supplies; Williams Patent Crusher & Pulverizer Co., Chicago, a coal crusher; Atlantic Refining Co., Philadelphia, lubricating oils; Hirsch Electric Mine Lamp Co., Philadelphia, miner's cap and lamp; Henry Troemner, Philadelphia, assay and analytical balances; West Virginia Rail Co., Huntington, W. Va., steel rails; Keuffel & Esser Co., Hoboken, N. J., mathematical and surveying instruments; C. O. Bartlett & Snow Co., Cleveland, Ohio, working model of a complete coal-handling plant; American Tempering Co., Springfield, Ill., a system of welding; Hyatt Roller Bearing Co., Newark, N. J., mine-car wheels with roller bearings; Roessler & Hasslacher Chemical Co., New York, the sodium compounds used in mining; Link-Belt Co., Chicago, elevating, conveying and transmission machinery; Fairmont Mining Machinery Co., Fairmont, W. Va., portable electric mine pumps, etc.; Draeger Oxygen Apparatus Co., Pittsburgh, Penn., life-saving apparatus; General Electric Co., Schenectady, N. Y., electric machinery and appliances; Jeffrey Manufacturing Co., Columbus, Ohio, storage-battery locomotive, etc.; John A. Roebling's Sons Co., Trenton, N. J., wire ropes and cables; the Alexander Millburn Co., Baltimore, Md., carbide lamps, etc.; Main Belting Co., Philadelphia, belting; Electric Storage Battery Co., Philadelphia, storage batteries designed for mine locomotives; Goodman Manufacturing Co., coal-mining machinery; John G. Scott, Girardsville, Penn., patented transmission rope clip; Edison Storage Battery Co., Orange, N. J., storage batteries and electric mine lamps.

In addition to the above, there are twenty or more representative mining concerns that are just closing up negotiations for space in the exposition.

⁂

Bells or Kettles

By H. D. Easton*

Nearly all coal miners are more or less familiar with the so called *bells* or *kettles* that so often occur in the roof above the coal. These bells are the fossil remains of tree stumps, and being larger at the bottom than at the top, they slip out of their sockets in the roof in a deadly manner; upon being sounded they may appear to be perfectly solid and safe, yet they will fall suddenly without giving the slightest warning to the men working beneath or near them. These bells are invariably coated with a thin skin or layer of coal which permits them to fall out of the roof, the origin of this thin coating of coal always being a source of wonder to the miner.

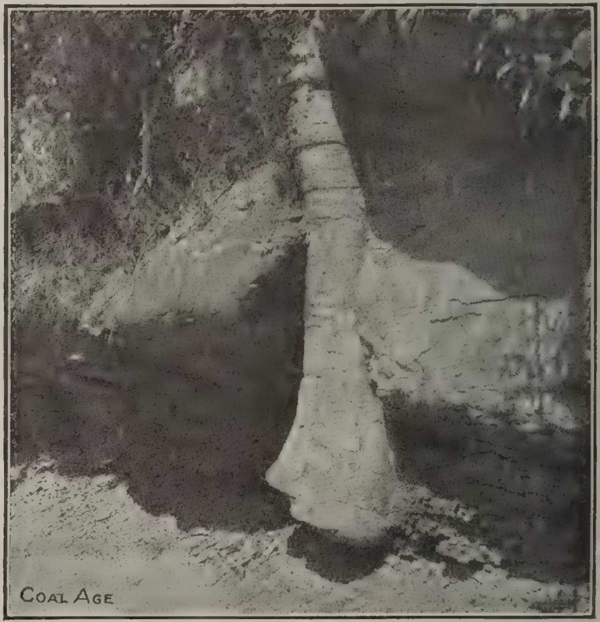
The Fossil Tree at Harlan

The accompanying photograph furnishes the best illustration of one of these fossil stumps that I have ever seen. This bell is in a soft shale beneath the Hazard coal on the bank of Greasy Fork, in Harlan County, Kentucky, and is on the property of the Pine Mountain Settlement School. It measures 26 in. in diameter at the base, 10 in. at the top and is 8 ft. in height. It carries the thin covering of coal wherever it is in contact with the shale, but the exposed surface has nearly all of the skin of coal removed.

These trees have their modern representatives in our common horsetails. The *Lepidodendra* trunks rose fully 50 ft. in the air, and the genus *Sigillaria* grew equally tall. The roots of these trees are among the fossils most generally found in the coal fields; the pitted and tubercular roots, so often uncovered are known as *Stigmaria.*

How the Coal Skin Forms around Bells

The theory regarding the formation of these bells with their thin skin of coal is well illustrated by the conditions now existing at Reelfoot Lake, in northwestern Tennessee, where, in 1911, an earthquake caused a subsidence which destroyed many large trees. It is reported that the trunks of the trees in this lake are wholly decayed except the outer ring of sapwood. It is readily seen that the core of such a stump could become filled with clay or sand which, under proper conditions, would change into rock, while the sapwood, still remaining, could form a skin of coal covering the core. In some cases these hollow stumps might not be filled until the sediment outside reached their tops, and the core, thus made subsequent to the deposition of the surrounding material, would then be composed of a material corresponding more closely with the strata at the top of the stumps rather than with that immediately surrounding them. It is usually true that these fossil trees are of a different composition from that of the strata in which they are found.



A Fossil Tree Trunk in Harlan County, Ky.

POWER DEPARTMENT

A Big Electrically Driven Air Compressor

Special Correspondence

SYNOPSIS—Although many mines have made installations for electric generation, transmission and utilization of power, some have, for various reasons, seen fit to use compressed air at the working face. This article describes a large electrically driven air compressor in use in South Wales.

⁂

Since the introduction of electricity into colliery operations, there has been a certain amount of rivalry between the new means of power production and transmission and older forms, such as compressed air. Each method has its advantages. Electricity, of course, is capable of transmission with the minimum amount of loss, the cables are flexible and can be led anywhere, and when due provision is taken as regards good installation and maintenance, its safety is fully equal to all colliery requirements.

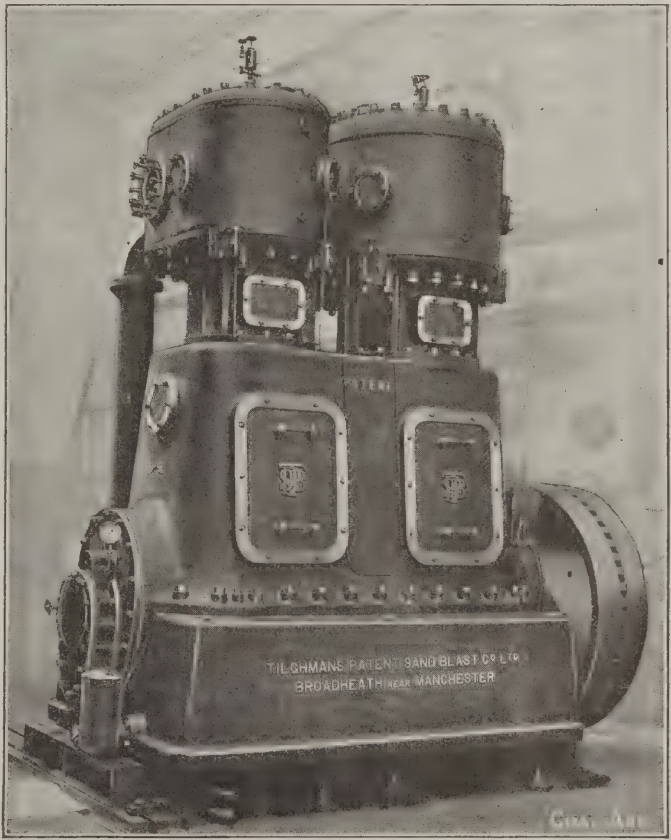
On the other hand, compressed air is much in favor, especially for drills, coal cutters and similar portable equipment. The exhaust provides a quantity of pure, fresh air at a low temperature, which greatly assists the conditions of operation at the working face. The chief disadvantage with regard to compressed air is the high cost of an efficient system of transmission and the inevitable loss of power which occurs due to leakage and temperature changes.

As colliery workings become more extended, electricity comes more and more into use. Obviously in those plants where a small central station is installed to operate the power-consuming appliances throughout the mine, the question arises as to whether it is not advisable to combine the advantages of the two systems, by installing electrically driven air compressors which can be operated at high efficiency, the compressed air thus obtained being then utilized in standard power-consuming appliances.

In a good many instances, this course has been adopted and attention may therefore be drawn to what is probably one of the largest installations of electrically driven air compressors for mine purposes which is at present in existence. This is to be found in the mines of the Great Western Colliery Co., Ltd., of Pontypridd, South Wales, and consists of two compressors of the type shown in the illustration. Each of these machines has a capacity of 2000 cu.ft. of free air per min., when running at a speed of 290 r.p.m. The diameter of the low-pressure piston is 28 in., while that of the high-pressure piston is 17 in., the length of the stroke being 12 in. They are suitable for a working pressure of 100 lb. per sq.in., and are each driven by an electric motor of 400 hp. One of these sets is installed at Llantwit Vardre, and the other one at Maritime colliery, Pontypridd.

The machines are of the vertical, high-speed, two-stage, double-acting type, inclosed and thoroughly water-jacketed. They were constructed by Tilghman's Patent Sand Blast Co., Ltd., of Manchester. The air cylinders are fitted with valve chambers, arranged at the back, these being water-jacketed together with the cylinder heads. The pistons are of the box-pattern type, fitted with cast-iron packing rings.

The cylinders are fitted with automatic multiple-plate valves. In the valve chest an independent inlet and outlet valve is arranged at each end of the cylinder and the common trouble of carbonized oil on the valves due to the heating of the air during compression, is prevented by the thorough water-jacketing previously mentioned. Each valve consists of six plain, thin steel plates or rings working on a removable cast-iron seat, a suitable guard plate being provided to control the lift of the valve.



TILGHMANS PATENT SAND BLAST Co LTD
BROADHEATH NEAR MANCHESTER
COAL AGE

The Air Compressor on Builder's Testing-Floor

The two plates next to the valve seat are made perfectly flat and the remaining four are slightly buckled, forming a simple and reliable spring, which, owing to its length, is not liable to break. The number of plates and the degree of buckling is arranged to suit the air pressure and speed at which this type of compressor operates. Each valve and spring, together with its seating and guard, can be removed as a whole for inspection. The four seatings are held in position by one through bolt, rendering the removal of any of the valves a simple and easy matter.

On the inlet or discharge sides of the machine, an automatic unloader is provided, which throws off the load when the air pressure in the receiver exceeds that required and allows the compressor to run light until the pressure drops to normal. The discharge unloader is provided with a back pressure valve, allowing the compressor to be started up from rest against no-load with the full working pressure in the receiver.

Pressure Lubrication Is Employed

Lubrication of the bearings and slides is effected by oil under pressure, while the cylinders are lubricated through a forced sight-feed lubricator on the front of the center box. The intercooler is of cast iron and is placed in a vertical position at the back of the machine, the cooling tubes being of brass secured in position in packed glands in the tube plates in the same manner as with ordinary steam condenser tubes.

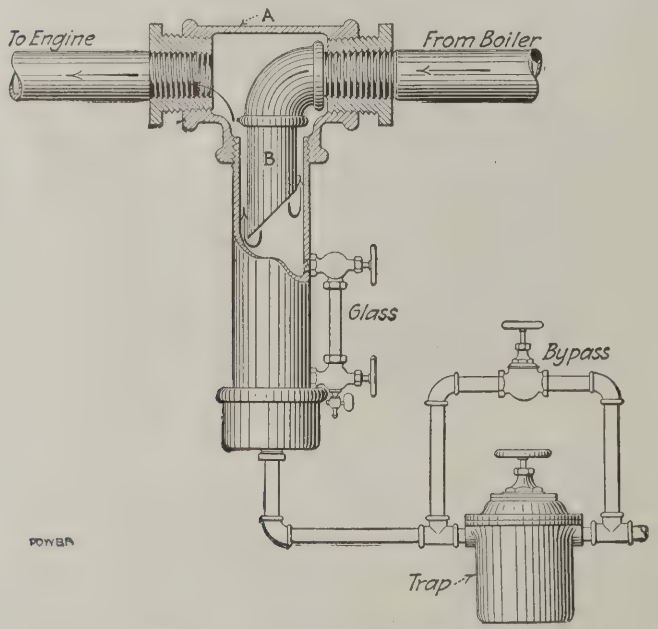
The photograph shown was taken in the shops of the manufacturers before shipment to the colliery, but since installation, it has been found that these compressors run in a satisfactory manner, thoroughly fulfilling the purpose for which they were installed.

⁂

An Improvised Steam Separator

The illustration clearly shows the construction of a steam separator made of pipe fittings, says Martin McGeery, in *Power* of Oct. 7, 1913. The size of the fittings used will, of course, vary with the size of line on which the separator is to be placed.

The tee *A* should be much larger than the steam line to allow sufficient steam to get through the separator.



Construction of the Separator

By cutting the nipple or short length of pipe *B* on an angle, as shown, turning the long side toward the direction of flow, I believe more water can be taken from the steam than if the nipple is cut straight across.

A gage-glass is fitted to the drop leg and a steam trap is placed in the line draining this leg. This type of separator can be easily and quickly made and gives fairly good results.

Home-Made Emery Wheel for Grinding Valves

I have heard and read of many ways of grinding valve seats, says E. E. Thompson, in *Power* for Oct. 7, 1913, but never heard of a method like my own: Remove the disk holder from the valve stem and cut out the composition disk and fill up with emery with just enough thin glue to make the emery damp. Smooth off the top and set away for a few hours; when the mixture hardens it makes a good emery wheel of the proper size. Place it in the valve and turn with a brace. If it is desired to use the disk holder in the valve, submerge it in warm water for a few minutes and scrape out the softened emery.

⁂

Recent Legal Decisions

Nondelegable Duty of Coal Operators Toward Miners in Washington—The duty of coal operators under the laws of Washington to provide sufficient ventilation in their mines for the safety of employees is absolute in the sense that the operator is liable for failure of one to whom the duty has been delegated to perform it. **(Washington Supreme Court, Davies vs. Rose-Marshall Coal Co., 134 Pacific Reporter, 180.)**

Rights of Purchasers of Corporate Stock—One who buys shares of stock, without notice of any claim existing in favor of the corporation against the person from whom he purchased, is entitled to compel the company to register the transfer on its books, or to recover damages resulting from its refusal to do so, and, hence, cannot recover against the seller on the theory of a breach of warranty as to his title. **(Arkansas Supreme Court, Bankers' Trust Co. of St. Louis vs. McCloy, 159 Southwestern Reporter, 305.)**

Actionable to Induce Breach of Contract—It is an actionable wrong to induce another to break a contract with a third person. **(Maryland Court of Appeals, Cumberland Glass Mfg. Co. vs. DeWitt, 87 Atlantic Reporter, 927.)**

Scope of New York Coal Sales Law—The law enacted in New York in 1911, making it a misdemeanor to deliver coal sold, without delivering a scale ticket to the buyer, applies to sales to retail dealers, as well as to ultimate consumers by dealers. **(Onondaga County, New York, County Court; People vs. Delaware, Lackawanna & Western Ry. Co., 143 New York Supplement, 159.)**

Duty to Keep Mine Roofs Safe—Kansas coal operators are bound to use a reasonable degree of care to keep the roofs of their mines in a reasonably safe condition for miners who are required to work under them. **(Kansas Supreme Court, Reynolds vs. New Century Mining Co., 133 Pacific Reporter 844.)**

Liability for Injury to Minors—A West Virginia coal mining company is liable for injury to a boy miner put to work by the company's mine boss, without being instructed against dangers not appreciated by him. But a boy more than 14 years old is presumed to know the ordinary dangers of his employment, though this presumption may be rebutted. **(West Virginia Supreme Court of Appeals, Sprinkle vs. Big Sandy Coal & Coke Co., 78 Southeastern Reporter 971.)**

Validity of Employment Contract—An agreement to employ plaintiff to do certain work in digging a slope and in driving an air course in defendant's coal mine, until defendant should begin shipping from the mine, was not unenforceable as being uncertain as to the duration of the contract. **(Alabama Court of Appeals, Barney Coal Co. vs. Davis, 62 Southern Reporter 895.)**

Injury Caused by Defective Appliance—A coal company is liable for injury to an employee caused by the company's failure to provide suitable blocks for his use in blocking cars as they descended a gravity switch to a shaft. **(United States Circuit Court of Appeals, Second Circuit; Lehigh Valley Coal Co. vs. Shondalla; 205 Federal Reporter 715.)**

Use of Dockyard by Public—A fuel company which maintains a dockyard does not impliedly dedicate any part of the premises as a public street, by merely permitting use by persons not transacting business with the company; it is necessary to show an express intent to dedicate land as a street before an implied dedication will be declared by the courts. **(Georgia Supreme Court, Savannah vs. Standard Fuel Supply Co., 78 Southeastern Reporter 906.)**

EDITORIALS

Comparatively few mining men realize the growing demand for technical knowledge and fair acquaintance with the theory and principles relating to mining, on the part of all mine officials. The man who thinks he has nothing to learn is the one, in truth, who has the most to learn. Whether we believe it or not, the man who ceases to study and read will retrograde, and must give place to his fellow worker who keeps more abreast of the times.

⁂

The suggestion that the eyesight of miners is injured by the burning of inferior oil in mine lamps, is a good one. While it cannot be doubted that certain diseased eyes develop what is known as miner's nystagmus; and that this disease is, perhaps, more common in districts where safety lamps are used exclusively, than elsewhere; it has not been proven that healthy eyesight is at all affected by the constant use of this lamp. Indeed, the evidence is to the contrary. There are too many contributory causes, in mining work, to regard the safety lamp as having any positive ill effect on the healthy eyesight of miners.

⁂

Retrospect and Prospect

THE PAST

One brief glance backward into the past of coal mining is sufficient to convince even the skeptical mind that the interests of the operator are those of the miner. These two factors in the coal-mining industry are indissolubly associated. It was the deepening and growing realization of the practical need of the HUMAN FACTOR in the operation of mines, two years ago, that gave birth to COAL AGE. Since that time no effort has been spared by the editors to foster the growth and encourage the development of all that pertains to humanizing the operation of coal mines.

THE PRESENT

Today, the recognized cornerstone of all effort for improving conditions in coal mining is the *practical training and education of mining men.* We are glad to say that this work has received the hearty indorsement and coöperation of all the larger coal-mining companies. Many of these have organized independent educational agencies, in the mining camps and at the mines in their charge. To further this work is the constant aim of COAL AGE. That we are succeeding is clear from the increasing interest of readers, and the earnest endeavors of writers for the paper, to engender an atmosphere that will, at once, help the miner and benefit the employer. The many articles written and questions discussed are encouraging men to write who never wrote before for publication; and, as a result, the "human element" in the coal-mining industry today is the recognized link that binds the operator to his employees; and the miner to his employer.

THE FUTURE

The future is bright. It promises more earnest, intelligent and united efforts on the part of all who honestly desire to improve the condition of mine workers, and establish a more safe, sound and equitable basis of operation. In that work, we, of COAL AGE, hope to play our humble part.

⁂

Cancer, A Coal-Smoke Disease?

Two weeks ago, we read that tuberculosis carried away more miners than were killed by the coal industry. This we considered a severe criticism, for have we not been taught that our accident death rate was an offense against Christendom?

And now a new charge is brought against the coal industry and we learn on excellent authority that cancer is caused by the burning of coal. Charles E. Green, of Edinburgh, is first sponsor for the idea, and Sir William H. Bennett, an eminent surgeon and president of the Coal-Smoke Abatement Society, at its recent meeting, indorsed his views, as being conclusive. To quote the message:

> Sir William said that investigation had shown that the incidence of cancer was limited to those areas where coal was a staple fuel, while it was almost nonexistent where ordinary peat alone was used. The only exception yet discovered to this rule, he declared, was in districts where the peat was a hard black substance which crackled like coal and was quite unlike the ordinary smoldering peat. Sir William in conclusion spoke strongly in favor of gas as a substitute for coal.

On such flimsy evidence do the smoke abaters base their claims as if a sufficient indictment could not be drawn without resting on such clouds. The peat countries are not successful industrially; they are, therefore, largely occupied by farmers, cattle raisers, and those engaged in manual trades. Probably this has more effect than smoke on the infrequency of cancer.

As a matter of fact, if statistics are to be taken as of their face value, smoke abatement will increase rather than diminish cancer. We will not compare Arcadia with Babylon, but will balance some industrial communities, using smoky fuels, with some of those which are using anthracite, which gives no smoke.

CANCER IN 1900

City	Deaths	Population	Deaths per million people
Philadelphia	806	1,293 697	6.23
New York City	2060	3 437,202	5.99
Scranton	40	102,026	3.92
Pittsburgh	117	321,616	3.64
McKeesport	8	34,227	2.34

Note how Philadelphia, New York City and Scranton, which all use large quantities of anthracite, have higher cancer death rates than cities using smoky soft coal. We cannot say that anything definite is proved, however, because into Scranton a large percentage of foreign adults is constantly entering, and Philadelphia and New York are both augmented yearly by grown persons, native and foreign. In consequence of that, the disease which attacks adults more than youth, may have a better chance to get in its fatal work.

The same exception may be taken to another table. Those who die by violence or consumption in their youth cannot die of cancer in their age, for death by the former is a sure preventive of a later decease by the latter. We give the table, however:

CANCER AND OCCUPATIONS PER 100,000 IN 1900

Sailors, pilots, fishermen and oystermen	113.1	Miners and quarrymen	33.4
Blacksmiths	107.3	Steam railroad engineers	30.9
Clergymen	102.2	Bookkeepers, clerks and copyists	28.0
Brick and stone masons	98.0	Saloon and restaurant keepers	28.0
Farmers, planers and farm laborers	87.7	Draymen, hackmen and teamsters	22.6
Carpenters and joiners	77.7	Compositors, printers, pressmen	22.1
All occupied males	57.1	Plumbers, gas and steam fitters	8.2

The following facts, however, will show, we think, how careful we should be in accepting the strange conclusion that clear air promotes cancer. The first three classes as a whole, live to more than the usual span of life. At 65 years of age, 55 per cent. of the clergymen are alive, 36.8 per cent. of the sailor group and 44.2 of the blacksmiths. So they live till cancer can attack and kill them. On the other hand, there are but 8.2 per cent. of the plumber group who live till 65, so they die too young for a high cancer death rate.

We are not disposed to believe that smoke causes cancer or destroys it. The imagination of the blue-sky advocates, commendable as it is, has repeatedly driven them to sensational and impossible statements.

⁂

The Element Sulphur

The lithosphere is the name given to that *outer* part of the earth of which we have knowledge. Of the inner part we can only hazard the most uncertain guess, while of the outer ten miles, we can form a reasonably correct idea.

F. W. Clarke says that one-tenth of one per cent. of that outer ten-mile shard, called the lithosphere, is sulphur, and he estimates that about eleven-tenths per cent. of that element is found in the igneous rocks. Hence it is clear that he believes that the sedimentary masses forming 5 per cent. of the whole lithosphere contain an inappreciable amount of sulphur.

And to a certain degree that is true; though the coal-mining engineer who nearly always finds 1 per cent. in his coal and may discover nodules and flakes of pyrite which will bring the percentage up to 10 per cent., is sometimes disposed to think that sulphur is somewhat generally disseminated through the earth's sedimentary rocks. In fact not a few engineers will declare that the pyrite in coal arises from solutions which entered after the coal was formed, forgetting that if these nodules and flakes were mere sedimentations, they would probably be found with almost equal frequency wherever there were cavities in roof or floor. It is true they might not be sulphides because of the absence of methane in bituminous rocks to convert the sulphates into unoxidized bodies.

Peat and all the other forbears of coal, oil, and bituminous shale, had a power of absorbing sulphur, which element is, like carbon, a marked constituent of living bodies. It is consumed by some bacteria just as is nitrogen. It is found in all vegetation and is a component of albumen. It is found abundantly in all hair. When fecal and other matters putresce, the evil odors may be largely traced to mercaptans, of which sulphur is an important element.

In purified Trinidad bitumen also may be found 6 per cent. of sulphur, and some asphalts contain as much as 10 per cent. The natural gases of Ohio and Indiana show 0.17 per cent. of sulphur and those from California and Canada are also sulphur-bearing. The same is true of petroleums, the oils of Texas, California and Syria being sulphurous.

When discussing the presence of sulphur in sedimentary rocks, it must be remembered that easy as its presence is to determine, important as are its effects in the clay-manufacturing industry, many chemists do not seek to determine its quantity in the rocks they analyze, and their failure to list it in their reports does not prove its absence. Nevertheless the fact that it is almost never found disseminatedly present in nonbituminous sedimentaries in percentage over unity in recorded analyses shows that it is not nearly as prevalent in nonbituminous rocks as in those which are bituminous.

It is not often found in the United States even in limestones. In Pennsylvania, 110 analyses of that mineral quoted in the Pennsylvania State College report 1899-1900, averaged 0.08 per cent. of sulphur, or less than one-tenth of 1 per cent., and there were 163 analyses which ignored the element entirely. The highest analysis showed 2.43 per cent. and the next 0.314 per cent.

A careful perusal of E. C. Eckles "Building Stones and Clays" will show a like absence of sulphur. We have tabulated the analyses which he quotes, as follows:

SULPHUR IN SEDIMENTARY ROCKS

Number of Samples	Kind of Material	Average Per Cent.	Maximum Per Cent.	Number of Samples with Sulphur Undetermined
48	Slates	0.202	0.92	127
628	Sandstones	0.032	......	0
6	Molluscan shells	0.177	0.324	....
843	Limestones	0.102	......	39
...	Marbles	......	......	1
...	Clays	......	......	24

A. C. Fieldner's analyses have shown how modern peat bogs are as full of sulphur as ancient coals. And this is not hard to believe, for there is, according to Warrington's "Chemistry of the Farm," almost as much sulphur as lime in the reaped part of a wheat plant. However, while the albuminous parts of all plants, the seeds, are richer in sulphur than in lime, the stalk and leaves are much richer in lime than in sulphur, so that hay, having small seeds, has 5 to 10 times as much lime as sulphur.

It is quite possible that the large beds of coal ceased growing not so much because of unfavorable atmospheric conditions and prejudicial earth movements, but from soil depletion and among the salts removed may have been those soluble sulphates necessary for plant life. The metabolism of the plant had made the sulphur in its make-up unsuited for further use in the vegetal economy.

Though the sulphur appearing as pyrite in coal is largely segregated, it does not follow, though the supposition is not wholly impossible, that it entered from the outside *after* the coal was formed; in fact, it probably entered the plant as part of its juices, remained as a sulphate or later became one, and was dissolved and deposited as a sulphide in cavities, the methane in the coal being able to achieve this chemical reaction.

BOOK REVIEW DEPARTMENT

THE COAL RESOURCES OF THE WORLD. An inquiry made on the initiative of the executive committee of the Twelfth International Geological Congress. Canada, 1913. Edited by W. McInnes, D. B. Dowling and W. W. Leach of the Geological Survey of Canada, 3 volumes, 8⅜x11¼ in., in all 1266 pp. with atlas, 13½x19½ in. with 48 maps, of which 19 occupy two pages. The reading volumes also contain several maps. Morang & Co., Ltd., Toronto, Can. Paper boards. Price $25.

This authoritative work completely covers the coal resources of the world as now known and does it, with exceptions, in a truly well balanced manner. One of the marked exceptions is the United States which receives only 16 pages for the description of its continental resources. Compared with Japan which occupies 70 and China which has 81 and Canada 86, the showing is somewhat meager but perhaps the citizen of the United States would rather buy a volume which tells him about foreign countries than one which gives him, in regard to his own, at a considerable price, what he can get for little or nothing and in more detailed form from the Geological Survey. British India is most inadequately treated in a bare 12 pages. However, as we have said, every country containing coal has its deposits described and their areas estimated in these volumes.

J. M. Gordon has severely criticised the method of classification adopted in the preparation of this book, but we cannot say we agree with his remarks. A division of coal had to be adopted such as would permit a report to be issued within reasonable time. Probably there is no country in the world where a classification could now be made on the basis of the plant life of which the coals are made up, and even if it were done, we think, it would be less useful and less instructive a classification than one based on fuel ratio or volatile content, despite all the valid objections to these methods of defining fuels.

Does Mr. Gordon seriously believe that in the future, the man on the street will order his merchant to send him ten tons of lepidodendrous or equisetaceous coal or a power user specify a fuel with a large percentage of asterophyllites? As a matter of fact, do not the age of the coal, the flow of sediments, the action of thrusts, the intrusion of dykes, the pressure and imprisonment by sediments and perhaps even the ground on which the peat-bog grew, modify the fuel more than the plant life of which it is composed?

Probably the lower Kittanning coal in Cambria County, Pennsylvania, is composed of precisely the same vegetation as the same seam in Jefferson County of the same state because the conditions under which it was produced were essentially similar and the growth in the two areas synchronous; but one is a high-carbon fuel and the other a coking coal; one is reasonably free from sulphur, the other a fuel with much sulphur impurity; one is clean, the other dirty; one smokeless, the other smoky; one disposed to break into small columnar bodies, the other large and blocky, one has no marked cleavage, the other has a well marked face and butt.

Paleobotany will never explain and delimit all these differences any more than a family tree will determine the occupation and annual income of a man. So many later influences arise that a description of a man or a chunk of coal as they now are will always be more explicit of actual qualities than a pedigree of these things can ever hope to be.

It is true, the fuel ratio does not divide coals into all the divisions the public would wish to have recognized, does not indeed separate coking from noncoking coal with precision, nor valuable from valueless fuel, but we feel that paleobotanical divisions would be far less satisfactory even if supplemented by the keenest petrographic subtleties.

We confess that we believe the classification used for this monograph is the best now available, as it does not rely wholly on fuel ratio but recognizes the effect of moisture.

The reader will be surprised to learn how generally coal is found and mined. Turkey is rarely regarded as a coal country, yet Leon Dominian states that Heraclea in Turkey produces about 827,000 short tons a year, a quantity larger than is credited to Brazil, Switzerland and Turkey in the Geological Survey Report of 1911.

Coal is found also in several parts of Ireland notably Leinster, Tipperary, Antrim, Sligo and Tyrone. Everywhere the beds appear to be badly tilted and broken by faults. Especially interesting to the coal men of the United States are the deposits of coal along the west coast of the Pacific in Japan, China and the Philippines. The coal appears to be of good quality, often containing less than one-half of 1% sulphur and not much ash. Even after the Panama canal is completed it is likely that countries of eastern Asia, will supply their own coal and may send much fuel to the United States, when their resources are thoroughly developed.

EXCAVATING MACHINERY. By A. B. McDaniel, assistant professor of civil engineering, University of Illinois. 329 pp. and index; 6x9⅜; copiously illustrated. McGraw-Hill Book Co. 239 W. 39th Street, New York. Cloth boards. Price $3.

This book will fill an important place in modern engineering libraries. It is a preëminently practical treatise on the art of excavating by machinery and gives the costs of handling by different methods and in some cases also the cost of the machinery used.

No form of excavator seems to have been overlooked. Beginning with drag and wheel scrapers, it goes on to describe graders of various kinds which push the earth before them. It then describes various forms of steam shovels including traction shovels which load by dragging along the surface.

Part II gives details relative to dredges, dry-land and floating excavators. Drag line excavators and templet and wheel ditchers are then discussed and some pages are devoted to the tower excavator and to walking dredges. The floating types treated are dipper and ladder dredges; the Löbnitz rock excavator and hydraulic dredges are also considered. Then follow the trench diggers with traveling derricks, cable conveyors and trestle tracks. Notice is also taken of the traction type of ditchers which simultaneously place the tile and backfill the ditch excavated. Levee builders also receive a chapter.

It may seem that this information is somewhat remote from the needs of mining engineers but any one who has observed the methods adopted around mines will realize that the pick, shovel and cart occupy too prominent a part because modern methods of dirt removal have not received due attention from the mine management.

Reservoirs, spurs of railroads and ditches have frequently to be built by mine engineers and in many places extensive stripping has to be done. The data in this book will serve to indicate how such work can be performed with economy and speed.

THE MINERAL INDUSTRY, Its Statistics, Technology and Trade during 1912. Edited by Charles Of. xv + 1090 pp. 6¼x9½ in., several illustrations. McGraw-Hill Book Co., 239 W. 39th St., New York. Cloth boards. Price $10.

This is the twenty-fifth publication of this comprehensive work, the first volume of the long series being produced by Richard P. Rothwell when he was editor of the "Engineering and Mining Journal." The list of contributors is so extensive and the men so well chosen for the services they render that the work merits the confidence so freely placed in it.

Every material quarried or mined is included in the list of subjects except clay and building stone. Such products of the mine as fuller's earth, gypsum, chalk, cryolite, bauxite, borax, garnet, glass sand, mica and diatomaceous earth are all considered. Coal and coke receive 38 pages beside their part in the chronology, the production tables of various countries, and the records of imports and exports. Moreover, R. H. Richards and C. E. Locke deal on the "Progress of Ore Dressing and Coal Washing in 1912" in a 67-page article, most of which is devoted to the separation of ores however. There is a 20-page bibliography treating extensively of coal and coke and general mining considerations. This bibliography is supplemental to those prepared for each mineral treated in the report.

The coal and coke division of the book was intrusted to A. T. Shurick of "Coal Age" but as no single person, however well informed can write a complete and balanced report of the whole industry in the United States, his work is supplemented by reports from their own states written by 17 separate authorities. The record of two states during 1912 is taken from the U. S. Geological Survey's advance sheets. Where new estimates of coal resources have been made, these facts are recorded under their proper headings. The coal markets are covered by three undoubted authorities. It should also be noted that the statistics and trade in foreign countries are treated with thoroughness.

SOCIOLOGICAL DEPARTMENT

Rescue Work of the Madison Coal Corporation

By James Taylor*

The Madison Coal Corporation, of St. Louis, Mo., has a mine at Dewmaine, Williamson County, Ill., which is more than usually well equipped for rescue work.

Fig. 1 shows the mine-rescue station, which is of brick and covered with a reinforced-concrete roof. The room containing the rescue apparatus measures 6x8 ft. and the first-aid and observation room covers 16x17½ ft. There is also a bathroom.

At all five plants of the Madison Coal Corporation there is an efficient rescue and first-aid corps composed of six men, who are thoroughly drilled and trained by the best of first-aid instructors. In the first-aid rooms underground, as well as in the rescue buildings, are kept Red Cross outfits, army blankets, stretchers and rubber pillows. The rescue-building equipment includes Fleuss helmets and a pulmotor.

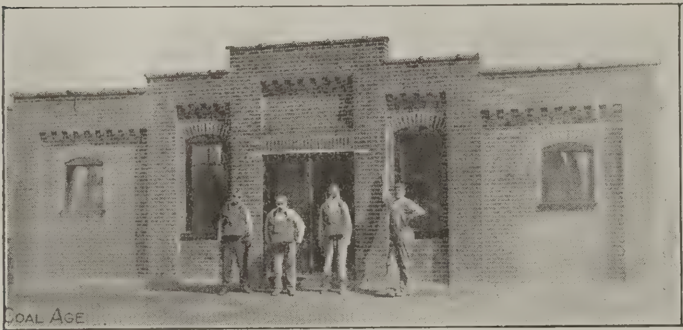


Fig. 1. Mine-Rescue Building

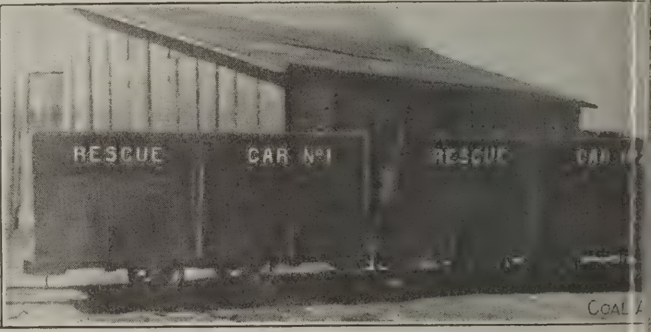

Fig. 2. Cars for Mine-Rescue Men

The cars shown in Fig. 2 are kept for rescue work only, having two seats on the inside running the full length of the car. The spaces beneath these seats are utilized as tool boxes and contain all the supplies needed by rescuers, including a life line, hatchets, hammers, wire cutters and other tools and instruments of like character.

The following rescue rules have been formulated:

1. It will be the duty of the mine manager to know
the breathing apparatus in all its parts is complete
properly cared for, and by actual test, not less than
every 14 days, in the gas room of the mine-rescue build
determine whether the rescue apparatus is in safe and eff
tive condition.

2. It will also be the duty of the mine manager
know that the mine-rescue building is kept in a clean
orderly condition, that all safety lamps are properly
for and ready for immediate use; furthermore that all
plies required in connection with rescue work are kept
ample quantities.

3. In case of fire, whether from the result of an
plosion or not, stop the fan only long enough to deter
the quantity of air and proper direction in which to force
ventilation so as to provide for the safety of those who
be in the mine.

4. Upon hearing the alarm of fire or the warning of
explosion, the regularly organized rescue parties will
mediately go to their respective places and make prepa

tions to enter the mine under the direction of the district superintendent and mine manager, who will be governed by the rescue rules prepared by the manager of the Illinois Mine-Rescue Stations.

5. When the danger signals are given because of fire or otherwise, the foreman of the first-aid corps must immediately telephone to the company's physician and other doctors if necessary, and see to it that his force is ready to care for the injured.

6. Immunity from accidents in general can only be secured by all employees thoughtfully performing their duties as required by the mining laws of the state and the company's rules for the government of its mines. It is furthermore necessary that there be complete coöperation between the employees and the management in maintaining an efficient fire-fighting and rescue organization coupled with a well trained first-aid corps.

The knowledge that complete efficiency in this respect exists should bring immeasurable satisfaction to the mine workers and their families and in the most complete way possible compensate all employees for their full and active support in making this feature of the service a complete success.

A. J. MOORSHEAD,
President and General Manager.

The hospital shown in Fig. 3 is provided with all modern appliances, including an X-ray machine for locating fractures. The building is heated with hot air and will accommodate six patients at one time.

Prizes have been given for the yards making the best appearance. Fig. 5 shows the yard drawing first prize in the 70-lot village.

⁂

H. C. Frick Coke Co.'s Finals

We described, in the issue of Oct. 4, one of the preliminary meets of the H. C. Frick Coke Co., held at Trotter mine, near Connellsville, Penn., Sept. 25. The victorious team at that meet nearly succeeded in getting first place at the finals, only being ⅛ per cent. from second place and ¼ per cent. from the winning team.

The finals were held at Continental No. 1, on Thursday afternoon, Oct. 9. There were eight contesting teams, representing all the H. C. Frick Coke Co.'s mines in the Connellsville region.

The following percentages were obtained by the competing teams:

Lambert	96¼	Whitney	93$\frac{3}{10}$
Phillips	96⅛	Redstone	93¼
Coalbrook	96	Colonial No. 1	93¼
South West	95$\frac{3}{10}$	United	92¾

The teams were given the four following problems:

First or One-Man Event—First and second fingers of the left hand torn off, and compound fracture of the nose.

Second or Two-Man Event—Compound fracture of the right forearm, incised wound of the left lower leg, and contusion above the eye.

Third or Full-Team Event—Compound fracture of the left thigh and burns of the face, neck, arms and chest. Place on a stretcher and carry 50 ft.

Fourth or Full-Team Event—Fractured skull, patient injured and unconscious. Fracture of four ribs on the right side and dislocation of the right ankle, and a crushed left foot.

The following are the members of the three leading teams:

Lambert—G. A. Millward, captain; Casper Schucler, Andy Hizaney, John Hatala and Samuel Rooneck.

Phillips—William Shaw, captain; Andy Secoskey, Elmer Moody, Sylvester Modjesky, Walter Kuhns, and John Donohue, substitute.

Coalbrook—Lyell Buttermore, captain; Earl Henderson, William Howe, Walter Trader and Charles Stinger.

The judges were not affiliated in any way with the competing teams and thus the contest was adjudged with complete impartiality.

Wages in Alberta, Can.

The following are the wages paid in the province of Alberta as recorded in the Annual Report of the Department of Public Works:

Outside Wages

Fire bosses . . $110.00 to $115.00 per mo.

	Per day	Hr.
Bottom man	$2.89	10
Slate pickers (boys)	1.37	10
Slate pickers (men)	2.47	10
Car oilers (men)	2.47	10
Car oilers (boys)	1.65	10
Tally boys	1.37	10
Teamsters	2.89	10
Blacksmith	3.85	10
Blacksmith's helpers	2.90	10
Power-house engineers	3.85	12
Power-house engineers	3.40	8
Fan-men	2.90	12
Hoisting engineers	3.20	8
Hoisting engineers	3.78	10
Hoisting engineers	4.40	12
Tail rope engineers	3.63	8
Tail rope engineers	3.85	10
Endless rope engineers	3.30	10
Box-car loader engineer	3.40	10
Tipple engineer	3.40	10
Screen engine tender	2.65	10
Locomotive engineer	3.40	10
Locomotive switchman	3.00	10
Fireman	2.89	8
Fireman	3.85	12
Fireman's helper	2.65	10
Railway-car helper	2.60	10
Tipple dumper (man)	2.89	10
Tipple dumper's helpers	2.64	10
Tipple dumper (boy)	1.65	10
Top cage	2.64	10
Car repairer	3.40	10
Car repairer's helper	2.90	10
Breaker engineer	3.40	10
Fan fireman	3.40	12
Machinists	$3.40 to 3.85	10
Machinist's helper	2.90	10
Ashman	2.50	10
Ashman	2.89	12
Wiper (man)	2.89	12
Coupler (man)	2.47	10
Coupler (boy)	1.65	10
Breaker oiler	2.89	11
Washer or tipple oiler	2.89	11
Breaker picker boss	2.89	10
Timber framer	3.40	10
Timber sawyer	2.64	10
Box-car shoveler	2.89	10
Breaker platform boss	2.89	10
Breaker platform men	2.60	10
Breaker screen men	2.47	10
Rock bank men	2.47	10
Dirt bank men	2.47	10
Finisher after box-car loader	2.47	10
All other outdoor labor	2.47	10
Lampman (depending upon number of lamps and skil! of man	$2.47 to 2.89	8
Lampman (depending upon number of lamps and skill of man)	$2.47 to 3.40	12

Beehive Coke Ovens

Leveling and drawing (6½ ton charge) per oven	$1.00
Leveling and drawing (5 ton charge), per oven	0.80
Loading into box or open cars (over 200 tons per month), per ton	0.17

Beehive Coke Ovens (Continued)

	Per day	Hr.
Loading into box or open cars (less than 200 tons per month), per ton	....	0.16
Seam locomotive engineer	$3.40	10
Motorman	3.18	10
Larryman	2.47	10
Plasterers	2.47	10
Carters and cleaners	2.47	10
All other labor	2.47	10

Belgian Coke Ovens

	Per day	Hr.
Ram engineman	$3.40	10
Chargers	2.89	10
Clayers	2.89	10
Drawers	2.89	10
Loaders	2.60	10

Briquette Plant

	Per day	Hr.
Engineer	$3.86	12
Briquetter	3.97	12
Briquetter's helper	3.40	12
Tar melter	2.89	12
Laborers	2.89	12

Inside Wages

	Per day	Hr.
Shotlighter	$3.30	8
Bratticeman	3.30	8
Bratticeman's helper	2.75	8
Timberman	3.30	8
Timberman's helper	3.75	8
Tracklayers	3.30	8
Tracklayer's helper	2.75	8
Motorman	3.05	8
Motorman's helper	2.75	8
Locomotive engineer	3.05	8
Locomotive switchman	2.75	8
Drivers	3.03	8
Drivers (wet places)	3.30	8
Drivers (spike team)	3.50	8
Couplers (men)	2.75	8
Couplers (boys)	1.65	8
Switch boys	$1.37 to 1.65	8
Door boys	1.10	8
Rope riders	3.03	8
Main and tail rope riders	3.30	8
Pushers	2.75	8
Buckers	2.75	8
Loaders	2.75	8
Miners	3.30	8
Miners (wet places)	3.75	8
Rock miners	3.75	8
Timber handlers	3.03	8
Laborers	2.75	8
Cagers, slope and incline	2.75	8
Cagers, shaft	3.30	8
Machine men	3.75	8
Machine men's helper	3.30	8
Pumpmen	2.75	8
Pumpmen (Dept. Nat. Res. C.P.R.)	3.20	8
Hoistmen	$3.03 to 3.30	8
Drivers (boys)	$1.65 to 2.75	8
Grippers	2.75	8
Grippers (boys)	$1.65 to 1.75	8
Pipe fitters' helpers	2.75	8
Pit carriers	$1.37 to 2.75	8
Clutchmen	3.30	8
Rollermen	2.75	8
Miners on contract average	$3.50 to 6.00	8

⁂

Development of Rescue Departments in State of Washington

The Washington Union Coal Co. has built a training station and equipped it with four Draeger Oxygen Apparatus and one Pulmotor and all other equipment necessary to train the men in helmet and first-aid work. They have also built and fully equipped an emergency hospital.

The Carbon Hill Coal Co. has added two more apparatus to their other equipment. This makes six appliances in all. The Northwestern Improvement Company has taken up the work of organizing and training rescue and first-aid teams with a greater measure of success than any of the other mining companies.

This company sent a team to the First National Mine Safety Demonstration held in Pittsburgh, Penn., Oct. 30-31, 1911. This team was made up of the following members, John Hutchinson, James Bagley, James Pascoe, John Parker and Robert McCollough, D. C. Botting, former mine inspector, acted as their subject. They were accompanied by Dr. E. G. Stimpson, chief surgeon of the Roslyn-Cle Elum Hospital Association, who is in active charge of the first-aid work for the company.

DISCUSSION BY READERS

Collapsible Stoppings

Letter No. 3—The proposition to build collapsible stoppings as a means of preventing extensive mine explosions is apparently based on the conclusion of the suggested preventative effect of increased room in the mine workings, for the expansion of the gases produced. In my opinion, such an expansive area is not always desirable or beneficial.

Under certain conditions, high and wide places in the path of the explosion, such as occur on entry turnouts or partings, have frequently checked the progress of the explosive wave by permitting the expansion and cooling of the gases. On the other hand, instances have occurred where conditions favoring the rapid expansion of the heated gases had no deterrent effect whatever on the initiation and extent of the explosion; but seemingly contributed materially to its development and force. Again, there are instances where the absence of such expansive area, under certain conditions, instead of favoring the development of the explosion, proved a potent factor in its suppression.

To illustrate this point, I would refer to the preliminary explosion tests made at the Federal Bruceton mine.* In these preliminary tests, the ignition of the coal dust was effected in an exterior steel gallery outside of the mine but connected therewith by a movable section. When this movable section was rolled to one side, thus providing unlimited expansion for the flaming gases, within 100 ft. of the initial point of explosion, there was no difficulty in obtaining a violent explosion of the coal dust in the gallery. This explosion gallery was similar, in all respects, to the one used at the Pittsburgh Testing Station. When, however, the movable section was in place, connecting the gallery with the mine and thus preventing the early and rapid expansion of the heated gases, there being no other change in the surrounding conditions, the flame was projected but feebly through the gallery and died away on entering the mine.

These facts suggest, at least, that the presence of ample room for the expansion of the heated gases, at the point where the explosion is started, may not always prove beneficial; and, on the other hand, the absence of such expansive area may not always be detrimental. The Bruceton tests would seem to indicate that the expansive area, at the point where the explosion originates, may act to increase instead of to decrease the initial energy of the blast and that greater safety is to be sought in the avoidance of such expansion, as far as practicable.

Another consideration is the fact that many of the most disastrous and extensive explosions originated in room entries where the stoppings between the entries were of a more or less temporary character and were readily destroyed by the initial blast. In many instances, a number of wide rooms connected by open crosscuts, the mouths of the rooms being unobstructed, afforded ample opportunity for a rapid expansion of the gases. But these did not prevent the development of an extensive explosion.

If there is any practical value in the suggestion of building collapsible stoppings, the theory should have received some support from the results in these instances. On the contrary, it seems that the fact is fairly well established that the easy destruction of stoppings at the point where an explosion occurs has no appreciable depressing effect on the development of the explosion.

Chariton, Iowa.

⁂

Letter No. 4—I have been much interested in the letters so far published on this subject. In my opinion, while it may be possible for thin collapsible stoppings to localize an explosion of gas or dust, in some cases, their effectiveness will depend upon conditions in respect to the force of the explosion, the strength of the stoppings, and the amount of space made available for expansion, by the destruction of the stoppings. The condition of the workings and the gaseous condition of the atmosphere would also affect the results.

There is no question but that the concussion of a heavy, windy or blownout shot would throw down a stopping that is built too light or flimsy. Should this occur the dust thrown into the atmosphere would possibly be ignited by the flame of succeeding shots. Moreover, the short-circuiting of the air would allow gas to accumulate at the working face, which would give trouble, later, unless the danger was averted by an efficient fireboss. My belief is that it is better practice to build the stoppings in all parts of the mine of suitable strength that they cannot be damaged by blasting operations or falls of roof caused by pillar drawing.

It is the practice in the most uptodate mines, where the coal is from 3½ to 4 ft. in thickness, to build concrete stoppings 6 in. in thickness on butt headings, while those on the main cross-entries are 8 in. thick and the main-entry stoppings from 10 to 12 in. thick. In order to provide the greatest protection from falls of roof and coal, these stoppings are built at the center of the crosscut. All overcasts are made extra strong to withstand the force of a possible explosion. The thickness of stoppings, in any case, must be determined by the kind of material used, the character and height of the coal and the nature of the roof and floor, considering, also, the expected life of the stoppings. The inclination of the seam and the position of the stopping with respect to the pitch may also vary the required thickness.

As a preventive of explosions I consider it of more importance to ventilate the mine in sections, giving to each a separate split of air properly conducted to the working face; to keep all places and roadways free from gas and dust; to drive all crosscuts of ample size at equal distances apart; to use nothing but permitted explosives; and finally to inspect all shots before firing.

Starting Fan after Explosion

Letter No. 4—Success in any operation depends on the extent and accuracy of the information available at the time. Since the Draeger and other types of rescue apparatus, and portable mine telephones have been brought to their present state of perfection, it is possible to ascertain more or less definitely the condition of the interior of a mine, with respect to fire and gas, shortly after an explosion has occurred. These means of making a rapid exploration of portions of the mine that are accessible afford the opportunity to extinguish any fires that may exist and to short-circuit any air currents that may be in circulation and which wisdom suggests should be diverted and not allowed to pass through the unexplored workings.

Speaking of this condition, following explosion in a mine, J. W. Paul, one of the most practical of the Federal Bureau's mining engineers, says:

> In the event of an explosion occurring within a mine generating large quantities of methane and containing highly explosive coal dust and plenty of dry timber, there is every probability that mine fires will be started in the timber and the coal, in different parts of the mine. Under these conditions, if the ventilating system of the mine be destroyed, there will naturally exist a real danger in starting the ventilating current through the mine. It may be assumed that the explosion originated at some point near the working face and that the stoppings in the vicinity are blown down, which will cause an accumulation of gas in the workings. * * * *"

Continuing, Mr. Paul states:

> The writer, in directing work in a mine of this character, immediately following an explosion, proceeded to advance the ventilation in stages; that is to say, by restoring the circulation only in those parts of the mine that had been previously explored by men wearing breathing apparatus. In this manner, when making the exploration, several fires were found and extinguished before the fresh air reached them.

The recent National Mine Rescue and First Aid conference, held at Pittsburgh, Penn., Sept. 23-26, 1912, adopted a number of resolutions, among which was a method of procedure in case of a mine explosion. One of the statements in this resolution reads as follows:

> (b) There should be a man in charge of outside arrangements who should see that ventilating appliances are put in readiness for operation when required.

It is evident that it was the opinion of this conference that occasions might arise when the ventilating fan should not be started immediately after being repaired, following an explosion in the mine.

Most mining men are familiar with W. E. Garforth's Rules for Recovering Coal Mines after Explosions and Fires. Mr. Garforth says, p. 41:

> Parties wearing apparatus will act chiefly as scouts, advancing ahead of the ventilation to prove the existence of and to deal with fires. Their principal and foremost duty will be, however, to relieve survivors cut off from the pit by afterdamp. * * * *

Again, on p. 44, he says:

> When the whole of the underground workings have been wrecked by an explosion it will generally be found to be the safest plan to recover the workings, in sections, by temporarily shutting off the air from all districts except the one being explored and those already recovered. * * *

And again, p. 45:

> Remember that there is likely to be fire about the point where the force of an explosion ceased, if there is any inflammable substance such as brattice cloth, doors, timber, tubs, or a feeder of gas in the vicinity.

As I understand the question under discussion, it assumes that the fan has been damaged and is stopped for repairs and there is an accumulation of gas in the mine. Referring to this question of the circulation of air in a mine, immediately following an explosion, Mr. Garforth goes so far as to say (p. 32), assuming, apparently, that the fan has not been stopped or gas allowed to accumulate in the mine:

> Having regard to the loss of life at Thornhill (139 lives lost) and Hamstead (25 lives lost) the course to be pursued seems in favor of stopping the fan, for a limited period, while an exploration is attempted; but only a knowledge and consideration of local conditions can determine the actual procedure.

Miners' Circular, No. 10, published by the Bureau of Mines, says, pp. 5 and 6:

> If the mine liberates explosive gas do not restore the ventilation in the advance workings until they have been explored by men using breathing apparatus. Any fires found should be put out before ventilation is restored, unless tests of the atmosphere within the mine indicate the absence of explosive gas.
>
> If the mine does not liberate explosive gas, it is better to restore the ventilating current at once for the benefit of any persons who may be alive within the mine.

The conditions assumed in this question call for a cool head and the exercise of good judgment on the part of the men in charge. Nevertheless, judging from the above quotations, the weight of authority appears to be in favor of not starting the fan until a preliminary examination of the mine has been made.

⁂

The Safety Lamp and the Eyesight

I have noticed a number of references to the injurious effects produced on the eyesight, by the continuous use of the safety lamp, which must, if true, materially diminish the producing power of the miner. The question has been asked: Does the safety lamp injure the miner's eyesight?

As a miner who has worked in the mines for 24 years, 22 of which have been marked by the use of safety lamps of the most approved type, I want to answer this question in the affirmative. I have read carefully what each one has said, but want to suggest that anyone who believes there is no injury to the eye produced by the use of the safety lamp, should spend his next vacation in visiting a safety-lamp district in the old country. Let him go to a mine worked entirely on safety lamps and ask the superintendent if his men suffer from nystagmus, as the result of the continuous use of the safety lamp. He will certainly answer "yes," and will probably show you quite a number of men working in the yards who suffer from this disease and have had to quit the mine for good. A few only recover from the effects.

In England, the disease became so serious that the British Government placed those suffering from its effects under the Compensation Act. A miner in England who is suffering from nystagmus and unable to follow his employment is thus able to draw compensation from the company, in the same manner as though he suffered from some bodily injury received in the mine and disabling him for work. To my mind, this is conclusive evidence that the eyesight is injured by the continued use of the safety lamp and that the producing power of the miner is diminished thereby.

A MINER.

Wylam, Ala..

Building a Mine Overcast

Mine overcasts should be built of incombustible material, and in such a manner as will guarantee that they will properly perform their duty for the length of time they are expected to remain in service. No practical mine foreman or superintendent would think of erecting an overcast that will be required to last but a single year, on the same plan as he would adopt when building one expected to serve during the life of the mine.

The method of constructing a mine overcast, described in Coal Age, Sept. 20, p. 428, is well enough when there is plenty of material at hand, such as is there mentioned. I want to describe how a mine overcast can be built cheaply of such material as is commonly at hand. At most of the mines, in this state, located on the mountains, stone is not handy, and brick and sand are almost out of the question, owing to the freight rates which forbid the use of these materials, for mine use. Necessity is the mother of invention; and, at our mines, the practice is to build overcasts in as cheap a manner as possible, using nothing having a market value, except when absolutely necessary. Iron rails, bricks and stone can be sold for other purposes, which, therefore, prohibits their use in the mine.

It is of the utmost importance that mine overcasts should be substantially constructed, in order to avoid the annoyance and trouble that are sure to develop when the air bridge leaks, allowing a portion of the ventilating current to short-circuit at this point, which would greatly impair its efficiency.

After the excavation has been made for the overcast by blasting down the roof, the space is cleared to the proper width and a dry wall laid up with the material blasted from the roof. Such a wall is built on each side of the roadway and the face of the wall coated with a mixture of cement and sifted ashes, the latter taking the place of sand. When the two sidewalls are complete, old boiler flues, that have no market value, are taken for the floor of the overcast. After these have been laid in place, they are covered with a coating of cement and ashes, to a sufficient thickness to form the floor of the overcast. When this is complete, a form is made and a sidewall built of boiler ashes and cement, on each side and above the floor of the overcast. These sidewalls are carried up to the overhanging roof. This style of overcast can be cheaply built and avoids the necessity of purchasing brick, stone or sand, which are important items in this district, since all these materials must be transported up the mountains, at a considerable expenditure of time and labor.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

DEFINITIONS

Numbers—A number is the expression of one or more units or things. Numbers are classified according to their character or kind and may be defined as follows:

A Whole Number or Integer is a summation of exact units, or will contain 1 an exact number of times; 1, 9, 16, 153, etc., are whole numbers or "integers," as they are called.

A Fraction expresses a part of a unit or thing, in distinction from an integer, which always expresses the whole of anything, in units. This will be explained more fully later. Thus, ½, ⅝, ¾, etc., are simple fractions.

A Mixed Number is composed of a whole number and a fraction; as 1½, 2¾, 12¼, etc.

An Even Number is one that is exactly divisible by 2; or when divided by 2 leaves no remainder. The even digits are 2, 4, 6, 8. Any number that ends with a cipher or an even digit is an even number; as, 140, 2368, 3516, etc.

An Odd Number is one that cannot be divided by 2 without a remainder. The odd digits are 1, 3, 5, 7, 9. Any number that ends in an odd digit is an odd number; 141, 2369, 3517, etc. Beginning with 1, every other number is odd and the intermediate numbers are even.

A Prime Number is one that cannot be divided by any number, except 1, without a remainder; or, as we say has no divisor except 1. Thus, 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, etc., are all prime numbers.

Numbers are said to be "prime to each other" when they cannot be divided by the same number without a remainder. In other words, they have no common divisor. Such numbers may or may not be prime numbers. For example, 4 and 9, although prime to each are neither of them prime numbers; so also, 6 and 35; 18 and 25; etc.

A Composite Number is one formed by multiplying two or more numbers together. The numbers multiplied together are called "factors."

A Denominate Number is one of a given kind or denomination that is named; as 1 in., 10 miles, 3 yd., 25 ft., etc.

A Simple Number is one that is expressed in like units only. The numbers last named are simple denominate numbers.

A Compound Number is one that is expressed in units of different denominations; as 8 ft. 6 in., 3 hr. 20 min., etc.

A Factor of a composite number is any exact divisor of that number; thus, 3 and 5 are factors of 15, because each of them is an exact divisor of 15.

A Prime Factor of a number is any prime number that is an exact divisor of the number; thus 5 and 6 are factors of 30; but the prime factors of 30 are 2, 3 and 5.

A Multiple of a number is the product obtained by multiplying that number by another, or the result of taking the same any number of times. Thus, the multiples of 7 are: 14, 21, 28, 35, etc.

The Coal Age Pocket Book

FRACTIONS

A Fraction is a part of a whole. When a unit is divided into any number of equal parts a single part is called a "fractional unit"; and any number of those parts taken together, except the number of the division is a "fraction." Thus, a fraction is the summation of any number of like fractional units. For example, $^{1}/_{3}$, ¼, ⅛, etc., are each fractional units; while $^{2}/_{3}$, ¾, ⅝, etc., are fractions. A fractional unit is, at the same time, a fraction.

How Expressed—The division of a unit into parts is expressed by writing the number indicating the division, below a short horizontal line (—) or immediately after a diagonal line inclined upward to the right (/), the unit being written above or before the line, as the case may be. Thus, the division into 2, 3, 4, etc., equal parts is expressed as:

$$\tfrac{1}{2},\ \tfrac{1}{3},\ \tfrac{1}{4},\ \text{etc.; or } ^{1}/_{2},\ ^{1}/_{3},\ ^{1}/_{4},\ \text{etc.,}$$

which are all fractional units.

The number written above or before the line is called the "numerator"; the number below or after the line, the "denominator." These are called the "terms" of the fraction.

The Denominator of a fraction shows the number of equal parts into which the unit is divided.

The Numerator of a fraction shows the number of parts taken or expresses the number of fractional units intended.

A Proper Fraction is one whose numerator is less than the denominator, and whose value is therefore less than 1; as, for example, ½, ¾, ⅞, etc.

An Improper Fraction is one whose numerator is greater than the denominator and whose value, therefore, is greater than 1; as, for example, $^{3}/_{2}$, $^{5}/_{4}$, $^{13}/_{8}$, etc.

A Simple Fraction is one whose terms are both whole numbers; as, for example, ½, ⅞, $^{10}/_{3}$, etc.

A Complex Fraction is one that contains a fraction in one or both of its terms; as, for example

$$\frac{2\frac{1}{8}}{3};\quad \frac{5}{1\frac{1}{2}};\quad \frac{3\frac{1}{4}}{6\frac{1}{2}}$$

A Compound Fraction is a fraction of a fraction; or where several fractions connected by signs are expressed as a single fraction; as for example,

$$\frac{2\frac{3}{4} + \frac{1}{2}}{3 - \frac{7}{8}}$$

REDUCTION OF FRACTIONS

The Lowest Terms—In order to simplify the work, fractions should always be reduced to their lowest terms by dividing both terms of the fraction by any number that is an exact divisor of both. A fraction is in its lowest terms when the numerator and denominator are prime to each other. The fractions ⅝, $^{9}/_{4}$, $^{13}/_{7}$, etc., are in their lowest terms and cannot be further reduced, because the terms in each case are prime to each other.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

ues.—There are 40,000 cu.ft. of air traveling in an vay, at an average velocity of 800 ft. per min.; what is area of the airway?

ns.—The circulation in a mine or airway is always en in cubic feet per minute; it is, in this case, 40,000 t. per min. Dividing this air volume per minute, by velocity in feet per minute, gives the sectional area the airway in square feet. Thus,

$$40{,}000 \div 800 = 50 \textit{ sq.ft.}$$

ues.—The area of an airway is 80 sq.ft. and the ount of air traveling, 60,000 cu.ft. per min.; what is velocity of the air current?

ns.—In this case, the air volume in cubic feet per nute, divided by the sectional area of the airway in are feet, gives the velocity of the air current in feet minute. Thus,

$$60{,}000 \div 80 = 750 \textit{ ft. per min.}$$

ues.—What velocity of the air current would you ommend at the working faces to properly ventilate eous and nongaseous mines?

ns.—The velocity of the air current passing the work- face should always be sufficient to sweep away the ses that would otherwise accumulate at the roof or in d places. In nongaseous mines, the complaint is somees made that the air is too strong for comfort; while, gaseous mines, there is danger of the flame being blown ough or against the gauze of the safety lamp and heat- it sufficiently to pass the flame and ignite the gas tside of the lamp. In either case, the velocity of the current may be reduced and the gases removed eftually, by erecting suitable brattices, so as to deflect the against the roof or into the void places.

The present anthracite-mining law of Pennsylvania reicts the velocity of air currents in gaseous mines, to 0 ft. per min., in all air passages except the main ine and return airways (Art. 10, Sec. 7). This is a rly safe velocity where bonneted lamps are used at face. The unbonneted Davy should not be subtted to a velocity greater than 360 ft. per min. In ngaseous mines, the velocity of the air at the working e may vary from 200 to 450 or 500 ft. per min., acrding to the conditions existing in the mine.

Ques.—(a) A certain airway, in a coal seam 6 ft. thick, 8½ ft. wide at the roof, and 9½ at the floor. When e fan is running at 80 r.p.m., the anemometer shows a ading of 450 revolutions in two minutes. What is the antity of air passing in this airway in one-half minute?) If the speed of the fan be increased to 100 r.p.m., at should be the quantity of air passing per minute?

ns.—The average width of this airway, or half the m of the top and bottom widths, is 9 ft. The sectional ea is, therefore, 9 × 6 = 54 sq.ft., assuming that the ight of the coal is the clear headroom in the airway. e anemometer is calibrated so that one revolution of e vein corresponds to 1 ft. of air travel. At this speed (450 rev.), no correction is necessary, in a good instrument.

(a) The velocity of the air current, in this case, is 450 ÷ 2 = 225 ft. per min. The volume of air passing is then 225 × 54 = 12,150 cu.ft. per min.; or, 6075 cu.ft., in one-half minute.

(b) It is commonly estimated that the volume of air passing is directly proportional to the speed of the fan, which would give, in this case,

$$12{,}150 \times \tfrac{100}{80} = 15{,}187.5 \textit{ cu.ft. per min.}$$

In practice, however, the quantity of air increases in a less ratio than the speed of the fan. The fourth power of the speed varies as the fifth power of the quantity. According to this rule, the quantity of air in circulation at a speed of 100 r.p.m. would be, practically, 14,500 cu.ft. per min.

Ques.—The anemometer makes 120 r.p.m. in an airway that measures 8 ft. 6 in. at the top and 10 ft. 6 in. at the bottom, and is 7 ft. high; what is the quantity of air passing per minute?

Ans.—The average width of the airway is half the sum of the top and bottom measurements, or, in this case, 9 ft. 6 in., and its area is, therefore, 9.5 × 7 = 66.5 sq.ft. Except in particular cases, it is common mine practice to disregard the correction for the instrument that is sometimes used; and, in that case, the number of revolutions per minute indicates the velocity of the air current in feet per minute, if care has been taken to obtain an average reading for the airway. The volume of air passing, in this case, is 66.5 × 120 = 7980, say 8000 cu.ft. per min.

Ques.—Is it a fact that the pillar coal, in a well regulated mine, costs less per ton than the coal mined from the faces of the chambers, in the first working; and, if so, what is the reason?

Ans.—The coal extracted in the first working or at the faces of the chambers must generally be undermined, or side cut, or both. Under these conditions or when the coal is shot off the solid, the same weight of powder will break less coal than in pillar work; also, a greater proportion of fine coal and slack is produced, which increases the cost of production. In pillar work, when the workings have been properly planned and executed, the roof pressure can be made to greatly assist the extraction of the coal. Less powder is required and the coal is taken out in larger sizes. Much will depend on the conditions and the way in which the work is carried out.

Ques.—When extracting a range of pillars of an average thickness of 20 ft., how would you proceed with the work to insure the safety of the workmen and the security of the mine?

Ans.—Care should be taken to keep the pillar work in line and not permit the work on certain pillars to advance more quickly than that on others. It is also necessary to draw all standing timber as the work on the pillars progresses, so as to cause a uniform settlement of the roof behind the line of pillar work. The purpose of this is to relieve the pressure on the pillars and make this as uniform as possible.

COAL AND COKE NEWS

Harrisburg, Penn.

Steps will soon be taken at the auditor general's department of Pennsylvania to prepare for the enforcement of the anthracite coal tax in accordance with the act of 1913. Before Jan. 1, 1914, when the new act takes effect, every coal operator in the state will receive blank forms on which to report output to the auditor general, who is charged under the act with the collection of the tax.

The coal tax will be 2½ per cent. ad valorem prepared for market, and the reports of output must be made in January annually, covering the output for the previous calendar year. This must be made under oath, and there is a fine of $500 and imprisonment up to a year, either or both for intentional failure to make such a report, and 10 per cent. is to be added to the tax in case of such neglect or failure.

If the auditor general and state treasurer are not satisfied as to the report they are empowered to have an estimate made and to make a settlement of the tax. One-half of the tax is to be returned to the county where originating.

In order to ascertain if they had any authority to inspect the quality of the coal served customers in the state, county sealers of weights and measures sent an inquiry to Chief Inspector Sweeny at the capitol at Harrisburg and received a reply that the law does not give them any authority to inspect the quality of coal, their duties being simply to insure full weight.

A conference of sealers is being held here on the question of shrinkage. A recent law was passed giving the chief of the sealers authority to fix the limit of such shrinkage as will be tolerated.

The complaint of York manufacturers against the Pennsylvania R.R. for carrying coal from the Clearfield region to York was withdrawn at the Public Service Commission this week, and it was stated that the complaint from Lancaster along the same lines would also be withdrawn. The present rate from the Clearfield region to Harrisburg is alleged to be $1.30 per gross ton, and it is $1.50 to either York or Lancaster. The rate from the same district to Baltimore, which is 85 miles south of Harrisburg, is given as $1.60, and the same rate applies to Philadelphia. The associations from York and Lancaster claimed these rates discriminated against the towns.

There came another turn to the bitter struggle of the regulars and insurgents of the United Mine Workers of America in the anthracite section this week, when the insurgents made an appeal to a committee from the international executive board for a special convention in District No. 1. James Moran, D. A. Frampton and William Harrison, the committee that is representing the international board in hearing the appeal, is listening to both sides of the case. The insurgents alleged that the last regular convention held at Wilkes-Barre was not conducted according to the terms of the constitution and that they desire another convention. The district officers denied that there were any violations of the constitution, and in opposing a special convention, they called attention to the fact that such a session would cost the union in the district anywhere from $10,000 to $20,000. It is being whispered about that the main reason for the insurgents desiring a special convention, is that they may make a fight for the division of District No. 1 into two districts.

That the life of the anthracite industry in Pennsylvania is only 81 years, if the various estimates upon which he bases his average are correct, was the conclusion reached by M. S. Hachita, chemist of the Lehigh Valley Coal Co., in a speech made before the New York and Western Pennsylvania Coal Merchants' Association. The first estimate he quoted was that of the Geological Survey of Pennsylvania, according to which there were approximately 19,500,000,000 long tons in the ground prior to mining operations in the state. Taking an average of 40 per cent. as the proportion which can be extracted, this would leave 7,800,000,000 tons as the initial supply. Since 1820 the total tonnage mined has been 1,982,961,263, which would leave 5,917,038,737 tons still available.

T. S. Harris, in the "Forum," estimated there were originally in the ground 14,453,379,600 cu.yd., which is equivalent to 16,766,000,000 tons. By taking 40 per cent. as the proportion which can be extracted and deducting the total amount mined 4,823,438,737 tons are left available.

A. D. W. Smith, one of the commissioners of the coal-waste commission, estimated the available supply of anthracite in 1892 at 6,898,000,000 tons. Since 1,141,684,910 tons have been mined, there remains 5,564,715,090 yet to be mined.

In 1896 William Griffith estimated the available coal yet to be mined at 5,073,786,000 tons. Since then 1,096,963,6[illegible]5 tons have been mined, leaving 3,976,832,305 tons in the ground.

The average of these four expert estimates is 5,070,506,217 tons.

The average annual production of coal for the last ten years has been 62,817,910 tons. If this annual average production continues until the exhaustion of the coal, the life of the anthracite industry will be only 81 years, but hard-coal production this year bids fair to reach 70,000,000 tons, and it is reasonable to believe it will increase at a normal rate in future time.

PENNSYLVANIA

Anthracite

Wilkes-Barre—Negotiations are under way for settlement outside of the courts of one of the most exceptional and unique lawsuits that has ever been brought to the attention of the courts, namely the famous case of Kingston Townshi against the Lehigh Valley Coal Co., to recover adequate payment for coal mined from under the surface of land in Forty Fort, which was dedicated for educational and religious purposes 145 years ago, in 1768, eight years before the outbreak of the American Revolution. This case was tried some years ago, and a verdict of $100,000 was rendered the township, but an appeal was taken to the supreme court, and it was sent back to be retried, so as to decide certain points.

Shickshinny—Failure on the part of twenty men employed at the West End Colliery of the West End Coal Co., to provide themselves with monthly buttons as called for by the United Mine Workers of America, caused a strike at the operations. District mine officials are trying to adjust the matter. Another button strike, affecting a larger numbe of men, is in progress at the Bliss Colliery of the D. L. & W Coal Co., at Nanticoke, and was called when the local investigation committee started an examination of union buttons at the mouth of the shaft and found a hoisting engineer without a button. The men reporting for work refused to be lowered by this man, and as a result the colliery was thrown idle. This is the first button strike to be called at this colliery, and it is said that the union officials are backing it.

Plymouth—By a decision handed down by Judge Fuller o Luzerne Co. in the equity case of Elizabeth Sweitzer agains the Plymouth Coal Co. the defendant company is enjoined from mining in the Bennett and Cooper veins within tw hundred feet of the plaintiff's property. The case wa brought in order to prevent the settling of the plaintiff' premises by reason of the mining operations of the defendant The borough of Plymouth is also interested in a similar suit and claims that as a result of the operations of the defendant its streets are sagging and its business places an homes are being ruined.

Philadelphia—Suit has been instituted for the possessio of 240 shares of stock of the George B. Newton Coal Co which recently absorbed several smaller companies in thi city. Samuel B. Crowell and Jonathan P. Edwards, forme owners of the firm of Roland & Bro., together with the Henr Hudson Estate, also owners of the firm of Robert Henderso & Co., contend that 240 shares of stock are due them, in addition to the $466,000 paid them for the assets and good wi of their companies. The shares in dispute are on deposi with the Philadelphia Trust, Safe Deposit & Insurance Co

Parsons—An announcement has been made that the Delaware, Lackawanna & Western Coal Co. will, in a short while operate a new mine at Parsons, Penn. The mine will be located on the mountainside to the southwest of the town where a hundred acres of virgin coal is still unmined. branch road will be run from the Delaware & Hudson track to the new colliery.

Bituminous

Clearfield—The Madeira Hill Coal Co., which is making extensive improvements and opening a new mine in the Clover Run district of Clearfield County, expects to be able to ship coal in a short time. This firm owns 7000 acres of coal in this region.

Pittsburgh—A warrant for $218,774.50 received by the Board of Education on Oct. 10, completed the three-cornered property deal by which the testing station of the government bureau of mines, obtained the Magee High-School site. In return the school system received three sites for day schools and a cash bonus. This property deal has been in contemplation for several months past.

Windber—It has been announced that the Berwind-White Coal Mining Co. will not buy power for its new McGregor Mine in the Reitz region, but will use its enlarged power plant at mine No. 35 for this service. Additional equipment has been purchased with a view to filling the needs of the company in this region.

Brownsville—That the Vesta Coal Co. is going to start operations on the west side of the Monongahela, several miles above West Brownsville, seems to be a certainty. Recently there have been officials of the Vesta company in the vicinity of the latter location, and indications point to this place as the scene of operation.

WEST VIRGINIA

Beckley—The merging of the majority of the collieries on New River is under way according to well-founded reports. The merging of these collieries has been under contemplation for several months, and it is believed that the consumation of the deal will be realized within a short time. It is reported that the syndicate is capitalized at $100,000,000, and that $18,000,000 in cash is ready to be applied on the first payment.

Matewan—The plant of the Marvin Coal Co. was sold recently at public outcry to George Buskirk, for $17,500. No plans have been announced in reference to the operation of the plant, but it is expected that Mr. Buskirk will personally superintend future operations.

ALABAMA

Birmingham—The Mining Department of the State of Alabama reports only seven fatal accidents during September, out of probably 25,000 miners working. This is said to be the direct result of the hard, systematic work being done by this department to prevent accidents.

The Tennessee Coal, Iron & R.R. Co. states that its production for 1913 will be at least 500,000 tons more than 1912.

KENTUCKY

Louisville—The Pittsburgh Coal Co., of Louisville, has been awarded the contract for supplying coal to the Louisville Board of Park Commissioners for the ensuing year.

The Kentucky Court of Appeals recently affirmed a judgment rendered in the Bell Circuit Court against the Continental Coal Corporation and its foreman, Robert Mattingly, in the unusually large sum of $20,000, for the death of W. P. Cole in one of the company's mines. This judgment was given in a verdict and judgment for $15,000, which was reversed by the court. The court held that the latter judgment could not be said to be excessive, and found no error in the record. In this connection, the prospect of definite payments through a compensation law is of interest.

Madisonville—The Sunset Coal Mines, among other industrial concerns near Madisonville, will probably be forced to shut down shortly on account of the unprecedented scarcity of water in that section, unless heavy rains fall soon. The Louisville & Nashville R.R. is now furnishing the mines and the city with water hauled a considerable distance, but all available supplies in the vicinity of the town are about exhausted, the Ohio river at Henderson being the railroad company's source of supply.

The United Mine Workers of District 23 met at Madisonville, on Oct. 14, a large attendance from all over the district being on hand, and discussed plans for the organization of the Hopkins County coal field.

Watsonton—Watsonton, Ky., named in honor of the Watsons, who are the principal stockholders and incorporators of the Mineral Fuel Co. and the Elkhorn Fuel Co., is the latest of the new towns in the Beaver Creek section. Work on the several mining operations in that section is about completed, and it is thought that coal can be shipped out as soon as the C. & O. branch line up Beaver Creek is finished.

Owensboro—The Fern Hill Coal Co.'s properties near Owensboro, have been taken over by a syndicate headed by John B. Brasher, formerly of Madisonville, who will superintend the operations of the mine hereafter.

OHIO

Steubenville—The coal tipple and engine house of the Eastern Ohio Coal Co., at Amsterdam, was destroyed by fire recently. The loss is estimated at $20,000. The fire originated from electric wirng.

Pomeroy—The Martin Ebersbach Co., which was recently incorporated under the laws of Ohio with a capital of $250,000, to mine and deal in coal, has taken over the producing properties in the Pomeroy Bend district, which were formerly owned by the same interests as a partnership.

Columbus—T. W. Brockman, of the Coal Credit Exchange, of Detroit, was a visitor in Columbus recently. The Ralston Steel Car Co., of Columbus, Ohio, which makes coal cars, has started to erect a large addition to the plant in order to increase its output.

The coal-mining commission named by Governor Cox, of Ohio, to investigate coal mining in the state has fixed public hearings for both the operators and miners in the senate chamber, Oct. 20. At that time opportunity will be given for both sides to present their cases and evidence in support of their contentions. According to J. C. Davies, a member of the commission, it is hoped to complete the taking of evidence by Nov. 1, and to have the report completed Dec. 1. So far the commission has investigated mining conditions in the Bluefield district of West Virginia, the Indiana field and the northern and southern fields of Illinois. It has also investigated the unloading machines at the Milwaukee docks, the stoker systems at the Detroit manufacturing and electric plants, and other things connected with the industry. The conservation of Ohio's coal supply is receiving considerable attention from the commission, and a part of the report will be devoted to that phase of the question.

Alliance—Fire destroyed the tipple and other buildings of the coal mine at Bergholtz early Oct. 7. Nearly 500 men will be out of employment. The mine is sometimes called the Phillips mine and belongs to the Rice Coal Co., of Cleveland.

INDIANA

Indianapolis—The southern shipment of coal for fall and winter consumption has crowded railroad lines to such an extent that it is sometimes difficult to find power to move the coal. A blockade of cars was recently found to exist at Indianapolis and also at Terre Haute. According to railroad officials, the coal freight service will be improved at once.

Vincennes—A deal has been practically completed between Vincennes lease holders of coal lands and the Wassan Coal Co., of Harrisburg, Ill., by which the latter for a consideration of $500,000 will gain control of about 50,000 acres of coal lands with the intention of immediately opening a number of mines and giving employment to 1500 miners from the South.

Linden—The recently organized Linden Summit Coal Co. expects to open a new mine near here in a short time, and give employment to about 200 men. Work on the new shaft will be begun at once.

Clinton—Dering mine, No. 1, is the first in the Clinton field to be electrified for hoisting, as well as lighting the entries, running the machines and hauling along the main entries.

Evansville—Miners of southern Indiana are in sympathy with their striking colaborers in western and northern Kentucky in their efforts to organize. It is reported that farmers are also giving them support and that they have the assistance of the members of the American Society of Equity, an organization of farmers. Coal operators of southern Indiana, it is said, are opposed to the organization of Kentucky miners because they are forced to compete with mines that pay less than the union scale. Indiana operators protested strongly against the shot-firers' bill in the last legislature, arguing that it would be unfair to them while the Kentucky field remained unorganized.

ILLINOIS

Belleville—The cable at the Little Oak mine broke the other day just after 50 miners had been lowered in the morning shift. A car of coal was loaded on the cage, and when it was just about at the surface the cable broke. Fortunately there was no one injured seriously.

Harrisburg—The receivers of the O'Gara Coal Co. have finally sold enough receivers' certificates to pay the miners at the O'Gara mines $237,000. Some of this money has been owing for over five weeks and on account of this money being paid some of the mines will resume work.

Johnson City—The fire in the McClintock mine, which for several days got beyond the control of the miners, is now confined to a small number of entries on one side of the mine. Work has been resumed.

MISSOURI

St. Louis—In a recent report by W. P. Hawkins, fuel agent for the Missouri Pacific-Iron Mountain lines, the itemized fuel account shows that in the past fiscal year the system paid $4,500,000 for locomotive fuel alone.

OKLAHOMA

McAlester—Coal operators in the McAlester fields are not unanimous on the proposed advance in price of coal among the mines due to increased demand. Whether this price will be advanced or maintained at the prevailing quotation will depend entirely upon the individual operators.

COLORADO

Colorado Springs—The coal miners in the El Paso County districts are rapidly being unionized. The difficulties which arose some time ago when the strike began have been adjusted with one exception.

KANSAS

Coffeeville—An effort is to be made to organize a company for the purpose of developing a coal field just north of this city. It is stated that a 10-ft. bed of what is believed to be a good quality of semi-anthracite has been discovered at two different places at a depth of 40 ft.

OREGON

Coos County—The Coos County Colliers Co., of North Bend, has completed negotiations for the entire output of the Riverton Coal & Development Co.'s mine, on the Coquille River, the Libby Mine on Coos Bay, and the surplus of the Smith-Powers mine, and has contracted to supply Vancouver and Prince Rupert, B. C., parties with 24,000 tons of coal during the next six months. The same company has chartered two vessels to ply in this trade, and the first shipment will go forward from the Riverton mine in a few days, when 800 tons will be taken from the bunkers. Thereafter it is expected to ship 1000 tons over the bar at Bandon each cargo.

The Riverton Mine, one of the most extensive producers in the county, is increasing its working force, and by Nov. 1 will be operating with a double shift and producing 150 tons of coal per day.

The Libby mine will double its force, also its output, for besides the contract just entered into, the Coos County Colliers Co. has Seattle, Washington and California orders for coal shipments.

Coos County is the largest coal producing county in Oregon. The total area of its coal fields approximates 230 square miles, the character of the coal being sub-bituminous.

PUBLICATIONS RECEIVED

Department of the Interior, Bureau of Mines. "The Production and Use of Brown Coal in the Vicinity of Cologne, Germany," by Charles A. Davis. Technical paper 55. Fifteen pages, 6x9 in., unillustrated.

Department of the Interior, Bureau of Mines, "Monthly Statement of Fatalities in the United States, July, 1913, with revised figures for preceding months," by Albert H. Fay. Nineteen pages, 6x9 in., with numerous tables.

Department of the Interior, Bureau of Mines, "Mining and Treatment of Feldspar and Kaolin in the Southern Appalachian Region," by A. S. Watts. One hundred and seventy pages, 6x9 in., with many illustrations and three insert maps.

Department of the Interior, Bureau of Mines, "The Titaniferous Iron Ores in the United States: Their Composition and Economic Value," by Joseph T. Singewald, Jr. One hundred and forty-five pages, 6x9 in., with numerous illustrations and tables.

PERSONALS

Jabez Woolley, a wealthy coal operator of Evansville, Ind., has been selected by the Chicago & Eastern Railroad Co. to manage its $500,000 coal properties at Paxton.

W. L. Klutz, formerly superintendent of the Thomas furnace of the Republic Iron & Steel Co., at Birmingham, has been appointed general manager of the Central Iron & Coal Co., at Holt, Ala.

E. B. Sutton has been placed in charge of the rescue station at Birmingham, Ala., by the Government, and will take up his duties at once, working in coöperation with the State of Alabama Mining Department.

Herbert Jones, aged 30, prominent in the development of the New River coal field, was probably fatally shot from ambush at Oak Hill, Oct. 7. He was acting as one of the managers of the Fayette County fair.

J. Warner Shook, vice-president and general manager of the Central Iron & Coal Co., at Holt, Ala., has tendered his resignation, and will enter other business. Mr. Shook is one of the best known coal and iron men in the South.

D. S. Duncan, of the W. G. Duncan Coal Co., of Greenville, was seriously injured in an automobile accident at Graham, a few days ago. The car in which Mr. Duncan was riding turned turtle, pinning him beneath it and causing the injuries referred to.

Due to the illness of his mother, John T. White, president of the United Mine Workers of America, has postponed his trip to the anthracite coal field. He has cancelled all his engagements in this section, and notice to this effect has been sent out by the district leaders.

A. M. Healy, with his wife and family, has taken up his abode at Salt Lake City, Utah. He succeeds F. N. Cameron as Vice-President of the Consolidated Fuel Co., the Black Hawk Coal Co., and the Castle Valley Coal Co. He will have entire supervision over the operating departments.

Paul Hardy, until recently General Manager of the Island Creek Coal Co., at Holden, W. Va., has been promoted to the position of Consulting Engineer of the Island Creek Coal Co., the Pond Creek Coal Co., and the United States Coal & Oil Co. His headquarters will probably be at Huntington, although this has not been definitely decided.

F. N. Ulrich, sales agent of the Lehigh Coal & Navigation Co., has returned from a trip through the South, which he made for the purpose of opening up that territory to Lehigh coal, made possible by the recent traffic agreements between the Lehigh & New England, a subsidiary of the Lehigh Coal & Navigation Co., and lines covering various important southern points.

Peter Lobenguela, eldest son of the former King Lobenguela, who, until the British occupation of South Africa, ruled the rich domain of Matabeleland, has been found living in poverty in Pendleton, Salford, England. His identity was revealed at the Revision Court in Pendleton, where he appeared recently in defense of his vote as a British subject. In recent yers, he has been employed as a coal miner in the Agecroft mines, near Pendleton.

⁂

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC.

of Coal Age, published weekly at New York, N. Y., required by the Act of August 24, 1912.

Editor, Floyd W. Parsons, New York, N. Y.
Business Manager, William Le Baron, New York, N. Y.
Publisher, Hill Publishing Company, New York, N. Y.
Owners, Hill Publishing Co., 505 Pearl St., New York, N. Y.

Owners of 1% or more of Stock Issued.

John A. Hill, 505 Pearl St., New York, N. Y.
Fred R. Low, 505 Pearl St., New York, N. Y.
John McGhie, 505 Pearl St., New York, N. Y.
Fred S. Weatherby, 1600 Beacon St., Boston, Mass.
Frederick A. Halsey, 505 Pearl St., New York, N. Y.
G. Eugene Sly, 50 Union Sq., New York, N. Y.
Frederick W. Gross, 447 E. 11th St., Erie, Pa.
Alfred E. Kornfeld, 114 E. 71st St., New York, N. Y.
Emma B. Hill, 80 Munn Ave., E. Orange, N. J.

The balance of the stock issued (less than 1% each) is owned by 62 employees, one ex-employee, and 11 others who are wives, daughters or relatives of employees.

There are no bondholders, mortgagees, or other security holders.

C. W. Dibble, Vice-President,
HILL PUBLISHING COMPANY.

Sworn to and subscribed before me this 29th day of September, 1913.

RICHARD L. MURPHY,
Notary Public.
(My commission expires March 30, 1915)

OBITUARY

ohn Bellas, aged 81 years, and believed to be the oldest e miner in the anthracite region engaged in underground , died at his home in Shamokin, Penn., Oct. 9. Since he 10 years of age, Bellas had worked in the coal mines.

ıkerman Bailey, Sr., one of the best-known operators in ern Kentucky, died Oct. 10 at Madisonville, at the age of ears, as the result of heart failure. Mr. Bailey was for y years connected with the Reinecke Coal Co., but for past few years he had been active in other operations, ntly organizing the Big Creek Coal Co. He leaves a wife four children.

he death of Col. John S. Holmes occurred in West Vir- a, on Oct. 5. Col. Holmes was one of the best known coal ators in West Virginia. For 25 years he was superin- ent of the Stevens Coal Co., the predecessors of the pres- Cabin Creek Consolidated Coal Co. With his two sons, iam S. and Daniel S., he shipped the first coal ever mined he Cabin Creek region.

hristopher Muckermann, 73 years old, a pioneer coal er, and founder of the Polar Wave Ice & Fuel Co., with ards in St. Louis, died unexpectedly at his home in St. s after an attack of gastritis. Mr. Muckermann was born Vestphalia, Germany, and came to St. Louis at the age 7. His father, upon arrival in St. Louis, engaged in the and coal business. His son followed in his footsteps and entire life has been devoted to that business.

. A. Sterling, aged 71, of Wilkes-Barre, died suddenly week at his summer home, at Glen Summit Springs. His h came almost without warning, even to his intimate nds. Mr. Sterling was taken with a heavy cold, which developed into bronchial pneumonia, and death came days afterward. Mr. Sterling was prominent in banking les, and was the active vice-president of the West End Co., as well as the Wyoming Valley Geological Society.

dolphus Busch, owner of the St. Louis & O'Fallon Coal mines at O'Fallon, Ill., and of the St. Louis & O'Fallon Co., died at his castle on the Rhine in Germany Oct. 10. th came somewhat unexpectedly, as the arrangements been made for the trip back home for the winter months. Busch was 76 years old last July, and was born in Ger- ıy. He came to the United States in 1857, settling in Louis. He is rated as being worth over $60,000,000, and is ous the world over as a brewer. He was a member of the . R. and of many foreign orders, and was in a general a great giver of money to various worthy causes.

CONSTRUCTION NEWS

omerset, Penn.—Work is progressing rapidly on the big ft of the Consolidation Coal Co., which is being sunk on John Biesecker farm, two miles west of Jenners No. 2.

airmont, W. Va.—The Fairmont & Cleveland Coal Co., of rmont, W. Va., organized with a capital stock of $600,000, acquired the holdings of the Parker Run Coal Co., in ion County and will increase the output and make new elopments.

roxton, Ky.—The Harlan Coal Mining Co. is progres- rapidly on its new No. 2 operation at Coxton. This ration will be handled by the company, as distinguished n its first mine at Coxton, which was leased to the Lick nch Coal Co., from which a good volume of coal is now ıg produced.

enkins, Ky.—The two great power plants of the Consoli- ion Coal Co., at Jenkins and Van Lear, Ky., respectively, gradually extending lines to various towns and mining rations in that section, and will ultimately supply electric- to a large area in that part of eastern Kentucky. The Van r plant was built two years ago, that at Jenkins, which is h larger, being completed during the past summer. The er plant cost $1,000,000, and contains five power units, able of developing an aggregate of 6000 kw., and the ıpany is now planning to increase this to 15,000 kw. The ıt develops a pressure of 40,000 volts, the highest of any er plant in the South. A line is in process of construc- between the two plants, a distance of 65 miles, so that er can supply the other with current in the event of acci- t.

NEW INCORPORATIONS

South Washington, Ind.—The South Washington Coal Co. has been organized with a capital of $7000 to engage in the coal business. The directors are A. A. Wallace, John Ridder, Jr., and Caspar Beale.

Clarksburg, W. Va.—The Templeton Coal Co. has been organized at Clarksburg, W. Va., to develop coal. The capital stock is $20,000, and the incorporators are J. M. Quinn, Ray Quinn, D. J. Carter, Harry W. Sheets and B. B. Jarvis, all of Clarksburg, W. Va.

Connellsville, Penn.—The Crescent Coal & Coke Co. has been granted a charter in Delaware, and will develop a tract of 122 acres in German Township, purchased from Sebastian Krado. Steps will be taken at once toward operation, but for the present at least, the company will produce only coal; but if conditions warrant, a battery of coke ovens will be built later.

INDUSTRIAL NEWS

Charleston, W. Va.—It is reported that Louis W. Adkins has sold his operations at Eagle near Boomer, and will in the future devote himself to coal ventures in other fields.

Pittsburgh, Penn.—Appalachian Coal & Timber Co., James T. Manning, president, has acquired 306,000 acres of coal and timber land in West Virginia, and will hold for developments through subsidiary companies and leases.

Charleroi, Penn.—For all the activity and confusion at Lock No. 4, they still have time to do business and surpass that of the preceding month. For the month of September the lockage of coal surpassed that of the month of August by 892,000 bu. of coal.

Washington, D. C.—The Interstate Commerce Commission on Oct. 13, suspended until Feb. 14, the proposed advances in rates on anthracite coal over the Lehigh Valley R.R. from the Wyoming coal district in Pennsylvania to Perth Amboy, N. J. The proposed advances would raise the freight rate from $1.40 to $1.55 per ton.

Atchison, Kan.—Although nothing definite can be announced, it now looks as if the negotiation looking toward the opening of a coal mine by a wealthy Eastern syndicate would reach consumation. Local men behind the deal are giving it careful and diplomatic attention, and they believe that negotiations can be brought to a successful issue.

Jenkins, Ky.—It is reported that negotiations are under way looking to the purchase by the Chesapeake & Ohio of the short branch line of the Baltimore & Ohio up Shelby Creek to the Consolidation Coal Co.'s Jenkins, mines, a distance of 28 miles. The branch referred to feeds to the C & O. route up the Sandy River, and is of great importance to that road, as more than 1,000,000 tons of coal a year move over it.

Wilkes-Barre, Penn.—Safety for employees of the mines of the Lehigh Valley Coal Co. has prompted this company to engage Evan A. Price, an expert mining man, to make a tour of the mines and report back to the company as to conditions pertaining to accidents, with a view of pointing out any faults that may come to his notice. Mr. Price will thoroughly investigate all fatal and nonfatal accidents which occur in the company's mines.

Brownsville, Penn.—The miners at the Denbeau mine of the Reliance Coke Co. have gone on strike. The men demand that the union scale as paid throughout the organized coal districts be allowed, but the operators have refused the request. The district and national organizations of the United Mine Workers are behind the miners in their demand. and a bitter fight is expected, unless the company agrees to terms. The Denbeau is a new mine, having in connection 236 modern coke ovens.

Birmingham, Ala.—John P. Harrison of Harrison-Tittswell Co., Ltd., of 66 Mark Lane, London, has placed with one of the large operators here an order for 50,000 tons of bunker coal, with the option of increasing the amount to 300,000 tons. This coal is to be used by the above company on its steamers, it being one of the largest water carriers in existence. The fuel is to be taken at the ports of Pensacola, Mobile and New Orleans. Mr. Harrison made a visit to this district and states that the collieries here were a revelation in comparison with the English mines.

COAL TRADE REVIEWS

GENERAL REVIEW

Conditions in anthracite are fairly active over the entire country, with stove coal in particular demand. The bituminous trade is holding its own with a tendency in many locations toward rising prices. The car supply is a predominating feature in Eastern and Central coal fields. Coke is, generally speaking, firm throughout all regions.

In Boston and New England generally, the anthracite market is strong. Many shippers are declining orders for stove coal unless accompanied by requisitions for other sizes. All firms appear to be well supplied with orders. The warm weather in New York has been a depressing feature in the anthracite trade, bringing the business to what is termed by some, a standstill. Nevertheless, stove coal and No. 1 buckwheat is in particularly strong demand. In Philadelphia and vicinity under adverse weather conditions, the market for anthracite does not improve as was expected. Prices, however, remain at circular level with but few rumors of concessions.

Reports on anthracite from Baltimore, Buffalo, Detroit and Chicago are all similar in tone. Dealers are buying freely, prices are well maintained, and stove coal is particularly scarce.

A week of steady fog along the northern Atlantic seaboard, has greatly shortened deliveries of bituminous coal to New England from Hampton Roads. There has been no improvement in the car supply throughout the Pittsburgh region while in northern Pennsylvania, Ohio and Indiana, generally, conditions have grown steadily worse. At Hampton Roads there is a fair accumulation of cars with but little free coal and that on hand is held for contract tonnage and Government colliers. But little change is reported anywhere in prices of bituminous. The demand throughout the South, generally, appears to be about normal. In the region tributary to the Lake trade, quotations have a general rising tendency. This would probably be decidedly augmented by a cold wave.

Lake shippers are still loading for the market of the Northwest as rapidly as possible. This condition is expected to continue until navigation closes. Warm weather in the St. Louis region has tended to break the market, but the indications are that with the possible exception of steam sizes, prices will recuperate. In some regions in Illinois and Kentucky screenings are a drug on the market, and are being either dumped at the mine or given away for freight charges.

British Columbia consumers are buying coal from the mines at Coos Bay. The practice in the past has been to occasionally import British Columbia coal to Oregon. A scarcity of fuel throughout the coming winter is predicted for this reason.

There is little change in coke conditions either as regards price or demand. A slight tendency has developed in the Connellsville region toward sagging, while throughout the Michigan and Illinois markets all grades of coke are firm.

Prices of all kinds of fuel are well maintained. What declines are recorded in certain varieties are fully compensated by advances in others. The sharp increase in the employment of railroad equipment, as shown in the new reports is an excellent index of the heavy movement of all grades of coal and coke.

BOSTON, MASS.

The Hampton Roads loading situation helped out by continuous fog along the coast. Prices firm on Pocahontas and New River but a slightly relaxed demand in New England. Distributing market dull. Georges Creek still out of the market and Pennsylvania operators beginning to feel the car shortage. Anthracite situation strong, with a heavy demand on Philadelphia, and barges in short supply.

Bituminous—A solid week of unbroken fog along the coast has served to help out the loading situation at Hampton Roads. Transportation has been practically at a standstill, and with few boats arriving there has been a chance for coal to accumulate. Most of this, however, is now going into Government colliers for the battleship cruise, and this week when bottoms begin again to arrive there will probably be further detention. Pocahontas and New River are being firmly held and on what small tonnages have be sold $3 has been the ruling price for the best grades.

The Pennsylvania coals are still in good demand, especially those of better quality. There is no marked chang in the price situation, but all the shippers maintain the usual caution about selling much ahead thus late in th year. Many operations are feeling the car shortage, pa ticularly for routings all-rail, and this is turning a larg proportion than is usual to Philadelphia for coastwise shi ment. If barge transportation is short at that port for th next fortnight on account of much of it being bunched this end it may be that prices f.o.b. will be a shade les firm than has been the case since early September.

Anthracite—The hard-coal situation in New England remarkably strong. One or two of the leading shippers a declining to accept orders for stove size and there are man signs of a shortening up of supplies. The retail trade tha started with a rush in September has so far depleted stock that dealers are getting anxious about October and November shipments. The heaviest demand is on shippers out Philadelphia and it remains to be seen whether a large proportion of the trade can be cared for from that quarter. goes without saying that all the companies are well supplie with orders.

Quotations on bituminous at wholesale are about as fo lows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahont New Riv
Mines*..................	$1.10@1.60	$1.30@1.70	$1.67@1.77

Providence†..........				3.88@3
Boston†..............				3.88@4

*F.o.b. †On cars.

NEW YORK

No improvement in car supply. Cooler weather wou have a quick and marked effect. Bituminous stocks at tid still below normal. Warm weather has brought the anthracite trade to a standstill. Stove and No. 1 buckwheat are strong demand and scarce, other sizes plentiful.

Bituminous—There has been no improvement in the situation as regards the car supply during the past week, an the continued shortage is having its effect on the deman some of which is coming from operators who are obliged t buy coal to take care of their contracts. Prices on coa for line or tide shipment have not been materially affecte though the market would probably respond quickly to an sudden pressure on the part of consumers. The continue shortage of labor and cars, the irregular operations due t petty strikes, etc., and cooler weather, are bound to hav an effect in the near future. Stocks on hand at tidewate still continue to be below normal. The local market remain quotable on the following basis:

West Virginia steam, $2.60@2.65; fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85 best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—The continued warm weather of the pas week has brought the retail trade in and around New York City to a practical standstill. A number of the dealers, o course, still have some of their "fill-in" orders to be taken care of but the spot business which is usually looked for about this time of the year has not as yet put in an appearance. A turn in the weather would undoubtedly stimulate business and bring in cash orders which are highly desirable to the retail dealer.

There seems to be no question that stocks in the hands of the consumers are much heavier this year than they were last. Stove coal continues to be the short size and it is getting to a point where very few of the wholesalers will accept orders for this size unless accomplished with orders for other sizes, especially egg.

Dealers in the outlying points are, where financially able keeping their stocks to capacity taking in additional supplies as fast as they are put out. With this condition the consumers should be much better taken care of than they were last year.

In the steam sizes the pea coal is in fair demand, No. 1 ckwheat is weak, and the better grades of No. 2 and No. 3 ckwheat are quite short and in urgent demand, where- some of the poorer grades are a drug on the market.

PHILADELPHIA, PENN.

Under poor weather conditions, the anthracite trade does t improve as quickly as was expected. Prices remain as rcular with few reports of concessions. Bituminous trade ill holding its own, with a tendency to higher prices.

Anthracite—The weather the past week has put a little mp in what looked like an auspicious opening for the an- racite coal trade for the fall and winter. Wholesale as ell as retail dealers state that the foggy weather has had e effect of curtailing orders, and while cancellations are t plentiful, there seems to be a disposition to hold up ders for delivery the latter part of the month.

The month of October is not likely to come up to the nnage of last year, as there was no insistency to the trade, e mining departments were not called on to exert them- lves in the way of production, but the prospects, are wever good, provided there is any cold weather. This is ally the important factor.

Bituminous—The bituminous trade seems to have taken on new lease of life, not that it was by any means dead, but ere has been a lack of snap and a tendency to softness for e last two or three weeks. Apparently this has disap- ared. Accumulations of coal at tidewater have vanished, and ere appears to be many dealers in the East who are not le to get the kind of coal they want when they want it. looks now as if the winter will see an almost continuous eriod of prosperity for the bituminous trade.

BALTIMORE, MD.

The coal market generally strong. Demand covers nu- erous new contracts, which consumers find hard to place. lack still a feature. Anthracite conditions active.

A gain in strength was apparently recorded by the coal arket here during the past week, when connections on very side reported that prices were still on the increase and vailable coal growing shorter and shorter. Car scarcity is utting a big figure in the market just now, and in both the airmont and Somerset regions, there were reports that ines were shipping but from one-half to two-thirds of what hey could do if given rolling stock as desired. Once under ay, it must be admitted, the fuel cars are being disposed f much quicker than ever before, and there is not now so uch delay in unloadings and by waits on sidings as was he case in previous years.

Ordinary grades of Pennsylvania steam coal were being isposed of in small lots around $1.15 and $1.20, and cheap uels from West Virginia were commanding about $1.05 he past week. Gas run-of-mine was worth $1.10, and three- uarter brought readily from $1.15 to $1.20. In the meantime lack took another leap and little was being let go below 1.20. The demand for this fuel seemed on the increase, ith mighty little unattached in sight. The cement industry emains particularly active in inquiries for this class of coal.

The foreign movement of coal from this port should soon ake a decided jump, as the past two weeks have seen a large umber of new charters announced. These charters are split etween South American, Cuban and southern European de- iveries.

Anthracite conditions remain active despite the rather arm weather that has prevailed. Steam sizes were reported n good call. Household business should take an added im- etus with the first winter weather. Deliveries are sufficient, espite car shortage in many regions.

PITTSBURGH, PENN.

Car supply unchanged, and not altogether adequate. Re- ent advanced asking prices easily obtained on limited ton- age available. Connellsville coke stagnant, with 1914 con- racts the next important business to be negotiated.

Bituminous—Car supply has not grown noticeably worse n the average during the past week. but is not as good as 0 or 60 days ago, and coal production is in keeping with t. While the labor supply is not entirely adequate it is a inor factor compared with the car shortage. There is ittle free coal available, and operators find no difficulty in elling what they can spare at the advances recently men- ioned over the regular circular prices of the season.

We quote for prompt and near forward delivery: Slack, $1@1.25; mine-run, $1.40@1.50; ¾-in., $1.50@1.60; 1¼-in., $1.65@1.75, per ton at mine, Pittsburgh district. There is no emand for long term contracts and the regular circular rices, have become practically nominal, these being based n $1.30 for mine-run, with slack at 90c.

Connellsville Coke—The market has been entirely colorless the past week. Demand for prompt coke has been extremely light and there has been practically no inquiry for forward deliveries. By a considerable reduction in output the free coke has been largely worked off. The market is no nearer than it was to a realization of the asking price of the majority of operators, $2.50 for furnace coke, and the only question is whether or not these operators will modify their views before 1914 contracts come to be negotiated.

In some quarters it is asserted that operators are committed to $2.50 for 1914 contracts, and will adhere to that figure even though it develops that a large tonnage will be available at lower prices. We quote the market, based chiefly upon sales made more than a week ago for October, as follows: Prompt furnace, $2.15@2.25; contract furnace, $2.25; prompt foundry, $2.75@3; contract foundry, $2.75@3, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 4 at 358,298 tons, a decrease of 27,196 tons, and shipments at 388,347 tons, an increase of 4981 tons.

BUFFALO, N. Y.

Market steady, with no indication or hint of immediate change. Not bituminous enough to go around and roads still cutting down their car supply. Anthracite selling in spite of the hot wave.

Bituminous—Certain of the big Pennsylvania coal roads have again cut down the car allotment, now making it 60 per cent. of the demand, which means that the mines are allowed to put out only a little more than half of what they are aiming at. There is much complaint of car shortage among the operators in the Allegheny Valley proper where they are dependent on roads in which they have no interest, but the more local coal roads, such as the Buffalo, Rochester & Pittsburgh, are said to be taking pretty good care of their shippers.

The quotations on bituminous coal are therefore as strong as ever, with no change of figures. Although there are notices of advances sent out from various centers, general survey shows that the advance is merely individual. The feeling is common that prices are high enough now. The figures are $2.90 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine run and $2.25 for slack, with Allegheny Valley coal about 20 cents lower, except for slack, which is about on a par with Pittsburgh.

Coke—There is no improvement in the state of the coke trade. Stock coke is a trifle easier, selling freely at $3.60 at Buffalo. Best Connellsville foundry is fairly strong at $4.85 f.o.b. Buffalo.

Anthracite—With the weather about as warm as it ever is in October and remaining so for several days, the anthracite market has shown unexpected activity, all shippers in that trade expressing satisfaction in the movement. There was so little stir through the summer that it is time to move now and the weather may change any day.

As a rule the lake-shipping agents of the anthracite companies are anxious to do more business and are wondering why the amount coming forward is no larger. While the space on the upper-lake docks is not what it was early in the season there is enough to keep the fleet busier than at present. It is felt by all that it will not be easy to get too much coal west this fall. Still the amount reported at the custom house for the week was only 108,000 tons.

TOLEDO, OHIO

Lake shippers are loading as fast as possible and are complaining of the car shortage. Domestic and steam demand is good and prices are firm with prospect of rising.

Lake shippers are loading as rapidly as is possible but have been somewhat handicapped by an inability to secure coal for cargoes fast enough, owing to the car shortage which has affected coal dealers somewhat during the past month and especially coal shippers who are anxious to get all the coal up the lakes possible in the short time still remaining before the close of navigation. The demand continues good and prices are exceedingly firm with prospects of rising a little later on.

Domestic demand was extremely good during the cooler weather of a couple of weeks ago and there was some falling off the past week owing to the warmth but this condition is purely temporary. Steam coal is in splendid demand. The traffic situation is looked upon by dealers generally as threatening and local coal dealers scoff at the charges recently made by certain state officials that coal cars are being sidetracked purposely by railroads for ulterior purposes. However there is a decided shortage of cars, brought on, so local dealers say by a variety of causes. The heavy sugar beet crop has made a big demand for cars for the transportation of sugar beets which will continue for practically 90 days. Railroads seem somewhat short of motive equipment also which has handicapped the return of empties to the coal fields. Some of the local dealers are complaining bitterly of a shortage of cars in the Pennsylvania coal fields which has greatly handicapped them in securing supplies. This they claim is not noticeable in nearly the same degree in the Ohio fields. Labor difficulties have been a source of annoyance and loss in the latter state and it is stated that there is at present fully a 60% shortage of labor.

Prices as quoted here follow:

	Pocahontas	Hocking	Jackson	Pomeroy	Massillon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.75	$2.50	$2.00	$2.50	$1.35	$1.35
Egg	2.25	1.20	2.50	1.75	2.50	....	....
Nut	1.80	1.20	2.25	1.75	2.50	....	....
⅞ lump	....	1.35	....	....	....	1.20	1.20
Mine-run	1.60	1.35	....	....	....	1.10	1.15
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

Despite the warm weather which has prevailed, there has been a good demand for all grades of coal in Ohio. Production is still limited by the car shortage which is growing worse in every district of the state. Prices are firm and inclined to advance. Tone of the market is good.

The feature of the coal trade in Ohio during the past week was the increasing car shortage, coupled with a good demand for all grades. The warm weather which prevailed for a greater part of the week apparently did not lessen the demand for domestic fuel to any extent and thus the trade is in excellent shape. Prices have ruled firm and no cutting of consequence is reported. Prospects for the future, outside of the smaller car supply are believed to be good.

Domestic trade is probably the strongest point in the market. Dealers stocks are generally small and they are trying to increase them for the rush which will come sooner or later. Retailers are busy with deliveries although the warm weather caused a slight lull in the retail trade. Retail prices are strong and no weakness of any consequence is reported.

Steam business is still strong and no falling off is seen in any branch of the trade. Manufacturing establishments are still taking a large tonnage and railroads are also using a fair amount. As the car shortage is mostly caused by a lack of motive power, there is some falling off in the consumption of railroad fuel. Steam prices are firm in every way. The small sizes are in good demand and prices are holding up firmly.

Production has been only fair during the week because of the shortage of transportation facilities. In the Hocking Valley the output is estimated at 60 per cent. and the same is true of the Pomeroy Bend district. In eastern Ohio the output is about 50 per cent. of the average. In the domestic fields there is a large falling off due to car shortage.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.75 @ 1.70	....	$2.00 @ 1.90	$1.75 @ 1.70
3-4 inch	1.60 @ 1.55	$1.50 @ 1.40	1.75 @ 1.65	1.55 @ 1.50
Nut	1.30 @ 1.20	....	1.60 @ 1.55	1.25 @ 1.20
Mine-run	1.40 @ 1.30	1.30 @ 1.25	1.50 @ 1.40	1.25 @ 1.20
Nut, pea and slack	0.85 @ 0.80	....	1.00 @ 0.90	0.85 @ 0.80
Coarse slack	0.70 @ 0.65	1.00 @ 0.95	0.90 @ 0.80	0.65 @ 0.60

LOUISVILLE, KY.

Practically no change in prices and the supply of gondola cars is short. Some operators are dumping their screenings as there is no sale for this grade.

There has been practically no fluctuation in price during the past week, although there is a pronounced tendency toward even lower figures than those which have prevailed on steam coal, especially the western Kentucky variety. Just one thing is standing in the way of an equally undesirable tendency in the eastern Kentucky steam-coal market, and that is the extreme difficulty of getting suitable cars for handling this coal.

The high-side hopper car question is quite as acute as ever in this section. With the absolute refusal of consignees of domestic coal to accept the "battleships" under any circumstances, operators have been forced to load only steam coal for the larger markets, in this type of car; and inasmuch as there are relatively few consumers willing to accept these cars, even with steam coal, the market is in effect substantially narrowed, and the available supply of steam coal is limited by the supply of gondola cars to a point where it is hardly more than adequate to meet demands.

A somewhat slackened demand for steam coal has resulted from the inactivity of business in some lines. The distilleries have not yet opened up, and there is still some uncertainty as to the extent of the busy season with them; while it is reported that lack of water has caused shutdowns of large manufacturing plants in various parts o state, and the consequent cessation of deliveries of fu them.

A number of mines in both of the big coal field dumping a large percentage of their screenings, findi useless to ship this grade, in view of market conditions. satisfactory movement of the domestic sizes continues, ing the production of screenings much larger than the any possible market for at present, hence the unusual cedure referred to. There seems to be no immediate pro of relief in this connection, as there is small doubt tha demand for domestic will become larger, rather than sm as the season advances and really cold weather begins.

As stated, there has been no change in prices, ea Kentucky block ranging up to $2.25 to $2.35, with scree somewhat slow at 60 to 75 cents. There is practicall market for western Kentucky screenings in this sectio

HAMPTON ROADS, VA.

Fair accumulation of cars at tidewater but little coal. Coal on hand being held for contract tonnage and ernment colliers about due. Quite a fleet of bunker s ers taken care of during the week.

The dumpings over the various piers at Hampton have been about normal. The New England market taken care of practically all the coastwise shipment while there have been some foreign cargoes there have no extra heavy shipments either coastwise or foreign. beginning of the week saw a large fleet of bunker ste taken care of at all piers but toward the end of the the supply of vessels arriving was not so heavy.

While there is a fair quantity of coal now at tide practically all of it is contracted for and is only held w for tonnage to arrive to lift it. Several government liers are about due to take large cargoes ranging 5000 to 12,000 tons each.

No heavy sales of Pocahontas or New River have be ported during the week. Some small lots have been dis of, however, at from $2.85 to $3.

The demand for high volatile coal is still light. quoted for this grade run from $2.65 to $2.75 with no reported.

Foreign cargoes for the week have been made to Zone. St. Lucia, Havana, Naples and Para and Manos,

BIRMINGHAM, ALA.

Little change in market, either lump or steam. on blacksmith coal fair. Practically no change in fu and foundry coke. Pig iron quiet.

This week has brought but little change in the coal ket. Domestic coal, due to the warm weather of the pa days, is quiet for this season of the year, and the ope can hope for no better market until cool weather co Steam coal is rather quiet, there being some new bus but due to the large production, prices are not quite no

Blacksmith coal is about normal with indications better demand shortly. Furnace and foundry coke practically no change over last week, fair demand at prices, with practically no large sales.

The market on pig iron is somewhat more quiet th has been for the past two weeks, no large sales being but with a fair tonnage composed of small sales. Pric holding at $11.50 to $12 for No. 2, foundry for the bala the year, with 25 to 50 cents advance for next year, first

INDIANAPOLIS, IND.

The car shortage continues and tends to stiffen pric domestic coal, which nevertheless has a good movemen consumers' hands. Warm weather in October has against any increased consumption of steam coal or sc ings.

The car shortage that began to show itself with the ing of October, is still cause for complaint. Operators that unless soon relieved it will have the effect of ma prices higher. Some buyers say they are already pa stiffer prices but operators affirm there has been no eral advance, though the market is strong. Where there been any rise, it was on domestic lump, which is in demand at $1.80 at the mines.

Notwithstanding the fact that October weather has be average summer temperature, coal continues to go into sumers' cellars in a way gratifying to retailers. There improvement in the call for steam coal or screenings, the sually fine weather being against them. Terre Haute is the center of the car congestion, which seems worse o Big Four, though the Vandalia is also a sufferer. it is the custom of yards to lay in stocks of Indiana coal ea than September and they prefer to wait until October. result is that there is an aggregate demand which w it starts swamps both mines and railroads.

When corn begins to move, the mines will be lucky, if they get half as much coal hauled as they would like to have. Cold weather will also make transportation more difficult. Some mines are not being operated, yet that does not seem to have much effect in lifting the blockade. The Big Four allows a larger part of the uniform rate for coal to Indianapolis and the gas belt to the originating road than does the Vandalia, so a greater amount of coal is routed by the Big Four and the congestion is greater in its yards and terminals. There is a better movement north to Chicago, than south to Indiana points, it is said. The advance in domestic coals at the mines has been 10c. and 15c., a total of 25c. since Sept. 1. This was promptly added to the retail prices, but the latter have not been changed since Sept. 20.

DETROIT, MICH.

Strength is the predominating feature of the local coal market and this with the car shortage is tending to raise prices. Anthracite is not plentiful and stove size is particularly scarce. Coke prices are firm.

Bituminous—The steam situation in and about Detroit is very active. No slacking off of any consequence is noticeable at the present time, there being a steady demand for steam grades from all the large manufacturing plants which will continue throughout the balance of the year. This will have a tendency to bring the market toward higher levels. Local operators claim that the production has been slightly curtailed over the previous week. This condition seems more acute in the Hocking Valley district where the car supply has probably not been the best; the output has probably not been over 70 per cent. of the normal.

Generally speaking, strength is the chief feature of the coal trade in Detroit. Demand for all grades is running along steadily, which together with the growing car shortage is making quotations firm in every respect. The volume of business that can be done here at the present time is entirely at the mercy of the car supply, which seems to be growing steadily worse, so far as this vicinity is concerned. Tone seems to be satisfactory and the future prospects bright.

Quotations are as follows:

	W. Va. Splint	Gas	Hocking	No. 8 Ohio	Cambridge	Jackson Hill	Pocahontas	Semi-Smo.
Domestic lump..	$1.75					$2.50	$2.75	
Egg	1.75	.....	.....	.....	.....	2.50	2.75	.....
Nut	1.60	.....	.....	.....	.....	.....	.....	.....
Steam lump	1.30	.....	.....	.....	.....	.....	.....	.....
$\frac{3}{4}$ lump	1.25	$1.25	$1.25	$1.20	$1.15	.....	.....	.....
Mine run	1.10	1.15	1.15	1.10	1.10	.....	.....	$1.00
Slack	0.90	0.95	0.75	0.80	0.80	.....	.....	0.85

Anthracite—This fuel is not as plentiful in the Detroit market as it was some time ago. Stove sizes are especially scarce and dealers are urging their customers to take a mixture of egg and stove. Jobbers are not hesitating to ask a premium of 35c. per ton for stove anthracite. The other sizes do not seem to be coming along in great abundance. The scarcity of box cars is given as reason for the slight shortage on hard coal and certain operators are asking permission of the dealers to ship their anthracite in open cars.

Coke—Prices on coke especially Semit-Solvay and gas are very firm. Semit-Solvay is being quoted at $3.70 and gas house at $3.25 ovens. The above cannot be said of Connellsville, because in some instances the foundry size has been quoted as low as $2.50 per ton.

CHICAGO

The coal trade throughout Chicago continues to be brisk. A number of the operators are sold up to Dec. 1. There is a heavy demand for steam coal and current orders absorb about all of the available supply. Retail dealers in anthracite are buying freely. The coke market remains firm.

All departments of the coal trade in Chicago are on an exceptionally satisfactory basis. There is an unusual demand for Hocking coal and some of the operators have sufficient orders on hand to keep them busy until Dec. 1. None have any free coal. The price of $1.75, the mines, continues firm. Additional strength is being displayed in the coke market, a wide demand for the by-products being noted.

Good prices are being obtained for domestic lump on spot business although a considerable quantity of low-price lump is being received. A large volume of orders is being placed by retail dealers for anthracite coal. Reports furnished by selling agencies disclose that the sales last month were the largest on record and that all indications point to exceptionally heavy business throughout the current month.

Smokeless lump and egg is being offered at $2.50, the mines. The mine-run price remains variable, ranging between $1.40 and $1.50. A new circular price of $2.25, the mines, is being quoted by producers in Franklin County, but there has been no recession in buying. No Carterville coal is being sold for less than $2, the mines, and the operators have about all the business they can conveniently handle. The price for Springfield domestic lump remains firm at $1.75. Screenings are selling at from 45c. to 55c. for the lower grades and from 70c. to 75c. for the higher product.

Prevailing prices at Chicago are.

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05@3.30	$2.52	
Steam lump	2.07		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.97	2.40@2.55	1.87	3.45@3.55
Screenings	1.27@1.32	1.75@1.85	..22@1.32	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-product, egg, stove and nut, $4.85; gas house, $4.65@4.75.

ST. LOUIS, MO.

Warm weather had a tendency to break market, but indications are it will regain. Steam sizes breaking and in the Standard field is given away for freight charges.

A drop in temperature the early part of the present week saved the coal market from going to pieces. As it was, the latter part of last week conditions were very bad locally with a tendency to cover the country market also.

Standard ¾-in. slack was given away for the freight charges, and when it became known the latter part of last week that the O'Gara miners had been paid, the screenings market on high grade fell off in Chicago, which, of course, affected St. Louis to the extent of 10 or 15c. a ton; and as a matter of fact, all sizes dropped.

Franklin County that had been up to $2.25 in our last report, dropped down to $1.75 with a maximum of $2. Carterville got down to about $1.60, as the minimum on domestic sizes, and No. 3 and No. 4 washed went down to $1.05.

The colder weather of this week, however, has strengthened the domestic market some but the steam market is very unsteady. This is a condition that will likely continue now for some time.

The prevailing market f.o.b. mines is as follows:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.10@1.15
3-in. lump	....	....	$1.40@1.50	....
6-in. lump	$1.75@ 2.00	....	1.50@1.60	1.35@1.45
No. 1 nut	1.35@ 1.50	....	....	....
Screenings	0.50@ 0.55	....	....	0.10@0.15
No. 1 washed nut	1.25@ 1.35	....	1.40	....
No. 2 washed nut	1.60@ 1.85	....	1.60	....
No. 3 washed nut	1.10@ 1.15	....	....	....
No. 4 washed nut	1.10@ 1.15	....	....	....
No. 5 washed nut	0.25@ 0.30	....	....	....

PORTLAND, OREGON

British Columbia coal consumers buy from mines at Coos Bay, Oregon, whereas practice has been occasionally to ship coal from British Columbia to Portland. Scarcity of coal predicted for the winter for various reasons.

News has been received that the Coos County Colliers Co., of North Bend, on Coos Bay, Ore., has completed negotiations for the sale of the entire output of the Riverton Coal & Development Co.'s mines, on the Coquille River, the Libby mine on Coos Bay, and the surplus of the Smith-Powers mine in that vicinity, to Vancouver and Prince Rupert, B. C., parties. The quantity will aggregate about 24,000 tons. This is the first instance known where Oregon has shipped coal to British Columbia. In past years it has occasionally been the practice to import coal here from the mines across the line to the north.

The Coos County Colliers Co. is reported as having chartered two vessels to carry the coal, the first shipment to be made at once. The Riverton mine will shortly begin the operation of double shifts and produce 150 tons daily. The Libby mine, too, will put on a night shift. In addition to the above orders, the mines have contracted with Seattle and California buyers for about 10,000 tons of coal.

As a result of the strike troubles in British Columbia prices on Washington coals have advanced during the past two weeks from 25 cents to 50 cents per ton, and indications are that they will go higher.

Following are prices in Seattle on staple and established coals at city bunkers:

Grand Ridge, lump, $5; nut, $3.50; Newcastle, nut, $3; lump, $5; Black Diamond, mine run, $4.25; lump, $7; South Prairie, mine run, $4.25; lump, $7; Renton, nut, $4; lump, $5.

Washington coals in the Portland market, delivered to consumers are quoted as follows: Newcastle, nut, $6; lump, $7; South Prairie, lump, $9.50; Black Diamond, $9.50.

Rock Spring, Wyo., is quoted at $9.50 for nut and $10 for lump, Utah egg is quoted at $9.50, and Australian, what little there is here is quoted at $10.

PRODUCTION AND TRANSPORTATION STATISTICS

COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during June and the first six months of this year in comparison to last year, in short tons:

	July		Seven Months	
Anthracite	1912	1913	1912	1913
Baltimore & Ohio[1]	122,214	80,404	825,636	839,103
Chesapeake & Ohio[1]	789	1,571	17,268	10,346
Erie[2]	715,621	765,140	1,008,675	4,970,188
Pennsylvania[1] [2]	952,741	719,944	5,525,010	6,138,175
Virginian[3] [1]	....	100	20	809
Total 5 roads	1,791,365	1,567,159	10,376,609	11,958,621
Bituminous

[1] Includes coal from connecting lines.

[2] Does not include company's coal hauled free.

[3] Includes company's coal.

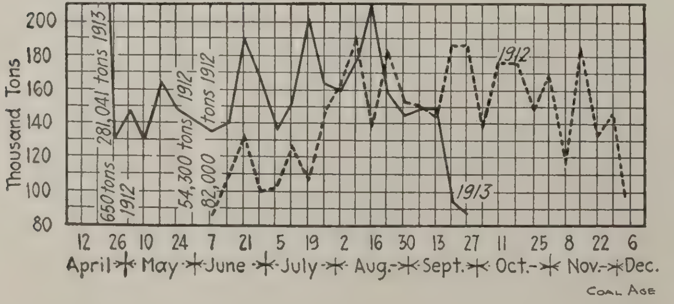
Note.—Southern Railway handled 338,648 short tons of coal during July and 2,409,598 short tons during the 7 months ending July.

ANTHRACITE SHIPMENTS

The following is comparative statement of the anthracite shipments for September and the first nine months, of the years 1912-13, in long tons:

	September		9 Months			
	1913	1912	1913	%	1912	%
Phila. & Reading	888,060	1,184,594	9,504,550	18.54	8,950,472	19.96
Lehigh Valley	1,031,876	1,168,649	9,671,928	18.86	8,287,807	18.49
Cent. R.R. N. J.	788,038	691,253	6,795,406	13.25	5,830,831	13.00
Del. Lack. & West.	834,345	835,316	7,357,984	14.35	6,354,946	14.17
Del. & Hudson	605,071	579,792	5,303,075	10.34	4,536,977	10.12
Pennsylvania	533,439	521,741	4,610,332	8.99	3,948,019	8.81
Erie	669,364	683,026	6,119,302	11.93	5,303,084	11.83
Ont. & Western	222,086	212,125	1,919,308	3.74	1,623,083	3.62
Total	5,572,279	5,876,496	51,281,885	100.00	44,835,219	100.00

Stocks at Tide on Aug. 31 were 575,385 tons as compared with 537,404 tons on July 31.



FOREIGN MARKETS

GREAT BRITAIN

Coals—Best Cardiff coals are fairly well "stemmed," and the price is about unchanged, but all other descriptions of large and small are in good supply for prompt loading and prices have an easier tendency. Colliery owners, while making concessions to immediate buyers, are reluctant to modify forward quotations.

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

Prices are approximately:

Best Welsh steam	$4.74@4.87	Best Monmouthshires	$4.07@4.14
Best seconds	4.38@4.56	Seconds	3.98@4.02
Seconds	4.38@4.44	Best Cardiff smalls	2.43@2.56
Best dry coals	4.38@4.63	Seconds	2.25@2.37

Freights—Tonnage is offering more freely and chartering is fairly active. Rates show some signs of weakening a little.

Quotations are as follows:

Gibraltar	$2.06	Colombo	$3.22
Malta	1.88	Sabang	3.22
Marseille	2.73	Singapore	3.40
Algiers	2.49	Las Palmas	2.24
Genoa	2.37	St. Vincent	2.43
Naples	2.43	Rio de Janeiro	4.30
Alexandria	2.37	Buenos Aires	5.28
Port Said	2.31	Santos	5.11
Aden	2.80

Burns Brothers—Dividend No. 1 on the common, 1¼% and No. 3 on the preferred, payable Nov. 15 and Nov. 1, respectively.

Pacific Coast Co.—Dividend of 1½% on the common and second preferred and 1¼% on the first preferred, all payable Nov. 1.

Colorado Fuel & Iron Co.—For the year ended June 30 last, this company reports a surplus after charges of $1,727,192, which is sufficient to meet the regular dividend of 8% on the $2,000,000 preferred, together with the 75% back dividends due, and still leave a substantial amount over. The back dividends now amount to only 40%, as 35% was paid in March of the current year.

The National Bituminous Coal & Coke Co. (Washington, D. C.)—The bonds of this company are secured by a first lien on about 52,000 acres of coal land and coal rights in West Virginia, 44,800 acres of which are owned in fee. There are eight operations on the property at the following points: Gauley, Peerless, Cedar Run, Crown Hill and Eskdale. The company has large holdings in the Pocahontas field. The production is contracted for up to March, 1914.

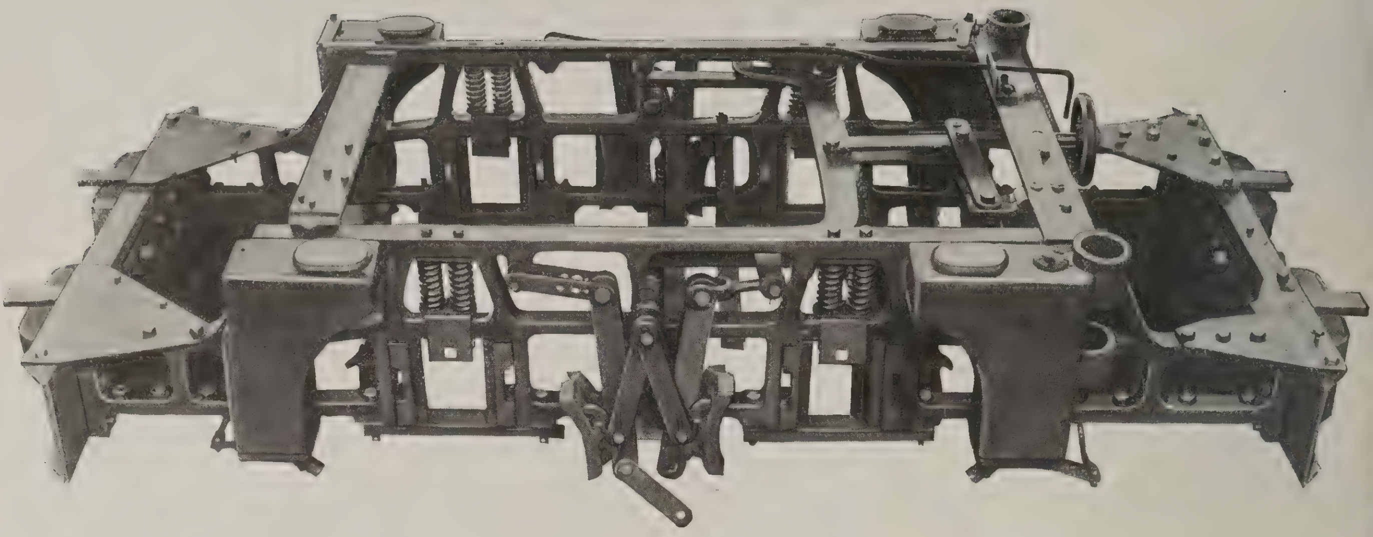
READY TO START A CUT WITH COAL PUNCHER, FRANKLIN COUNTY COLLIERIES SESSER, ILL.



The Cast Steel Bar Frame

(*Barsteel*)

of Baldwin-Westinghouse Mine Locomotives

This frame is of the same type as that used on the famous Baldwin Mikado steam freight locomotives. It is designed to give greater strength than any other type of frame for a specified weight of locomotive and to allow easy access to all parts so that the locomotive can be inspected or overhauled, when necessary, with the least possible cost of time and labor.

The motors; brake shoes; brake rigging and sand boxes are all quickly reached, and excellent ventilation is given to the motors and resistance, through the openings allowed by the ***Barsteel*** frame construction. The journals and the motor armature and axle bearings are also easy to get at for thorough lubrication.

The ***Barsteel*** frame is only one of the important features of Baldwin-Westinghouse Mine locomotives, which give the user the greatest possible service.

Full information can be obtained by addressing either Company.

Baldwin Locomotive Works
Philadelphia, Pa.

Westinghouse Electric & Manufacturing Co.
East Pittsburgh, Pa.

The frame on this Baldwin Mikado locomotive and the mining locomotive frame shown above are of the same type—simple, accessible, strong and durable.

VOLUME 4 OCTOBER 25, 1913 NUMBER 17

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 603
Suggests the value of study to all mining men and calls attention to the fact that personal progress can only occur in direct proportion to advancement in the entire industry. Readers are asked to contribute their own ideas by entering into the discussions, and by preparing descriptive articles. COAL AGE, Vol. 4.

THE CERTIFICATE LAW: *Page* 604
Charlton Dixon. COAL AGE, Vol. 4.

*A STEEL CHANNEL TIE FOR MINE TRACKS: *Page* 604

*THE LARGEST MINE LOCOMOTIVE: *Page* 605

THE MINER'S CIRCULARS: *Page* 605
Charlton Dixon. COAL AGE, Vol. 4.

*STRIP-PIT MINING IN KANSAS: *Pages* 606-608
The field is 35 miles in length and the coal averages about 3 ft. in thickness. Mining costs vary from 80c. to $1 a ton, according to the thickness of overlying cover. The coal sells for about $1.30 a ton at the mine. Barry E. Scobee. COAL AGE, Vol. 4.

A NEW COAL CRUSHER AND SAMPLER: *Page* 608

*MINING LOW SEAMS OF ANTHRACITE: *Pages* 609-612
A discussion of the methods and difficulties of working thin seams of anthracite, with particular reference to the adaptability of machines. It is the general impression that hard coal cannot be successfully mined with machines. Some remarks are also made on longwall practice in the anthracite regions. Hugh Archbald. COAL AGE, Vol. 4.

*AËRIAL ROPEWAY AT ENGLISH COLLIERY: *Page* 612

*GERMAN METHODS OF ALLAYING STONE DUST: *Page* 613

POWER DEPARTMENT: *Pages* 614-615
*THE UTILIZATION OF EXHAUST STEAM:
In using low-pressure steam from hoisting engines some kind of accumulator is necessary. A device is here described which is flexible in that it accommodates itself, within limits, to a varying supply of exhaust steam. COAL AGE, Vol. 4.

EXAMINATION QUESTIONS: WITH ANSWERS: *Page* 629

COAL AND COKE NEWS: *Pages* 630-633

Go After It

The Weekly Ad-Talk Page

Graham Hood, who writes the little stories of practical, every-day philosophy for the New York *Evening Globe*, recently published one on the importance of a man's equipping himself with the right knowledge and training, in the right way, and at the right time in his career.

To quote a part of it:

"If there is anything that it is absolutely necessary that you should know, especially in your business life, there is every probability that you will in some way manage to acquire this information some time. If you are wise you will go about the work of acquiring this knowledge systematically, beginning at the earliest possible moment.

"Because you fail to do this, however, don't imagine for a moment that you are to go through life in the state of ignorance that you have adopted.

"Even though you might be so foolish as to deliberately elect to know nothing that might help you get on in the world, you can't keep yourself from gaining this knowledge, for the only way to escape the lessons that Schoolmaster Experience teaches is to stop living. As long as breath remains in our bodies we are compelled to continue our studies in this school.

"The mistake that a great many persons make, however, is that of waiting until the knowledge comes to them instead of going after it. It may be true that the knowledge may come eventually, but what are to become of the countless opportunities when the sometime-to-be acquired knowledge would enable you to change a failure into a successful achievement?

"It is true that it costs something to secure this knowledge at first hand. It costs a great deal of time, much patience and persistence, and possibly a little money, but if you could compare the cost of the knowledge you get in this way, and that for which you have to wait until experience can get a chance to teach you, you would be amazed to see how much cheaper it is to secure your training in the right way.

"In the first place, the man who knows just what he wants to do, and exactly how he should go to work to get these results, reduces the possibility of mistakes and failure to a minimum. Mishaps may occur, for it is not easy to devise a positive safeguard against such incidents, but should they happen the man who knows how can usually find an easy way to remedy them.

"It is the fellow who does not know, and who is waiting for experience to teach him, who falls into all sorts of costly pitfalls. Experience does teach him in time, but in the meanwhile he must meet the cost of his experiments, and the expense of tuition in the School of Experience is far in excess of that which is charged for the thorough training that he may so easily secure at the beginning of his career."

The moral is, don't wait until knowledge comes to you—go after it.

It is the Coal Age's business to bring you a fund of valuable knowledge each week—all you need to do is to go after it, to read it. The selling section of this paper represents in reality an enormous, costly system of engineering education, which comes to you every week.

If you don't conscientiously read and study the ads, you are neglecting a great opportunity.

The information is there—*go after it.*

COAL AGE

Vol. 4 NEW YORK, OCTOBER 25, 1913 No. 17

Coal Age is entering the third year of its growth. All expectations have been surpassed. It is probable that this journal now has a larger circulation than any other mining paper in the world. 'Tis a record of which we need not be ashamed.

But with it all, we are not satisfied. We must have the lowest accident rate, although our business is the most hazardous. We must have the most contented body of workmen, notwithstanding the dreariness and drudgery of laboring each day in dust and darkness.

You say, "Fine talk, commendable sentiments, but easier said than done." Of course, it's not easy. The attainment of any ideal condition is the result of persistent effort—so much more reason why we must all lend a hand. At least if we can't render material service to the betterment of coal mining, we can refrain from discouraging those who have their shoulders to the wheel.

The success of every mine official is measured by the results he obtains. It's the cost sheet and the accident roll which most interest stockholders and directors. No manager can carry the burden of his entire operations; he is dependent on the efficiency of his superintendents. The latter are often made or broken by their foremen, and the foremen can't get coal out with safety and economy if the miners are ignorant or careless.

Every man engaged in the production of coal is "His brother's keeper." A "slip-up" in the mines may cost, not one, but many innocent lives. Education is the solution, and no man should be too busy to keep himself informed as to the progress of the industry. Originality and initiative are not everything; ability to grasp and utilize the essentials that have made the other fellow successful is a quality that marks the industrial leader.

If all this be true, then every coal man should regard the papers devoted to his particular business with a sense of proprietorship. They have been created to bridge the chasm between him and his brothers in other fields. He should not only read what they say, but should express his own thoughts, tell of his individual exploits and relate the results of his company's experience.

The manager or superintendent who won't look beyond the limits of his own backyard is doomed. The foreman or fireboss who refuses to see over the fence at his particular colliery is already booked for the discard. The miner who is satisfied to be a miner all his life need not fear that "Opportunity" will lasso him and force honor and success down his throat. Such things happen in dreams, but in real life we labor and fight for all we get.

You want a fireboss' or foreman's certificate —then study our instruction pages conscientiously for a few months, and you'll have no trouble in realizing your ambition. Perhaps your aim is to land a job as "super" at some plant where you can show your real worth; the advance will come to you sure as death if you have the requisite knowledge and ability. The man who is too busy or too smart to absorb further education is booked for an early and indefinite vacation, without salary or old-age pension.

Commence today. Adopt a plan based on so much study per week—it may be only one evening or one hour—the results will justify all the time you can give. And this goes for the man who is sixty, as well as for the one who is twenty; it applies to the mine manager as much as to the man who is loading coal at the face of a room.

And don't forget to show people you are still alive. Enter into our discussions, ask us questions, write an article describing something of interest at your mine. It may all seem commonplace and uninteresting to you, but probably the man at the colliery down the river or over in the next county will get a good idea from what you are doing at your eplant. Coal Age will pay you liberally fo very word published. For instance, if your can write a foreword of 500 words worth printing on this page, we will pay as much as $20 for it. Let us hear from you NOW.

The Certificate Law

By Charlton Dixon*

It is but a few years ago that the mine foreman was not required to pass an examination to prove his ability to fill that position in the mine. Before the adoption of the law requiring the certification of mine foremen, the entire country presented a wide field for employment. The mining man could go to any coal-mining state, and a position was open to him if he was a competent man. This condition had the advantage that many good men found their way to different states and districts.

That day has passed. The certificate law, so prevalent in most mining states, practically confines men to a certain prescribed territory, as it prevents their going to other states, without taking another examination and obtaining a certificate in that state.

When one reflects that the conditions, in different states, are very much the same in respect to the methods and systems of mining, the laws and regulations controlling the operation of mines, as well as labor conditions, it would seem only a wise provision if each coal-mining state would pass a law *making the holders of a duly authorized certificate of competency in another state, eligible to hold a like office in that state also.* The law could be so drawn as to protect the state against imposition, by specifying certain limitations to govern the practice.

Such a law would encourage the interchange of intelligent mining men and could not fail to prove an advantage. It would also provide a means by which ambitious young men could obtain a wider experience and increase their competency. It would prove a particular advantage in those states where a certificate law had been in force for several years, and, in which, as a result, there is an over-supply of qualified men.

The British Government granted such a privilege to her qualified officials some years ago by sending them to the colonies where, in many cases, the language and conditions differed materially from those with which they were familiar. The idea is worthy of consideration, and a discussion of this subject would be interesting and profitable.

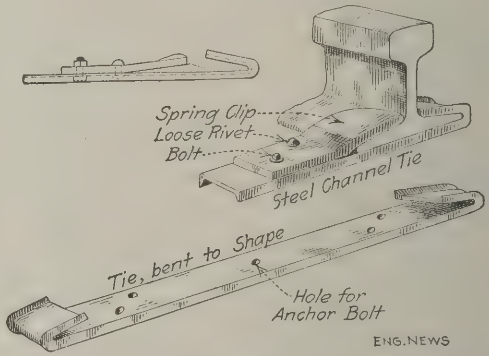
⁂

A Steel Channel Tie for Mine Tracks

The steel tie is becoming the approved support for the rails in the rooms of mines, largely because of the economy of space its use affords. It seems, however, that it has a marked adaptability for outside and heading tracks. It is true that it tends to bend when subjected to the heavy straining thrusts of the hoofs of mules, and these thrusts also tend to move the tie from its proper place in the track. These defects are met, however, by the W. H. Coffman tie, because instead of the bearing surface being flat, it is channeled, which increases its strength and by indenting the floor prevents slipping.

It would seem that the saving in ballast is an advantage which would serve with the reduction in the ties needed, to pay for their greater cost. Where the floor is hard, the laying of a few steel ties on the bottom of the cut or on the top of the bottom rock will be better than using wood ties and bringing in crushed ballast from outside. The maintenance of ditching with a shallow track is cheaper than with one which is of standard depth, especially where that track has to be kept close to a traveled road, as in a mine heading.

The ties are made of ½-in. steel, and they weigh from 1.75 to 1.90 per running foot. They have already been in use for years. *Engineering News* thus describes the tie: A form of steel tie for mine tracks, which is now being introduced in the mines of the Pocahontas coal field, consists of a light channel having the ends bent back so as to fit over the outer side of the rail base. The fit is close enough to require the rail to be driven in with some force, thus insuring a tight grip on the rail. On the inner side of the rail is a clamp held loosely by a rivet, so that it can be swung aside to allow the rail to be placed in position. The clamp is then driven back into line with the tie so that it grips the inner side of the rail base. A bolt can be fitted in the tail of the clamp, to keep it from working loose, but this is rarely used, as the clamp is slightly sprung when driven on the rail, so that it exerts a direct pressure and would require some force to displace it. At the middle of the tie is a hole for an anchor rod which is driven in the roadbed and prevents creeping of the track, but we are informed that this is not always necessary.



Steel Channel Tie for Mine Tracks, with Spring Clip Fastenings for the Rails

The channel is 2x$\frac{9}{16}$ in., $\frac{3}{16}$ in. thick, and is bent cold to shape in a machine specially designed for the purpose. A form of steel tie used somewhat extensively in these mines is made from a flat bar 1½x½ in., weighing 2.55 lb. per ft., but this is not so stiff as the channel of lighter weight. The price for the channels, however, is a little higher than that for the bars. For track of 44-in. gage the channel is 50½ in. long, and the two spring clamps are 6 in. long. Such a tie will weigh 9½ to 10 lb.

A special advantage of the steel tie is its shallowness as compared with wood ties, and it is said that this is sufficient to enable 8 or 9% more coal to be carried in each car. It also enables the rails to have a bearing on the floor of the mine, so that track will keep in better surface than when the rails are unsupported between the ties. Under these conditions it is stated that the steel ties may be spaced 5 to 8 ft. apart, especially if the cars are not heavy and are operated by mules. Some of the steel ties, however, are used on tracks operated by electric motors. Separate short pieces of steel channels (not attached to the rails) may be placed longitudinally under the joints or at intermediate points.

These steel channel ties and the bending machine used in their manufacture are the invention of W. H. Coffman, Bluefield, W. Va.

*3010 Banksville Ave., Pittsburgh, Penn.

Mining Low Seams of Anthracite

By Hugh Archbald*

SYNOPSIS—A discussion of the methods and difficulties of working thin seams of anthracite, with particular reference to the adaptability of machines. It is the general impression that hard coal cannot be successfully mined with machines. Some remarks on longwall practice in the anthracite regions are also made.

⁂

A few years ago a seam of anthracite coal 30 in. in thickness would have been disregarded in making any estimate of the possible tonnage which could be obtained from a colliery. In a suit decided in 1899, where the proper prosecution of a lease on a certain tract was involved, it was held from the evidence produced that such a seam was unminable. Nowadays, however, a large amount of coal is obtained from small seams from 2 to 3 ft. in thickness.

This is especially true in the Lackawanna Valley, where the thicker seams have been almost exhausted as far as first mining goes. The Mine-Cave Commission, appointed by the governor of Pennsylvania to investigate the caving of the surface in the anthracite region, reported that there is only sufficient coal left under the city of Scranton to last 20 years at the present rate of mining; the same commission reports that there is enough coal in the Schuylkill region to last four hundred years. It can, therefore, be seen that there is not, at the present time in the Schuylkill region, the necessity for mining the smaller seams that exists in the Lackawanna district, where the mining of low coal is the general practice, the price of anthracite being such that this can be done at a profit.

One distinct difference between these regions, is the position of the seams. Throughout the Lackawanna Valley the seams lie almost flat, so that there is little pitch mining and practically none on any heavy pitch, whereas in the Schuylkill region, most of the mining is done on the pitch, flat seams being the exception. Pitch mining has the advantage over horizontal in the fact that the miner can stand up when boring a hole for blasting and also that he is not compelled to do any shoveling.

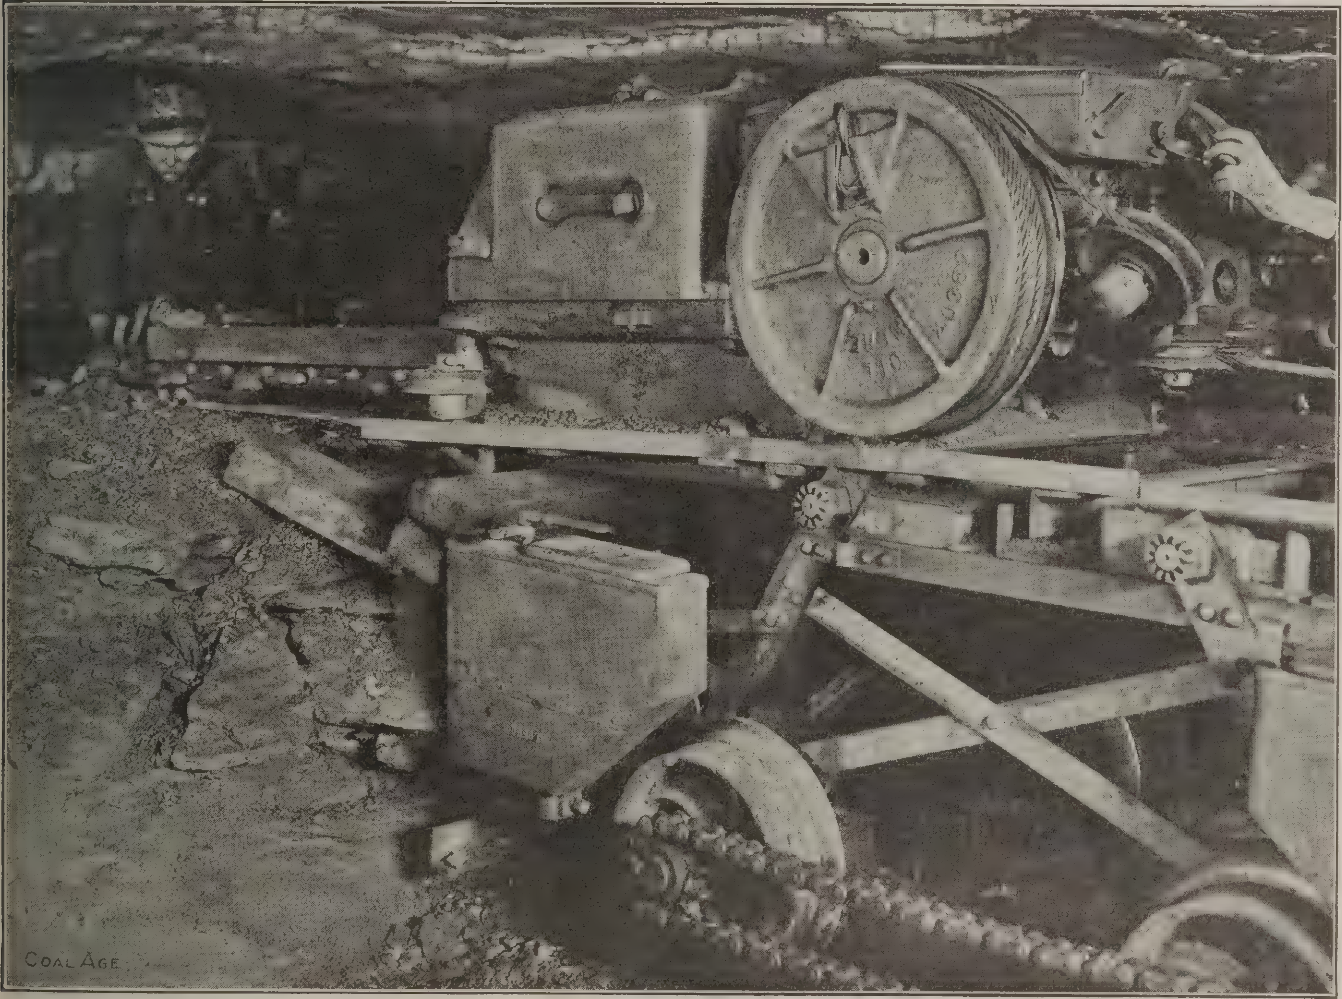

Fig. 1. Goodman Cutting Machine Being Loaded onto a High Truck

Early Method of Working Subjacent Seams

In this region the first mining was done on the room-and-pillar method, and it has not been customary to draw the pillars until the whole seam has been worked out. As a result there are large areas with pillars still standing from which coal will be obtained for a number of years to come. As there are a number of overlying seams, the leaving of pillars in one seam has necessitated the leaving of those in the seams beneath, in order not to break them by any movement of the subjacent strata.

---

*Cresson, Penn.

It has not always been realized, though, that the coal would ultimately be won from the pillars, this being especially true in the early days when the best seams were being mined. At that time no care was taken to drive the rooms with any regularity or to leave strong pillars, a seam being considered worked out as soon as there was no more room for chambers. The result has been that the small pillars left standing have weakened from air chipping, and squeezes have occurred over large areas, affecting all the seams above. This has meant, in some places, the loss of as much coal as is contained in the small seams which are now being mined.

The method employed in mining the thin seams has generally been the room-and-pillar system, as they underlie other seams from which the pillars have not yet been withdrawn. The exception to this rule occurs in those cases where the small seam happens to be uppermost; when this is the case, the coal is mined on the longwall system, either by maintaining roads at chamber intervals, blasting down the top rock or taking up the bottom in order to give height for the passage of the mine cars; or sometimes the panel longwall system is used with conveyors for loading the mine cars and a face from 200 to 250 ft. long. In this latter case, the coal is first undercut by machines and then loaded into the conveyor by hand.

Mining Machines in Low Seams

The use of undercutting machines in the anthracite mines has not become at all general, there being less than one hundred in the Lackawanna Valley at the present time. But a few have been in use long enough to demonstrate that they are as advantageous in mining anthracite as bituminous. The universal practice is shooting off the solid. It is to be expected, now that only the small and hard seams are left, that mining machines should come into more general use.

In mining some of the 30-in. seams of coal, it has been found that as much as 50 per cent. of the coal was broken into the smaller or steam sizes. As a higher price is obtained for the larger or domestic sizes, this is, of course, a great loss. An advantage in the use of undercutting machines is the increase in the amount of large sizes secured. The cuttings from a machine are merchantable sizes, being mostly pea coal and No. 1 buckwheat, with some chestnut mixed in.

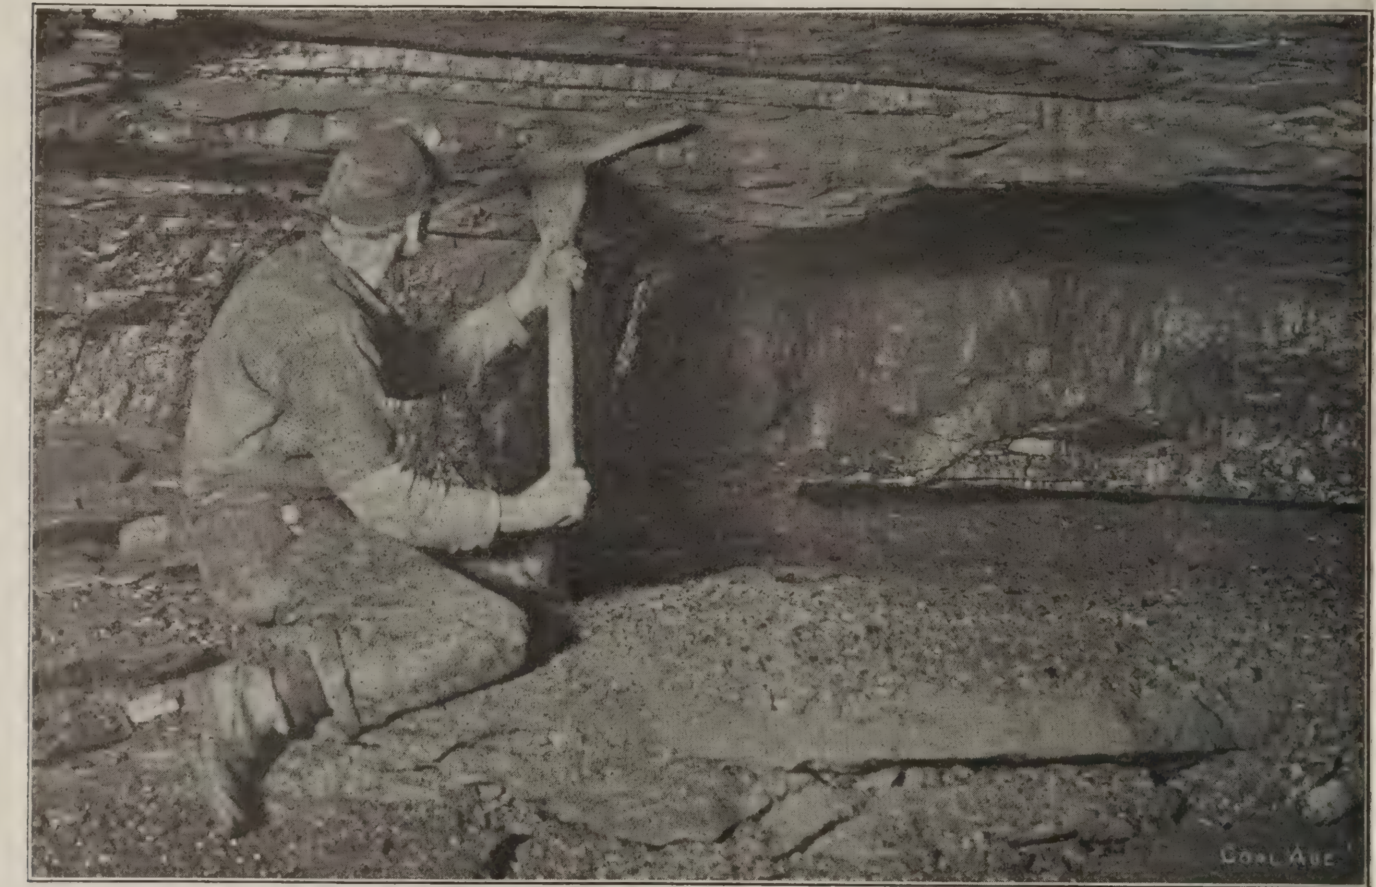

Fig. 2. Cutting in a Thin Seam at the Cayuga Mine of the D., L. & W. R.R. Co.

Machine Mining of Anthracite Coal

The generally accepted idea that anthracite coal is too hard for the successful operation of undercutting machines is wrong. They have been used to an advantage in places where the coal was so hard that a miner could only blast three and four cars with a keg of powder. Where the coal is as hard as this, a machine cannot cut much more than three places a day, but the cost of mining is reduced when a machine cuts between two and three places per shift. Nor is this confined entirely to low seams of hard coal, but has been a success in five feet and more.

In a hard seam there is greater loss from coal being blown into the gob than where it blasts easily, though even in free blowing coal there is some loss from this cause. This is due to the fact that a greater amount of powder has to be used and the lack of care in the arrangement of the gob. When the waste is piled up in neat order with walls, the coal scattered by the blast will fall on clear spaces where it can be easily recovered, but this is not the case when the flying pieces fall on the rough surface of the gob.

Roof Brushing vs. the "Buggy"

One of the large items of expense in mining low coal is the rock blasting. Where not more than two feet to two feet and a half of bottom or top has to be removed to give height, it is easier and cheaper to blast this and carry the track to the face. But where a large amount of rock has to be moved, it is more economical to employ a small car, or "buggy," into which the coal is first loaded and then unloaded into the mine car at the mouth of the chamber. The "buggy" is handled by the miner and his laborer, though sometimes a mule and a rope are used to draw it back and forth.

The "buggy" stands low, somewhat less than the height of the seam, so that it can run on a track placed in the chamber, and will hold usually about half a mine car of coal. The cars which are used in the Lackawanna region have a capacity of from two to three tons of coal. Frequently the high standing car, which was well adapted to the large seams of former days, has been still employed in the smaller ones now being mined, necessitating the cutting of a large amount of rock to give height. Along main roads it is well to maintain sufficient height, so that a man can stand upright, but this is not as essential in the chambers, where the greater part of the rock cutting is done.

System of Mining with the "Buggy"

In places where a "buggy" is used to load out the coal, enough bottom rock is taken up at the mouth of a chamber so that a switch may be laid in. The cut is made deep enough so that the mine car stands below the buggy in order to facilitate the loading. The chambers are driven in this case about 200 ft. long. Where undercutting machines are used, they are fitted with a special truck about 33 in. high, in order that the machine may be loaded and unloaded onto the bottom rock in the chamber. The height of the undercutting machine is 24 in., so that with one of these high trucks, a clearance of 57 in. above the rail must be maintained along the gangways. This is no more than is usually kept for the loaded car and its topping.

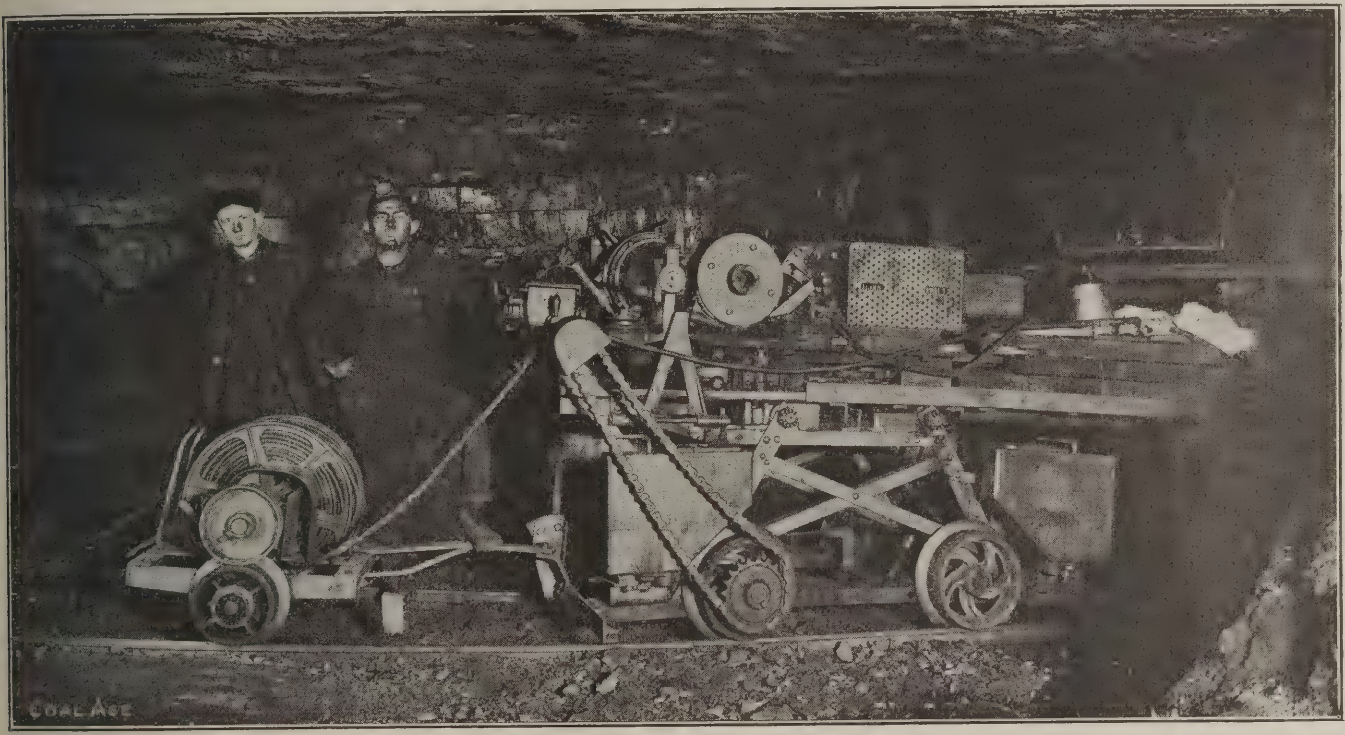

Fig. 3. Complete View of Machine Equipped with a High Truck

In Fig. 1 is shown a Goodman machine in use at the Cayuga mine of the D., L. & W. R.R. Co., being loaded onto a high truck after having made a cut; Fig. 2 shows the seam and the undercut which the machine has made. In this case the coal is from 30 to 36 in. high and above that is about 8 in. of bone. About 3½ ft. of bottom rock is taken up here. In Fig. 3 is shown another view of the undercutting machine shown in Fig. 1; this view shows the chain connections by which the machine is moved under its own power, and also the cable reel, which works automatically. The "buggy" can also be seen at the right-hand side, standing above the end of the machine; this gives an idea of the amount of rock that is taken up at the mouth of a chamber, it being quite thick but not covering a great area.

The chambers are driven about 200 to 250 ft. long and from 24 to 30 ft. wide, according to the conditions of the roof. Any greater depth than this consumes too much time and labor in the movement of the buggy back and forth.

LONGWALL MACHINE MINING

In one mine, where exceptionally strong roof occurs, the scheme has been tried of driving two narrow places to the full depth by means of a buggy, leaving a small pillar eight or ten feet wide between them. When they have been finished, an undercutting machine is used along the rib on opposite sides of each of the places, thus allowing the machine to make one long undercut before moving to another place. The real mining of most of the coal is then done by widening a narrow place. Loaders follow up the undercut, loading out the coal by means of a "buggy." The narrow places are driven in pairs and a strong pillar is left between each pair of chambers.

By the use of a "buggy" a saving in the cost of mining is obtained on account of the reduction in the amount of rock handled. There is not always room, in small seams, to stow the rock on the side of the chamber, so a great deal must be packed in other portions of the mine. Another advantage in the use of a "buggy" is the continuity of the work on coal, as the miner is not employed every so often in blasting rock.

In a certain panel longwall system in use at some places, gangways and airways are turned off from a main road at 500-ft. intervals. As soon as the gangway has advanced far enough to provide a strong pillar along the main road, two places are driven in to a depth of 225 ft. Allowing 50 ft. for the gangway and airway and the pillar between them, this will make the depth of the place equal to half the distance between the roads. After the places are driven in, a conveyor and an undercutting machine are installed. The undercut is made parallel to the main road and in the beginning it is made along the rib of the narrow place. One-half of the block of coal is mined advancing and the other half retreating.

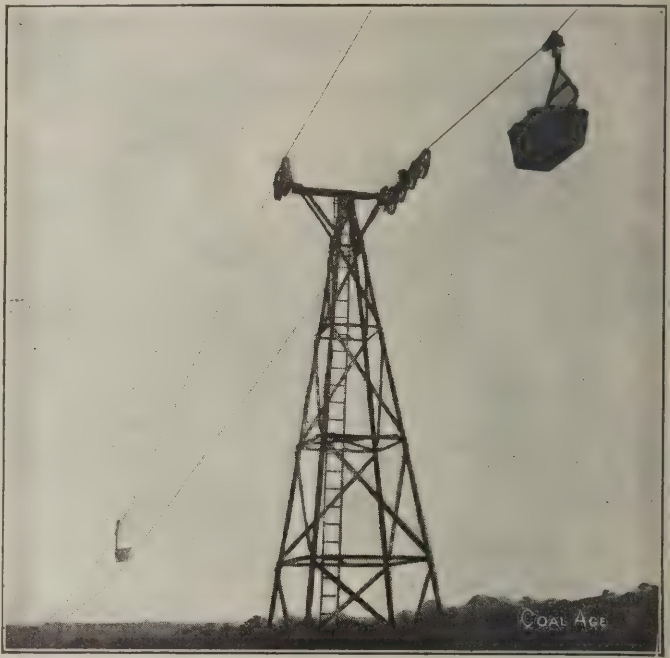
The undercutting of the coal is done at night, the face being about the length that a machine can undercut in an average of nine hours. The conveyor is moved forward also at night, and is kept as close to the face as possible and still allow room for the movement of machine and men. The coal is loaded into the conveyor by hand during the day. A 30-in. seam will produce about 150 tons from an undercut 6 ft. deep, which is about as much as can be conveniently loaded in one shift in the cramped quarters of such a seam. An advantage which the use of the conveyor and the panel longwall system has, is the concentration of the work. Moreover there is the least maintenance of roads and branches.

⁂

Aerial Ropeway at English Colliery

Among the more interesting equipments recently installed in British Collieries is an aërial ropeway at the Bayton Colliery in Shropshire. It is interesting as being the first case in which the makers have adopted a positive rope saddle for a single-cable ropeway. In this case one rope both supports and hauls the carriers. The ropeway is 7030 ft. long and has been built to carry coal from the screens at the colliery, delivering it to railroad cars on the colliery siding close to the Cleobury Mortimer Station. At the colliery end of the line there is a main coal bunker, which has four sections for storing different sizes of coal, the classification of the coal being done by a shaking screen located over the bunker. The ropeway buckets are loaded by gravity, there being eight loading chutes, so that all four classes of coal can be loaded, if necessary, at the same time, and carried to different railroad cars at the siding.

At an angle station, situated about the middle of the ropeway, the rope makes a turn of 104½ deg., and arrangements have been made so that coal can be discharged at this point. The ropeway passes over two main roads between the colliery and the siding, but it has not been considered necessary to provide safety bridges at these points, reliance being placed on the grip of the rope saddles.



VIEW OF STANDARD, BAYTON ROPEWAY

The standards are built of steel sections and vary in height from 25 to 50 ft., according to the varying contour of the ground. Four steel sheaves are used to support the loaded rope and two similar sheaves for the no-load rope on the return side of the standards. They are bushed with phosphor-bronze and mounted on balancing arms, so as to divide the stress equally between them. The spindles on which they are carried, have a hole drilled through the middle and a Stauffer lubricator fixed at the end, which can be filled with grease or have the caps tightened, while the ropeway is working. The discharge terminal is 76 ft. long and allows the simultaneous loading of three railroad cars without their being shifted, as it has a shunt rail onto which the carriers run to the required position for loading the cars. It also

DISCHARGING AND RETURN TERMINAL

contains apparatus that automatically and continuously maintains the working tension on the ropes. A telephone line connects the loading and discharging terminals and also the angle station.

THE DISCHARGE OF THE BUCKETS

The buckets on reaching the discharging position are tipped into chutes, provided with anti-breakage shutters, to lessen the degradation of the coal as much as possible. As they leave the rope to pass onto the shunt rail at the terminal, their weight is taken by the inner wheels and the position of the grip is such that its movable jaws are able to easily clear the rope. The actual amount of this clearance is about ¾ of the diameter of the rope, leaving plenty of play in reserve for the time that the carrier leaves the shunt rail to run onto the rope.

When the movable jaws of the gripper have closed onto the rope, the whole of that clamp is clear of the under side of the latter, allowing it to easily pass over the supporting sheaves without fouling them. It is stated that this form of gripper is not affected by frost or snow or even by an excess of lubricant on the rope and that loads can readily be taken up a gradient of 1 in 1½ or even 1 in 1. Another advantage of this gripper is that buckets can be carried around the return terminal without being stopped or detached from the rope or handled in any way. This is unusual in single-rope systems.

The installation is designed to carry 39 short tons of coal an hour, but this capacity could be increased by adding further buckets. Special carriers are provided for bringing up pit props and other materials from the railway to the colliery.

⁂

German Methods of Allaying Stone Dust

Some notes on recent Prussian practice in allaying the dust resulting from the drilling of boreholes are contained in the "Zeitschrift für das Berg- Hütten- und Salinenwesen," Vol. 61, No. 1. The increasing amount of rock work in coal mining and especially the development of machine drilling makes this provision of no little interest.

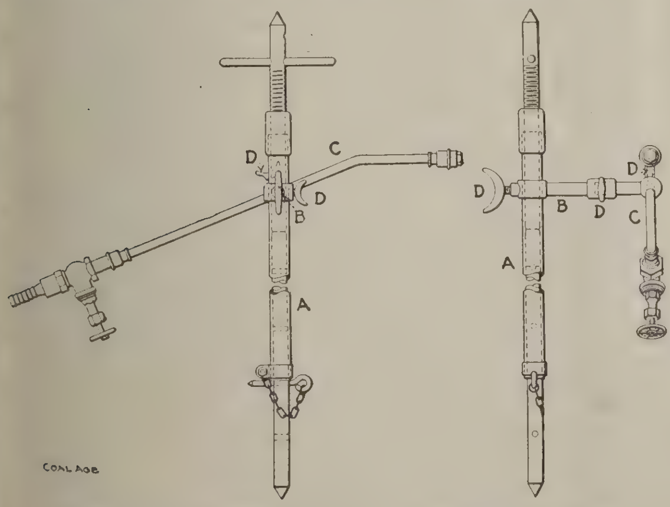


FIG 1. APPARATUS FOR ALLAYING DRILL DUST

At the Richter shafts of the Laurahütte coal mine in the North Kattowitz district, a water jet is used to remove drill dust from holes bored in the rock by compressed-air hammer drills. Wrought-iron gas pipes about 0.4 in. in diameter and 4 ft. long are connected by hose with the water piping and introduced into the hole during the work of the drill so that the water continuously removes the drill dust.

At the Monopol mine in the Dortmund I mining district, a water-jet device has been used with excellent success to render the stone dust of machine drills harmless. This is shown in Fig. 1. It is comprised of a mounting column *A*, similar to a drill post, which extends from floor to roof in the middle of the roadway. Upon it one or more movable brackets *B* are affixed according to the number of holes to be drilled simultaneously. On the ends of these arms are carried sprinkling pipes *C*, which can be revolved and moved longitudinally. They are equipped at the front ends with brass or bronze nozzles, while the rear ends which are provided with valves are connected with the water-supply piping by rubber hose. The valve of each pipe is so adjusted that a fine stream of water flows from the nozzle. The jet of water is arranged to strike exactly in the drill hole and is clamped in this position by the winged screw *D*. Experience has shown that a water jet about 0.04 in. thick suffices to moisten the waste from a hole so as to prevent the formation of a cloud of dust. Since the workmen are not annoyed by so small a quantity of water and as the apparatus is easily and quickly manipulated, they are willing to use it.

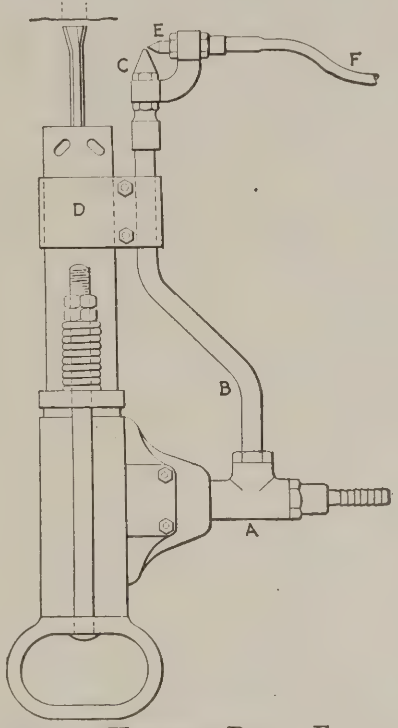

FIG. 2. HAMMER DRILL FITTED WITH A WATER JET

To obtain a similar end an appliance is being used in the Schlägel und Eisen I-II mine in the East Recklinghausen mining district. This is patented by Herr Voss and called a "dust destroyer." It is manufactured by the Glückauf Drill Factory, in Gelsenkirchen, Germany. As shown in Fig. 2, the apparatus consists of the small tube *B* connected with the T-piece *A* and the collar *D* on the hammer drill. This little tube ends in a nozzle *C*. Perpendicular to this is another nozzle *E* connected with a hose *F*. When drilling, this is hung in a water tank. The T-piece *A* is connected with the compressed-air piping so that a part of the air flows through the little tube *B* and the nozzle *C* and sucks a supply of water through the nozzle *E* and the water hose *F*. This is finely sprayed around the drill hole thus continuously allaying the stone dust as it forms in drilling.

Since the fixture is fast connected with the hand-hammer drill, the workmen are compelled to make use of it.

POWER DEPARTMENT

The Utilization of Exhaust Steam

SYNOPSIS—In using low-pressure steam from hoisting engines, some kind of accumulator is necessary. A device is here described which is flexible in that it accommodates itself, within limits, to a varying supply of exhaust steam.

⁂

In many collieries the problem of the efficient utilization of the exhaust steam from the hoisting engines, making a large intermittent demand on the boiler capacity, is a perplexing one. Even when run condensing these machines do not utilize the full heat value of the steam. Attempts have been made to secure further thermal efficiency by passing the exhaust through turbines on its way to the condenser.

Providing that the condensing arrangements are effective and the vacuum maintained is high, it has been proved in practice that a considerable increment of power can be thus obtained. This is generally utilized in driving electric dynamos, from which auxiliary machinery can be economically run.

Much trouble has, however, occurred in the past, owing to the fact that the power demand of the hoisting engines is intermittent and hence the supply from the exhaust may vary in a ratio of as much as five to one, comparing the maximum with the mean output.

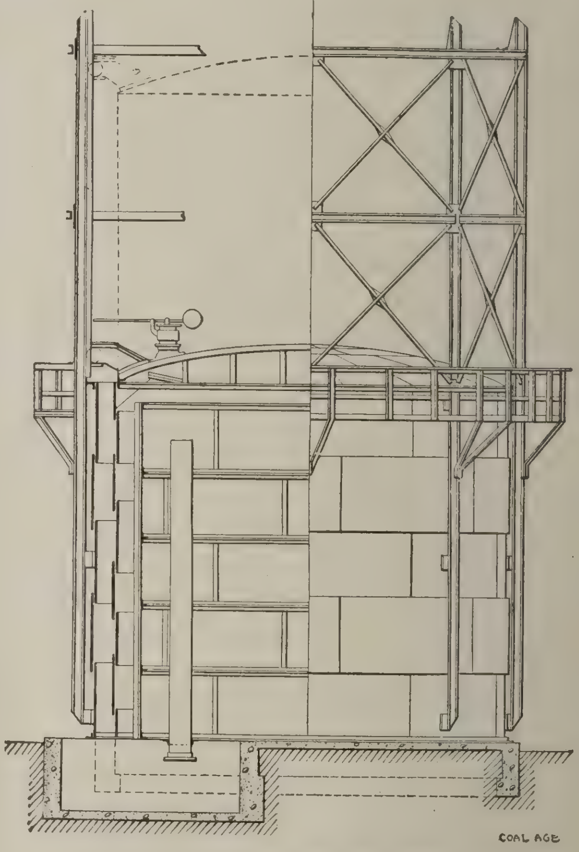
This obviously imposes a considerable difficulty in the proper use of exhaust steam from this source, because in order to utilize the whole amount, a low-pressure plant of sufficient capacity to deal with the maximum output, would have to be provided, which for considerable periods would operate at but a small proportion of its rated output. Where electrical power is obtained in this way, some form of electrical storage could be adopted in order to equalize supply and demand, but the expense of equipping and maintaining a storage battery becomes a serious factor in the adoption of such a scheme.

Steam Storage Is Advantageous

It is evident therefore that suitable storage, located between the main engine and the exhaust-steam equipment, would have many advantages, and numerous attempts have been made in this direction. In many situations compactness and simplicity are essential features in connection with exhaust-steam accumulators, and one of the successful types which has been adopted in practice is that illustrated herewith. It is made by Messrs. Louis Schwarz & Co., of London.

The exhaust steam leaving the primary engine in a fluctuating manner is collected in an inverted bell accumulator, similar to a gas holder, without regeneration. An intermittent supply is thus changed into a continuous stream passing at an even tension to the low-pressure machine. The simplicity of construction and reliability in operation make it a simple and easy means of surmounting the difficulty outlined above.

The accumulator consists of a riveted wrought-iron or mild-steel bell, contained in a structural-steel framework, and so arranged that it is freely movable in a vertical direction. The pressure of the steam thus remains constant irrespective of the variation of the volume of the space between the bell and the stationary floor of the accumulator.



Half Section of Receiver

The bell dips at its lower end into a water seal and an easy upward and downward movement is obtained without tilting or jamming by means of suitable guides and guide wheels or similar devices in exactly the same way as the gas holder is constructed. On the inside of the bell internal ribs and girders are provided to resist pressure.

The bell is constructed of an ample capacity in relation to the output of the primary engine in order to give a storage proportionate to the usual ratio between maximum and mean demand. There are, however, frequent occasions in practice when this ratio may be exceeded.

Overloads and Underloads

On the one hand the primary engine may operate on an overload larger than that originally intended, or for a longer period than the storage capacity of the bell was designed for. In this case there will be an excess of steam, and in order to allow its escape in the event of the bell rising to the full extent of its travel, there is provided a suitable safety valve. This allows any surplus steam to blow off, is large enough to prevent a dangerous increase of pressure inside the accumulator, is automatically opened just before the bell reaches its top position and closes again when descent has begun.

On the other hand, the primary engine may be operated on light loads for a considerable period. In this event there will be a shortage of exhaust steam compared to the demand of the low-pressure equipment. In such cases it is necessary to admit live steam to the accumulator should the ordinary supply be insufficient for the requirements of the secondary engine. This is also automatically provided for. When the bell falls to a predetermined point, shortly before its arrival at its lowest position, a valve is opened by means of a suitable mechanism arranged therefor and live steam is admitted to the accumulator.

This steam then expands to the pressure for which the bell is arranged and a further supply is automatically cut off as soon as the accumulator regains a certain height, which can also be predetermined.

In order to prevent, in case of a shutdown, the possibility of a vacuum being formed in the bell or in the pipes leading thereto, an automatic air valve is provided. The necessary drain valves and pressure gages are also suitably located.

Surface Condensation Is Reduced

In order to reduce the condensation of steam, due to surface radiation, to a minimum, a coating of heat-insulating composition is placed over the bell, so applied that there is no danger of its being displaced in working. The floor of the accumulator consists of concrete which also serves as a foundation. This is in consequence suitably thickened under the side walls and around the piping leading into the accumulator.

Between the main engine and the accumulator an oil extractor is fitted in order to eliminate the oil and impurities from the exhaust steam. This is necessary because it would be disadvantageous to allow oil to pass through the turbine into the condenser and thence to the boiler. It is also desirable that back pressure be reduced as far as possible as this lowers the initial pressure of the exhaust-steam plant. A device has been produced which accomplishes both these results admirably, the steam reaching the low-pressure apparatus being said to contain only 0.001 per cent. of oil. Moreover, the oil thus recovered can be filtered and used over again.

The accumulator above described would appear to be a valuable means of reclaiming waste power from an intermittent supply of exhaust steam. Its compactness, simplicity and reliability are strong features in its favor.

⁂

The Norfolk & Western Electrification

The Norfolk & Western R.R. has decided to electrify that portion of its trackage lying between Bluefield and Vivian, W. Va. Including branch and feeder lines, this amounts to about 85 miles.

The carrying out of the contract which has been already let will give form to one of the most important projects of steam-railroad electrification yet undertaken. This contract calls for the manufacture and delivery of twenty-six 130-ton electric locomotives of the single phase-two phase type, together with all required power-house generating machinery and transmission apparatus.

Single-phase alternating current at a frequency of 25 cycles and a tension of 11,000 volts will be supplied to the locomotives through an overhead trolley wire. This is the same type of system that has long been successfully used by the New York, New Haven & Hartford R.R. on its main line, by the Boston & Maine in the Hoosac tunnel and by the Grand Trunk Ry. in the Sarnia tunnel, also by the New York, Westchester & Boston Ry.

The Norfolk & Western locomotives besides being large and of enormous hauling capacity, will embody many unique features and refinements of design, which it is expected will result in their showing unprecedented flexibility and economy of operation.

The Bluefield-Vivian section serves the Pocahontas coal field, which is one of the largest and most celebrated coal regions in the world. The coal handled amounts to 65,000 tons per day, necessitating trains weighing as high as 3250 tons. It was in order to facilitate handling this heavy traffic that electrical operation has been decided upon. There are a number of grades on this section, the maximum being 2 per cent. At the present time, three Mallet locomotives are required per train, one at the head and two pushing. Only two electric locomotives will be required for this service and the speed will be approximately doubled.

Three Speeds of Operation

Since the Norfolk & Western locomotives are intended for handling what is called tonnage trains, they will be built for running speeds of approximately 7, 14 and 26 miles per hour. The design of the electric equipment will be such that the tonnage can be readily increased in the future as the service may demand. The traffic conditions on this section of the road are especially well adapted for electrical operation. It is in reality a separate engine division at present and can therefore be operated electrically without affecting locomotive service on other sections of the line.

Power for the entire electrified section will be generated in one central station, located at Bluestone, W. Va., with an installed capacity of 27,000 kw. in turbo-generators. All of the electrical apparatus including the locomotives, will be supplied by the Westinghouse Electric & Mfg. Co.

Conditions that are conducive to high economy in an electrification like that of the Norfolk & Western, are: (1) Traffic requirements such that a minimum electrical equipment will give practically continuous service. (2) Fewer engine crews will be required per train. (3) The speed of operation over the division will be nearly double that possible with present steam equipment. (4) Increased capacity of electrified section. (5) Electric locomotives are not limited to short hours of service, on account of boiler or fire conditions, as are those propelled by steam. (6) Watering and coaling delays incident to steam operation will be entirely eliminated. (7) The general reliability of locomotive operation will be considerably improved.

As stated above, the contract for this work has already been let. This calls for its completion in the summer of 1914.

An Example of Colliery Switch Gear

Special Correspondence

SYNOPSIS—A totally inclosed switch with many features making for safety. The device has been designed and constructed in conformity with the rigorous stipulations and recommendations of the British Home Office.

⁂

The conditions imposed by the British Home Office with regard to colliery-switch gear have been made stringent. This is a step in the direction of insuring safety to employees in what is admittedly a dangerous occupation.

In the report of the Departmental Committee appointed by the Secretary of State for the Home Office to consider special rules for the use of electricity in mines, a good deal was said with regard to the switch gear in use in collieries. It was pointed out that such apparatus was not sufficiently strong mechanically to resist rough usage and that switch gear of the open type was really designed for surface work and was not suitable for underground use.

Switch gear for underground use should be dust-proof, moisture-proof, and so constructed as to prevent open sparking. The outer metal coverings should be of ample thickness with well-fitted joints and glands where cables and spindles pass through. All handles for operating the switches themselves should be safely and conveniently placed. The general design should be such that any fault or failure is under all conditions confined to the inside of the metal box or covering so as to avoid all danger and risk even to the operator himself.

The switches should be so constructed as to reliably make and maintain all contacts, and so designed, built and adjusted that they cannot be left in partial contact or accidentally moved into such when left out of contact.

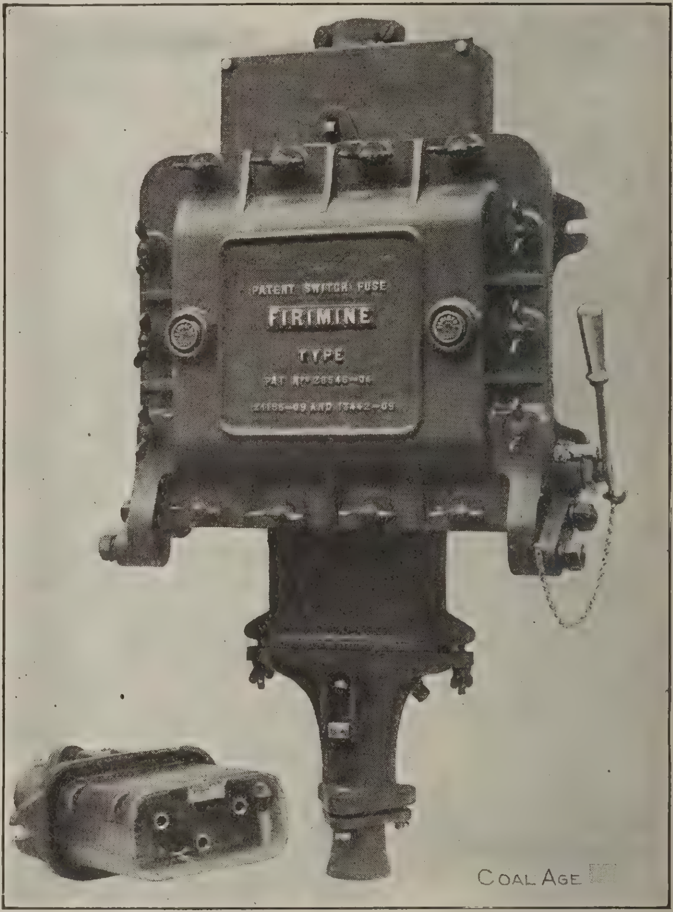
Unless the "on" and "off" positions are obvious from the position of the handle, the two extremes "on" and "off" should be clearly marked. Except in the concentric system, single-pole switches are not to be used. In choosing a switch, furthermore, regard should be paid not only to its capacity to carry the working current but also to its ability to open the circuit safely on any short-circuit with which it may be called upon to deal.

Reference has been made to the foregoing details of this report inasmuch as it has been upon these recommendations that modern British practice in switch-gear design for colliery work has been based. The accompanying illustration shows the general appearance of a fused switch constructed by Messrs. Berry, Skinner & Co., of Birmingham, England, who specialize in the design of switch gear capable of being used by unskilled attendants. It will be seen from this illustration that it is particularly substantial in its design and construction and highly suitable for use in mines. It has been actually tested with a violently explosive gaseous mixture and withstood the trial admirably. This particular test was witnessed by several expert mining engineers who commented on the switch in favorable terms.

The arrangement is entirely fool-proof, that is to say, the lid of the switch cannot be opened until the lever is first thrown to the "off" position. The plug cannot be withdrawn from the live contacts, nor can it be inserted into them. The switch has to be brought to the "off" position before this operation can be effected, and the plug is provided with a special ground connection.

Particular attention may be drawn to a good feature in the design which is the broad machine-faced jointed box which is provided with unloosable fastenings. When the plug is withdrawn all live contacts are shrouded and in this way the operator is not liable to accidentally receive a shock from exposed and live metal-work. Mica is used as an insulating material throughout the design. The illustration shows a triple-pole combination, and owing to the compactness of the design it is claimed that for a given current capacity less internal space is required than is generally the case. The fuses are of the cartridge type and when correctly installed are guaranteed to open any short circuit with which they may be called upon to deal. They can only be replaced after the current has been automatically cut off as all fuse-carrying parts are dead when the switchbox is opened.

The apparatus is automatically locked on and off for intermediate positions, and it is impossible to tamper with the contact to any extent. As regards carrying capacity the switch fuse is designed with a generous margin of safety. Total inclosure as regards terminals, cable ends, cable joints and connections are provided and suitable bushed packing glands are used of a type approved by the factory inspector. The entire mechanism constitutes a fine example of modern British switch-gear design.



The Switch. Note Careful and Heavy Contruction

Our British Coal-Mining Letter

SYNOPSIS—Bath-houses should not involve an expenditure of over 6c. per person. Requirements for their construction and management suggested by British investigating committee. Account of the byproduct plant at Birchenwood, which produces gas, tar, ammonia, benzol, phenol, cresylic acid and pyridine. Turbine pumps for raising water, their operation, advantages and desiderata. Recommendations to machine runners. Difficulties in grounding, and the inefficiency of the earth as a conductor.

⁂

In accordance with the terms of the Coal Mines Act of 1911, where a two-thirds majority of workmen represent to the owner of a British mine that they desire facilities for taking baths and drying clothes at the mine, the owner must provide sufficient and suitable accommodation for the purpose. It is assumed the maximum cost of maintenance will not exceed 6c. per head per week.

A departmental committee has reported that the bathing accommodation should consist of spray or douche baths, each bath being contained in a cabinet so constructed as to secure privacy, and having suitable arrangements for dressing and undressing. The committee states that the number of baths should be in the proportion of one to every six persons in the largest shift employed in the mine. The building must be of sufficient dimensions, efficiently lighted and ventilated, must be constructed of non-inflammable material and have a floor of concrete or similar material so graded and drained as to allow any water to run to and be carried away at the sides of the building. It is also proposed that each person using the bath shall be provided with soap, and, at the beginning of each week, and at such other times as the person in charge may think necessary, with a clean towel for his sole use.

English Indorse the "Monte-Habits"

As regards drying accommodation, arrangements have to be made for suspending in the roof of the building the clothes of each person using the bath, by means of a chain so arranged and fitted as to be under the sole control of the person to whom it is allotted, and to keep the clothes of such persons, when suspended, entirely separate from the clothes of any other person. Efficient means must also be provided for drying clothes when so suspended. The management of the baths as suggested by the departmental committee shall be vested in a committee consisting of three persons appointed by the owners of the mine and three elected by ballot of the workmen.

Coking Plant Makes Seven Byproducts

The Birchenwood Colliery in North Staffordshire has acquired some fame by reason of its coking and byproduct-recovery plant. There are two sets of coking plants, the first being erected by Simon Carvés, Ltd., in 1909, and consisting of 84 ovens, 60 of which are of the nonregenerative, or waste-heat type, and 24 of the regenerative type, with complete byproduct plant for the extraction of tar, ammonia and benzol. Each oven takes a charge of 8 tons of slack and yields about 5.5 tons of dry coke.

The second plant was only completed last autumn; it consists of 72 Still coke ovens of the regenerative type, and in addition a complete byproduct plant for the extraction of tar, ammonia and 65 per cent. of the crude benzol, also for the manufacture of carbolic and cresylic acids and pyridine. Each oven takes a charge of 9.5 tons of slack and yields about 6.6 tons of coke, the charging and coke-discharging machines being electrically operated.

The producer-gas plant, at Birchenwood, consists of 13 Mond producers, each capable of gasifying 20 tons of fuel per 24 hours. The gas is used both for direct boiler firing and also for driving gas engines to generate electricity for general purposes. The electrical supply consists of three-phase alternating current, generated at 2500 volts, 60 cycles.

Turbine Pumps in Collieries

Features common to turbine pumps, as noted by R. H. Willis, before the East Scotland branch of the Association of Mining Electrical Engineers are: One or more impellers, mounted on a shaft, revolving in suitable chambers, each delivering the water through a diffusion vane into the succeeding impellers, and finally into an annular space, from which the water escapes into the delivery pipe. The diffusion vane takes hold of the water after it leaves the impeller at a high velocity, and guides it into suitable passages until the velocity is comparatively reduced; the kinetic energy due to the velocity being thus converted into static energy.

There is no actual displacement of water in the turbine, as in the ram pump, the action depending on the velocity imparted to the water, due to the revolving impeller, this velocity being ultimately changed into pressure head. There is, therefore, no necessity to provide relief valves on a turbine pump, as the pressure can never rise above that due to the velocity set up by the speed of the impellers.

By reason of this the pumps can be started up with the delivery valve closed, and this is a great advantage as there is no chance of accidents happening, as would be the case if this procedure were adopted with a pump of the ram type.

Desirable Points in a Turbine Pump

Mr. Willis says the following points should be considered when undertaking the installation of a turbine pumping plant: (1) The pump should be capable of being easily reërected; (2) all wearing parts should be made renewable, and all similar parts of similar pumps should be made interchangeable; (3) effective construction should be adopted to obviate end thrust. Having decided upon the type of pump, further considerations include: (a) The pump should be fixed on solid foundations and set carefully in line; (b) the suction pipe should be absolutely airtight; (c) an efficient foot-valve should be provided; (d) the pump should be placed as close as possible to the water to be lifted.

Don'ts for Machinemen

In his paper on the Installation and Manipulation of Coal Cutters, before the West of Scotland branch of the Association of Mining Electrical Engineers, J. McCann gave some advice in the form of Don'ts, including:

Don't switch on the power too quickly; let the machine attain full speed gradually. If the load is unusually heavy, switch on the power more slowly, not faster.

Don't increase the size of the fuse just because it often "blows." It is easier to change a fuse than an armature.

Don't raise or lower the cutting level in quick steps when driving a disk or chain machine. The only machine that can be so operated is the bar cutter.

Don't force the machine through a hard cut with blunt picks. Time is saved, not lost, by changing them.

Don't neglect such trifles as a loose screw or a broken spring, because it is a small detail; either repair it or report it. "A stitch in time saves nine."

Don't bury the machine in a cut because you are working by contract. Work out your costs properly and see whether it does not pay better to cut with the crown wheel clear.

Dangers of Electricity in Mines

Before the Association of Electrical Engineers (South Wales), Chris Jones pointed out that (1) the danger from shock arises from leakage, and is more likely to arise in mine work than in other industrial applications, owing to the rough conditions under which the plant is used. (2) Fire risk is greater also and means of escape are not readily provided. (3) Risk from explosion is peculiar to colliery work; and excluding the risk peculiar to brushes on motors and to switchgear it may be due to (a) an explosion arising from leakage accompanied by arcing or sparking; (b) an explosion arising from breakdown of an individual device or cable, and accompanied by arcing or sparking.

In both these sources of danger the leak is the principal contributing cause, a leak being the passage of electricity through some path other than that provided by the conductors intended for the purpose. The best protection against the danger of shock from conducting bodies lies in properly conducting or inclosing live parts; and in efficiently grounding armored cables and substantial fittings for making good mechanical and electrical connections between the metallic cases and the armoring.

The Earth an Uncertain Conductor

The earth is a conductor of electricity, and in the past it has been so used for telegraph and telephone work. A "ground" has been legally defined as follows: "*The* ground is *a* ground, but *a* ground need not necessarily be *the* ground." Grounding the tubing or other metal sheathing of insulated electric light and power conductors is generally meant to signify that the tubing, etc., are to be grounded to the earth; that is to say, they are to be connected to the general mass of the earth. A really satisfactory ground is not easy to obtain, for the old idea that the earth is of zero resistance, because it is of practically infinite cross-section, is now recognized as erroneous.

Testing Permissible Explosives

Prof. Vivian B. Lewes, discussing the "Testing of Safety Explosives," before the Royal Society of Arts, said the only true way to test the safety of a mine explosive was to use it in coal mines during a period of many years, his opinion being that when tons of the material had been used and millions of shots fired under every condition conceivable in practice without a single accident being traceable to its legitimate use, such an explosive held a certificate of safety which no series of tests under empirical and artificial conditions could ever afford. He pointed out that testing stations had different methods of testing and he feared that satisfactory explosives would be supplanted by others so feeble in character that great difficulty would be found in insuring their complete detonation.

It seems wrong to reject years of experience gained under mine conditions and to follow other methods unless statistics show that per million tons of coal won a certain explosive in use gives rise to greater loss of life than others. The practical conditions in use are so widely different from those of the tests that the personal factor of care in use becomes of enormous value. Mr. Lewes is convinced that a reliable and careful shotfirer blessed with common sense is a greater protection than any tests, rules and regulations that can be framed. For this reason he views with suspicion anything tending to lessen personal responsibility.

Explosive Dusts Classified

Doctor Wheeler, who is the chemist to the British committee investigating the causes of explosions in coal mines, has conducted experiments with samples of carbonaceous dust collected by factory inspectors to determine (1) the degree of inflammability and (2) the capacity to transmit explosions. The dusts are divided by Doctor Wheeler into three classes: (*a*) Dusts which ignite and propagate flame readily, the source of heat required for ignition being comparatively small, such, for instance, as a lighted match. This class includes sugar dextrine, starch, cocoa, rice meal, sugar refuse, cork, unextracted soya bean, wood, flour, malt, oat husk, grain (in flour mills), corn meal, tea, compound cake, grain (in storage), rape seed, cornflour, flour (in flour mills), chicory, briquettes, gramophone record material, and extracted soya bean. (*b*) Dusts which are readily ignited, but which for the propagation of flame require a source of heat of large size and high temperature, such as an electric arc, or one of long duration, such as the flame of a bunsen burner. This class consists of copal, gum, leather, dead cork, cocoanut oil, milling rice, milling sawdust, castor oil, meal oil, cake offal, dust from the grinding of bran, grist milling, horn meal, mustard, shoddy and shellac composition. (*c*) Dusts which do not appear to be capable of propagating flame under any conditions likely to obtain in a factory either (1) because they do not readily form a cloud in the air, or (2) because they are contaminated with a large quantity of incombustible matter, or (3) because the material of which they are composed does not burn rapidly enough. This class consists of organic ammonia, tobacco, spice millings, drug grindings, cotton seed, soya bean, bone meal, coal, lampblack, sack cleanings, retort carbon, rape seed (Russian), blacking, brush carbon, stale coke, plumbago, bone, charcoal, and mineral and ivory black.

⁂

As a result of investigations made by the U. S. Bureau of Mines, it was estimated that a cubic foot of coal from Monongah set free, during its mining and in the first two weeks thereafter, 1.4 cu.ft. of methane. During the first 12 weeks after mining, a volume of methane is liberated equal to 1¼ times the volume of the coal. At first the gas escapes rapidly; then it gradually diminishes and stops altogether in from 8 to 18 months.

Fire Fighting by the Madison Corporation

By A. T. Shurick

SYNOPSIS—Through the courtesy of President Moorshead, of the Madison Coal Corporation, a number of mining men were afforded the opportunity of viewing a demonstration of the company's fire-fighting, rescue and first-aid work at two of its Illinois mines. The exhibition was unique in that all the conditions of an actual explosion were assumed and acted upon, including the recovery of the mine, extinguishing the fire and administering first aid. In view of the fact that the Madison people are the acknowledged leaders in Illinois, if not in the United States, the demonstration is of particular interest.

⁂

It is probable that no one unequipped with a military training could ever perfect such a fire-fighting machine as the Madison Coal Corporation boasts of. Such a task requires something more than mere executive ability. In event of an explosion or fire, the operating department is subjected to a severe test—a test under which the most efficient organizations frequently crumble to pieces.

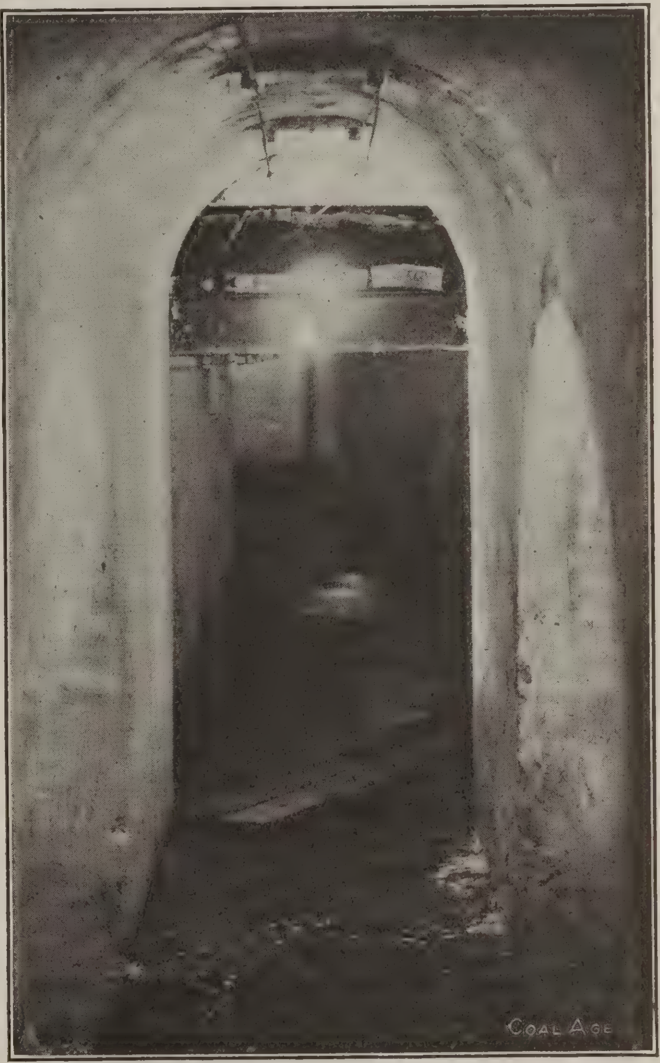
It is clear, therefore, that the exigencies of the case must be anticipated insofar as it is possible to do so. Each man must be allotted his particular task so that all may act promptly, without waiting for orders, and the work of each unit must be performed with the precision of an automaton, for the slipping of a single cog at a critical moment may disarrange the working of the whole machine. Obviously this perfection can be attained only by such frequent drills that each man's duty becomes a matter of habit with him. Apparently the Madison Corporation, thanks to President Moorshead, has reached this millenium.

The Fire Team in Action at No. 8 Mine

The Surface Equipment at No. 9 Mine

At the request of Manager Cartlidge, of the Illinois Mine-Rescue Station, seconded by many of the state mine inspectors, President Moorshead was prevailed upon to give a special demonstration of the company's apparatus and methods. Through the courtesy of his company a special train was arranged to convey the visitors from Carbondale to their No. 9 mine, at Cambria. This is a shaft operation somewhat over a hundred feet deep and having a capacity of 3000 tons per day. It was not working on the day of the inspection, Oct. 14.

Arriving at the mine a complete inspection of the surface plant was made, which developed a number of interesting features. One of these was a plant for manufacturing concrete blocks for the arching of the roof in the mine. The forms are of steel, quite simply constructed and economical. There is also an unusually efficient Jeffery fan installation kept up in remarkably excellent shape; it is equipped with a pressure-recording apparatus and under test showed 290,000 cu.ft. of air per minute with a 6-in. water-gage. Insufficient boiler capacity at the time of the test made it impossible to bring the fan up to full speed.



Reinforced-Concrete Run-a-Round at the No. 9 Shaft Bottom

The rescue station, shown on page 588, of last week's issue, was of particular interest. It is a substantial brick building having rooms for smoke testing, washing and dressing, helmets and oxygen tanks. Another unique feature was the automatic gates at the shaft top. These are controlled entirely by the hoisting engineer and cannot be opened when the cage is in motion; also, should it be attempted to open them when the cage is not at the landing a gong sounds a warning in the engine room.

This device, together with an arrangement for belling the engineer from the cage, when same is in motion, were invented by A. J. Gurney, master electrician of the Madison Coal Corporation. Patents are now being taken out and we hope shortly to publish detailed descriptions of these inventions.

Fire Drill on the Surface

When the inspection of the surface plant had been completed the fire alarm was sounded. It seems difficult to pay a sufficiently high tribute to the excellence of the fire drill. In one minute and thirty seconds by the watch a strong covering had been lowered over the shaft top*, a 2-in. stream of water was playing on each side of the head frame, and the busy little hand extinguishers were in evidence on every hand. Each man had his allotted task and he did it with an accuracy and dispatch that left little to be desired.

Rescue Car About to Start for the Scene of the Accident

Rescue Corps Fully Equipped and Ready to Enter the Mine

It was now explained to the visitors that the hypothetical condition of an actual mine fire and explosion had been assumed underground. Accordingly the helmet corps of five men was ordered out to make an inspection of workings and report the location of the trouble. Before going underground the men are subjected to a rigid inspection and testing of the apparatus. The smoke room in the rescue station is filled with sulphur gases and each man is required to enter, after which they are lined up, the oxygen pressure and general condition of their apparatus noted, clocks set and the name of each man recorded. All of this is done with military precision, and 18 min. after the alarm sounded the party was ready to descend. In the meantime the rescue team from No. 8 Mine, about two miles distant, had been ordered out to be on hand in case of emergency.

Everything being in readiness, even to the canary bird and electric hand lamps, the rescue party was lowered away. In about half an hour the foreman returned to the surface and reported the location of the trouble; also, that while they had been unable to determine the full extent of the fatalities, there were at least two men injured. The first-aid men were accordingly ordered out and entered the mine equipped with safety lamps.

Inspection of the Underground Workings

The visiting party having been equipped throughout with overalls and carbide lamps, then went below and witnessed the preparation and departure of the special rescue cars for the scene of the trouble. These cars are of particular interest and we hope to publish a detailed description of them shortly. They were illustrated in our issue of last week. On the exterior they much resemble the ordinary mine car. On each side, however, are arranged lockers which contain the first-aid appliances and serve as seats for the rescue team while riding in. Before starting the entire equipment, consisting of rubber pillows and gloves, blankets, bandages, stretchers and tools, such as wire cutters, hammers, hatchets, axes and crowbars, are thoroughly overhauled. These two cars, together with a 50-gal. revolving chemical fire extinguisher, mounted on mine-car trucks, are always standing in readiness for instant use.

After the departure of the rescue party, the visitors made a complete inspection of the bottom, which was of interest because of the large amount of steel and concrete construction used. This was made necessary by the inadequate pillars left in the early mining. Concrete is used profusely at the immediate shaft bottom, in the run-a-round and in the pump room and sump. Steel doors only are used here and the double partings at the bottom are carried on large I-beams.

The underground hospital is also concrete lined and has a lighter section of I-beam for the roof; it is quite commodious, clean and sanitary. The underground stables proved a model of cleanliness and convenience; whitewashing is liberally applied and perforated pipes make it possible to flood the entire stable almost instantaneously. A concrete underground oil house was another feature of interest, also an electric device for drying the sand required by the mine motors.

---

*It should be noted here that an underground concrete conduit leads from the side of the shaft, a few feet below the surface, off to a point well removed from danger, where it comes to the surface. Thus when the covering has been lowered over the shaft the air enters through this auxiliary air course.

Guests of the Madison Corporation Who Viewed the Fire-Fighting Demonstration
President Moorshead wearing a black "jumper" is seated near center of picture in front row.

Some Safety Devices and an Underground Fire Drill

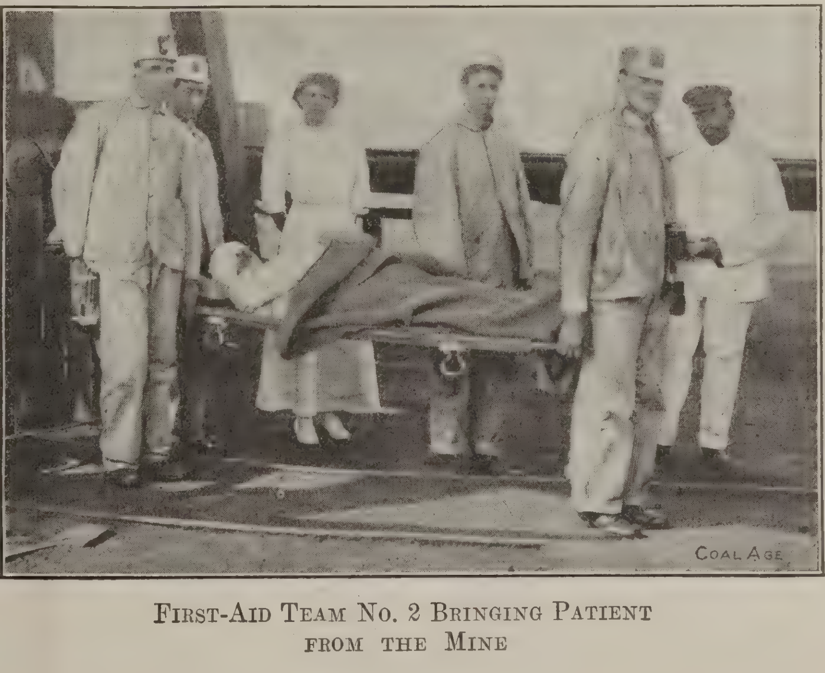
The Madison Corporation employs a unique safety arrangement that seems worthy of particular attention, because of its simplicity. This consists in whitewashing all wide places in main haulageways that are also used as traveling ways. These points stand out with remarkable distinctness in the inky blackness of the underground workings and provide a ready safety hole in which to escape a passing trip. The underground motors are also equipped with powerful searchlights and gongs. In view of the possibility of running into fall, or other trouble on the track, or in the roof, it is rather remarkable that this feature of a better light on the motors has not been more generally adopted.

Pending the return of the rescue men from the face, the visitors were again treated to the inspiring sight of the Madison company's fire-fighting machine in action, this time underground. The company officials seem to have anticipated all the possible contingencies of a mine fire with an almost inhuman ingenuity.

Thus, while all regular hose connections are being made and the different stations brought rapidly into action, there is one man equipped with an extra length of hose and nozzle, who goes rapidly from station to station, so that any defective apparatus may be promptly replaced. The foreman and his assistants are employed entirely in pacifying and reassuring the escaping miners. The importance of this latter feature cannot be too strongly emphasized as those of experience in such matters will readily concede; the moment the official personnel shows indication of weakening or losing control of the situation, discipline rapidly disintegrates and the rout becomes general.

In the immediate vicinity of the shaft bottom there are six hydrants, eight extinguishers and the same number of pump buckets. Water for the hose is obtained directly

The Colored Rescue and First-Aid Teams



First-Aid Team No. 2 Bringing Patient from the Mine through the mine pumps; provision is also made for cutting in water from the surface in event of the failure of the underground apparatus, for any reason. In addition to this there is the 50-gal. revolving chemical extinguisher, and perforated pipes in the stable, as already noted.

Underground First Aid

The fire drill was followed by the return of the first-aid men with the two "victims" of the explosion; they were carried on stretchers swung on the usual spring chains hooked over the sides of the cars. It was assumed that one was overcome by afterdamp and burned on the chest and right hand, while the second was supposed to be suffering from a broken left arm, a fracture of the left thigh and bleeding at the temple. Appropriate first aid was administered to each, the man overcome with afterdamp, being treated with the Salvatore oxygen apparatus and the pulmotor. Superintendent Duncan, of the Benton Rescue Station, complimented the rescue men highly, particularly on the application of splints; it was his opinion that their work exceeded the requirements of actual first-aid assistance.

The Company Ambulance and Physicians

The "patients" were removed to the underground hospital and the visitors made a further inspection, witnessing the operation of some automatic switches for landing the loaded trips at the shaft bottom, by a flying switch. Every car hoisted at this shaft is handled over one of these switches which has been in operation for more than a year and has not yet been the cause of an accident; even disregarding the cost of an extra man for handling the switch, Mr. Mooreshead expressed the belief that this method was superior, for the reason that it was purely mechanical in its operation and therefore eliminated the uncertainty of the human equation. In addition to this there are turnouts at different points where the motorman can throw the switch for either track while the trip continues at its normal speed.

Luncheon and the Inspection at No. 9

Returning to the surface the visitors saw the two "injured" men brought up and put in the ambulance to be transported to the hospital, about two miles distant. It is worthy of note with what infinite care all the minute details of an actual fire and explosion had been worked out and followed up. It is probable that such a complete all-around exhibition as this was never before attempted.

After a general wash-up, the visitors participated in a delicious and substantial luncheon, served by the ladies of the vicinity. The special train was again called into service and the party was conveyed to No. 8 Mine, which was in full operation. This plant is essentially a replica of the No. 9 Mine.

The visitors were again accorded a demonstration of fire-fighting on the surface, a description of which would only entail needless repetition of what occurred at No. 9 Mine. After an inspection of the surface plant the party went below and viewed the bottom arrangement at the shaft, which also resembled that at No. 9 Mine in the permanency and substantial character of the work.

A block-signal system for protecting trips against collision with each other was observed in operation here. Thus when an electric locomotive makes its flying switch, throwing the loads into the shaft bottom, while it goes into the empty "hole" for another trip, a red light out on the main haulageway warns approaching motormen that the bottom is occupied. Red lights are also installed at the automatic doors to warn the motormen of approaching trips on the other side. The automatic doors are provided with man-doors at one side.

Commendatory Remarks and the Hospital

Returning again to the surface some additional first-aid work was observed and a few brief speeches made, in which the thanks of the party were extended to Mr. Moorshead and the heartiest approbation expressed of his men and methods. In reply Mr. Moorshead expressed his gratification at the interest shown and modestly disclaimed any particular credit to himself on the grounds that his work along this line was only made possible by the altruistic policy of the company he represented.

The Automatic Safety Gates at the Shaft Top

A brief visit was then made to the district superintendent's office, where the mine maps and office systems were seen, after which the party adojurned to the hospital. This latter is in charge of Dr. Springs and his wife, both of whom are graduates in medicine. The two "victims" of the mimic explosion were again seen here, carefully propped up in standard hospital cots. The hospital itself is equipped with an unusually thorough complement of surgical instruments and an excellent X-Ray machine. The general cleanliness and sanitary conditions at the hospital called forth favorable comments from all.

Returning once more to the train, the run was made into Carbondale, where the party disbanded at 4:30 in the afternoon.

EDITORIALS

In no industry is a closer study of conditions and nethods of greater importance than in coal mining. In io calling is there a greater need of efficiency on the art of the individual worker than in the mining of coal. ntelligent supervision of all departments by the mangement is essential in promoting the highest individual nd collective efficiency. Such intelligent supervision an only be attained by the close and continued study of onditions and a thorough familiarity with the principles f mining.

The Wooden Mine Car

Of the many inconsistencies in coal mining, none stands out more conspicuously than the continued general use of the leaky wooden end-gate mine car. We spend much thought and effort in evolving plans to prevent dust explosions, and yet cling to a practice that creates the evil we are working to overcome. There is no doubt but that leaky pit cars are the chief cause of finely powdered coal dust on the haulage roads in most of our coal mines. Wouldn't it be better if we started our preventative measures somewhere nearer the source of our troubles.

Another Petition

Some weeks ago, about 13,500 employees of the H. C. Frick Coke Co. petitioned Congress to prevent the dissolution of the United States Steel Corporation. More recently some of the men employed by the Tennessee Coal, Iron & Railroad Co. have sent a similar missive to Washington. This latter document contained no less than 13,000 signatures and weighed twenty pounds.

In both of the above instances, the action of the men was neither instigated nor fostered from "higher up," the signers of the petitions acting entirely upon their own initiative. Regardless of what action may be taken by the legislative or judicial branches of the government in the dissolution case above mentioned, one fact is established—over 26,000 perfectly sane and rational citizens in two widely separated states are not believers in indiscriminate "trust busting."

Where Progress is Opposed

It isn't always a question as to whether a certain system is most economical and efficient that determines whether the plan shall be adopted. In this day of organized labor, the employees of a company have much to say in the administration of its affairs. Especially is this true in European coal mines. One of the reasons machine mining has not been more generally adopted on the continent is because the miners believe the substitution of mechanical means for human labor is inimical to their welfare.

A company in Belgium was daring enough to experiment with machines, and found that in one of their collieries the cost of mining the coal was reduced 40c. a ton when undercutters were used. Notwithstanding the evident desirability of machines, this company could not overcome the hostility of their employees and persuade them that the undercutters would lighten their labor and increase their pay.

Just what the unions expect to gain through their opposition to modern machinery is hard to determine.

An Efficient Fire-Fighting Machine

We wish to invite particular attention to the article appearing in this issue on the rescue- and first-aid work of the Madison Coal Corporation in Illinois. Since the unfortunate Cherry catastrophe in that state, most stringent laws governing mining operations have been enacted by the Illinois legislature. As a result, safety precautions, methods and devices have probably been developed here to a higher general efficiency than in other fields.

The movement generally has met with the enthusiastic support of the leading coal men of the state, who, as a rule, have more than complied with the full requirements of the law. Naturally some leaders have appeared who are setting the pace, and among these is President Moorshead, of the Madison Coal Corporation. In a recent interview with Francis Peabody, of the powerful Peabody coal interests, and Carl Scholz, president of the Rock Island coal subsidiaries, both freely acknowledged Mr. Moorshead's leadership. We are particularly gratified, therefore, at being able to publish a detailed description of the Madison's men and methods.

The Nanticoke Movement

Last year at the town of Nanticoke, the school board and the Susquehanna Coal Co. both contributed to supply mining education for those desirous of such training. The innovation, based on the new law relative to occupational schools, was a complete success. This year, profiting by the indications obtained, commercial and domestic science classes are to be added.

We are convinced that the miner would resent the suggestion that there was nothing but muscle in his employment, and we are equally sure that to obtain success in a broad sense, the miner should combine knowledge, intelligence and enthusiasm. The mining schools will make this change. They give promise that hereafter there will be a scientific precision in operation from office to working face.

The Continent of America, 400 years ago, was physically better equipped to sustain a large population than it is today. It had limitless woods filled with comparatively harmless game, coal and iron were to be found outcropping on the hills, and the soil had all its original fertility. But the Indians starved, shivered in tents, had no comforts, raised negligible crops and did not increase in numbers. Despite our waste of resources, conditions are better today than then, because the people are better informed and more resourceful.

Hence, in order to urge technical education, it is, we believe, not necessary to represent life as a strife between man and man, all seeking for preferment. The usual competitive cry is raised, now it is America seeking to crowd England or Germany out of its markets, now it is the miner seeking to be foreman. Skill is needed for other objects, to make it possible for us to gather from such resources as we now have such a measure of comfort, dignity and ease as education and skill will enable us to wrest from nature.

This is the answer—the only reply to those who would urge on us that only a certain number of men can occupy positions of trust. It is becoming clear that only by training can men succeed in operating with safety, efficiency and minimum labor in the modern mine, with all its dangers and complications. There is no use for brain till a brain is found. When men present themselves in numbers who have and can use their knowledge, we shall be able to place our mines on a higher basis, use machinery which demands that higher intelligence, and which will make possible not only larger economies, but less exhausting labor and higher earnings. The time will come when the mines will be operated like a railroad by engineers; every man who digs a ton of coal by machinery will be an expert in running the machine under his control, every motorman will understand, not merely how to throw a controller, but wind an armature.

The School in the Mining Town

The Tennessee Coal, Iron & Railroad Co. entertained the school teachers of the Birmingham, Ala., district at a hotel on Shades Mountain and, for a whole week, experts told them about education; not about cramming the students with book learning, but about the sociological aspects of their duties. For instructors should teach the children about health, cleanliness, thrift, safety and how to play, how to perform house duties, how to garden and to sew.

Particularly desirable is instruction in play, for any boy who is so taught, is free from the temptation to break windows, throw stones and terrorize the neighborhood. When manly games are popular, the necessity for boarding up the windows of idle houses and for locking and guarding store rooms is removed and the deterioration of the boys due to delay in putting them to work is largely prevented. The healthy rivalry makes the child approaching manhood appreciate the necessity for subjecting himself to rules and this training in later life will make him assertive of his rights, yet keen to respect those of others.

We long ago urged that in schools, children be taught regarding the right use of the home, so that better houses could be intrusted to tenants and also about safe practices in mines and out of them. But the instructors of the teachers around Birmingham have gone even further; they would have the students warned against loan sharks, and patent-medicine venders. They are seeking to promote public-school libraries and to popularize training in manual occupations, music, art and science.

In a few years the miner who seeks a good education for his children will not have to send them to the normal school to be educated. The farmer may always suffer that drawback, but there is little cause in our larger mining towns for inadequate schools if we can only inspire that same spirit in the rank and file of the miners which the farmers now possess. The foreign miner will doubtless always be somewhat of a drawback, but even he can be made to appreciate educational advantages.

The public school is not a place for political propaganda, but it is the appropriate opportunity for grounding our boys and girls in the arts of right living, decent home life, generosity, good citizenship and charitable estimates of their fellowmen. Time was when the mining population of a village prided itself that it could beat up the citizens of some neighboring lumber town or could ride rough shod over the policemen and merchants of a near-by borough. Present ideals are better, though still not of the best. As the school does its work, rivalry in violence will give way to competition of a less destructive and more amiable character and our labor situation will be freed from breaches of contract and outbursts of vandalism.

The American Mining Congress

The sixteenth annual session of the American Mining Congress, which was held in Philadelphia this week, was a quality meeting rather than a quantity affair. A number of men were present whose names stand for all that is biggest and best in American coal mining. The papers and discussions dealt with such vital topics as "Taxation of Mining Property," "Mine Accounting," "Mine Rescue Work," "Coal-Mining Legislation" and "Cost of Production." All of these papers and discussions will appear in Coal Age next week.

The mining-machinery exposition in Horticultural Hall was a much more complete exhibit of the kind than is usually the case and was deserving of closer attention and better attendance. In fact, the mining congress, on the whole, is a laudable enterprise if it can be brought to fulfill the purpose for which it was conceived. As an institution, or viewed in the light of a movement for betterment in mining conditions, the American Mining Congress today is not a national body of great importance, although the intent is there and magnificent possibilities exist.

⁂

Harmonizing the work of many different departments in all industrial operations is more essential to success than to establish and maintain a high-pressure system, in which the employees are forced to work under a strain that is nerve-racking in the extreme. Just as an expert engineer knows instantly by the throb of his engine when the load is excessive, so the intelligent manager knows by the response of his men when the system needs revision and the conditions amelioration. Not that the day's labor should be shortened, or the wages increased; but that the work should be readjusted and made to run more smoothly. It is even more important for the manager or superintendent to study to harmonize working conditions, than that he should continually strive to reduce the cost of production by lengthening the hours of labor, cutting down wages or requiring more work for the same pay.

trolled and a selection of the best men made, to form an exploring party. If a helmet squad is available they should enter the mine and advance, as far as possible, ahead of the air, to ascertain the condition of the mine with respect to fire, gas and the circulation of air. By this means, any fires that might exist would be discovered before the air current is restored in that part of the mine. After exploring a certain section and finding no fire, this party should return and report the condition of the mine to the men charged with the duty of restoring the ventilation. When that has been accomplished in one section or portion of the mine, another section can be explored and the circulation restored there, in the same manner.

Assuming that the fan has suffered no injury from the explosion, however, it should be slowed down so as to furnish only sufficient air to force back the products of combustion, to the point on the main entry where the air is made to return, whether this be a blownout stopping or an overcast. At this point, a regulator or canvas brattice should be erected, so that the quantity of air passing here can be controlled until the next crosscut is reached when this opening should be stopped and a regulator or canvas brattice established at the next opening, for the same purpose.

While thus advancing through the entries, the air should be carefully tested, at frequent intervals with a safety lamp, and a careful watch be kept to detect any fire that may exist in adjoining workings. By pursuing this course, the danger of a second explosion occurring is minimized and the rescue of any possible survivors is made possible, in the shortest time. I have proved the efficiency of this method in a particular case, and have no hesitancy in recommending its general adoption.

Charlton Dixon.

Pittsburgh, Penn.

⁂

Letter No. 6—The advisability of again starting a fan disabled by an explosion, as specified in the question under discussion, can only be answered directly by saying, in the most emphatic manner, that to start the fan previous to making a most careful preliminary examination underground, as far as practicable, would be both unwise and criminal, and would probably destroy all hope of the rescue of any survivors and endanger the life of those who attempt to enter the mine.

Even after such preliminary examination of the mine has been made, the question of starting the fan will depend entirely on the conditions found to exist underground, and whether restoring the circulation will imperil the entombed workmen or increase the danger of rescue work. The existence of mine fires would be the chief determining factor. The question that must be considered is: What will be the probable effect in the mine if the fan is started even at a slow speed?

In my opinion, whatever the condition found below, with respect to the stoppings, overcasts, doors, etc., if fires exist in the workings, they will produce a disturbance of equilibrium in the mine air and start a circulation of air that will make a second explosion imminent, without the assistance of the fan. It may be supposed, however, that if the fan is started, its action may either assist or oppose the natural current produced by the heat of the fire, according as that current is traveling with or against the current induced by the fan. Thus, in either case, unless the speed of the fan be properly regulated, the result would be favorable to the occurrence of a second explosion. These conditions can only be ascertained by a careful preliminary examination underground.

While the direction of air current and the possible existence of fires might be ascertained by indications at the surface, it will be important to know in what sections of the mine fires exist; and to ascertain this, it is necessary to explore the shaft bottom and gradually extend the investigation through the mine. This will determine whether, if the fan be put in operation, the current will be short-circuited near the shaft bottom or extended to more distant parts of the mine, and will reveal the existence and location of fires, if any exist.

But, whatever the conditions with respect to restoring the ventilation in the workings may be, one fact impresses me as of the utmost importance; namely, to destroy as far as possible, any natural currents of air that may be induced by the heat of the fire, and thus to prevent the access of fresh air to the fire areas as these are found to exist. If this is accomplished successfully, I see no reason why there would be any additional risk incurred by restoring the circulation between the intake and return openings of the mine, by starting the fan slowly, providing the air current be short-circuited at the proper point and not allowed to enter workings that have not been explored. This being accomplished, a more extended exploration can then be made with breathing apparatus.

I. C. Parfitt.

Jerome, Penn.

⁂

The Safety Lamp and the Eyesight

On returning home from the West and reading the article of John Rose, in regard to the effect the safety lamp produces on the eyesight of miners, Coal Age, Sept. 27, p. 465, I want to add a few words. I have worked in the mines from the time I was a boy, 11 years old, for the past 36 years, and have filled every place, digging coal, bossing, superintending and managing. A few years ago I visited the Barnsley district, in Yorkshire, England, where there are some of the largest collieries, worked exclusively with safety lamps. The miners of that district had the superstition that the wearing of bright-gold ear-rings, in some way, reduced the effect they supposed was produced on the eyesight by the brightly polished brass of the lamps.

My experience, after many years' use of the safety lamp, teaches me that all men do not have the same eyes; nor does the safety lamp have the same effect on all men's sight, just as the same medicine will not affect all men alike. What will cure one man will kill another. Some men have good, bright eyes, while others have weak eyes. Some miners can work in gas all day without complaining of headache at the end of the shift; while other men can hardly walk home because of the effect of the gas. This used to be my case, but it is not so today. I believe the same is true of the safety lamp; what will blind one man will not hurt his fellow.

Mr. Rose says a man can load as many cars with the safety lamp and timber his working place as well, as when using an open light. This may be true; but, as Mr. Rose adds, it seems a little "unreasonable." I believe very much depends on the condition of the mine, the thickness of the coal and the class of work, whether room-and-pillar, long wall, or some other system. Mr. Rose states that he has worked eight years with open lights, followed by 13 years with safety lamps. I do not doubt his statement, but I am inclined to believe that he was not mining coal for 13 years with the safety lamp. A part, or all of that time, he may have been a "walking boss;" but the effect of the lamp on the eyes is greater when mining coal with the pick.

Samson Smith,
Mineral, Va. Mining Engineer.

⁂

Fire Protection in Mines

In addition to what has been said, Coal Age, Sept. 13, p. 391, in regard to adequate fire protection in mines, I want to suggest that statistics show that there are more fires occurring in mines where open lights are used than where safety lamps are employed.

Among the numerous causes of mine fires may be mentioned: A blast setting fire to a gas feeder, which ignites the coal; gob fires occurring mostly in abandoned portions of mines and, especially, in mines where the coal absorbs oxygen readily. I believe such coals have a low percentage of carbon and a high percentage of moisture. Sulphur in the coal increases the tendency to fire.

The old proverb, "An ounce of prevention is worth pound of cure," teaches that it is more important to pr vide ways and means to prevent fires in mines than t study how to extinguish fires after they have started, al though we must be prepared to do both. An importan matter is to carry a pipe line along the main entry, wit connections at each cross-entry and fire plugs at shor intervals, where hose may be attached. The lack of a adequate water supply, in the mine, has often resulted i great loss.

There is one other point I want to mention. It is i reference to fires that are started by the ignition of gas in blasting. To avoid this danger, every working plac should be examined as soon as practicable after shots hav been fired. In many mines, the first examination of th working face, after shotfiring, is that made by the fire boss, in the early morning, from 7 to 10 hr. after th shots are fired. It frequently happens that the fireboss at that time, discovers a fire that has gained a consider able hold in the chamber where it started. In man cases, an entire section of the mine is thrown idle as th result, and several days are required to extinguish th fire. This could all have been avoided by an earlier exam ination of the working face.

John Sutton.
West Terre Haute, Ind.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

HEAT

Definition—Heat is now understood to be a form of motion. All matter is assumed to be in a state of molecular vibration. The rapidity of the vibration depends on the degree of heating of the mass. The theory assumes that the amplitude of the vibrations or the swing of the molecules is greater as the density of the mass is less. This would lead naturally to the conclusion that pressure, which increases the density of matter, will decrease the amplitude and increase the rapidity of vibration.

Heat is thus assumed to be a form of energy, the amplitude and rapidity of the vibrations being functions, respectively, of pressure and velocity, the factors of energy, in mechanics. The theory is well supported by observed facts, as the blow of a hammer or the friction of rubbing surfaces alike develop heat.

Heat In Bodies—Assuming that heat is a form of molecular vibration, which varies in different kinds of matter, it is clear that each kind of matter has its own peculiar capacity for heat. This is shown to be the case by the fact that different bodies when exposed to the same source of heat are heated differently. For example, when equal weights of water and mercury are exposed, for the same time, to the same heat it is found that the mercury becomes much hotter than the water. When water and mercury at the same temperature are allowed to cool in the atmosphere, the air absorbing the same heat from each, the mercury is found to cool much quicker than the water. It is evident that the water absorbs more heat and gives out more heat, per pound, than the mercury, for the same change in temperature. In other words, water has a greater heat capacity.

Temperature—The temperature of any body or mass of matter is the degre of heat it can radiate or impart to other bodies or matter with which it is in contact; or, in other words, the degree of sensible heat of the body. It is not the amount of heat in the body; as water contains 30 times the quantity of heat contained in an equal weight of mercury, at the same temperature.

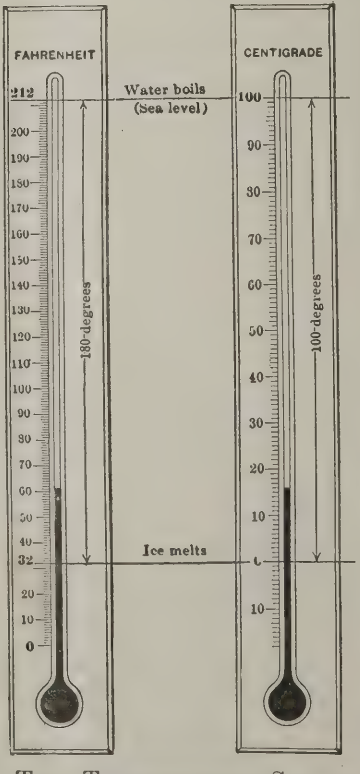
The temperature of a body depends on the quantity of heat the body contains, per unit weight, and its heat capacity. A body or matter having a large heat capacity will have a comparatively low temperature.

Sensible Heat—The heat that when absorbed or given out by a body is accompanied by a change of temperature is called "sensible heat" because it is manifest to the senses.

Latent Heat—When matter passes from the solid to the liquid state, or from the liquid to the gaseous state, the change is always accompanied by the absorption of a considerable amount of heat, although the temperature remains constant. The heat thus absorbed is called the "latent heat," being absorbed in performing the work of driving the molecules of matter farther apart than they were in the previous state. This heat is again given out when the matter passes from a gas to a liquid, or from a liquid to a solid.

The Coal Age Pocket Book

How Temperature Is Measured—Temperature is measure by the thermometer, an instrument so common as to need n description. The principle involved is that the expansio of the liquid contained i the bulb of the thermometer is much magnified i the capillary stem. An rise of temperature is thu clearly indicated by a co responding rise of the li uid in the stem and a fa of temperature is likewis accompanied by the co traction of the liqui which drops in the ster



Two Thermometer Scales

Two Scales—There a two principal thermome scales, the Fahrenheit ar the Centigrade. These a each calibrated with re erence to the freezing ar boiling points of wate As shown in the accon panying figure these poin are marked 32 and 212 deg respectively, in the Fah enheit, and 0 and 100 deg respectively, in the Cent grade scale. Thus, 180 de of the former correspor to 100 deg. of the latter; the ratio is 9:5.

To convert Fahrenhe (F.) readings into Cent grade (C) or vice vers the following formulas a useful:

$$F = \frac{9}{5} C + 32$$

$$C = \frac{5}{9} (F - 32)$$

Example—(a) What a the readings of the Fahre heit scale corresponding 40°, and —10° Centigrad

Solution—

$$F = \frac{9}{5} \times 40 + 32 = 104° F$$

$$F = \frac{9}{5} (-10) + 32 = 14° F.$$

Example—Convert —4 and 50 F. into Centigra readings.

Solution—

$$C = \frac{5}{9} (-4 - 32) = -20 C.$$

$$C = \frac{5}{9} (50 - 32) = 10 C.$$

Readings above zero are plus. (+) and those below ze minus (—).

EXAMINATION QUESTIONS

Miscellaneous Questions

Ques.—What is a windy or blown-out shot?

Ans.—There is, or should be, a slight difference in the meaning of these terms. A "windy" shot is one that produces a heavy concussion of the air, because much of the energy of the powder is expended on the air. The shot may or may not have blown its tamping. It may have broken the coal, or may have found vent through a crack or crevice; but, in any case, the energy of the powder is not wholly absorbed in the work of breaking the coal, as is the case when the shot works properly.

A blownout shot is one that blows its tamping without breaking the coal. The effect produced is quite similar to that of a windy shot; but the projected flame is, generally, more intense and the shot liable to prove more dangerous.

Ques.—What are the causes of windy shots?

Ans.—The chief causes that give rise to windy shots are: 1. Too great a charge of powder for the work to be accomplished. 2. The exploding charge finding vent through a crack or crevice, or blowing out through a soft stratum of the seam. 3. The use of different grades of powder, at the same time, in the same hole.

Ques.—What are the chief causes of blownout shots?

Ans.—The principal causes of blownout shots are: 1. Too small a charge of powder for the work to be performed in breaking the coal. 2. The shot being unable to free itself, as when roof-bound, or when the hole is drilled perpendicular to the face, with no side cut or mining, or when the charge is laid too deep on the solid. 3. The hole having too great a diameter for the quantity of charge. 4. Insufficient or poor tamping. 5. The hole being tamped with coal slack or other combustible material. 6. The use of too quick a powder.

Ques.—Name some conditions under which a windy or blownout shot may prove dangerous.

Ans.—Such a shot is dangerous in a dry mine, where dust and fine coal have been allowed to accumulate at the working face, particularly if the coal is highly inflammable. Also, in the working of a gaseous seam, where the gas is liable to accumulate over the waste and on the "falls" or in other void places that are difficult to ventilate. The concussion of a windy shot is liable to throw much dust into the air or dislodge the gas from its lurking place, which may then be ignited by the flame of succeeding shots. The projected flame of a blownout shot may raise and ignite the dust and accumulated gas.

Ques.—How is the size of mine cars affected by (a) thin coal; (b) poor roof?

Ans.—The mining of a thin seam of coal in which the cars must be taken to the face will require building low cars. In this case, in order to provide a suitable tonnage or capacity for each car, if the conditions permit the cars must be built broad and long.

(b) A poor roof always requires narrow openings or roadways; and, for a given capacity or tonnage, the cars, in this case, must be built as high and as long as possible; since the width of the car is limited by the width of the opening, after leaving sufficient clearance at the side of the roadway.

Ques.—What is the breaking strain and safe working load of a good steel rope $1\frac{1}{8}$ in. in diameter?

Ans.—The breaking strain of a crucible-steel 1-in. rope is 39 tons. On this basis, the breaking strain for a $1\frac{1}{8}$-in. crucible-steel rope is $39\ d^2 = 39\ (1\frac{1}{8})^2 = 49.36$ tons. The safe working load, for this rope, will depend largely on the depth of the shaft and the speed of hoisting. In common mine practice where the depth of the shaft does not exceed 100 yd. and the speed of hoisting is not greater than 20 ft. per sec., a factor of safety of 5 may be used, making the safe working load, in this case, say 10 tons. In deeper shafts with a greater speed of hoisting, say up to 50 ft. per sec., a factor of safety of 8 or even 10 should be used, making the safe working load, then, say from 5 to 6 tons.

Ques.—In a 12-in. column pipe 450 ft. long, on a 42-deg. pitch: (a) What would be the pressure per square inch at the bottom of the pipe? (b) What would be the total weight of water in the pipe, in tons?

Ans.—On this pitch, the vertical rise of a pipe 450 ft. long is $450 \times \sin 42° = 450 \times 0.669 = 301$ ft. The sectional area of the 12-in. pipe is $0.7854 \times 12^2 = 113$ sq.in.

(a) When the pump is not in action, there is, at the bottom of the pipe, a static pressure of 0.434 lb. per sq.in., for each foot of vertical height or water column. The pressure, in this case, therefore, is $0.434 \times 301 = 130.6$ lb. per sq.in.

(b) The total weight of water in the pipe, taking the unit weight of water as 62.5 lb. per cu.ft., is $(113 \times 450 \times 62.5) \div (144 \times 2000) = 11.035$ tons.

Ques.—The main entry in a mine runs due west; at a point 600 ft. from the shaft bottom a cross-entry has been run due north for a distance of 160 ft. This cross-entry caved in and was lost. In order to reach the coal at the head of the entry, it is resolved to start a cutoff on the main entry 400 ft. from the shaft. Find the length and the bearing of this cutoff.

Ans.—The distance from the point where the cutoff is to be started to the mouth of the cross-entry is $600 - 400 = 200$ ft. The cutoff forms the hypotenuse of a right triangle, therefore, whose sides are 200 and 160 ft., respectively. The length of the cutoff is then

$$\sqrt{160^2 + 200^2} = 256 + ft.$$

The bearing of the cutoff is the angle that it makes with a due north and south line, or the angle between the cutoff and the cross-entry. The tangent of this angle is $200 \div 160 = 1.25$; and the angle of the bearing is, therefore, 51 deg. 20 min. The bearing of the cutoff is then N 51° 20′ W.

The length of the cutoff can be found, also, thus

$$\frac{200}{\sin 51° 20'} = \frac{200}{0.7808} = 256 + ft.$$

COAL AND COKE NEWS

Washington, D. C.

The Government has filed a brief with the Supreme Court in behalf of F. W. Howbert, Collector of Internal Revenue for the District of Colorado, in the case of "Stratton's Independence Ltd.," this being the case involving the applicability of the corporation tax to mining corporations, the contested issue in which was the matter of depreciation allowance, fully dealt with in these pages heretofore.

Three questions were certified to the Supreme Court—whether the act applies to mining corporations, whether the proceeds of ores mined by corporations are income, and whether if they are income such a corporation is entitled to deduct the value of ore as depreciation.

After contending that the act is applicable to mining corporations the Government brief goes on to argue that the proceeds of the ore is income, contending that:

> When capital is by labor changed from a fund into a flow, it necessarily changes its character from capital to income. In the case of a mine, the mineral as it lies in the ground is capital, but when it is extracted, converted into ore and sold, the result is a flow; the tree has borne fruit, and income has accrued.
>
> The argument that, since this flow necessarily results in depletion or exhaustion of capital, therefore, the flow is a flow of capital and not of income, is entirely fallacious, according to the above definitions, the understanding of business men, and the practical necessities of a tax based on income. The law takes things as it finds them; it taxes property under the character which the owner has impressed on it, and where that owner voluntarily changes his funds of capital into a flow of income the law accepts the designation and taxes him accordingly.

The brief goes on to say that an ordinary life tenant may not open new mines but when opened he may work them even to exhaustion, while a lease by the State of the mineral under its public land would not be a sale of such lands and the payment of dividends by a mining company out of the proceeds of ore is not a payment of capital. Moreover the fact that the operation of a mine may decrease its valuation does not prevent profits not spent in dividends from being called surplus. Lastly it has been held by the Supreme Court of Pennsylvania that oil companies and mining companies have incomes within the meaning of an income tax act.

In summing up the Government says that: "The principle for which the mining companies contend is not applicable to them alone, and if applied generally, as it must be if applied at all, would seriously hamper the working of an income tax. A pension or a terminable annuity produces an income at the expense of capital, but who would think of calling such produce any the less income?"

As for the claim that depreciation ought to be allowed on the ore the Government says:

> In the absence of any showing to the contrary, the word "depreciation" here must be given its ordinary meaning in business usage, and also it must be taken as similar in meaning to a "loss." So considered, depletion of capital cannot be called "depreciation," nor would any business man think of so calling it.
>
> When capital is converted into income, as when a loaf of bread is eaten it cannot be said that the capital has "depreciated:" it has merely been converted into another form. "Depreciation" takes place when the capital retaining its form, decreases in value owing to wear and tear, change of fashion or methods of manufacture, or the like. When a fund of capital in a mine consisting of the ore in place is converted into a flow of income resulting in money to the owners, the ore has not depreciated; it has suffered a change. Gold is mainly valuable because it does not depreciate. The buildings, machinery, shafts, etc., do depreciate. They retain their form and use, but their value diminishes at different ratios with different causes.
>
> If a man have a stock of goods and he sells some and the balance becomes worthless through a change of fashion, it would be absurd to call the two processes by the same name, nor would any business man carry the results to the same account. In fact in the Nipissing Mines Co. case, in which a writ of certiorari from this court is asked, the company in its second return abandoned the theory of depreciation and replaced it with the items "return of capital," "distribution of capital nontaxable."

In closing the claim is made that because the mining company never actually retained any sum and applied it to depreciation, but distributed the income, in the form of dividends, no claim for depreciation can justly be made. The brief further undertakes to apply the reason in the case to coal mining companies as well as to those engaged in metal mining.

HARRISBURG, PENN.

The Lehigh Coal and Navigation Co., one of the defen ants in the suit brought by the Government last Septemb to dissolve the so called "anthracite coal trust," filed answ on Saturday, Oct. 18, making general denials. This suit primarily against the Philadelphia & Reading Railway C and other coal-carrying railroads, charging illegal combin tion in restraint of trade in violation of the Sherman ant trust act and the commodities clause of the Interstate Com merce Act.

The Lehigh Coal and Navigation Co. denies any com munity of interest between it and the Philadelphia & Rea ing Railway Co., the Philadelphia & Reading Coal & Iron C and the Reading Co., through its directorship, contract otherwise. It also denies entering into a combination stifle competition in the sale of anthracite coal.

The answer gives a history of the company since its form ation in 1822, with a detailed account of the acquisition canals, railroads and coal lands in Pennsylvania. The d fendant contends that, had it not been for the ownership mines by companies that built canals and roads, these nev would have been built. The company denies any allian with the Central Railroad of New Jersey designed to suppre competition.

The answer of the Reading Co., which is expected to b most important in the defense, is expected to be filed in week or ten days.

Good Car Service to Coal Mines

The car service furnished the coal and coke trade by th railroads is conceded to be above the average and about a perfect as possible. For years past the operators have bee furnished with sufficient cars to move their output whe as now other interests suffered from lack of transportatio In return for this service the railroads have asked the oper ators to make their service go as far as possible by load ing cars to capacity.

At a meeting held last week between about 35 coke oper ators and representatives of the railroads, the transportati representatives made a plea for better lading. The new ste cars have a capacity of 50 tons. A great proportion o them are going out under 40 tons. The lading runs fro 36 to 41 tons. Other cars are also loaded short. The rai road managers presented some calculations showing how th poor lading kept cars in service in the coke region tha could be profitably employed in the coal trade and thus de prived the railroads of valuable revenue. It was estimate that with proper lading in the coke region the railroad would have 3000 cars more to put into the coal trade. Thes cars are constructed to haul coal, coke, ore and limeston and can be utilized in any of these industries.

The coke operators confessed that they did not want t load too full because of the loss of coke by being jarred of the tops of the cars. It was pointed out, furthermore, tha the specific gravity of the coke varies considerably in dif ferent portions of the Connellsville region. The operators however, acknowledged the justice of the railroads' com plaint, and promised to do all they could to remedy th conditions.

More Button Strikes

The numerous button strikes at the mines in the anthracite region are clearly contrary to the agreement between the representatives of the miners and the operators The award of the original Strike Commission, to which both parties subscribed, says:

> It is adjudged and awarded, that no person shall be refused employment, or in any way be discriminated against on account of membership or nonmembership in any labor organization and there shall be no discrimination against or interference with any employee who is not a member of any labor organization by members of such organization.

It is apparent that the operators are living up to their part of the agreement. Refusal on the part of the employees at a number of collieries to work with men who do not belong to the union, or who are in arrears in their dues, is a form of discrimination expressly denounced by the Commission. At this time of the year when there is a big demand for coal, both the employees and the operators are put to a serious loss by the suspension of operations for days, sometimes weeks at a time. It is understood that the union officials are averse to the button strikes. It will be to the miners' interests and to the officials' interests, in future negotiations with the operators to abide by the stipulations of previous contracts.

The strikes during the past year have become so expensive and annoying to both sides that some definite arrangement should be entered into to continue until the expiration of the present contract.

PENNSYLVANIA

Anthracite

Harrisburg—The Pennsylvania, New York & New Jersey Power Co., of Scranton, has filed the biggest return of an increase of stock or debt known at the capitol in a long time. The stock was increased from $405,000 to $5,000,000, and notice given of authority to issue bonds to the amount of $25,000,000.

Pittston—After being abandoned for fifteen years the Schooley colliery is to be opened and operated by the Pennsylvania Coal Co., which has bought the property. Pumps are now drawing out the water which flooded the workings of the mine 15 years ago when a cave occurred under the river bed.

Hazleton—The Lehigh Valley Coal Co. is preparing to tear down the company houses at Laurel Hill prepartory to stripping operations.

The G. B. Markle Co. has completed arrangements for the erection of a modern club house for the use of its mine employees. This company, to insure a more plentiful and certain supply of water for its mine workings, is drilling three artesian wells.

Wilkes-Barre, Penn.—Damages to the amount of $4000 was the verdict awarded Joseph Zizkie in a suit against the Pennsylvania Coal Co. for the loss of his arm. The plaintiff was employed as a brakeman on a mine motor at No. 14 colliery and while seated on the front of the machine sanding the rail it collided with two cars left standing on the track and he was badly injured, one of his arms having to be amputated. The company was charged with negligence in not having a suitable headlight and a sanding device on the motor.

Shamokin—In a terrific explosion of gas on Oct. 17, at Bear Valley shaft, operated by the Philadelphia & Reading Coal & Iron Co., four miners were severely burned, probably fatally. Members of the first-aid corps quickly arrived, and after bathing the victims in oil, wrapped them in blankets and conveyed them to the surface. The explosion was probably caused by one of the victims exposing a naked lamp in a corner full of gas.

Two miners while mining coal at the Mineral R.R. & Mining Co.'s Luke Fidler Colliery on the same day were fatally burned by a gas explosion caused in a peculiar manner. A piece of rock slipped from the roof, struck and broke a safety lamp, the flame becoming exposed and instantly igniting the gas.

Scranton—The Bliss Colliery of the Lackawanna Coal Co., which was tied up for a few days by a button strike, has resumed operations, the members of the union claiming 100 per cent. membership. The Seneca Colliery of the Lehigh Valley Coal Co. has been closed down for a few days for the same cause. It is claimed that a very large proportion of the workmen at the Seneca have failed to ally themselves with the union.

Bituminous

Johnstown—Coal operators are viewing with concern the inroads made in the labor supply of this mining field by the agents of the West Virginia miners. Hundreds of miners brought to this part of the country as raw material and worked into experienced men by the Cambria County operators are being offered inducements by the West Virginia agents and enticed to that field. Thus far no strenuous effort has been made to stay the movement though it is not thought that any attempt in that direction would prove successful.

Cannonsburg—The Henderson Coal Co. has begun the preliminary work of opening a mine on the Montour R.R. There is a large acreage of coal in this vicinity which has not yet been opened. The same company also is clearing off land preparatory to erecting about 100 houses which will be occupied by miners' families. This mine will be one of the largest in the Central Charitiers Valley and will be equipped with modern machinery It is expected to be opened and in operation by next summer. Several other mines will be opened at various points along the new railroad, work on which is progressing steadily.

Patton—The strike of the 800 miners in the Pennsylvania Coal & Coke Corporation mines has been settled. The half dozen or so employees who had been holding out against joining the union have finally been prevailed on to join for the sake of peace, and the men have gone back to work.

Washington—An ejectment suit has been brought by the Reliance Coke Co. against several miners. The trouble between the miners and the company is, it is averred, the outgrowth of a determination to operate nonunion . The men, against whom the suits are brought, refused to work and also refused to give up the company houses in which they are living.

WEST VIRGINIA

Charleston—Fifteen thousand jobs that will pay from $80 to $180 per month depending entirely upon the industry of the men who hold them are waiting applicants at the coal mines in West Virginia. Every coal field in the state is ready to take on more men, and the sooner these men come the better.

A conference was recently held between a committee of miners from the Fairmont coal region and Thomas J. Haggerty, International Board member and President Thomas Cairns of District 17, at which meeting the organization of the Fairmont field was discussed. It was decided to invite the coal operators to meet a committee representing the miners for the purpose of entering into a wage agreement.

Wheeling—A number of coal mines both in this state and on the Ohio side of the river have been forced to suspend operations owing to the scarcity of coal cars. So great has been the demand for coal at Lake ports and other shipping points that the railroads although doing their utmost to meet the emergency are unable to supply sufficient cars. As there is no apparent relief from this situation in sight at present it is likely that many of the mines may be off indefinitely.

TENNESSEE

Knoxville—October 25 has been set as the date for a meeting of representatives of the Kentucky Mine Owners' Association and of the Southern Appalachian coal Operators' Association at Knoxville, to discuss various matters of interest to the operators, including the details of workmen's compensation legislation which will be recommended to the next Kentucky legislature. Kenneth U. Meguire, of Louisville, will probably present to the meeting a tentative draft of an act embodying features desired by the coal interests. It is the object of the coal operators to do what they can toward securing the adoption of an act which will be equally fair to mine owners and miners, and which will be free from the confusion and ambiguity which has resulted in legal entanglements over many acts passed in other states.

KENTUCKY

Pineville—Various rumors regarding the establishment of a large electrical plant, or of several plants, at some point in the vicinity of Pineville, Ky., have been crystalized by the recent purchase of the T. J. Asher plant, which has been leased to the Southern Mining Co. The Kentucky Utilities Co., which has recently acquired numerous other electric plants in Kentucky, is the purchaser, and it is taken for granted that large improvements will be made in the small plant referred to, which has at present one 500 k.w. unit only, for the purpose of enabling the company to take full advantage of the possible market for electricity which is presented by the numerous coal mines in that section.

Madisonville—A picnic held at Madisonville, by the United Mine Workers of America, was largely attended, a parade of more than 2000 miners and their sympathizers being a leading feature. The affair was intended as a demonstration in connection with the work of organizers among the nonunion mines in that section, and was regarded as highly successful from that standpoint. The miners were especially careful to avoid any semblance of disorder, all of the saloons being closed and the proceedings being decorous in every way. It is claimed, however, by several of the larger non-union operators that their men did not attend the picnic, figures being presented showing that the amount of coal loaded out on that day was as large as usual, and larger in some instances.

OHIO

Columbus—The Detroit, Toledo & Ironton R.R. is to be purchased by the bondholders committee, Jan. 20, and to be put in condition to take care of the business of the road. Attorney General Hogan, who threatened ouster proceedings because of insufficiency of equipment received a letter from George P. Johnson, receiver, from Detroit, saying the bondholders committee had agreed with Judge Tuttle of the United States district court of Michigan to bid in the road Jan. 20 and to advance sufficient money to keep it going and improve the conditions.

Cadiz—The Selway Coal Co., which was recently granted a charter by the Secretary of State has secured 200 acres of coal land at Rayland. Mining operations have started. D. W. Selway is president.

INDIANA

Brazil—Drillers for coal on the farm of Fred Emmert, four miles south of this city, struck a pocket of gas at a depth of 42 feet.

A keg of powder exploded in a car at the Lost Creek mine, Seeleyville recently. The driver a few feet away escaped injury. The car was attached to the electric locomotive and it is believed a spark from the trolley fell into the can. Several other cans were badly bent and thrown many feet but none exploded. Two trap doors and two brattices were blown in.

ILLINOIS

Marion—At the village election at White Ash, a mining town north of here, the entire Temperance ticket was elected on account of the vote of the miners' wives. About one-half of the votes cast were by women, only a small number of the men voting with the female voters.

West Frankfort—The Burlington R.R. has finally made its connection with the several mines west and south of this place. Heretofore the mines depended upon the Chicago & Eastern Illinois entirely for moving its coal to market.

MISSOURI

Higginsville—There is little probability that a reorganization of the Farmers' Coal Co., operating mines at Higginsville, Mo., will take place, at least during this winter, according to an announcement by Receiver John H. Bovard. Mr. Bovard is now giving his attention to the producing end of the business, and hopes to demonstrate that the mines are fully up to all claims. A daily capacity of 500 tons has been attained, Missouri block coal being mined. The company will probably be put on a more stable basis next spring. It went into the receiver's hands in June.

KANSAS

Lansing—Deputy Warden Fitzgibbon has reported to Governor Hodges that there is a big shortage in the coal production at the state penitentiary at Lansing. The production for the summer was 34,201 bushels less than during the summer of 1912. This is accounted for by the fact that there were less men employed in the mines to the extent of 5456 fewer days work being done.

ARKANSAS

Clarksville—A. P. Hoye formerly of Russellville recently secured a lease on the Eureka Anthracite Coal Co.'s property near Montana. This development has in the past been operated by John E. Daley.

TEXAS

Rockdale—Seven Mexican miners, entombed since Oct. 16 in the Vogel & Lawrence lignite workings here, were found alive Oct. 21, when rescuers gained the mine interior by drilling a ninety-foot shaft. The men were imprisoned by a cave-in following a cloudburst which flooded the mine. Two other men entombed in another part of the mine are believed to be dead.

COLORADO

Crested Butte—The Colorado Fuel & Iron Co. is erecting a model gymnasium for its employees at Crested Butte. This building is to be completed by Dec. 1.

Baldwin—The Citizens' Mine is to be opened shortly after three years of inactivity. Arrangements for opening this operation have already been made and 100 men will be put to work. This will more than double the output of the Baldwin district.

OREGON

Marshfield—A new coal mine has been opened up by Smith & Hennessy on Isthmus Inlet, four miles above the town of Marshfield. It is now producing 50 tons daily, and by Jan. 1, will be turning out 250 tons per day.

Beaver Hill—It is stated that this mine is about worked out, at any rate the Southern Pacific interests, owners are opening up a new mine which will be the main producer. The Beaver Hill has had a steady and large output for years.

Libby Mine—The management of this mine on Coos Bay are now working a double shift and making a record production, as all their coal is contracted for.

PERSONALS

A. B. Kelly, for the past three years superintendent of the Dearth plant of the H. C. Frick Coke Co., has resigned to assume a similar position with the J. H. Hillman Co.

James M. Page, of Pratt City, Ala., has resigned his position as division engineer of Pratt No. 1 Division of the Tennessee Coal, Iron & R.R. Co., to accept the position of superintendent of the Rex No. 2 coal mine of the Lafollette Coal, Iron & Ry. Co. He will be located at Lafollette, Tenn.

John Phillips of Century, Barbour Co., W. Va., has been appointed a district mine inspector, by Chief Earl Henry. He has not yet been assigned to a district. For the past three or four years Mr. Phillips has been general superintendent at the Century Co.'s mine and has acted as manager at other collieries.

A. R. Miller, superintendent of the Leisenring No. 3 plant of the H. C. Frick Coke Co., has tendered his resignation and upon its becoming effective, will become associated in the operations of Francis M. Ritchey, Jr. Mr. Miller will have charge of the physical end of the Ritchey coal and coke operations.

J. M. Webb, foreman for the United States Bureau of Mines, who has been assigned to the Knoxville station has been notified to instruct the miners in the Jellico district in mine rescue work. Four or five teams have already been organized and the coal companies in that locality expect to send more men to learn mine rescue work during the next four or five weeks.

Howard Millington, cashier of the Pittsburg Northern Coal Co., was held up, near Pittsburg, Kan., while carrying the weekly payroll of $6000. The bandits, who proved to be a couple of miners, were repulsed, one being fatally wounded and the other landed in jail. An unusual motive was back of the robbery, one of the miners, two brothers, saying that he needed the money with which to get married.

OBITUARY

John Fallon, prominent for over a decade in the affairs of the United Mine Workers of America, died in Wilkes Barre on Oct. 14, after an illness of but a few days. Peritonitis, following an operation for gall stones, was the cause of his death. For fourteen years Mr. Fallon served in official capacity for the miners. As a member of the national executive board for this district, he had a prominent part in the stirring times of 1902, when as a close associate and confidant of John Mitchell, he was a leader in the great strike conducted by the miners. He is survived by his wife and six children.

CONSTRUCTION NEWS

Benscreek, Penn.—The Juniata Coal Co., of this place, has started work on two fine new mines which will be in operation within the next few months.

Logan, W. Va.—The seven mile extension of the Chesapeake & Ohio up Main Island Creek into the coal and timber land of Cole & Crane, of Cincinnati, is almost completed.

Lehigh, Okla.—The local coal company is now building new bath houses at mines Nos. 1, 5, 6 and 8. When finished, these will be the best in the state; all will have concrete floors, hot and cold shower baths, steam heat, and double rows of lockers.

The company is also preparing to put in a complete telephone system in all the mines. To accomplish this will require 21 miles of wire. A large new boiler, much bigger than ever before used here, is being put in place at mine No. 6.

Radley, Kan.—The Mayer Coal Co. is planning to add two new mines to its present developments. The additional mines will be sunk at Radley Kan., during the next month. The company is in the market for necessary equipment and will operate the new developments throughout the winter.

Johnstown, Penn.—The Berwind Coal Mining Co. has just ordered the erection of 10 more modern houses with all conveniences for miners' families at Mine No. 42. The investment will amount to about $25,000 and will bring the total expenditures of the company for the year up to about $100,000. Plans for extensive building are being drawn up already for next year.

Whitesburg, Ky.—The Elkhorn-Kentucky Coal Co. has been incorporated by Welch, W. Va., parties with a capital of $100,000 for the purpose of developing coal and timber land along Troublesome Creek and Carrs Fork in Knott County. A large area of fine property has been purchased, and it is the intention to induce the Lexington & Eastern R.R. to build at least two branches into the property, and to begin developments early next spring upon a large scale.

Logan, W. Va.—John Laing, ex-chief mine inspector of West Virginia, has recently been elected to the head of a new coal corporation that has under development 27,000 acres of coal land in Logan county, about five miles from Logan. The coal to be developed is known as the Island Creek seam, and 3200 acres will be opened immediately. Two tipples are being erected, each with a capacity of 3000 tons daily. The new firm expects to be able to ship coal by Jan. 1 of the coming year.

Welch, W. Va.—It is understood that the Norfolk & Western expects to double track its Tug Branch line next spring. This improvement will be necessary to care for the ever-growing output of coal in the field which this line serves. The United States Coal & Coke Co., whose mines are located upon this branch, is making great developments, and the coal tonnage is rapidly growing heavier every day. This field is immensely wealthy in coal, and promises to become, in a short time, the heaviest producer of any tributary branch to the Norfolk & Western.

NEW INCORPORATIONS

Houston, Texas—An ammendment has been filed by the Belknap Coal Co. of Witchita Falls decreasing its capital from $200,000 to $50,000.

Marietta, Ohio—The Iron Chest Mining Co., of Marietta, Ohio, has been recently chartered with a capital of $30,000 to engage in all kinds of mining including that of coal.

Indianapolis, Ind.—The Public Fuel Co. is a new concern with $10,000 capital stock, to do a wholesale and retail trade. The directors are A. R. Nicholas, L. E. Kirkpatrick and W. H. Nicholas.

Chicago, Ill.—The Rudenga Coal & Material Co. has been organized in Chicago with a capital stock of $50,000 to deal in and handle all kinds of fuel, building material, etc. The incorporators are William Rudenga, Reider Schoonveld, and John Heck.

Pittsburgh, Penn.—The Coal Bell Co. has been organized at Pittsburgh for the purpose of mining coal, with a capital stock of $600,000. The incorporators are W. B. Beecher, S. B. Kelly, W. H. Young, M. J. Holliday, and George H. Wolf all of Pittsburgh, Penn.

Johnstown, Penn.—The Ajax Coal Co. has been reorganized under the corporate title of the Ajax Consolidated Coal Co. and has increased its capital stock to $275,000. Under the plan of consolidation, the company has taken title to the Fort Hill mine of 300 acres and arranged for the purchase of nearly 1000 additional acres adjoining. The company's mines in Maryland and West Virginia comprise over 900 acres. Richard M. Duvall is president, James B. Pugh, vice-president, Fred E. Rowe, treasurer and Daniel Cloud, secretary.

INDUSTRIAL NEWS

Springfield, Ohio—Fire recently destroyed the round house of the Detroit, Toledo & Ironton Railway Co., causing considerable loss and wrecking two engines.

Earlington, Ky.—The Victoria Coal Co. has, upon the recommendation of its engineer, decided to cease work at its present mines and to open an entirely new operation on its property near Madisonville.

Johnstown, Penn.—Coal operators in this section are becoming alarmed over the scarcity of miners, and they predict that, if they cannot obtain more men to work in the mines, there will be a shortage of coal this winter.

Butler, Penn.—One of the largest coal deals in Butler County, involving 10,000 acres, is to be closed up soon by a syndicate now in the field. The operation will mean the building of several coal towns, and the employing of 1000 miners.

Patton, Penn.—Because eight men refused to unite with the union, 800 employees of the Pennsylvania Coal & Coke Corporation recently went on strike. There is a possibility that the trouble may spread to other operations of this concern in Cambria, Clearfield and Indiana counties.

Johnstown, Penn.—John Lochrie, of Windber, and John Reese, of Scalp Level, purchased the mineral and surface rights of the George Meyers' estate in Solomon Run Hollow, above Walnut Grove, consisting of 30 acres and containing, approximately, 300,000 tons of coal in three seams. Development of the property will be begun at once.

Connellsville, Penn.—The Crescent Coal & Coke Co. has been granted a charter in Delaware and will develop a tract of 122 acres. Steps will be taken at once to operate. For the present the company expects to take out the coal and will not engage in the manufacture of coke. If conditions warrant, a battery of coke ovens will be built later.

Toledo, Ohio—The Toledo Fuel Co. has moved from the former location on St. Clair St. into handsome new quarters in Toledo's new skyscraper, the 22-story building of the Second National Bank. This building is the tallest in the city and being of rather small ground dimensions, is quote noticeable. It overlooks the Maumee River and all the big docks and railroad yards in that section of the city.

Princeton, W. Va.—A new set of scales being built by the Virginian R.R., at Princeton, is said to be the only equipment of its kind used by any railroad in the United States. These scales are of two-car capacity, devised with double platforms working independently of each other, and the tonnage of both cars is registered on the inside of the scale house. This expedites the weighing of a train of coal to such an extent that it can be performed in less than half the time required by the one-car scales.

Wilmington, Del.—The United States Coal Co. which was incorporated under the laws of Delaware, in 1910, recently held a meeting at Wilmington, for the purpose of electing a board of directors. This company's coal property consists of 2280 acres situated about four miles southwest of Kemmerer, Lincoln County, Wyo., on the tracks of the Oregon Short Line R.R. The property is underlaid with 11 seams of bituminous coal aggregating 210 ft. in thickness. Reliable engineers estimate that the property contains 478,000,000 tons of marketable fuel.

Baltimore, Md.—To supply the increased demand for its products, the Davis Coal & Coke Co. is opening an additional mine at Franklin, West Va. This will become a part of the lower Potomac branch of the company. No statement is made as to what the tonnage will be. Simultaneously, the same firm is enlarging its mines at Henry, W. Va., so as to double the output, thus giving a daily output of about 1000 tons. The electric power used in connection with these operations will be furnished by the company's central power plant at Thomas, W. Va.

Pineville, Ky.—The Cumberland Telegraph & Telephone Co., in response to the repeated requests and petitions of coal operators and business men in the Harlan field, has announced that it will construct long-distance lines to Harlan and points in that vicinity as soon as possible. This section has heretofore been practically cut off, as far as telephone communication is concerned, by the fact that the Cumberland lines did not go further than Pineville. It is probable that the work of constructing the necessary new lines will begin in the spring, as the winter months are not favorable to that work.

St. Louis, Mo.—Before Commissioner Harlan, of the Interstate Commerce Commission, in Chicago, has come up the hearing of the Business Mens' League, of St. Louis, vs. the St. Louis Terminal Association for the removal of the twenty cents per ton bridge toll on coal for St. Louis.

A large delegation of St. Louis business men and manufacturers are fighting against the toll and the business interests of East St. Louis are lined up with the Terminal, fearing that the roads may be able to prove that the rate to East St. Louis is not a paying one in the event that the bridge toll is removed.

Upon the outcome of this contest depends the future of the manufacturing enterprises on the east side of the Mississippi River, and to some extent the development of St. Louis proper on the other hand. This is the first time that the St. Louis bridge toll question has got to a hearing before the Commission, the Terminal having always been successful in getting the proposed hearings blocked.

COAL TRADE REVIEWS

GENERAL REVIEW

An abrupt and general decline in temperature, in all parts of the country, checked a weakening tendency in the market. Anthracite stimulated into activity. Bituminous feeling the effects of the uncertainty in the business outlook and the continued heavy movement.

The week opened with a general storm in all parts of the country, accompanied by a sharp fall in temperature which arrived at the crucial moment. Under the combined influence of unseasonable weather conditions and a heavy production at the mines, the broadening tendency of the market had suffered a check, and the trade was beginning to mark time pending further developments. While prices were being well sustained, there was a notable contraction in the absorbing power of the market; activity was confined more closely to the higher grades, and the fact that a number of these were being offered in the outside markets was significant evidence of the trend of conditions. There has been no potential disturbance in the week's developments, and with the added stimulus of the changed weather conditions the strong latent power, which has been the distinguishing characteristic of the market for the past two months, will be revived.

The anthracite trade is momentarily dormant, but with a strong undertone. The last rush is on to the Atlantic Coast ports which close to navigation, and the trade only needs the reviving influence of colder weather to start the usual winter activity.

There is less anxiety apparent in the Eastern bituminous situation; stocks are said to be larger than usual, and no shortage is anticipated provided the car supply remains moderately good. Consumers are showing a tendency to go slower because of the decrease in industrial activity, particularly in the iron and steel lines, and the uncertainty in the business outlook generally. Production is restricted, however, by car and labor shortages, so that the market will probably continue on the same firm basis until the closing of navigation on the Lakes, at least.

Advanced circulars have been announced by most of the operators in Ohio, and the new quotations are being well maintained by slow deliveries which show indications of becoming even worse. The dumpings over the Hampton Road piers are heavy, both plenty of vessels and coal being available; the piers are working practically continuous. The southern markets continue rather quiet.

The effects of the changed weather conditions, which were particularly severe in the Mississippi Valley, are not available at this writing. They will no doubt have a material influence upon the situation there. The car shortage is not as bad as was anticipated, and the market has been holding steady with the possible exception of the steam grades. The supplies on the docks at the head of the Lakes are heavy, but it is conservatively estimated that the movement to the interior has been 25 per cent. less up to Oct. 1 of this year than last year.

BOSTON, MASS.

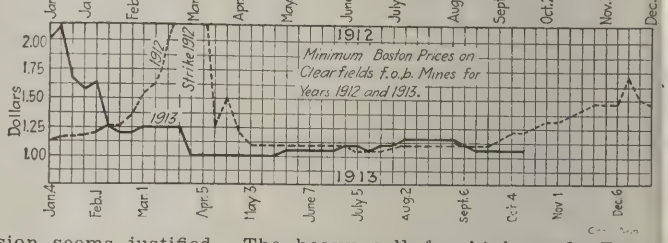
An easier situation on Pocahontas and New River, with the outlook doubtful. Shipments of Georges Creek from Philadelphia another sign of a relaxed market. Bunkering demand at New York holds prices, on the better Pennsylvania grades about where they have been for several weeks. The poorer grades are off. Anthracite continues strong.

Bituminous—Whether due to a slackening demand or purely to the slow movement of water transportation, supplies of Pocahontas and New River are notably easier than a week ago. The loading dispatch at Hampton Roads has improved and tonnage is being freely accepted for the balance of the month. With some of the agencies, too, there has been a recession in price so that $2.85 is again heard in scattered instances for spot coal. This is the more surprising when recent heavy consignments for the Government and an active demand for export are both taken into account.

Whether the market will get firmer again when transportation gets moving regularly, remains to be seen. There is apparently no anxiety in New England over coal for November except in the relatively few cases where navigation will close soon after Dec. 1. Stocks are understood to be larger than normal in most directions and anything approaching a "flurry" is now hardly possible unless a really serious car shortage develops in the next month or two. A scarcity of mine-workers is still reported from West Virginia but output seems to be kept up to the usual mark for this time of year.

For inland shipments there is very light demand and distributors with cargo balances to dispose of find the going rather hard. Prices are off somewhat in consequence.

Georges Creek has been available on contract requisitions at Philadelphia this week, the first invoices there of this grade for coastwise shipment since late August. That is another factor in the general easing up that is evident all along the line. There are a number of shippers who are quietly looking around for small orders to relieve a possible pressure of coal later and in many ways their apprehension seems justified. The heavy call for high-grade Pennsylvania coals for bunkering purposes at New York, transatlantic business especially, is holding prices up to the level that has prevailed now for several weeks. The poor grades however, are selling pretty well down and the increasing differential between "good" and "poor" is one of the interesting developments of 1913.



Anthracite—The situation is quite as strong as when last reported. Interruptions to barge movement have caused a rather sharpened demand for prompt cargoes. The last rush for shipments east to the Penobscot and the Kennebec taken together with urgent calls from the larger cities make a situation that grows harder to manage as the season advances.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.05@1.65	$1.30@1.75	$1.67@1.77	
Philadelphia*	2.30@2.90	2.55@3.00	2.92@3.02	
New York*	2.60@3.20	2.85@3.30	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.95
Providence†				3.73@3.88
Boston†				3.83@8.93

*F.o.b. †On cars.

NEW YORK

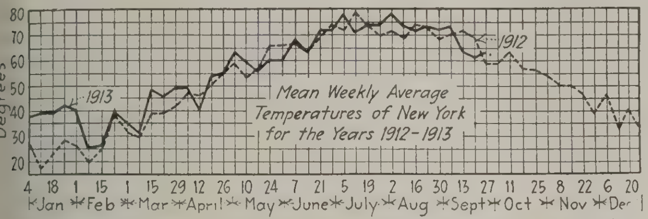
More seasonable weather has had a stimulating influence upon both branches of the local trade. Stove continues the shortest in supply with steam grades all fairly long. Bituminous moving freely but the general tone is not so assured.

Bituminous—There is a notable feeling of hesitancy in the local soft-coal market. Prices are nominally stronger at the moment than last week, but the market seems to have encountered unexpected cross currents, and the general tone is by no means so assured. The trouble is ascribed to a variety of causes; the main difficulty seems to be in the currency legislation. It is even rumored in some places that pressure is being exerted on the market by large interests for the purpose of creating adverse sentiment regarding the new laws.

Despite these unfavorable factors, coal continues to move freely and the local supplies are temporarily reported at an unusually low point. Production for the current month seems to be falling behind both the preceding two months; this is not due to the lack of orders, but to the inadequate car supply and labor troubles in the mining regions. This latter phase of the situation is becoming more accentuated and operators are inclined to a pessimistic view of the outlook. The trouble is not so much in obtaining men, as in the difficulty of keeping them at work.

There is little doing in contracting, and those who have not already covered their requirements probably will not do so this season. We continue quoting the New York market on approximately the following basis:

West Virginia steam, $2.60@2.65; fair grades of Pennsylvania, $2.70@2.75; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.



Anthracite—The hard coal companies have had a few good days, but the trade is hardly up to normal yet. The appearance of more seasonable weather the early part of the week had a stimulating affect upon the retail branch of the market, but on the other hand, the big wholesalers have had orders cancelled by the dealers, and complaints of slow business are general. The heaviest trade of the year normally develops in October, but such is not the case the current year. Although it is conservatively estimated that the difference in consumption between a hard and easy winter in New York does not exceed 10%, the local agencies seem to be agreed that the situation is now hinging entirely upon the weather.

In the prepared sizes, stove continues the leader, with egg and broken rather weak; nut is easy, but can be moved with stove. The lower grade steam sizes are nearly all in long supply, with the possible exception of No. 2 buckwheat, which is rather short.

We quote the New York hard-coal market moderately firm, according to weather conditions, on about the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	$4.95
Egg	5.25	$5.15@5.25	5.20	5.10@5.20
Stove	5.25	5.25@5.50	5.20	5.20@5.45
Chestnut	5.50	5.50	5.45	5.40@5.45
Pea	3.50	3.35@3.50	3.45	3.30@3.45
Buckwheat	2.75	2.65@2.75	2.45@2.70	2.00@2.70
Rice	2.25	2.25@2.35	1.95@2.20	1.60@2.20
Barley	1.75	1.70	1.50	1.50@1.70

PHILADELPHIA

Anthracite inactive pending the arrival of more seasonable weather. Supplies adequate. Uncertainty over the new Pennsylvania state tax.

Local anthracite dealers are waiting anxiously for the appearance of cold weather. During the past week the volume of business increased, but failed to equal that of a year ago. Reports from the mines state that the production this month will be larger than in September and the consumption of coal will be greater. Stove coal is reported scarce and has been sold at a premium. Egg has not been active in the local market contrary to expectations. During the week there was some cutting of prices. It is thought here that the trade will not be embarrassed for coal this winter as was the case last year.

There have been many complaints from the retail dealers in anthracite coal over the state tax on all anthracite mined in Pennsylvania. Many dealers declare that they lose 10 and 12c. on every ton they sell. A year ago they were making more money than at the present time, they assert. It is said that a number of the dealers are going to organize and make the consumer pay the additional 10c. per ton. Several large companies have already announced their intention of levying the extra charge next month.

With the circular at $7.25 a ton for nut, stove $7, egg $6.75 and pea $5.25, the market is more nearly quotable at $7.35 for nut, $7.10 for stove and $6.85 for egg coal. Only the arrival of cold weather will create an active market. Wholesalers report increased demand although retail dealers assert they have had few inquiries worth while during the past week.

BALTIMORE, MD.

Trade conditions remain excellent. Predictions of a drop in the market are again delayed. Demand strong for all classes of fuel and consumers are showing more and more anxiety to get under cover.

The better grades of coal are quickly taken up as offered. Producing interests are being forced to refuse to ship any excess fuel on contracts, and for this reason a number of concerns who have wanted coal above their usual weekly or monthly allotment have been forced to the open market. The heavy call from the Lakes keeps up, and for the present at least there seems to be no disturbing element in sight. West Virginia coals, even of medium grade are easily commanding from $1.05 to $1.15, and three-quarter, is good for $1.20. The Pennsylvania steam coals are worth from $1.15 to $1.25 for the least desirable grades, and better coals are reported farther out of the market now than for many seasons past at this time of the year. Cars were short on certain days in both the Fairmont and Somerset districts. The trouble was not as acute as some time back, but is still an uncertain feature.

Announcement of a new freight tariff from the mines to Baltimore was made by the Baltimore & Ohio R.R. this week. Eight cents is added to the all-rail rate to Baltimore and inside the Virginia Capes deliveries through this city, while seven cents is added to the tariff on both coastwise and foreign shipments outside the Capes.

The anthracite business here is normal for the season. No great rush is to be expected until real cold weather sets in, and in the meantime a fair delivery is being made for the household trade, gaps in yards being filled easily under a steady movement from mines to the city.

PITTSBURGH, PENN.

Car supply poorer, restricting production. Demand less than expected, but easily absorbing current production; recently advanced prices maintained. Temporary weakening expected at close of lake shipping season. Connellsville coke dull, but not particularly weak.

Bituminous—The car supply has decreased somewhat in the past week and is decidedly inadequate at the majority of mines. It is commonly accepted that there has been a slight decrease at least in general industrial activity, and that otherwise the car shortage in the coal industry at present would be greater. Demand for coal has not improved as much as expected, consumers showing a tendency to go slow on account of the general business outlook which, particularly in iron and steel, is not as bright as it was. With lake shipments very heavy and production somewhat restricted by car and labor shortage there is room for all the coal mined, and more, so that the recently advanced prices are secured without much difficulty for such limited tonnages of free coal as are available.

It is not improbable that there will be a little slump in the market when the lake shipping season closes, but operators expect this to be of brief duration at most; consumers are all imbued with the idea that there will be an unusually long suspension next year at the time of the biennial wage adjustment, and stocking against this contingency is expected to steady the market eventually.

We quote for prompt and near forward delivery the advanced prices announced Oct. 1: Slack, $1@1.25; mine-run, $1.40@1.50; ¾-in., $1.50@1.60; 1¼-in., $1.65@1.75, per ton at mine, Pittsburgh district.

Connellsville Coke—The market continues extremely quiet, but prices are not without some firmness, particularly when strictly standard coke is required. For instance, it is understood that a furnace interest which only buys on exceptionally rigid specifications has made a number of purchases of prompt furnace in the past fortnight at $2.25. November requirements yet to be filled are not large, and interest in the market now centers upon price prospects on contracts to be made for 1914. While a large number of operators, probably representing about two-thirds of the total merchant output, are understood to be committed to a price of $2.50; consumers appear firm in the belief that they will be able to cover at not much if any above $2. We quote the market largely nominal at present: Prompt furnace, $2.15@2.25; contract furnace, $2.25@2.50; prompt foundry, $2.75@3; contract foundry, $2.75@3, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 11, at 386,890 tons, an increase of 28,592 tons, and shipments at 386,890 tons, a decrease of 3055 tons.

TOLEDO, OHIO

Demand for domestic grades curtailed by warm weather. Car shortage the feature of the market. Transportation problem becoming steadily serious. Lake shipping continues heavy

The recent warm weather has put something of a damper on the demand for domestic coal. However the real difficulty of the situation here is the car shortage. Few dealers are receiving anything like normal shipments and this is especially true of the Pennsylvania field. Coal is also difficult to get from the southern Ohio fields. The alarming thing about the whole situation is that conditions seem to be growing worse instead of better. Railroads do not deny that cars are scarce and say that this will continue for about 90 days. There seems to be a shortage of motive power rather than an actual scarcity of cars.

Lake shipping continues as active as possible under the circumstances but many more boats would be loaded at the Toledo docks if coal supplies could be secured. During the present month there has been about 905,634 tons of coal sent up the lakes from the Toledo docks. There have of late been some unverified rumors of embargoes on some of the local railroads and it is feared that a little bad weather would tie the coal market up in bad shape. Prices are holding firm and there are practically no offers below the list.

DULUTH—SUPERIOR

W. W. Broughton, of Minneapolis, vice-president of the Pittsburg Coal Co., and one of the best traffic men in this country, comments on the coal situation at the head of the lakes as follows:

"The country is short and the Duluth-Superior docks long on coal supplies, and as a result we shall see less than the average tonnage on the docks Dec. 1. To look at the docks one would be impressed that there is a large supply, but much of this should be in the yards of the country coal dealer, and in the bins of consumers, at this time, to make room on the docks for additional supplies to meet the winter demand. We will go into the winter with a larger demand for coal, and only a normal supply, or less, to meet it. Last season there was a free movement to the interior with the result that we had sufficient coal on docks to meet the winter demands. The movement to the interior this season to Oct. 1, has been less by 25 to 30% than a year ago for the corresponding period."

COLUMBUS, OHIO

Many of the operators in the Ohio district have announced an advance in quotations effective, Oct. 20 and others are expected to follow; as a result the price levels are considerably higher in the face of rather unfavorable weather. Car shortage continues severe.

The feature of the coal trade during the past week was the announcement by a number of operators of an advance in the circular, effective Oct. 20. Others are expected to follow suit and all will probably be asking higher quotations by Nov. 1 if not sooner. While the warm weather has not been the best for the trade, still the congested condition was only partially relieved and the demand still continues insistent.

The new circular issued by some of the Hocking Valley operators provides for an advance in domestic lump to $2 and three-quarter inch to $1.75 to $1.85. Other grades have also been increased. These prices are expected to be maintained because of the shortage of equipment which delays deliveries to a large extent. In fact very few shipments are going through to their destination promptly.

Lake demand is still good although the shortage of equipment is having its effect on the tonnage moving to the Northwest. Dockmen at the upper Lake ports are asking for as large a tonnage as possible before the winter weather closes navigation. Dock prices are still strong and no weakness of any sort has appeared. Interior movement is good although reports show that the car shortage is prevelent in that section also.

Manufacturing plants are running along steadily as far as their fuel requirements are concerned. Many are ordering a larger tonnage although no especial effort is being made to accumulate a surplus to take care of the plant in case of a marked car stringency.

Dealers demands are steady in all of the Ohio markets. While retail business has been adversely affected by the higher temperatures, still orders to the operator and jobber are up to the mark for the time of the year. Reports from the mining districts indicate a car supply of between 55 and 65% and those figures show the output as compared with normal. In Eastern Ohio the shortage is very marked and the production is believed to be but 50%. The Hocking Valley is the best off as far as car supply is concerned.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$2.00 @ 1.90	....	$2.00 @ 1.90	$1.75 @ 1.70
3-4 inch............	1.85 @ 1.75	$1.50 @ 1.40	1.85 @ 1.75	1.55 @ 1.50
Nut..............	1.30 @ 1.20	....	1.60 @ 1.55	1.25 @ 1.20
Mine-run..........	1.50 @ 1.40	1.30 @ 1.25	1.50 @ 1.40	1.25 @ 1.20
Nut, pea and slack..	0.90 @ 0.85	....	1.00 @ 0.90	0.85 @ 0.80
Coarse slack........	0.80 @ 0.75	1.00 @ 0.95	0.90 @ 0.80	0.70 @ 0.65

HAMPTON ROADS, VA.

Loadings at piers fairly heavy. Virginian Railway breaks all previous records at Hampton Roads for fast loading. Prices firm on all grades.

The movement from Hampton Roads during the week was heavy. There was a good supply of coal with an ample number of vessels arriving which kept all piers working coninuously practically all week. The heaviest shipments have as usual been made to the New Englnd market although there have been a number of large cargoes loaded for foreign ports. Quite a fleet of bunker steamers have also been taken care of.

Prices on all grades have remained firm with a good demand for New River and Pocahontas mine run. Inquiry has not been so heavy, however, for the high volatile coals.

Record time was made by the Virginian Ry. at Sewalls Point on Oct. 17 when they loaded the steamer "Melrose" with 7238 tons of cargo and 238 tons of bunker coal in five hours. A total of 157 cars of coal were loaded which made an average of 31⅔ cars dumped per hour. The coal loaded was supplied by the Chesapeake & Ohio Coal & Coke Co. and was consigned to Everett, Mass.

LOUISVILLE, KY.

Operations in the eastern Kentucky field seriously restricted by the inadequate car supply. Western Kentucky better fixed in this respect. A large shortage of river coals due to the low water.

While the abnormally warm weather is giving way to something of a more seasonable character, the coal men are not much cheered over the prospects, because of the poor car supply. As a matter of fact, the light demand for domestic grades has been rather a relief than otherwise. Because of the poor supply of equipment the eastern Kentucky operators have been able to work on only about half time. Operators generally in all parts of the state are perplexed to know how the situation will be handled when the heavy winter demand opens up.

Because of the low stage of water in the river there is an almost acute shortage of the river coals at Louisville. The supply is practically exhausted at the moment, which is a most unusual situation at this period of the year. It is stated in some quarters that consumers demanding the Pittsburgh products are being furnished with Straight Creek and other eastern Kentucky coals. If the car supply continues short in that district the operators there will be pushed to meet their own requirements, so that any surplus demand will have to be furnished by the western Kentucky producers.

The better grade eastern Kentucky block coal is selling up to $2.50 f.o.b. mines, with the others ranging down to a minimum of $2.25 for the large sizes of good coal. Contracts may be negotiated at the low point, but sales for prompt delivery are more likely to bring the higher figure. Good grades of nut and slack from the eastern part of the state are quotable at 70@80c., with the second grades at from 50@60c. a ton, f.o.b. mines; western Kentucky screenings are at a very low point.

BIRMINGHAM, ALA.

Steam and domestic coals quiet with blacksmith about normal. Little doing in furnace or foundry coke except in small lots. Pig iron quiet, with small buying for next year. Railroad commission or Alabama takes a hand in the car shortage.

The market on both steam and domestic coal has assumed a rather stagnant condition; while fairly good, it is not up to the normal for this season, due to the continued warm weather, and the large output. A little cool weather will bring a decided change for the better on both grades. Blacksmith coal is in fair demand, with sales slightly over last week. Due to the number of furnaces out of blast undergoing needed repairs, there is a surplus of furnace coke for the time being, and several of the large companies have curtailed production. There have been some sales of fair tonnage at satisfactory prices. Foundry coke is in demand in small quantities, no large contracts being made.

Pig iron is quiet, and although numerous small sales in quantities of 100 to 500 tons are being made for the balance of this year, little tonnage was booked for next year, during the past ten days.

The car shortage continues serious on some roads, while others have improved to some extent. The Southern Railroad is causing the most trouble at the present time, mines on that line running only about three or four days in the week, due to lack of cars. The Alabama State Railroad Commission has just issued a letter giving advice to shippers and railroads in regard to quick handling of empties and loads; it is hoped that this will have some good effect, on both the railroads and the shippers, and increase the car supply during the next three or four months.

NEW ORLEANS

Domestic and harbor demands contribute to activity. Upriver companies' stocks low and an early rise will be necessary to save an embarassing situation.

Domestic demand opened strong last week and the delivery departments of the different agencies were kept busy.

Orders from the towns and cities in this territory came in large volume, almost invariably marked "rush." Cotton began to move in earnest and the demand from the waterfront was heavier than has been the case in some time.

Much concern is being felt by the Pennsylvania and other up-river companies' agencies. Stocks are forty per cent. below the average figure for this time of the year and business is heavier than ever before. An early rise in the river will save an embarassing situation but should this be delayed as late as some years the Alabama interests will have to be called upon to fill out contracts. Such a situation would be interesting, to say the least, considering the feeling that exists, and probably would result in the exacting of a profit that would be limited only by the cost of rail transportation from Pittsburgh.

INDIANAPOLIS

Warm weather the first half of the month cut down both the domestic and steam trade but conditions are better now. The railroads are relieving congestion at junction points and giving improved service at the mines. Prices hold strong. Screenings have advanced from their low point.

The first half of October did not produce as much business for Indiana coal operators as the last half of September, due principally to the warm weather which cut down the quantity of coal required for steam purposes. The second half of October is giving something more like seasonable weather and the trade expects the month as a whole to show up more normal.

The continued mild weather resulted in finally relieving the car trouble to the extent that it is only bad in spots now but production is still restricted to 75 to 85 per cent. of normal. It is said in extenuation of the railroads that much money was spent on making good the losses of the March floods, and they are further handicapped by the lack of borrowing facilities in the financial market, due to circumstances over which they have no control. There is much complaint about the Chicago & Eastern Illinois and roads that bring Ohio coal into this state.

Prices are strong except on screenings, though these have improved, ranging from 50@65c. f.o.b. mines, as compared with 30@50c. a short time ago. Bituminous lump commands $1.60@1.85, with the top price higher on urgent orders. Mine run is $1.10@1.15; nut and egg, $1.30@1.50; washed coal, $1.65@1.75; Brazil block, $2.25@2.40. The immediate market is regarded largely as a weather one. Retail prices in this city remain at the advanced figures of Sept. 20.

CHICAGO

Heavy buying orders for various grades still coming in. The movement of splint coal to this market unusually heavy. Steam grades somewhat unsteady, but prices are at a satisfactory level. The demand for Hocking is strong. Prices for coke have not been altered.

Despite Indian summer weather there has been little recession in the strong demand for various grades of coal. Orders for anthracite are plentiful and chestnut is a trifle scarce. Although shipments have been heavy, the volume of orders has been in excess of receipts and a number of dealers are looking forward to premium prices. There has been an increase in the movement of splint coal and quotations range between $1.75@1.85. Although there has been some decrease in the buying of coke, prices remain firm. A number of Springfield operators are attempting to obtain $2 a ton for domestic lump, but, as a rule, $1.75 is the market.

Buying of steam coal has been somewhat unsteady and prices, after a decline of 15c. a ton, have returned to the basis of two weeks ago. Many mines still have a large amount of low-priced orders for screenings on hand. On mine-run the majority of Western operators are averaging $1.10@1.15 a ton. Smokeless lump and egg prices range from $2.25@2.50. Many orders are being received for smokeless mine-run, small lots selling at $1.50 and larger orders at $1.40.

Carterville operators are selling lump, egg and No. 1 washed at $2, the mines; No. 1 washed is given the preference over either lump or egg. The demand for Hocking coal continues steady and prices are firm. Quotations by Franklin County producers for lump and egg vary from $2@2.25, the mines.

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05@3.30	$2.52	
Steam lump	2.07		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.92	2.40@2.55	1.87	3.45@3.55
Screenings	1.12@1.22	1.55@1.80	1.12@1.22	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; byproduct, egg, stove and nut, $4.85; gas house, $4.65@4.75.

DETROIT, MICH.

Warm weather and approaching end of the Lake shipping season is having a depressing effect on the soft-coal market. Car shortage becoming more evident. Domestic coals and better grades generally continue strong.

Bituminous—A slight slump has been noticed in soft coal, and the situation is uncertain at the moment. There has been a distinct falling off in the demand during the week, and the near approach of the closing of the lake shipping season is having an undeniably depressing effect upon the immediate outlook locally. However, the slump seems to center around the low-grade West Virginias, the better qualities holding firm, with a few spot sales being negotiated on the basis of $1.10 for mine-run.

The bituminous market is now quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.75	....	....	....	....	$2.75	$2.50
Egg	1.75	....	....	....	....	2.75	2.50
Nut	1.35	....	....	....	....	....	....
Steam lump	1.50	....	....	....	....	....	....
¾-in. lump	1.15	$1.15	$1.10	1.10	1.10	....	....
Mine-run	1.05	1.05	1.00	1.05	1.05	....	....
Slack	0.75	0.90	0.75	0.80	0.80	....	....

Anthracite—Because of the unseasonably warm weather the situation in hard coal is rather disappointing at the moment. The trade is in fair shape, however, and the advent of cold weather will certainly create some activity. The general tendency seems to be to store liberally in anticipation of a rather severe winter.

ST. LOUIS

Market conditions looking better the present week. Car shortage still continues, and the steam market seems to have no foundation. Conditions bad in general, with a supply that exceeds the demand.

The present week brought about a better condition in the coal trade, but only to a slight extent. The trade became demoralized last week because of the warm weather and the forcing of the market on several sizes from the different fields. Some mines are sold up on lump and have no market for the other sizes; others have taken no advance orders at all in hopes that the market would go up. The result has been that with every additional day's work there is more coal forced on the market than there is a demand for.

This applies especially to the Carterville and Franklin County fields. In the Standard field, coal is still going at the cost of production or less, and several mines have shut down until the market gets better. This shows what a demoralized coal market the St. Louis operators are playing to when, at this season, they cannot get cost of production.

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.05@1.15
3-in. lump	....	....	$1.50	....
6-in. lump	$1.65 @ 1.85	....	1.60	1.30@1.40
Lump and egg	1.50 @ 1.60	$2.25	....	....
No. 1 nut	1.25 @ 1.50	....	....	....
Screenings	0.45 @ 0.50	....	....	1.10@1.20
Mine-run	....	....	....	0.90
No. 1 washed nut	1.65 @ 1.85	....	1.40	....
No. 2 washed nut	1.30 @ 1.45	....	1.60	....
No. 3 washed nut	1.15 @ 1.20	....	....	....
No. 4 washed nut	1.05 @ 1.15	....	....	....
No. 5 washed nut	0.35 @ 0.40	....	....	....

Anthracite—Quotations f.o.b. St. Louis are: Chestnut, $7.54; egg and stove, $7.27; grate, $7.01.

Coke—Gas house is quoted at $4.50@4.75, and byproduct at $4.85@5, both f.o.b. St. Louis.

KANSAS CITY, MO.

Market stiff with an advance likely. Larger sizes of steam coal, slow. Other movement good. Car shortage still interfering.

Demand is brisk and practically all lines are moving nicely. A possible exception may be the larger sizes of steam coal. However, a little snappy weather will give impetus to the marketing of these grades. The ideal weather which has prevailed for the past month has come to an abrupt end and the indications now are for the beginning of winter. Cooler weather already has arrived and a continuation will probably result in another 25c. advance. This is likely to take place about Nov. 1.

Prices are the same as those of a week ago, Kansas deep shaft fancy lump being held at $2.50; Arkansas Russellville anthracite grate, $4.35; Missouri Richmond and Camden block, $2.25 and Iowa Mystic and Centerville block, $2.25. All quotations are f.o.b. mines.

OGDEN, UTAH

Demand exceeds production. Colder weather causes increased demand for lump and nut. Sugar factories consuming surplus of slack and steam coal. Strike of the Colorado miners causing shortage there and in Nebraska. Car shortage at Wyoming mines.

All of the mines are now receiving plenty of orders to take care of the full production and many of the operations are even getting behind on shipments. Colder weather throughout the territory is the general cause. This has enabled the operators to force the market demand for nut coal and the surplus of this grade has been moved.

The sugar factories are all running full time, and are consuming all the steam and slack coal produced. The strike in Colorado has caused a heavy demand for Rock Springs coal in Colorado and Nebraska; winter is approaching rapidly in these two states, and it is evident that they will have quite a shortage.

The Wyoming mines were visited by a car shortage this week and several of the operations lost two days on this account. However it is not expected that this will continue for any length of time as there are plenty of cars en route.

On Oct. 13 quotations for shipment in Nevada advanced to: Lump, $3; nut, $2.50; mine-run, $1.85; slack, $1. For the balance of the territory the quotations are: Lump, $2.75; nut, $2.25; mine-run, $1.85; slack, $1.

PORTLAND, ORE.

Small shipments from Australia this fall may effect prices to some extent. Elimination of duty will not have any extensive bearing on situation.

The sailing schooner "George E. Billings" arrived in the Columbia River this week from Australia with a cargo of coal of about 1500 tons, part of which was discharged at Astoria and the remainder will be brought to Portland. This is the first water shipment received here since early last spring. It was announced today that a second shipment of about 1500 tons will arrive in a couple of months.

General indications here are that there will be a scarcity of coal in this market during the winter and retail dealers are notifying customers accordingly. The weather so far has been mild in the western part of the state, but snow fell in the eastern sections during the week. Receipts of coal are rather light for the present owing to the difficulty in getting cars promptly.

FOREIGN MARKETS

GREAT BRITAIN

Oct. 10—Steam-coal market conditions are not materially changed. A good demand continuing for admiralty list coals, while inferior classes are plentiful and prices on the easy side.

Best Welsh steam	$4.58@4.80	Best Monmouthshires	$3.84@4.08
Best seconds	4.44@4.56	Seconds	3.78@3.90
Seconds	4.20@4.32	Best Cardiff smalls	2.46@2.58
Best dry coals	4.32@4.56	Seconds	2.28@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for August and the two months ending Aug. 31, 1913, in short tons:

	August		2 Months			
Destination	1913	1912	1913	%	1912	%
Tidewater	319,616	356,296	558,254	18	644,989	22
East	172,249	200,216	364,040	12	364,964	12
West	1,066,671	975,301	1,933,543	63	1,907,186	65
Total	1,558,536	1,531,813	2,855,837		2,917,139	
Coke	26,723	22,082	56,668		42,058	
From connections						
Bituminous	106,989	21,079	200,391	7	36,620	1
Anthracite	1,642	808	3,213		1;597	
Total (except coke)	1,667,167	1,553,700	3,059,441	100	2,955,356	100

THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Oct. 1, as follows:

	Surplus	Shortage	Net*

The Reading Co.—Regular quarterly dividend on the first preferred stock of 1%, payable Dec. 11 to holders of records Nov. 25.

Consolidation Coal Co.—Regular quarterly dividend of 1½%, payable Oct. 31 to holders of record Oct. 25.

Consolidation Coal Co.—According to a statement made the early part of the current year this company operates 82 bituminous coal mines. It also owns 32 miles of railroad and two thousand 60-ton steel coal cars. The aggregate of both road and cars is valued at $5,000,000.

A New Departure In Coal Washing

About 30 to 40% of the tonnage handled in every coal washery today is too fine for a successful separation by the use of jigs. These tailings, heretofore a waste product, can now be successfully treated, making a product of very low ash content, excellent for coking purposes.

The MASSCO Coal Washing Table

(Fully protected by U. S. Patents.)

is the first machine to accomplish this to any degree of success.

The table shows a remarkably high percentage of separation and the process is visible at all times while the table is in operation, which is susceptible of exact adjustment and under easy control of the operator.

A big coal washery in Dawson, N. M., recently put a Massco Table through an exhaustive test. And the test was so successful that we later received their order for 24 Tables.

A summary of this test will be sent on your request—also other details. WRITE.

The Cast Steel Bar Frame

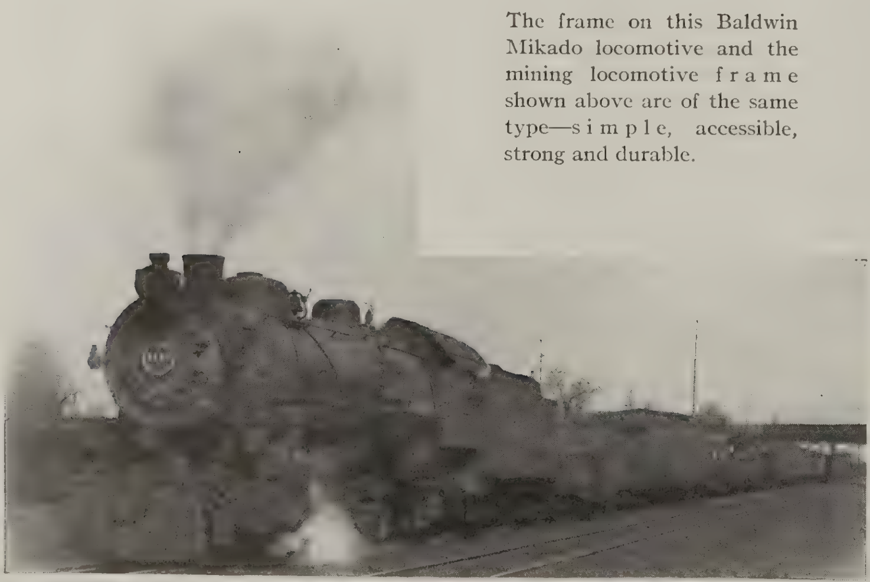
(*Barsteel*)

of Baldwin-Westinghouse Mine Locomotives

This frame is of the same type as that used on the famous Baldwin Mikado steam freight locomotives. It is designed to give greater strength than any other type of frame for a specified weight of locomotive and to allow easy access to all parts so that the locomotive can be inspected or overhauled, when necessary, with the least possible cost of time and labor.

The motors; brake shoes; brake rigging and sand boxes are all quickly reached, and excellent ventilation is given to the motors and resistance, through the openings allowed by the ***Barsteel*** frame construction. The journals and the motor armature and axle bearings are also easy to get at for thorough lubrication.

The ***Barsteel*** frame is only one of the important features of Baldwin-Westinghouse Mine locomotives, which give the user the greatest possible service.



The frame on this Baldwin Mikado locomotive and the mining locomotive frame shown above are of the same type—simple, accessible, strong and durable.

Full information can be obtained by addressing either Company.

The Price Cutter

By Berton Braley

You have met him I am sure
He's the salesman who would lure
Orders from you with a discount,
round and fat.
Who would whisper in your ear
So none else could ever hear,
The special price he'd quote for
this or that.

He's the man who tells you straight,
That for *you* he'll pay the freight,
If you never breathe a word to
Smith or Brown.
And you find as time goes by
This was just the same old lie,
That he told to every customer in
town.

He will tell in the convention
How he's strongly for prevention
Of price cutting with its wrongs
and useless ills.
But he can't resist temptation
And he'll cut his "best" quotation
By perhaps a special discount on
the bills.

But there's hope for us at last
For his kind is fading fast,
And the salesman who will win
out in the end
Is the one who knows his biz
Knows what isn't and what is
And upon whose price quotation
you'll depend.

COAL AGE

ol. 4 NEW YORK, NOVEMBER 1, 1913 No. 18

The technically educated mine manager is uch in evidence these days. We hasten to dd—this is as it should be, in fact, when we onsider the extent and possibilities of mehanical equipment, as applied to mining at he present time, it is hard to believe that it ould be otherwise.

We are far from agreeing, however, with he official who insists that he desires an entire rganization of superintendents and foremen who can boast an engineering education. The viewpoint of the man with a technical training is so radically different to that of the so called practical man, that unless an organization contains able men of both classes, errors of judgment are sure to develop sooner or later—generally sooner.

We gave an illustration of this in our "Foreword" of Sept. 6, in discussing the possibilities of getting clean coal: The mechanical expert, with his picking belts and washeries, was compared with the practical man, who knows absolutely the kind of coal his miners *ought* to load.

The ventilation problem often brings out noticeably the two viewpoints:

If a mine inspector unexpectedly demands that the quantity of air in a certain mine be generously increased, the engineer of technical training will immediately tabulate water-gage readings, investigate fan efficiencies and live for days with fan catalogs. In contrast to him, the practical man will don his overalls and start on a personal inspection of all air courses in the mine. When you recall that the fan engineer requires eight times the power to get twice the volume, if he makes no change in his air-course areas, while the fellow with the overalls can often get double the volume with the same power, providing he can discover that his air-course area is obstructed unnecessarily. You must admit, therefore, that the overalls are about as important as the slide rule, to say the least.

Many a mine has been taxed with a new fan installation that would not have been required had an intelligent examination of airways been conducted by a competent man, with authority to carry out his recommendations.

One more example: A mine is to be greatly enlarged, and as the mine cars that have been in use are pretty well worn out, besides being of obsolete design, it is decided to purchase new cars throughout. (You'll find mines in this transition stage near at hand, if you investigate.)

The technical engineer compares prices of steel cars, as against wood, investigates the average life of each and then makes a decision. The practical man interviews the miners to see just how well the wood car, about to be discarded, suits his requirements. Is it so heavy that it can not be pushed in and out of rooms without exhausting the miner, before a fair tonnage is loaded; is it too high, requiring unnecessary effort in loading; is its wheel base too long, or too short? If too long it is difficult to put on the track when derailed, if too short it will jump the track too easily.

We know of a case where steel mine cars were purchased for a low-seam coal mine, upon the recommendation of a competent mining engineer. The cars were so heavy that the men could not handle them to advantage in and out of their rooms and the mine became so unpopular with miners that the cars eventually were replaced with wooden ones.

College men, as a rule, are clannish, when it comes to choosing between college men and practical men, just as the practical fellows are clannish, when choosing between men of their ranks, as against those with a college training; this, no doubt, explains that "birds-of-a-feather" tendency, in so many coal mine organizations.

The Madison Coal Corporation Mine No. 9

By James Taylor*

SYNOPSIS—Brief description of the surface plant and underground arrangements. The checking system, to show the number of miners and other employees in the mine, and to avoid accident by a miner going unwarned into a place where danger exists. Fire rules in force.

⁂

The property known as Mine No. 9, of the Madison Coal Corporation, St. Louis, Mo., is located at Dewmaine, Williamson County, Illinois, and embraces 1560 acres of coal and surface. The seam of coal is that known as the Williamson County coal No. 6. This seam varies in thickness from 7.5 to 9.2 ft., and is found at different depths up to 276 ft. below the surface.

The Surface Plant

The plant of this company, two illustrations of which adorn the front cover of our next issue, is one of the most complete in the state, having a maximum capacity of 3500 tons, for an 8-hour day.

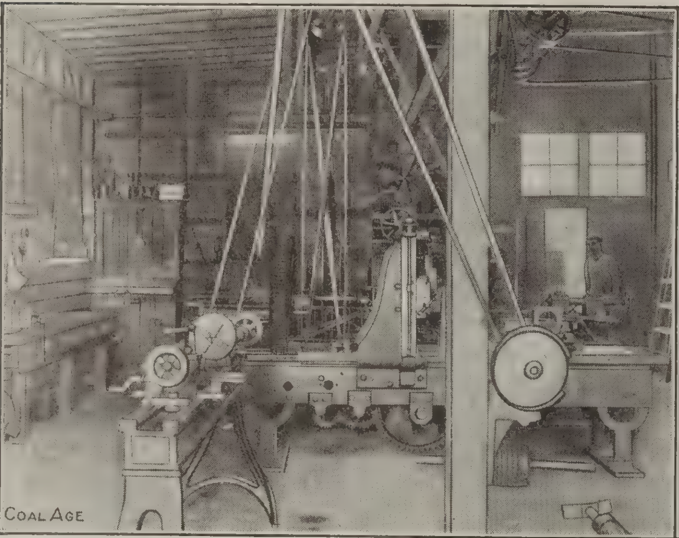

Fig. 1. Showing Interior of Machine Shop

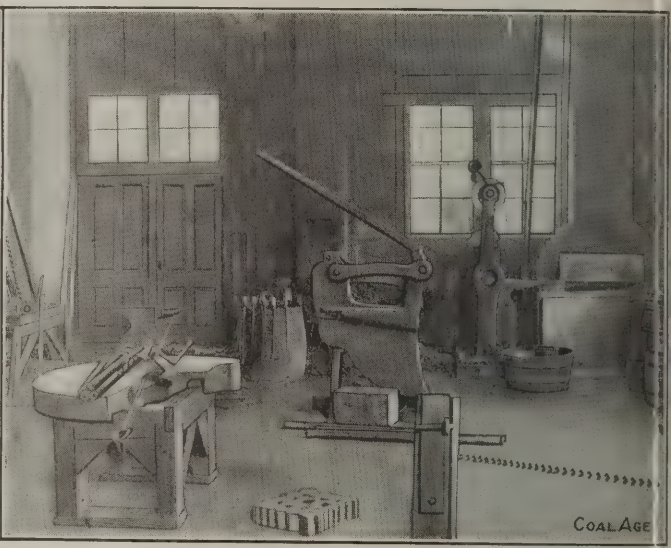

Fig. 2. Showing Interior of Blacksmith Shop

The office contains a large concrete vault, for preserving maps and documents of value, and two large bedrooms furnished with five single beds for the accommodation of the mine officials or entertainment of visitors.

The hoisting engines are equipped with automatic engine stops to prevent overwinding, and the cages are fitted with a signal device so arranged that the men on the cage can signal the engineer, at any point of the trip, to stop, raise or lower the cage, as desired. The plant is equipped with an electric concrete-mixing machine, adapted to either underground or surface use. Figs. 1 and 2 are views of the interior of the machine and blacksmith shops, respectively.

The machine shop (Fig. 1) is 38x27 ft., inside measurement, built of brick and concrete. It is equipped with an electric motor, for power purposes; a steam engine to be used when the generators are out of service; a 26x28-in. by 12-ft. planer; a 26-in. lathe; a 13-in. by 6-ft. lathe; a power hacksaw; and a 27-in. swing-drill press. Ther are, besides, a complete set of tools for winding arma tures and a complete set of machinist's tools.

The blacksmith shop (Fig. 2) is a building 38x21 ft. inside measurement, of brick construction, and i equipped with two forges; a shaper for pit-car iron; power hammer for sharpening machine bits; a swag block; a power grindstone; an emery wheel; a power saw for cutting wood at any angle; a portable electric drill for both wood and iron; and a crab for handling cars There is, besides, a complete set of tools of every description, required for repairing and building cars, as well a for repairing and building dwellings.

System of Mining and Underground Construction

The system of mining is that known as the "panel system." The mine workings are laid out in panels 60 ft. square. The main and stub entries are driven 12 ft. wide and 25-ft. pillars are left between the entries of each pair. Rooms are turned off the stub entries on 40-ft. centers, at right angles to the road, and driven a distance of 250 ft.; these rooms are 20 ft. wide, with 20-ft. pillars between them.

The sides of the main entry, at the shaft bottom and in the runway or cutoff for the entries, are protected with concrete walls on which are placed steel I-beams, to support the roof over the tracks. Fig. 3 shows these concrete walls and the I-beams in position. This construction is used for a distance of 1800 ft. on the main entry. The automatic trap doors used in this mine are provided with side entrances or doors, for the use of men only.

The mining law of Illinois provides that all crosscuts, connecting inlet and outlet air courses, except the last one nearest the face, shall be closed with substantial stoppings, to be made as nearly air-tight as possible. In the making of the air-tight partitions or stoppings, no loose material or refuse shall be used.

Fig. 4 shows a crosscut closed with "Pyrobar" blocks,

---

*State mine inspector, Fourth district, Peoria, Ill.

3x10x16 in. The floor in the crosscut in which the stopping is to be erected is first leveled off, and the rib coal cut away to a depth of 6 in. and the full width of the block. A concrete foundation is then made 12 in. wide by 14 in. high, on which the blocks are placed. The blocks are laid in a good portland cement, and the work finally sealed so as to be air-tight. These blocks have proved the best stopping material ever used where it is dry.

The mining law of Illinois requires that the mine manager (mine foreman) shall provide a suitable checking system whereby the entrance into and departure from the mine of each employee shall be correctly recorded for reference. In compliance with this requirement, the Madison Coal Corporation have adopted the following system: Two duplicate check boards are provided, one being placed at the top and the other at the bottom of the main hoisting shaft.

One of these check boards is shown in Fig. 5. It is made in the form of a cabinet, having two folding doors, which when thrown open expose the checks to view, as shown in the figure. The entire board is subdivided, according to the different classes of employees. The miners' checks occupy the center of the board. The spaces are numbered in consecutive order and each is provided with a hook on which the corresponding check is hung. The check is a brass tag with a hole in it and numbered, as shown in the center of the figure. There is, also, a special tag designed to be used to notify the miner of any danger in his place. On the face of the tag is the date, check number and acknowledgment of the man that he is informed of the danger existing in his place. On the reverse side, the existing danger is explained by the mine examiner (fireboss).

When going on shift in the morning, the men receive their checks from the board at the top of the shaft, present them to the cager, who then permits them to go on the cage. At the bottom of the shaft, the miner hangs his check in its proper place on the board there provided and proceeds to his work. On leaving the mine, each man takes his check from the board at the shaft bottom, presents it to the cager, who permits him to go on the cage. Arriving at the top of the shaft, the miner returns his check to the board on the surface and goes home.

Should it happen that the mine examiner find a dangerous place, on his inspection of the mine, he removes the corresponding check from the board at the surface and hangs in its place the tag previously mentioned, on which he has written a brief description of the nature of the danger existing in that place. The checks removed by the examiner are given to the mine manager and, before the man can enter the mine, he must go to the mine manager for his check. His tag is then examined and, if he is unable to read, the nature of the danger existing in his working place is explained to him, after which the man is given his check and allowed to go below; and the tags are filed for reference.

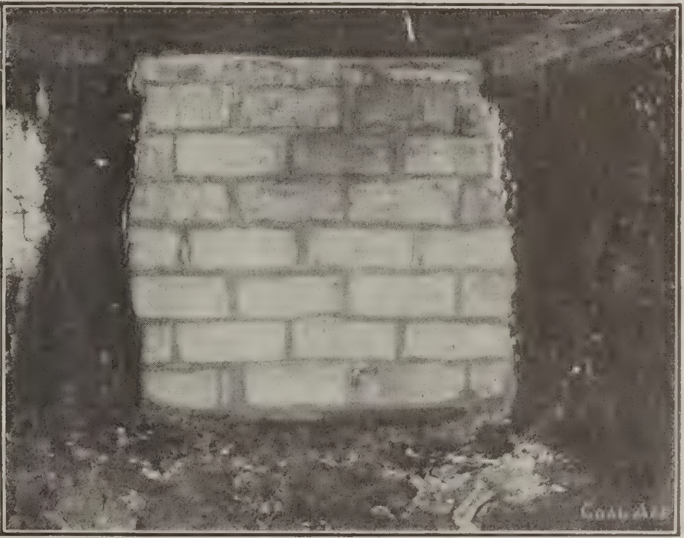

FIG. 4. SHOWING A "PYROBAR" PERMANENT FIREPROOF ENTRY STOPPING

FIRE RULES OF THE MADISON COAL CORPORATION

The Mining Law of Illinois requires fire-fighting equipment and other means for the prevention and control of fires and to avoid the loss of life from this cause, in coal mines.

1. All fire equipment shall be tested in actual drill "not less than once every fourteen days," both on the surface, as well as in the mine workings.

2. The alarm of fire on the surface shall be short, continuous blasts of the steam whistle.

3. When fire is discovered underground it must be immediately made known by telephone to the cagers at the bottom of the shaft, and by them to the mine manager and his assistants, who will immediately give such telephone instructions as will best protect the men in making their escape. Whoever first gives the alarm of fire by telephone must stay at the telephone to receive and convey such instructions as are required and in addition must notify all drivers to go into their respective territories and warn all who are working there.

4. Telephones must be kept at each "parting" and in good working order.

5. The head cager must test the telephone every two hours during each working shift, making the first test before hoisting commences in the morning. The mine manager in charge of the night shift must make frequent tests and know that the telephones are in working condition in districts where men are employed.

7. The mine managers are charged with the duty of testing the telephones and making report of their condition each day.

8. After the alarm has been given either on the surface

or below ground, no coal except that on the ascending cage must be hoisted, and both cages must be immediately relieved of cars.

9. All men upon hearing the alarm of fire must immediately go to their respective stations and prepare the pumps, hydrants, hose and chemical extinguishers for action. Drivers, motormen, trip-riders and others must immediately give notice to all employed in their respective districts and exert their best efforts to aid in the safe escape of the entire force.

10. Hoisting engineers must remain in the engine room and obey regular signals and the orders of the district superintendent or mine manager.

11. The firemen must remain at the boilers unless otherwise directed by the district superintendent or mine manager.

12. The head dumper or weigh boss, as may be directed, shall have charge of the gates and guard the shaft at the surface landing, and attend mine signals.

13. The head bottom cager will retain charge of the cages and attend to fire alarm and other signals at the shaft bottom.

14. The machinist's duty will be to attend the fire pumps only.

15. It shall be the duty of the head blacksmith or his helper (as may be designated) to open valves for conveying water to the fan house and all water pipes on the surface and in the mines.

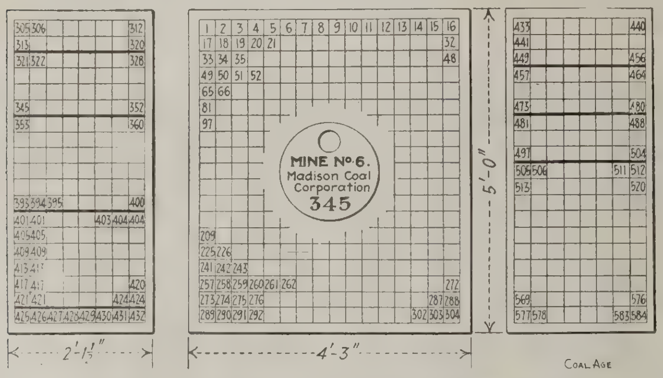

Fig. 5. Showing the Check Board Open

16. Certain assigned duties shall be given to a sufficient number of men to take charge of valves connected with all underground fire pipe lines, handle the hose on the surface and in the working buildings, as well as in the mine.

17. Under no circumstances must hay or straw be permitted to be loaded into the mine until all miners of the day shift are on the surface, and then must only be lowered into the mine after it has been inspected by the hoisting engineer or top foreman to see that the hay and straw are in bales and contained in a closed forage box with lid securely fastened to make it impossible of ignition from any cause, and the hoisting engineer on duty at the time is charged with the knowledge of such inspection.

18. The first duty of the night watchman or such other person as may be designated by the district superintendent or mine manager (when the weather permits) shall be to unreel two lines of hose (one on each side of the mine) and open the hydrant valves.

19. On the discovery of fire at night, the steam whistle must be blown and alarm also given as provided in rules 2 and 3.

The night forces must, upon the alarm of fire, go to their regular stations and duties assigned by the district superintendent or mine manager.

The greatest degree of protection and safety to life and property can only be secured by the cool, prompt action of those in charge of the forces and the fire apparatus; as well as calmness and good order on the part of all employees leaving the mine. Fire apparatus must not be handled by anyone except those authorized to do so, and then only in case of fire or for the purpose of drill and repairing.

Any person known to mutilate or damage any part of the fire machinery and appliances will be prosecuted, and if an employee, in addition thereto, will be discharged.

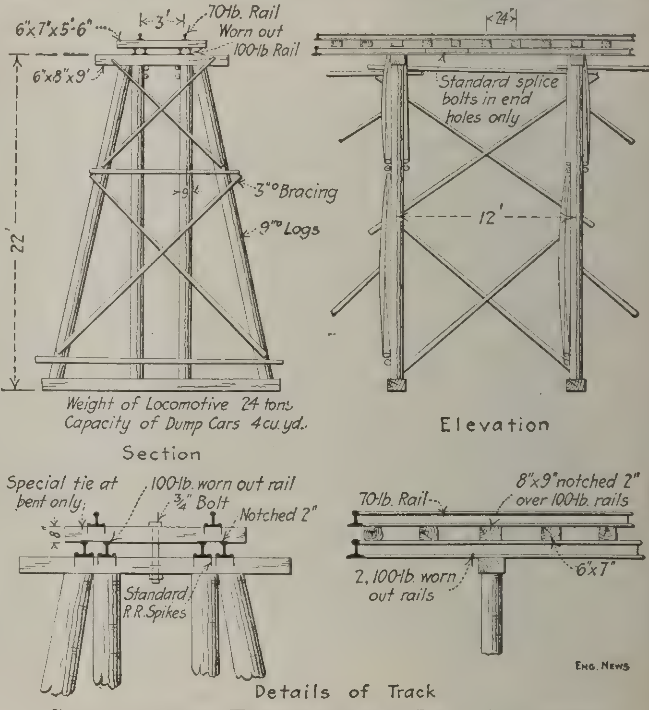
Among the numerous improvements the Madison Coal Corporation has installed at No. 9 mine is a Jeffrey 14x5-ft. double-inlet, reversible, underthrow fan. This fan is installed in an absolutely fireproof building of brick, concrete and steel, and has a capacity of 200,000 cu.ft. of air per minute, at a speed of 150 r.p.m., against a 4-in. water gage. This fan is driven by two Skinner high-speed automatic 19x20-in. direct-connected engines. With both engines running, it will be capable of delivering 250,000 cu.ft. of air per minute, against a 6-in. water-gage.

⁂

Trestles with Old Rails for Stringers

In the reconstruction of the line of the Pennsylvania R.R. at Rahway, N. J., the Keystone State Construction Co. has a considerable length of timber trestle in which the stringers are made of old rails discarded by the railway. These trestles are of two types, one used as a construction railway and the other as a filling trestle which is covered by the fill as it progresses.

The construction-railway trestle is the heavier of the two (Fig. 1). It is made up of the usual framed bents with round log uprights and sapling braces and a squared 6x8-in. cap. On this cap run the stringers, four old 100-lb. rails, in groups of two, spanning the 12-ft. opening between bents. These rails are spiked with standard railway spikes to the cap, and are spliced wherever the breaks come with the standard rail splices with bolts only in the end holes.



Construction Trestle with Rail Stringers

(Pennsylvania R.R. track elevation, Rahway, N. J., The Keystone State Construction Co.)

The 3-ft. gage construction track is built of old 70-lb. rails spiked to 6x7-in. ties with an 8x9-in. tie dapped 2 in. over the stringer rails at the bents. These latter ties are bolted with ¾-in. bolts to the bent caps, and this is the only fastening of the track to the bents or stringers.—*Engineering News.*

⁂

Relation of Big Business to Mining

Coal Age next week will contain an address on this subject, delivered by Charles Richard Van Hise, to the annual convention of the American Mining Congress held in Philadelphia last week.

Administration of Public Mining Lands

By J. F. Shafroth*

SYNOPSIS—Coal lands are not now to be obtained in the West as they were formerly acquired in the Central States. They are either held at an unreasonable price per acre or withheld from entry entirely. They are not selling and the Western States are unable to tax them for revenue. It is proposed that a royalty by some evaluated at 37 billion dollars shall be ultimately paid by the operators of Colorado to the national government, the lands meanwhile being exempt from taxation.

⁂

It was Daniel Webster who eternally damned the Rocky Mountain region, the greatest mineral-producing area of our country. In consigning this great empire of states to the limbo of outer darkness he used the following language:

> What do we want of that vast, worthless area, that region of savages and wild beasts, of deserts, of shifting sands and whirling winds, of dust, of cactus and prairie dogs? To what cause could we ever hope to put those great deserts and those endless mountain ranges, impenetrable and covered to their very base with eternal snow? What can we ever do with the western coast, a coast of 3000 miles, rockbound, cheerless and uninviting?

The American pioneer, braving every danger, overcoming every hardship, meeting with fortitude and courage the difficulties and perils of the wilderness has returned sufficient answer to the doubts of the New England statesman. Where lay the barren desert now thrives a fruitful land of promise. But the spirit that prompted the harsh dictum of Webster is still alive in activities of later statesmen. Where he lacked imagination and vision they refuse to accept the evidence of their own senses. And so they have added to the pioneer's burden, discouraging rules and regulations which seek to deny to him the fruits of his toil.

Western Mining Conditions Once Favorable

The government recognized that it was the explorers, settlers and developers who made the value of everything in a wild and uninhabitated country; that if the lands were not exploited and improved they would remain as worthless as they had been for 6000 years.

Under this general policy of rewarding the pioneer citizens of the United States in the development of the natural resources of the public domain, thousands of people crossed the trackless desert for California, and there discovered the richest gold fields ever known in the history of the world. These gold mines were upon the public domain. There was no law providing for the location of mining claims. The miner locating gold fields in California could have been considered by the government a trespasser and liable to refund to the government the value of all the gold extracted; but under the policy of the government as to the settlement of lands in Ohio, Indiana, Illinois and Missouri no one ever suggested that the miner was not entitled to the fruits of his discovery; and the miners themselves proceeded to frame rules and regulations as to the manner of locating and developing the mines. These provisions were afterward enacted into laws by Congress, not to provide a profit to the national government, but for the purpose of promoting the production of the greatest wealth to the nation and benefitting all the citizens thereof.

Under that policy there has been a development of the Western country unparalleled in the history of the world. Three billions of dollars in the precious metals, produced at a cost of perhaps that amount of money, but turned into the channels of trade, have contributed largely toward making this country the most prosperous nation on earth. It is the increase of basic money that has always given a quickening impulse to business and commerce. An enormous development has been produced in all the other industries of that region.

The Lands Are Now to Be Leased

Now it is proposed, by bills introduced in Congress, and advocated by followers of Mr. Pinchot, to change this policy, to impose royalties upon powers generated by falling water, and to lease the oil and phosphate lands and the coal and metalliferous mines upon a rental basis payable to the treasury of the United States.

No other states have had their resources taxed by the national government, and we deem it is unfair that the people of the states which had all the products of their natural resources for themselves should now require, through their senators and representatives, these less favored states in the West not only to undertake the development of the natural resources of these states, but to pay into the federal treasury a tax upon the very development thereof.

Exemption from Taxation

What does the leasing of the natural resources of the mountain states mean? It means perpetual ownership in the national government, and that means exemption from taxation forever. Perpetual exemption from taxation of vast territory in a state is almost destructive of its development. It is an injustice which, it seems to me, every fair-minded person must recognize. The state must maintain government for state, county and school purposes over all the lands within its borders, whether reserved or not.

In the West the taxes upon land for a period of 30 years, including reasonable interest upon each yearly payment, amount to the value of the land. Therefore, when the lands privately owned must pay all of the taxes for state, county and school purposes it is equivalent to their paying every 30 years, in addition to their just taxes, an amount equal to the value of the public lands. Thus the people of these states must pay for these public lands every 30 years and yet never own a foot of the same. Is that right; is it just; is it the way a parent would treat a child? Is it a compliance with the enabling acts which provide that each state is "admitted into the Union upon an equal footing with the original states in all respects whatsoever."

This new policy would not only deprive the states of the means of raising the necessary revenue to establish and maintain good government, but in addition to that injustice the advocates thereof propose to make revenue for the federal treasury by taxing the natural resources of the West. By so doing they propose to make the mountain states pay an undue proportion of the burdens of the national government.

---

*Senator from Colorado.

Note—Paper read before the American Mining Congress, Oct. 22.

WHAT A TEN-CENT ROYALTY WILL RAISE

It has been estimated by the geological survey at Washington that there are contained within the boundaries of the state of Colorado 371,000,000,000 tons of coal. More than three-fourths of this coal is upon the public domain. If a rental of 10c. per ton is to be imposed upon that natural resource of the state of Colorado, it would mean ultimately that the citizens of our state must contribute $37,000,000,000 to the federal treasury. This tax is advocated on the ground that it will prevent waste. According to the geological report, Colorado alone has sufficient coal to supply the world for 300 years, at the present rate of consumption of about one and one-quarter billion tons per annum. Although my state is now mining 11,000,000 tons of coal a year, yet our production for 50 years has exhausted only one-half of 1 per cent. of our coal deposits.

If royalties are to be paid for the extraction of the precious and base metals, other millions will be turned into the federal treasury from the natural resources of our state. It may be that it will be proposed, as is done in the forestry department at Washington, that one-fourth of the receipts will be turned over to the state treasury, to be used only for certain purposes to be prescribed by the federal government. But is it equal or fair treatment to our commonwealth for the government to impose any tax whatever upon our natural resources, which it has never imposed upon the older and richer states of the Union? It must be remembered that the act of Parliament of Great Britain imposing duties upon goods shipped to the 13 colonies, against which our forefathers rebelled, provided that the revenue derived therefrom should be expended in America for its protection and defense.

The policy of the nation holding in perpetuity great forest reserves and coal, gas, oil, phosphate and mineral lands, and rights-of-way for water-power plants, and controlling the same, is an interference with local affairs which, according to our theory of government, should belong to the states.

THE STATE SHOULD CONTROL THE LANDS WITHIN ITS BORDERS

It was the late Justice John M. Harlan, of the supreme court of the United States, who said:

> A national government for national affairs and state governments for state affairs is the foundation rock upon which our institutions rest. Any serious departure from that principle would bring disaster upon the American system of free government.

The permanent administration of public lands in a state, sovereign as to all functions except those which were delegated to the national government, is an interference with local affairs never before attempted in the history of this country. Such administration by a bureau at Washington, with its thousands of guards imported from other states patrolling these gigantic areas, can never be satisfactory to the people of the states in which such lands are situated. The bureau will always be controlled by officers who are not in sympathy with the people of such states. Carpetbag government of such local affairs is bound to follow with its antagonism to everything that interferes with the national government's control and use of these reserves, which we think are so destructive of the development of our states.

The discouragement to the prospector of mineral lands, by reason of the rules adopted by the forestry bureau, has been so great in Colorado that there are now practically no prospectors left. And yet we know that the hills of our state have hardly been scratched in prospecting for the minerals therein contained. It is impossible for these reserves to be managed to the best interests of our people by a bureau administered two or three thousand miles away.

HOW CONGRESS IMPOVERISHES THE NATION

The effects of this bureaucratic administration of our mineral lands are evidenced in great distress not only to the states directly concerned but also to the commerce and industry of the entire nation. The prospector has been driven from the hills. Under the rules and regulations promulgated by absentee guardians of our estate he has become a trespasser upon the lands of his commonwealth. He dare not go into the hills to scratch for precious metals lest some ranger lately imported from Connecticut or New Jersey warn him off.

Against the physical obstacles which nature placed in his path the pioneer prospector pitted a stout heart and a willing hand, and came victorious from the encounter. But the artficial barriers raised up by the government of the United States have proved too strong for him and he has succumbed in the unequal struggle. His state is poorer by his passing, and industry and commerce move in sluggish channels with the cutting off of his contributions to them.

Appointment of Mine Inspectors in West Virginia

Following is a list of district mine inspectors appointed by the new chief of the Department of Mines, in West Virginia, Earl A. Henry. The appointments are for a period of four years.

Name	District	Address
Karl F. Schoew	First	Fairmont
Frank E. Parsons	Second	Clarksburg
L. D. Vaughn	Third	Grafton
W. B. Plaster	Fourth	Elkins
R. B. Cobb	Fifth	Montgomery
Enoch Carver	Sixth	Charleston
James Martin	Seventh	Charleston
E. J. Flanagan	Eighth	Montgomery
L. B. Holliday	Ninth	Beckley
Arthur Mitchell*	Tenth	Bluefield
John Phillips	Eleventh	Welch
E. C. Lambert	Twelfth	Williamson

Mr. Henry has served the state, as district mine inspector, for a number of years, and is thoroughly familiar with the conditions of mining throughout the state. Much is to be expected, during Mr. Henry's administration, in the work of continuing the systematizing of the mine-inspection service in West Virginia. The chief of the Department of Mines has always had the hearty coöperation and confidence of the entire body of district inspectors, and to this fact is largely due the rapid advance that has been made in the state, during the incumbency of John Laing, formerly at the head of the department. We bespeak the same hearty support, during the present administration.

The Costs and Profits in Coal Mining

By Edward W. Parker*

SYNOPSIS—An illuminating study of some of the business aspects of the coal industry. Despite the well known fact that the anthracite companies are growing stronger financially each year, Mr. Parker presents figures showing that anthracite mining yields practically no profit. The same rather incongruous condition prevails in the bituminous industry. Western operators fare the best.

⁂

In order to do justice to the subject and to the occasion, a paper on the cost of coal mining prepared for presentation before the American Congress should be based upon an intensive study of the records, not too many, of typical operations in a sufficient number of states to get results capable of analytical comparison and deduction.

Unfortunately, when I was asked by the Secretary of the Congress to prepare this paper there was not time to collect data from which such a study could be made, and I have been compelled to adopt as the basis of this discussion the latest official statistics available, those of the Thirteenth Census of the United States, which covers the calendar year 1909. Since that time wages have been advanced in both the anthracite and bituminous districts, and prices for the product have been raised to compensate for (and in some cases, possibly more than offset) the increased cost of production.

Necessity for More Careful Accounting

If at the outset I may be permitted to make a suggestion, as to one thing needed in the coal-mining industry (looking at it from the standpoint of the statistician and economist) it is a standardization in the methods of accounting. It is difficult—one might say impossible—to compile accurate statistical data regarding cost and value of product when operators themselves cannot tell what their product costs nor what they actually receive for it, and when their only means of judging whether they are making or losing money is by their bank accounts.

Within the present year the Geological Survey was requested by one corporation, whose value of production is measured by the tens of millions, to furnish statements of its output some ten or fifteen years ago, which it was unable to ascertain from its own records. The only reason that the Survey could not comply with the request was that the schedules and tabulations are kept for two years only, for purposes of comparison, and are then destroyed, as there is no place where they can be safely stored and the best method of maintaining their confidential character is to burn them.

In the anthracite region particularly is it difficult to secure accurate information, not only in regard to mining cost, but also the value at first hand of the output. A large proportion of the anthracite is sold at so much a ton delivered at Buffalo, or Chicago, or Milwaukee, or wherever it may be, and the sale price of the coal at the mines includes the freight to the point of delivery and is so entered on the books. Until the recent action of the United States Supreme Court abolishing the contracts between the anthracite companies and the transportation interests, all the anthracite shipped to New York harbor ports for a number of years has been sold on a percentage basis of the tidewater price, the railroads taking 35 per cent. for the freight and returning 65 per cent. to the operators.

The magnitude of the task of determining what the actual value of the product is, was rather forcibly brought home to me last spring, when I called at the New York office of one of the big anthracite companies for the purpose of urging the expediting of that company's report. It had furnished complete reports of production, by sizes, for its numerous mines, but had omitted any statement of values. I had written a letter urgently requesting as accurate a statement of the value as I had received of the production, and had been promised the additional information. The auditor brought for my observation sheet upon sheet of closely written figures, upon which the calculations necessary to get the data had been made. It had taken the entire time of one clerk more than two weeks to do the work.

Difficulty in Computing Costs

What goes into mining cost is in many cases as difficult to ascertain. As many here well know, the old type of wooden or corrugated-iron breakers in the anthracite regions of Pennsylvania is giving way rapidly to modern structures or reinforced concrete or other fireproof construction. I have been reliably informed that the investment in most cases is charged, not to capital account, but to mining expenses. It must, of course, eventually go into the cost of mining, but it seems to me that it is an investment, not an expense, and when charged into the cost of mining should be in the form of depreciation, and of interest on the investment.

These are cited merely as examples of the complexities which confront the economist when he undertakes to annalyze such statistics as he finds available. There is a somewhat general impression that the mining of coal, both anthracite and bituminous, is a highly lucrative vocation, and that the principal occupation of the so called coal barons is to look pleasant as the golden stream flows into their coffers. I venture to state, taking the industry as a whole, that there are few lines of industrial endeavor where, during the last ten years, there have been smaller returns for the capital invested and for the energy, mental and manual, that has been put into it, than in the business of coal mining.

As has been already observed, the only recent official statistics of relative cost and value available are those presented in a recent bulletin published by the Bureau of the Census and which cover the calendar year 1909. This report shows that the value of the Pennsylvania anthracite produced in that year was $148,957,894. The total gross expenses amounted to $139,110,444, from which should be deducted $4,864,844 made up from charges to miners for explosives, oil and blacksmithing, making the net expenses $134,245,600.

---

*Statistician, U. S. Geological Survey, Washington, D. C.

Note—An address before the 16th annual convention of the American Mining Congress, Philadelphia, Oct. 20 to 24, 1913.

The gross expenses are itemized as follows:

Services:		
Salaries	$4,572,489	
Wages	92,169,906	$96,742,395
Supplies:		
Fuel and power	3,189,279	
Other supplies	23,472,809	26,662,088
Royalties		7,969,785
Miscellaneous		7,736,176
Total gross expenses		$139,110,444
Deductions		4,864,844
Net expenses		$134,245,600

Earnings of the Anthracite Operators

The total production in 1909 amounted to 72,215,273 long tons, so that the average value per ton for the output in that year was $2.06; the average cost per ton was $1.86; and the net returns on the operations for the year were $14,712,294, or an average of 20c. per ton. This at first glance looks like a fair return, but attention must be called to the fact that the Census figures of cost make no allowance for interest on capital invested or borrowed, and no offsetting charges for amortization or depreciation.

According to the returns to the Bureau of the Census, the entire capital invested in anthracite mining in 1909 was $246,700,000, which may appear rather inadequate when one considers the magnitude of the industry, and an annual production of $150,000,000 (in 1911 the output was valued at $175,189,392 and in 1912 it was $177,622,626), but I am taking the figures reported by the Census Bureau. If on this capitalization an allowance of 4 per cent. be made for interest, the net returns for the year amounted in round numbers to $4,844,000.

If, as I suggested at the outset, new breakers and other equipment are charged into operating expenses no allowance need be made for depreciation, but surely the exhaustion of from 75,000,000 to 80,000,000 tons from the reserves every year should have some amortization charged against it and if 5 cents a ton be allowed the margin of $4,800,000 is practically wiped out. At least it may be said that from the operators' standpoint there may have been some reason for the recent advances in the price of anthracite, the effect of which the author of this paper has felt as keenly as any other consumer of anthracite.

The figures covering the cost and value of bituminous coal show even more striking comparisons. I may remark here that there are some slight differences in the statistics of production between the Census figures and those published by the United States Geological Survey for the reason that the Census investigations excluded mines having a production of less than 1000 tons, whereas the Survey rakes the country with a fine-tooth comb and includes every small country bank, from which it can secure a report. For 1909 the Survey showed a bituminous coal production of 379,744,257 short tons valued at $405,486,777, and the Census Bureau showed a production of 376,865,510 tons valued at $401,577,477, the difference being about 3,000,000 tons in quantity and $4,000,000 in value—less than 1 per cent. in either case. As the Census figures for cost of mining are the basis of this discussion, the Census figures of production are also used.

Profits in the Bituminous Industry

The total value of the bituminous production, as already stated, was $401,577,477, and the mining expense of producing this value, including salaries of officers, was $378,159,282. As in the case of anthracite, the expenses of production do not include any charges for depreciation, amortization, or interest on capital invested or borrowed. The expenses are divided as follows:

Salaries	$20,417,392
Wages	282,378,886
Supplies	45,345,932
Royalties	12,035,90
Miscellaneous	17,961,17
Total	$378,159,282

From this it appears that 75 per cent. of the total cost and 70 per cent. of the total value was spent in wages. Salaried officials got less than 5.5 per cent.

Now, let us see what capital got. The total capital invested in the bituminous coal mines of the United States in 1909 was, according to the Census bulletin, in round numbers $960,000,000 ($960,289,465), and I do not think that looks as if there were very much over-valuation, whatever the capitalization may be as represented by stock issue. The difference between the value of the product and the expense of producing it was $23,440,000 in round numbers or a fraction over 2.5 per cent. on the capital.

The average value per ton of all the bituminous coal produced in the United States was $1.07 and the costs averaged a fraction of a cent over $1, so that the margin of profit to cover interest, depreciation and amortization was a little less than 7c. a ton. In some states the expenses exceeded the returns. Take Arkansas, for instance, where the expenses totaled $3,630,526 and the value of the product was $3,508,590. Other instances were:

	Value of Product	Expenses
Iowa	$12,682,106	$12,816,076
Kentucky	9,940,485	10,127,987
Tennessee	6,548,515	6,691,482
Oklahoma	6,185,078	6,536,441
Virginia	4,336,185	4,392,440

Conditions in the Leading States
